Our notions of geometrical magnitudes are obtained by the contemplation of a *body*, or *solid*. We readily understand that this is extended in three directions; that is, it has length, breadth, and thickness. The outside or boundary of a solid, that which separates the particular space it occupies from space in general, is called a *surface* or *superficies*. A surface, then, is not conceived as having any thickness; it has only length and breadth.

A surface has a boundary; something which encloses it, or separates any portion of it from the remainder. This boundary, which has no thickness, nor breadth, but length only, is a *line*.

Again, there is something which terminates a line, indicating where it begins and where it ends, or which may

Lines and Figures upon a Plane.

separate it into distinct portions. This is a point, which has neither thickness, length, nor breadth. These three kinds of magnitude, viz. solids, surfaces, and lines, are the objects of geometrical discussion.

There is no limit to the number of lines, and surfaces, and solids, which may be considered in geometry. The elements of the science, however, treat only of a few of these: Straight lines, circles, rectilineal plane figures, and their affections, constitute one part of geometry; another treats of the intersections of planes, of solids bounded by planes, and of the three round bodies, viz. the cylinder, the cone, and the sphere. This diversity of objects leads to the division of the subject into two parts, one which treats of figures on a plane, and another the geometry of solids.

PART I.—OF LINES AND FIGURES UPON A PLANE.

SECT. I.—PRINCIPLES OF GEOMETRY.

Definitions.

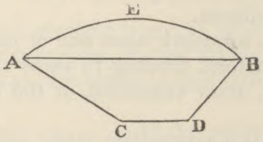
I. Geometry is a science which treats of the properties and relations of quantities having extension, and which are called magnitudes. Extension is distinguished into length, breadth, and thickness.

II. A *Point* is that which has position, but not magnitude.

III. A *Line* is that which has only length. Hence the extremities of a line are points, and the intersections of one line with another are also points.

IV. A *Straight* or *Right Line* is the shortest way from one point to another.

Fig. 1.



V. Every line which is neither straight nor composed of straight lines is a *Curve Line.* Thus AB is a straight line, ACDB is a line made up of straight lines, and AEB is a curve line.

VI. A *Superficies* or *Surface* is that which has only length and breadth. Hence the extremities of a superficies are lines, and the intersections of one superficies with another are also lines.

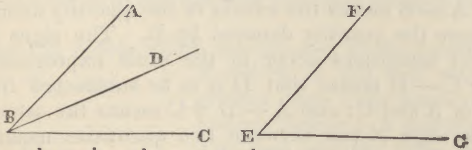
VII. A *Plane Superficies* is that in which any two points being taken, the straight line between them lies wholly in that superficies.

VIII. Every superficies which is neither plane nor composed of plane superficies, is a *Curve Superficies.*

IX. A *Solid* is that which has length, breadth, and thickness. Hence the boundaries of a solid are superficies; and the boundary which is common to two solids which are contiguous, is a superficies.

X. A *Plane Rectilineal Angle* is the inclination of two straight lines to one another, which meet together, but are not in the same straight line. The point in which the lines meet one another is called the *Vertex* of the angle.

Fig. 2.



When there is only one angle at a point, it may be expressed by the letter placed at that point; thus the angle contained by the lines EF and EG may be called the angle E. If, however, there be several angles, as at B, then each is expressed by three letters, one of which is the letter that stands at the vertex of the angle, and the others are the letters that stand somewhere upon the lines containing the angle, the letter at the vertex being placed between the other two. Thus the angle contained by the lines BA and BD is called the angle ABD or DBA.

Angles, in common with other quantities, admit of addition, subtraction, multiplication, and division. Thus the sum of the angles ABD and ABC is the angle DBC; the difference of the angles DBC and ABD is the angle ABC.

Fig. 3.

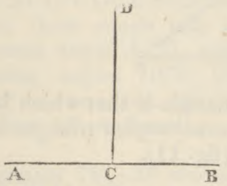


Fig. 4.

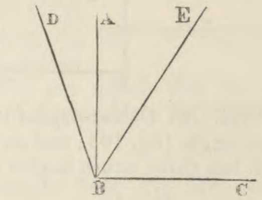
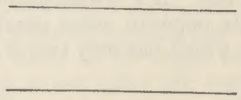


XI. When a straight line standing on another straight line makes the adjacent angles equal to one another, each of them is called a *Right Angle*, and the straight line which stands on the other is called a *Perpendicular* to it. Thus, if DC meet AB, and make the angles ACD, DCB equal to one another, each of them is a right angle, and DC is a perpendicular to AB.

XII. An *Obtuse Angle* is that which is greater than a right angle, and an *Acute Angle* is that which is less than a right angle. Thus ABC being supposed a right angle, DBC is an obtuse angle, and EBC an acute angle.

XIII. *Parallel Straight Lines* are such as are in the same plane, and which being produced ever so far both ways, do not meet.

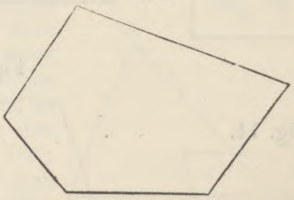
Fig. 5.



XIV. A *Plane Figure* is a plane terminated everywhere by lines.

If the lines be straight, the space which they enclose is called a *Rectilineal* figure, or a *Polygon*, and the lines themselves constitute the *Perimeter* of the polygon.

Fig. 6.



XV. When a polygon has three sides (which is the smallest number it can have), it is called a *Triangle;* when it has four, it is called a *Quadrilateral;* when it has five, a *Pentagon;* when six, a *Hexagon,* &c.

XVI. An *Equilateral* triangle is that which has three equal sides (fig. 7); an *Isosceles* triangle is that which has only two equal sides (fig. 8); and a *Scalene* triangle is that which has all its sides unequal (fig. 10).

Fig. 7.

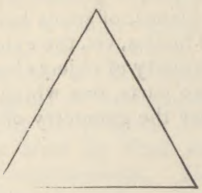


Fig. 8.

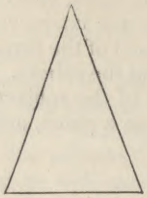
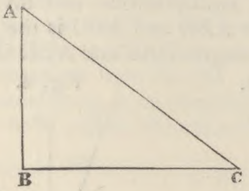


XVII. A *Right-angled* triangle is that which has a right angle; the side opposite to the right angle is called the *Hypothenuse.* Thus in the triangle ABC, having the angle at B a right angle, the side AC is the hypothenuse.

Fig. 9.



XVIII. An *Obtuse-angled* triangle is that which has an obtuse angle (fig. 10); and an *acute-angled* triangle is that which has three acute angles (fig. 11).

Fig. 10.

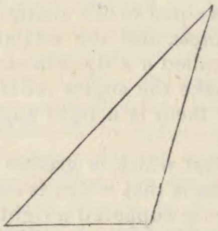


Fig. 11.

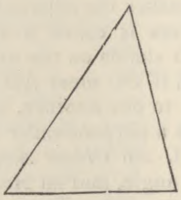

XIX. Of quadrilateral figures, a *square* is that which has all its sides equal, and all its angles right angles (fig. 12). A *Rectangle* is that which has all its angles right angles, but not all its sides equal (fig. 13). A *Rhombus* is that which has all its sides equal, but its angles are not right angles (fig. 14). A *Parallelogram,* or *Rhomboid,* is that which has its opposite sides parallel (fig. 15). A *Trapezoid* is that which has only two of its opposite sides parallel (fig. 16).

Fig. 12.

Fig. 13.

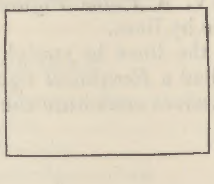

Fig. 14.

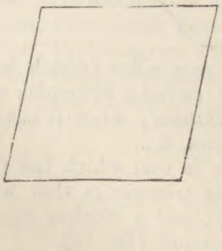

Fig. 15.

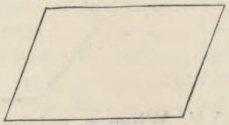

Fig. 16.

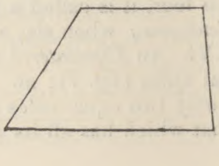


XX. A *Diagonal* is a straight line which joins the vertices of two angles, which are not adjacent to each other, such as AC in fig. 42.

XXI. An *Equilateral Polygon* is that which has all its sides equal; and an *Equiangular Polygon* is that which has all its angles equal. If a polygon be both equilateral and equiangular, it is called a *Regular Polygon.*

XXII. Two polygons are *equilateral* between themselves when the sides of the one are equal to the sides of the other, each to each, and in the same order; that is, when in going about each of the figures in the same direction, the first side of the one is equal to the first side of the other; the second side of the one is equal to the second side of the other; the third to the third, and so on. The same is to be understood of two polygons which are *equiangular* between themselves.

Explanation of Terms.

An *Axiom* is a proposition the truth of which is evident at first sight.

A *Theorem* is a truth which becomes evident by a process of reasoning called *Demonstration.*

A *Problem* is a question proposed, which requires a solution.

A *Lemma* is a subsidiary truth employed in the demonstration of a theorem, or the solution of a problem.

The common name, *Proposition,* is given indifferently to theorems, problems, and lemmas.

A *Corollary* is a consequence which follows from one or several propositions.

A *Scholium* is a remark upon one or more propositions that have gone before, tending to show their connection, their restriction, their extension, or the manner of their application.

A *Hypothesis* is a supposition made either in the enunciation of a proposition, or in the course of a demonstration.

Explanation of Signs.

That the demonstrations may be more concise, we shall make use of the following signs borrowed from algebra; and in employing them we shall take for granted that the reader is acquainted with at least the notation and first principles of that branch of mathematics.

To express that two quantities are equal, the sign $=$ is put between them; thus $A = B$ signifies that the quantity denoted by A is equal to the quantity denoted by B.

To express that A is less than B they are written thus, $A < B$.

To express that A is greater than B they are written thus, $A > B$.

The sign $+$ (read *plus*) written between the letters which denote two quantities, indicates that the quantities are to be added together; thus $A + B$ means the sum of the quantities A and B.

The sign $-$ (read *minus*) written between two letters means the excess of the one quantity above the other; thus $A - B$ means the excess of the quantity denoted by A above the quantity denoted by B. The signs $+$ and $-$ will sometimes occur in the same expression; thus $A + C - D$ means that D is to be subtracted from the sum of A and C; also $A - D + C$ means the same thing.

The sign $\times$ put between two quantities means their product if they be considered as numbers; but if they be considered as lines, it signifies a rectangle having these lines for its length and breadth; thus $A \times B$ means the product of two numbers A and B; or else a rectangle having A and B for the sides about one of its right angles. We shall likewise indicate the product of two quantities, in some cases, by writing the letters close together; thus mA will be used to express the product of m and A, and so on with other expressions, agreeably to the common notation in algebra.

The expression A^2 means the square of the quantity A, and A^3 means the cube of A; also PQ^2 and PQ^3 mean, the one the square, and the other the cube, of a line whose extremities are the points P and Q.

On the other hand, the sign $\surd$ indicates a root to be extracted; thus $\sqrt{A \times B}$ means the square root of the product of A and B.

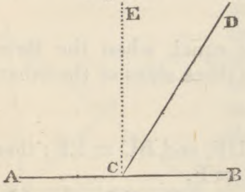
Axioms.

1. Two quantities, each of which is equal to a third, are equal to one another.
2. The whole is greater than its part.
3. The whole is equal to the sum of all its parts.
4. Only one straight line can be drawn between two points.
5. Two magnitudes, whether they be lines, surfaces, or solids, are equal, when, being applied the one to the other, they coincide with one another entirely, that is, when they exactly fill the same space.
6. All right angles are equal to one another.

Note.—The references are to be understood thus: (7) refers to the seventh proposition of the section in which it occurs; (4, 2) means the fourth proposition of the second section; (2 Cor. 28, 4) means the second corollary to the twenty-eighth proposition of the fourth section.

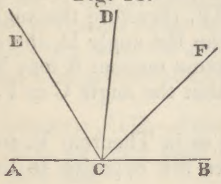
Theorem I.—A straight line CD, which meets with another AB, makes with it two adjacent angles, which, taken together, are equal to two right angles.

Fig. 17.



At the point C let CE be perpendicular to AB. The angle ACD is the sum of the angles ACE, ECD; therefore ACD + BCD is the sum of the three angles ACE, ECD, BCD. The first of these is a right angle, and the two others are together equal to a right angle; therefore the sum of the two angles ACD, BCD, is equal to two right angles.

Fig. 18.

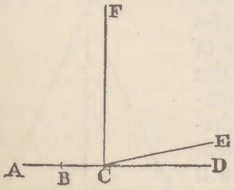


Cor. 1. If one of the angles is a right angle, the other is also a right angle.

Cor. 2. All the angles ACE, ECD, DCF, FCB, at the same point C, on the same side of the line AB, are, taken together, equal to two right angles. For their sum is equal to the two angles ACD, DCB.

Theorem II.—Two straight lines which coincide with each other in two points, also coincide in all their extent, and form but one and the same straight line.

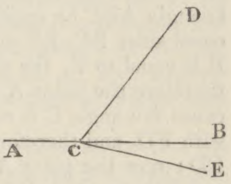
Fig. 19.



Let the points which are common to the two lines be A and B; in the first place it is evident that they must coincide entirely between A and B; otherwise two straight lines could be drawn from A to B, which is impossible (Axiom 4). Now let us suppose, if possible, that the lines when produced separate from each other at a point C, the one becoming ACD, and the other ACE. At the point C let CF be drawn, so as to make the angle ACF a right angle; then ACE being a straight line, the angle FCE is a right angle (1 Cor. 1); and because ACD is a straight line, the angle FCD is also a right angle, therefore the angle FCE is equal to FCD, a part to the whole, which is impossible; therefore the straight lines which have the common points A, B cannot separate when produced, therefore they must form one and the same straight line.

Theorem III.—If two adjacent angles ACD, DCB make together two right angles; the two exterior lines AC, CB, which form these angles, are in the same straight line.

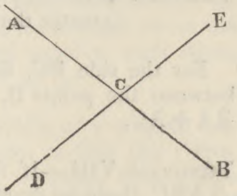
Fig. 20.



For if CB is not the line AC produced, let CE be that line produced, then, ACE being a straight line, the angles ACD, DCE are together equal to two right angles (1); but, by hypothesis, the angles ACD, DCB are together equal to two right angles; therefore ACD + DCB = ACD + DCE. From these equals take away the common angle ACD, and the remaining angles DCB, DCE are equal, that is, a part equal to the whole, which is impossible; therefore CB is the line AC produced.

Theorem IV.—If two straight lines AB, DE cut each other; the vertical or opposite angles are equal.

Fig. 21.



For since DE is a straight line, the sum of the angles ACD, ACE is equal to two right angles (1); and since AB is a straight line, the sum of the angles ACE, BCE is equal to two right angles; therefore the sum ACD + ACE is equal to the sum ACE + BCE. From each of these take away the same angle ACE, and there remains the angle ACD equal to its opposite angle BCE.

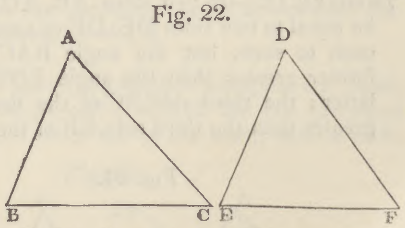
In like manner it may be demonstrated, that the angle ACE is equal to its opposite angle BCD.

Cor. 1. From this it appears, that if two straight lines cut one another, the angles they make at the point of their intersection are together equal to four right angles.

Cor. 2. And hence all the angles made by any number of lines meeting in one point are together equal to four right angles.

Theorem V.—Two triangles are equal when they have an angle, and the two sides containing it of the one, equal to an angle, and the two sides containing it of the other, each to each.

Fig. 22.



Let the triangles ABC, DEF have the angle A equal to the angle D, the side AB equal to DE, and the side AC equal to DF; the triangles shall be equal. For if the triangle ABC be applied to the triangle DEF, so that the point A may be on D, and the line AB upon DE, then the point B shall coincide with E, because AB = DE; and the line AC shall coincide with DF, because the angle BAC is equal to EDF; and the point C shall coincide with F, because AC = DF; and since B coincides with E, and C with F, the line BC shall coincide with EF, and

Lines and Figures upon a Plane.

the two triangles shall coincide exactly, the one with the other; therefore they are equal (Ax. 5).

Cor. Hence it follows that the bases, or third sides BC, EF of the triangles are equal; and the remaining angles B, C of the one are equal to the remaining angles E, F of the other, each to each, namely, those to which the equal sides are opposite.

Theorem VI.—Two triangles are equal, when they have a side, and the two adjacent angles of the one equal to a side, and the two adjacent angles of the other, each to each. (See fig. 22.)

Let the side BC be equal to the side EF, the angle B to the angle E, and the angle C to the angle F; the triangle ABC shall be equal to the triangle DEF. For if the triangle ABC be applied to the triangle DEF, so that the equal sides BC, EF may coincide, then, because the angle B is equal to E, the side BA shall coincide with ED, and therefore the point A shall be somewhere in ED; and because the angle C is equal to F, the side CA shall coincide with FD, and therefore the point A shall be somewhere in FD; now the point A being somewhere in the lines ED and FD, it can only be at D their intersection; therefore the two triangles ABC, DEF must entirely coincide, and be equal to one another.

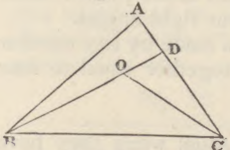
Cor. Hence it appears that the remaining angles A, D of the triangles are equal; and the remaining sides AB, AC of the one are equal to the remaining sides DE, DF of the other, each to each, viz. those to which the equal angles are opposite.

Theorem VII.—Any two sides of a triangle are together greater than the third. (Fig. 22.)

For the side BC, for example, being the shortest way between the points B, C (Def. 4), it must be less than $BA + AC$.

Theorem VIII.—If from a point O, within a triangle ABC, there be drawn straight lines OB, OC to the extremities of BC, one of its sides; the sum of these lines shall be less than that of AB, AC, the two other sides.

Fig. 23.

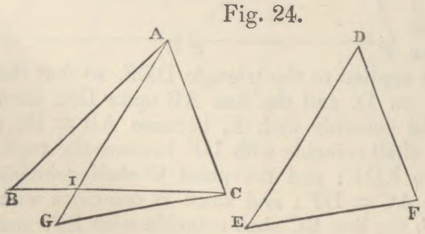


Let BO be produced to meet CA in D; because the straight line OC is less than $OD + DC$, to each of these add BO, and $BO + OC \angle BO + OD + DC$; that is, $BO + OC \angle BD + DC$.

Again, since $BD \angle BA + AD$, to each of these add DC, and we have $BD + DC \angle BA + AC$; but it has been shown that $BO + OC \angle BD + DC$, much more then is $BO + OC \angle BA + AC$.

Theorem IX.—If two sides AB, AC of a triangle ABC be equal to two sides DE, DF of another triangle DEF, each to each, but the angle BAC contained by the former greater than the angle EDF contained by the latter; the third side BC of the first triangle shall be greater than the third side EF of the second.

Fig. 24.

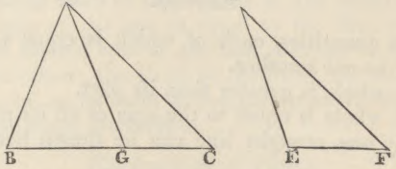


Suppose AG drawn so that the angle CAG $= D$, take $AG = DE$ and join CG; then the triangle GAC is equal to the triangle EDF (5), and therefore $GC = EF$. Now there may be three cases, according as the point G falls without the triangle BAC, fig. 24, or on the side BC, fig. 25, or within the same triangle, fig. 26.

Lines and Figures upon a Plane.

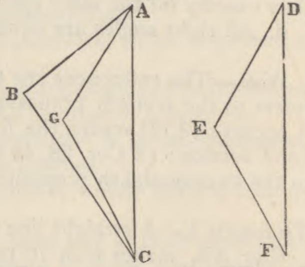
Case I. Because $GC \angle GI + IC$, and $AB \angle AI + IB$ (7), therefore $GC + AB \angle GI + AI + IC + IB$, that is, $GC + AB \angle AG + BC$; from each of these unequal quantities take away the equal quantities AB, AG, and there remains $GC \angle BC$, therefore $EF \angle BC$.

Fig. 25.



Case II. If the point G fall upon the side BC, then it is evident that GC, or its equal EF, is less than BC.

Fig. 26.



Case III. Lastly, if the point G fall within the triangle BAC, then $AG + GC \angle AB + BC$ (8), therefore, taking away the equal quantities AG, AB, there remains $GC \angle BC$ or $EF \angle BC$.

Cor. Hence, conversely, if EF be less than BC, the angle EDF is less than BAC; for the angle EDF cannot be equal to BAC, because then (5), EF would be equal to BC; neither can the angle EDF be greater than BAC, for then (by the Theor.) EF would be greater than BC.

Theorem X.—Two triangles are equal, when the three sides of the one are equal to the three sides of the other, each to each. (Fig. 22.)

Let the side $AB = DE$, $AC = DF$, and $BC = EF$; then shall the angle $A = D$, $B = E$, $C = F$.

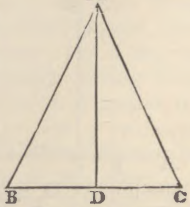
For if the angle A were greater than D; since the sides AB, AC are equal to DE, DF, each to each, it would follow (9), that BC would be greater than EF; and if the angle A were less than the angle D, then BC would be less than EF; but BC is equal to EF, therefore the angle A can neither be greater nor less than the angle D, therefore it must be equal to it. In the same manner it may be proved that the angle $B = E$, and that the angle $C = F$.

Scholium. It may be remarked, as in Theorem V. and Theorem VI. that the equal angles are opposite to the equal sides.

Theorem XI.—In an isosceles triangle, the angles opposite to the equal sides are equal to one another.

Let the side $AB = AC$, then shall the angle $C = B$

Fig. 27.



Suppose a straight line drawn from A the *vertex* of the triangle, to D the middle of its base; the two triangles ABD, ACD have the three sides of the one equal to the three sides of the other, each to each, namely, AD common to both, $AB = AC$ by hypothesis, and $BD = DC$ by construction, therefore (preced. Theor.) the angle B is equal to the angle C.

Cor. Hence, every equilateral triangle is also equiangular.

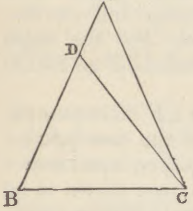
Scholium. From the equality of the triangles ABD, ACD, it follows that the angle BAD = DAC, and that the angle BDA = ADC; therefore these two last are right angles. Hence it appears that a straight line drawn from the vertex of an isosceles triangle to the middle of its base is perpendicular to that base, and divides the vertical angle into two equal parts.

In a triangle that is not isosceles, any one of its three sides may be taken indifferently for a *base;* and then its *vertex* is that of the opposite angle. In an isosceles triangle, the base is that side which is not equal to one of the others.

Theorem XII.—If two angles of a triangle be equal; the opposite sides are equal, and the triangle is isosceles.

Let the angle ABC = ACB; the side AC shall be equal to the side AB. For if the sides are not equal, let AB be the greater of the two; take BD = AC, and join CD; the angle DBC is by hypothesis equal to ACB, and the two sides DB, BC are equal to the two sides AC, BC, each to each; therefore the triangle DBC is equal to the triangle ACB (5); but a part cannot be equal to the whole; therefore the sides AB, AC cannot be unequal, that is, they are equal, and the triangle is isosceles.

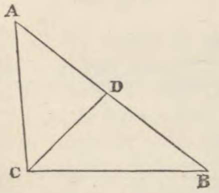
Fig. 28.



Theorem XIII.—Of the two sides of a triangle, that is the greater which is opposite to the greater angle; and conversely, of the two angles of a triangle, that is the greater which is opposite to the greater side.

First, let the angle C $>$ B; then shall the side AB opposite to C be greater than the side AC opposite to B. Suppose CD drawn, so that the angle BCD = B; in the triangle BDC, BD is equal to DC (12); but AD + DC $>$ AC, and AD + DC = AD + DB = AB, therefore AB $>$ AC.

Fig. 29.

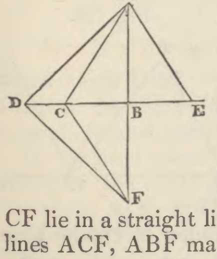


Next, let the side AB $>$ AC; then shall the angle C opposite to AB, be greater than the angle B, opposite to AC. For if C were less than B, then, by what has been demonstrated, AB $<$ AC, which is contrary to the hypothesis of the proposition, therefore C is not less than B; and if C were equal to B, then it would follow that AC = AB (12), which is also contrary to the hypothesis; therefore C is greater than B.

Theorem XIV.—From a point A without a straight line DE, no more than one perpendicular can be drawn to that line.

For suppose it possible to draw two, AB and AC; produce one of them AB, so that BF = AB, and join CF. The triangle CBF is equal to the triangle ABC, for the angle CBF is a right angle, as well as CBA, and the side BF = BA; therefore the triangles are equal (5), and hence the angle BCF = BCA; but the angle BCA is by hypothesis a right angle; therefore the angle BCF is also a right angle; hence AC and CF lie in a straight line (3), and consequently two straight lines ACF, ABF may be drawn between two points A, F, which is impossible (Axiom 4); therefore it is equally impossible that two perpendiculars can be drawn from the same point to the same straight line.

Fig. 30.



Theorem XV.—If from a point A, without a straight line DE, a perpendicular AB be drawn upon that line, and also different oblique lines AE, AC, AD, &c. to different points of the same line.

First, The perpendicular AB shall be shorter than any one of the oblique lines.

Secondly, The two oblique lines AC, AE, which meet the line DE on opposite sides of the perpendicular, and at equal distances BC, BE from it, are equal to one another.

Lastly, Of any two oblique lines AC, AD, or AE, AD, that which is more remote from the perpendicular is the greater.

Produce the perpendicular AB, so that BF = BA, and join FC, FD.

1. The triangle BCF is equal to the triangle BCA; for the right angle CBF = CBA, the side CB is common, and the side BF = BA, therefore the third side CF = AC (5); but AF $<$ AC + CF (7), that is, 2AB $<$ 2AC; therefore AB $<$ AC; that is, the perpendicular is shorter than any one of the oblique lines.

2. If BE = BC, then, as AB is common to the two triangles ABE, ABC, and the right angle ABE = ABC, the triangles ABE, ABC shall be equal (5), and AE = AC.

3. In the triangle DFA, the sum of the lines AD, DF is greater than the sum of AC, CF (8), that is, 2AD $>$ 2AC; therefore AD $>$ AC, that is, the oblique line, which is more remote from the perpendicular, is greater than that which is nearer.

Cor. 1. The perpendicular measures the distance of any point from a straight line.

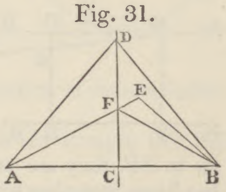
Cor. 2. From the same point three equal straight lines cannot be drawn to terminate in the same straight line; for if they could be drawn, then two of them would be on the same side of the perpendicular, and equal to each other, which is impossible.

Theorem XVI.—If from C, the middle of a straight line AB, a perpendicular CD be drawn to that line; first, every point in the perpendicular is equally distant from the extremities of the line AB; secondly, every point without the perpendicular is at unequal distances from the same extremities A, B.

1. Let D be any point in CD; then, because the two oblique lines DA, DB are equally distant from the perpendicular, they are equal to one another (15); therefore every point in CD is equally distant from the extremities of AB.

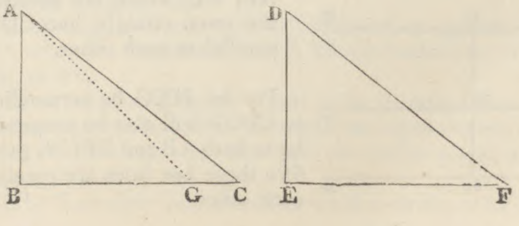
2. Let E be a point out of the perpendicular; join EA, EB; one of these lines must cut the perpendicular in F; join BF, then AF = BF, and AE = BF + FE; but BF + FE $>$ BE (7), therefore AE $>$ BE, that is, E any point out of the perpendicular is at unequal distances from the extremities of AB.

Fig. 31.



Theorem XVII.—Two right-angled triangles are equal, when the hypothenuse and a side of the one are equal to the hypothenuse and a side of the other, each to each.

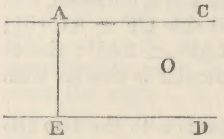
Fig. 32.



Let the hypothenuse $AC = DF$, and the side $AB = DE$; the triangle ABC shall be equal to DEF. The proposition will evidently be true (10), if the remaining sides BC, EF are equal. Now, if it be possible to suppose that they are unequal, let BC be the greater, take $BG = EF$, and join AG; then the triangles ABG, DEF, having the side $AB = DE$, $BG = EF$, and the angle $B = E$, will be equal to one another (5), and will have the remaining side $AG = DF$; but by hypothesis $DF = AC$; therefore $AG = AC$; but AG cannot be equal to AC (15), therefore it is impossible that BC can be unequal to EF, and therefore the triangles ABC, DEF, are equal to one another.

Theorem XVIII.—Two straight lines AC, ED, which are perpendicular to a third straight line AE, are parallel to each other.

Fig. 33.



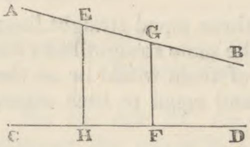
For if they could meet at a point O, then two perpendiculars OA, OE, might be drawn from the same point O, to the straight line AE, which is impossible (14).

In the next theorem, it is necessary to assume another axiom, in addition to those already laid down in the beginning of this section.

Axiom 7.

If two points E, G in a straight line AB are situated at unequal distances EH, GF from another straight line CD in the same plane; these two lines, when indefinitely produced, on the side of the least distance GH, will meet each other.

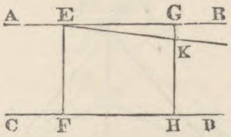
Fig. 34.



Theorem XIX.—If two straight lines AB, CD be parallel; perpendiculars EF, GH to one of the lines, which are terminated by the other line, are equal, and are perpendicular to both the parallels.

For if EF and GH, which are perpendicular to CD, were unequal, the lines AB, CD would meet each other (by the above axiom), which is contrary to the supposition that they are parallel. And if EF, GH be not perpendicular to AB, let EK be perpendicular to EF, meeting GH in K; then, because EK and FH are perpendicular to EF, they are parallel (18); and therefore, by what has been just shown, the perpendiculars EF, KH must be equal; but by hypothesis $EF = GH$, therefore $KH = GH$, which is impossible; therefore EF is perpendicular to AB; and in the same way it may be shown that GH is perpendicular to AB.

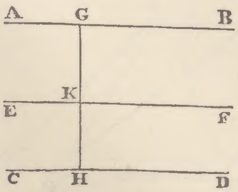
Fig. 35.



Cor. Hence it appears, that through the same point E, no more than one parallel can be drawn to the same straight line CD.

Theorem XX.—Straight lines AB, EF, which are parallel to the same straight line CD, are parallel to each other.

Fig. 36.

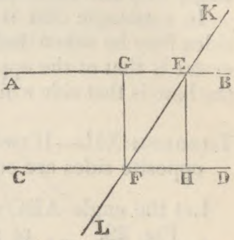


For let HKG be perpendicular to CD, it will also be perpendicular to both AB and EF (19); therefore these last lines are parallel to each other.

Theorem XXI.—If a straight line EF meet two parallel straight lines AB, CD; it makes the alternate angles AEF, EFD equal.

Let EH and GF be perpendicular to CD, then these lines will be parallel (18), and also at right angles to AB (19), and therefore FH and GE are equal to one another (19); therefore the triangles FGE, FHE, having the side $FG = HE$, and $GE = FH$, and FE common to both, will be equal; and hence the angle FEG will be equal to EFH, that is, FEA, will be equal to EFD.

Fig. 37.



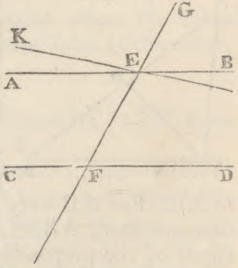
Cor. 1. Hence if a straight line KL intersect two parallel straight lines AB, CD; it makes the exterior angle KEB equal to the interior and opposite angle EFD on the same side of the line. For the angle $AEF = KEB$, and it has been shown that $AEF = EFD$; therefore $KEB = EFD$.

Cor. 2. Hence also, if a straight line EF meet two parallel straight lines AB, CD; it makes the two interior angles BEF, EFD on the same side together, equal to two right angles. For the angle AEF has been shown to be equal to EFD; therefore, adding the angle FEB to both, $AEF + FEB = EFD + FEB$; but $AEF + FEB$ is equal to two right angles, therefore the sum $EFD + FEB$ is also equal to two right angles.

Theorem XXII.—If a straight line EF, meeting two other straight lines AB, CD, makes the alternate angles AEF, EFD equal; those lines shall be parallel.

For if AE is not parallel to CD, suppose, if possible, that some other line KE can be drawn through E, parallel to CD; then the angle KEF must be equal to EFD (21), that is (by hypothesis), to AEF, which is impossible; therefore, neither KE, nor any other line drawn through E, except AB, can be parallel to CD.

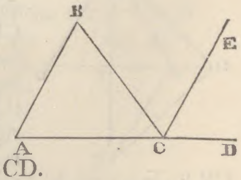
Fig. 38.



Cor. If a straight line EF intersecting two other straight lines AB, CD, makes the exterior angle GEB equal to the interior and opposite angle EFD on the same side; or the two interior angles BEF, EFD on the same side equal to two right angles; in either case the lines are parallel. For if the angle $GEB = EFD$, then also $AEF = EFD$ (4). And if $BEF + EFD =$ two right angles, then, because $BEF + AEF =$ two right angles (1), $BEF + EFD = BEF + AEF$, and taking BEF from both, $EFD = AEF$, therefore (by the theorem) in each case the lines are parallel.

Theorem XXIII.—If a side AC of a triangle ABC be produced towards D; the exterior angle BCD is equal to both the interior and opposite angles BAC, ABC.

Fig. 39.

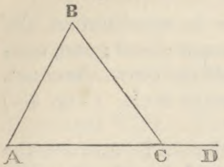


Let CE be parallel to AB, then the angle $B = BCE$ (21), and the angle $A = ECD$ (1 Cor. 21), therefore $B + A = BCE + ECD = BCD$.

Cor. The exterior angle of a triangle is greater than either of the interior opposite angles.

Theorem XXIV.—The three interior angles of a triangle ABC taken together are equal to two right angles.

Fig. 40.



For if AC be produced to D, then $A + B = BCD$, (23); to each of these equal quantities add ACB, then shall $A + B + ACB = BCD + BCA$; but $BCD + BCA =$ two right angles (1), therefore $A + B + ACB =$ two right angles.

Cor. 1. If two angles of one triangle be equal to two angles of another triangle, each to each; the third angle of the one shall be equal to the third angle of the other, and the triangles shall be equiangular.

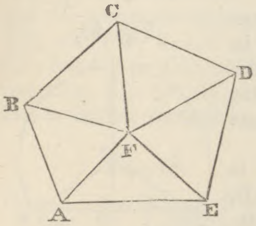
Cor. 2. If two angles of a triangle, or their sum, be given, the third angle may be found, by subtracting their sum from two right angles.

Cor. 3. In a right-angled triangle, the sum of the two acute angles is equal to a right angle.

Cor. 4. In an equilateral triangle, each of the angles is equal to the third part of two right angles, or to two thirds of one right angle.

Theorem XXV.—The sum of all the interior angles of a polygon is equal to twice as many right angles, wanting four, as the figure has sides.

Fig. 41.

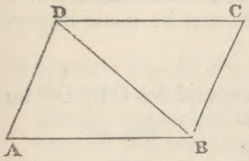


Let ABCDE be a polygon; from a point F within it draw straight lines to all its angles, then the polygon shall be divided into as many triangles as it has sides; but the sum of the angles of each triangle is equal to two right angles (24); therefore, the sum of all the angles of the triangles is equal to twice as many right angles as there are triangles, that is, as the figure has sides; but the sum of all the angles of the triangles is equal to the sum of all the angles of the polygon, together with the sum of the angles at the point F, which last sum is equal to four right angles (2 Cor. 4); therefore the sum of all the angles of the polygon, together with four right angles, is equal to twice as many right angles as the figure has sides, and consequently the sum of the angles of the polygon is equal to twice as many right angles, wanting four, as the figure has sides.

Cor. The four interior angles of a quadrilateral are, taken together, equal to four right angles.

Theorem XXVI.—The opposite sides of a parallelogram are equal, and the opposite angles are also equal.

Fig. 42.



Draw the diagonal BD; the two triangles ADB, DBC have the side BD common to both, and AB, DC being parallel, the angle $ABD = BDC$ (21), also, AD, BC being parallel, the angle $ADB = DBC$; therefore the two triangles are equal (6), and the side AB, opposite to the angle ADB, is equal to DC, opposite to the equal angle DBC. In like manner the third side AD is equal to the third side BC, therefore the opposite sides of a parallelogram are equal.

In the next place, because of the equality of the same triangles, the angle A is equal to the angle C, and also the angle ADC composed of the two angles ADB, BDC is equal to the angle ABC composed of the angles CBD, DBA; therefore the opposite angles of a parallelogram are also equal.

Theorem XXVII.—If the opposite sides of a quadrilateral ABCD be equal, so that $AB = DC$, and $AD = BC$; then, the equal sides are parallel, and the figure is a parallelogram. (Fig. 42.)

Draw the diagonal BD. The two triangles ABD, CDB have the three sides of the one equal to the three sides of the other, each to each, therefore the triangles are equal (10); and the angle ADB, opposite to AB, is equal to DBC opposite to DC; therefore the side AD is parallel to BC (22). For a similar reason AB is parallel to DC; therefore the quadrilateral ABCD is a parallelogram.

Theorem XXVIII.—If two opposite sides AB, DC of a quadrilateral be equal and parallel; the two other sides are in like manner equal and parallel; and the figure is a parallelogram. (Fig. 42.)

Draw the diagonal BD. Because AB is parallel to CD, the alternate angles ABD, BDC are equal (21); now the side $AB = DC$, and DB is common to the triangles ABD, BDC, therefore these triangles are equal (5), and hence the side $AD = BC$, and the angle $ADB = DBC$, consequently AD is parallel to BC (22), therefore the figure ABCD is a parallelogram.

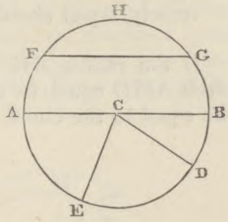
SECT. II.—OF THE CIRCLE.

Definitions.

I. A *Circle* is a plane figure contained by one line, which is called the *circumference*, and is such that all straight lines drawn from a certain point within the figure to the circumference are equal to one another.

And this point is called the *centre* of the circle.

Fig. 43.



II. Every straight line CA, CE, CD, &c. drawn from the centre to the circumference, is called a *Radius* or *Semidiameter;* and every straight line, such as AB, which passes through the centre, and is terminated both ways by the circumference, is called a *Diameter.*

Hence it follows that all the radii of a circle are equal, and all the diameters are also equal, each being the double of the radius.

III. An *Arch* of a circle is any portion of its circumference, as FHG.

The *chord* or *subtense* of an arch is the straight line FG which joins its extremities.

IV. A *Segment* of a circle is the figure contained by an arch and its chord. If the figure be the half of the circle it is called a *Semicircle.*

Note. Every chord corresponds to two arches, and consequently to two segments; but in speaking of these, it is always the smallest that is meant, unless the contrary be expressed.

V. A *Sector* of a circle is the figure contained by an arch DE and the two radii CD, CE, drawn to the extremities of the arch. If the radii be at right angles to each other, it is called a *Quadrant.*

VI. A straight line is said to be *placed,* or *applied,* in a circle, when its extremities are in the circumference of the circle, as FG.

VII. A rectilineal figure is said to be *inscribed* in a circle, when the vertices of all its angles are upon the circumference of the circle; in this case, the circle is said to be *circumscribed* about the figure.

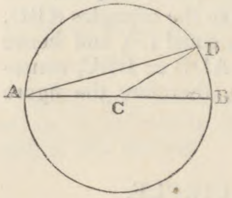
VIII. A straight line is said to *touch* a circle, or to be a *tangent* to a circle, when it meets the circumference in one point only; such, for example, is BD, fig. 49. The point A, which is common to the straight line and circle, is called *the Point of Contact.*

IX. A polygon is said to be *described* or *circumscribed* about a circle, when all its sides are tangents to the circle; and in this case, the circle is said to be *inscribed* in the polygon.

THEOREM I.—Any diameter AB divides the circle, and its circumference, into two equal parts. (Fig. 43.)

For if the figure AEB be applied to AFB, so that the base AB may be common to both, the curve line AEB must fall exactly upon the curve line AFB; otherwise there would be points in the one, or the other, unequally distant from the centre, which is contrary to the definition of a circle.

Fig. 44.



THEOREM II.—Every chord is less than the diameter.

Let the radii CA, CD be drawn from the centre to the extremities of the chord AD; then the straight line AD is less than AC + CD, that is, AD $\angle$ AB.

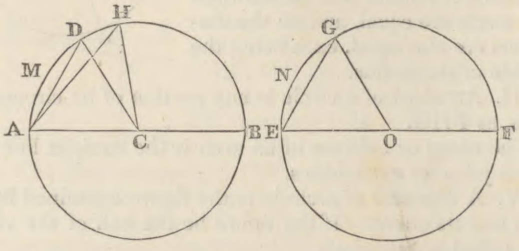
THEOREM III.—A straight line cannot meet the circumference of a circle in more than two points.

For if it could meet it in three, these three points would be equally distant from the centre, and therefore three equal straight lines might be drawn from the same point to the same straight line, which is impossible (2 Cor. 15, 1).

THEOREM IV.—In the same circle, or in equal circles, equal arches are subtended by equal chords; and, conversely, equal chords subtend equal arches.

If the radius AC be equal to the radius EO, and the arch AMD equal to the arch ENG; the chord AD shall be equal to the chord EG.

Fig. 45.



For the diameter AB being equal to the diameter EF, the semicircle AMDB may be applied exactly upon the semicircle ENGF, and then the curve line AMDB shall coincide entirely with the curve line ENGF; but the arch AMD being supposed equal to ENG, the point D must fall upon G, therefore the chord AD is equal to the chord EG.

Conversely, if the chord AD = EG, the arch AMD is equal to the arch ENG.

For if the radii CD, OG be drawn, the two triangles ACD, EOG have three sides of the one equal to the three sides of the other, each to each, viz. AC=EO, CD=OG, and AD=EG; therefore, these triangles are equal (10, 1), and hence the angle ACD = EOG. Now, if the semicircle ADB be placed upon EGF, because the angle ACD = EOG, it is evident that the radius CD will fall upon the radius OG, and the point D upon G; therefore the arch AMD is equal to the arch ENG.

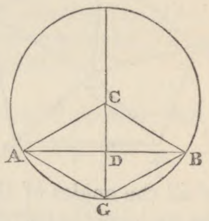
THEOREM V.—In the same circle, or in equal circles, the greater arch is subtended by the greater chord; and, conversely (if the arch be less than half the circumference), the greater chord subtends the greater arch. (Fig. 45.)

For let the arch AH be greater than AD, and let the chords AD, AH, and the radii CD, CH, be drawn. The two sides AC, CH, of the triangle ACH, are equal to the two sides AC, CD of the triangle ACD; and the angle ACH is greater than ACD; therefore the third side AH is greater than the third side AD (9, 1), therefore the chord which subtends the greater arch is the greater. Conversely, if the chord AH be greater than AD, it may be inferred (Cor. 9, 1) from the same triangles, that the angle ACH is greater than ACD, and that thus the arch AH is greater than AD.

Note. Each of the arches is here supposed less than half the circumference; if they were greater, the contrary property would have place, the arch increasing as the chord diminishes.

THEOREM VI.—The radius CG, perpendicular to a chord AB, bisects the chord (or divides it into two equal parts); it also bisects the arch AGB subtended by the chord.

Fig. 46.



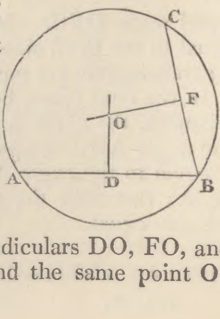
Draw the radii CA, CB; these radii are two equal oblique lines in respect of the perpendicular CD, therefore they are equally distant from the perpendicular (15, 1), that is, AD = DB.

In the next place, because CG is perpendicular to the middle of AB, every point in CG is at equal distances from A and B (16, 1), therefore, if GA, GB be drawn, these lines are equal, and as they are the chords of the arches AG, BG, the arches are also equal (4).

SCHOLIUM. Since C the centre, D the middle of the chord AB, and G the middle of the arch subtended by that chord, are three points situated in the same straight line perpendicular to that chord; and that two points in a straight line are sufficient to determine its position; it follows that a straight line which passes through any two of these points must necessarily pass through the third, and must be perpendicular to the chord. It also follows, that a perpendicular to the middle of a chord passes through the centre, and the middle of the arch subtended by that chord.

THEOREM VII.—If three points A, B, C be taken in the circumference of a circle; no other circumference which does not coincide with the former can be made to pass through the same three points.

Fig. 47.



Let the chords AB, BC be drawn, and let OD, OF be drawn from the centre, perpendicular to, and consequently bisecting these chords. The centre of every circle passing through A and B, must necessarily be somewhere in the perpendicular DO (last theor.), and in like manner the centre of every circle passing through B and C must be somewhere in the perpendicular OF; therefore the centre of a circle passing through A, B, and C, must be in the intersection of the perpendiculars DO, FO, and consequently can only be at one and the same point O;

Lines and Figures upon a Plane.

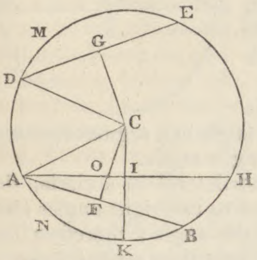
therefore, only one circle can be made to pass through the same three points A, B, C.

Cor. One circumference of a circle cannot intersect another in more than two points; for if they could have three common points, they would have the same centre, and consequently would coincide with each other.

Theorem VIII.—Two equal chords are equally distant from the centre; and of unequal chords, the less is farther from the centre.

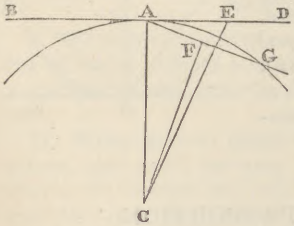
Let the chord AB = DE; suppose the chords bisected by the perpendiculars CF, CG from the centre, and draw the radii CA, CD. The right angled triangles CAF, CDG have equal hypothenuses CA, CD; the side AF ($= \frac{1}{2}$ AB) of the one is also equal to the side DG ($= \frac{1}{2}$ DE) of the other, therefore, their remaining sides CF, CG (which are the distances of the chords from the centre) are equal (17, 1).

Fig. 48.



Next, let the chord AH be greater than DE; the arch AKH shall be greater than DME; upon the arch AKH take ANB equal to DME, draw the chord AB, and suppose COF drawn from the centre perpendicular to AB, and CI perpendicular to AH. It is evident that CF $>$ CO, and (15, 1) CO $>$ CI; much more then is CF $>$ CI; but CF = CG, because the chords AB, DE are equal; therefore CG $>$ CI; that is, of the unequal chords, the less is farther from the centre.

Fig. 49.



Theorem IX.—The perpendicular BD, drawn at the extremity of a radius CA, is a tangent to the circle.

For any oblique line CE is greater than the perpendicular CA (15, 1), therefore the point E is without the circle; therefore the line BD has but one point A common with the circumference, and consequently it is a tangent to the circle. (Def. 8.)

Scholium. Through the same point A, only one tangent, AD, can be drawn to the circle. For if it be possible to draw another, let AG be that other tangent; draw CF perpendicular to AG; then CF shall be less than CA (15, 1), therefore F must be within the circle; and consequently AF when produced must necessarily meet the circle in another point besides A; therefore it cannot be a tangent.

Theorem X.—If BC, the distance of the centres of two circles, be less than the sum of their radii, and also the greater radius less than the sum of the distance of their centres and the lesser radius, the two circles intersect each other.

Fig. 50.

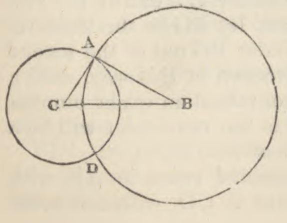


Fig. 51.

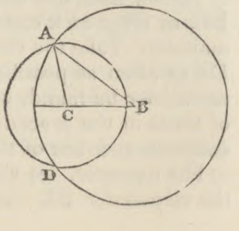
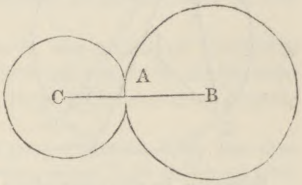


For, that the circles may intersect each other in a point A, it is necessary that the triangle ABC be possible; therefore, not only must CB be less than CA + AB, but also the greater radius AB must be less than AC + CB (7, 1); and it is evident, that as often as the triangle ABC can be constructed, the circumferences described on the centres B, C, shall intersect each other in two points A, D.

Lines and Figures upon a Plane.

Theorem XI.—If the distance CB of the centres of two circles be equal to the sum of the radii CA, BA; the circles shall touch each other externally.

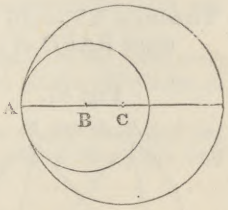
Fig. 52.



It is evident that they have a common point A; but they cannot have more; for if they had two, then the distance of the centres must necessarily be less than the sum of the radii.

Theorem XII.—If the distance CB of the centres of two circles be equal to the difference of the radii; the two circles shall touch each other internally.

Fig. 53.

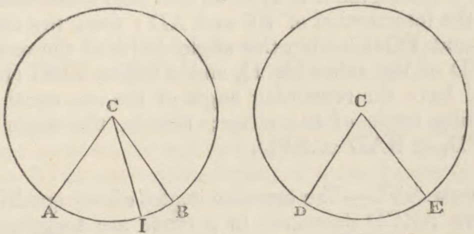


In the first place, it is evident that the point A is common to them both; they cannot, however, have another; for that this may happen, it is necessary that the greater radius AB be smaller than the sum of the radius AC and the distance CB of the centre (10), which is not the case.

Cor. Therefore, if two circles touch each other, either internally or externally, their centres and the point of contact are in the same straight line.

Theorem XIII.—In the same circle, or in equal circles, equal angles ACB, DCE, at the centres, intercept upon the circumference equal arches AB, DE. And, conversely, if the arches AB, DE be equal, the angles ACB, DCE are equal.

Fig. 54.



First, if the angle ACB be equal to DCE, the one angle may be applied upon the other; and as the lines containing them are equal, it is manifest that the point A will fall upon D, and the point B upon E; thus the arch AB will coincide with and be equal to the arch DE.

Next, if the arch AB be equal to DE; the angle ACB is equal to DCE: for if the angles are not equal, let ACB be the greater, and let ACI be taken equal to DCE; then, by what has been already demonstrated, the arch AI = DE; but by hypothesis AB = DE; therefore, AI = AB, which is impossible; therefore the angle ACB = DCE.

Theorem XIV.—The angle BCD at the centre of a circle is double the angle BAD at the circumference, when both stand on the same arch BD.

First, let the centre of the circle be within the angle

Lines and Figures upon a Plane.

BAD; draw the diameter AE. The exterior angle BCE of the triangle BCA is equal to both the inward and opposite angles BAC, CBA (23, 1); but the triangle BCA being isosceles, the angle BAC = CBA; therefore the angle BCE is double of the angle BAC. For the same reason, the angle DCE is double of the angle DAE; therefore the whole angle BCD is double of the whole angle BAD.

Fig. 55.

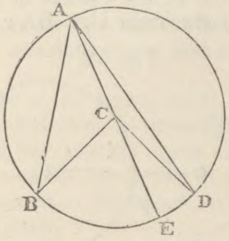


Fig. 56.

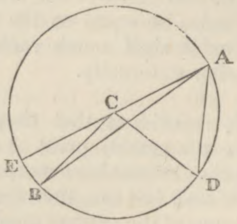

Suppose, in the next place, that the centre is without the angle BAD; then, drawing the diameter AE, it may be demonstrated, as in the first case, that the angle ECD is double of the angle EAD, and that the angle ECB, a part of the first, is double the angle EAB, a part of the other; therefore the remaining angle BCD is double the remaining angle BAD.

Theorem XV.—All angles BAD, BFD in the same segment BAFD of a circle are equal to one another.

Fig. 57.

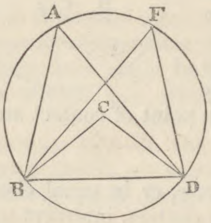

Fig. 58.

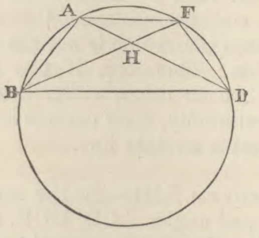
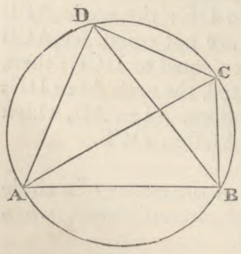


If the segment be greater than a semicircle, from the centre C draw CB and CD; then the angles BAD and BFD being (by last theorem) each equal to half BCD, they must be equal to one another.

But if the segment BAFD be less than a semicircle, let H be the intersection of BF and AD; then, the triangles ABH and FDH having the angle AHB of the one equal to FHD of the other (4, 1), and ABH = FDH (by case 1) will have the remaining angle of the one equal to the remaining angle of the other; that is, the angle BAH = HFD, or BAD = BFD.

Theorem XVI.—The opposite angles of any quadrilateral figure ABCD described in a circle are together equal to two right angles.

Fig. 59.

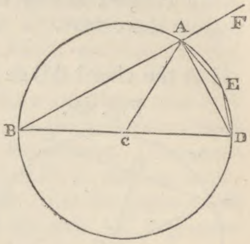


Draw the diagonals AC, BD; because the angle ABD = ACD, and CBD = CAD (last theor.), the sum ABD + CBD = ACD + CAD; or ABC = ACD + CAD; to each of these equals add ADC, and ABC + ADC = ACD + CAD + ADC; but the last three angles being the angles of the triangle ADC, are taken together equal to two right angles (24, 1), therefore ABC + ADC = two right angles. In the same manner the angles BAD, BCD may be shown to be together equal to two right angles.

Lines and Figures upon a Plane.

Theorem XVII.—In a circle, the angle BAD in a semicircle is a right angle, but the angle ABD in a segment greater than a semicircle is less than a right angle; and the angle AED in a segment less than a semicircle is greater than a right angle.

Fig. 60.



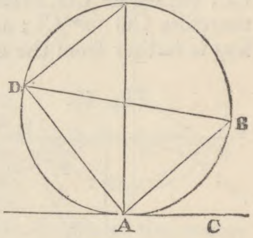
Let C be the centre, join CA, and produce BA to F. Because CB = CA, the angle CAB = CBA (11, 1); and because CD = CA, the angle CAD = CDA, therefore, the whole angle BAD = CBA + CDA; but these two last angles are together equal to DAF (23, 1), therefore the angle BAD = DAF; and hence each of them is a right angle.

And because ABD + ADB is a right angle, therefore ABD, an angle in a segment greater than a semicircle, is less than a right angle.

And because ABDE is a quadrilateral in a circle, the opposite angles B and E are equal to two right angles (last theor.), but B is less than a right angle; therefore the angle E, which is in a segment less than a semicircle, is greater than a right angle.

Theorem XVIII.—The angle BAC contained by AC, a tangent, and AB, a chord drawn from the point of contact, is equal to any angle ADB in the alternate segment of the circle.

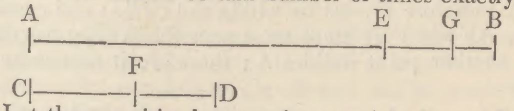
Fig. 61.



Draw the diameter AE, and join DE. The angles EAC, EDA, being right angles (last theor.), are equal to one another; and of these, EAB, a part of the one, is equal to EDB, a part of the other (15), therefore the remainder, BAC, of the former is equal to the remainder, BDA, of the latter.

SECT. III.—OF PROPORTION.

In comparing two quantities of the same kind, in respect of magnitude, we are led to consider how often the one quantity contains either the whole or some part of the other quantity. To resolve this question, we must find a *common measure* of the quantities; that is, a quantity that is contained in each a certain number of times exactly.



Let the quantities be two given straight lines AB, CD; their common measure (if they have one) may be found by proceeding as follows:

Take the less line CD out of the greater AB, as often as possible, and let BE be the remainder. Next take the remainder BE out of the line CD, as often as it can be had, and let DF be the second remainder.

Again, take the second remainder DF out of the first BE, as often as it can be had, and let BG be the third remainder. Take the third remainder BG out of the second DF as often as possible, and proceed in this way, until a remainder be found, which is contained an exact number of times in the preceding. This last remainder will be a common measure of the two lines.

For example, let CD be contained twice in AB, with the remainder BE; and BE once in CD, with a remainder DF; and DF once in BE, with a remainder BG, and let BG be contained twice exactly in DF; then

$$\begin{aligned} DF &= 2\ BG \\ EB &= DF + BG = 3\ BG \\ CD &= EB + DF = 5\ BG \\ AB &= 2\ CD + EB = 13\ BG. \end{aligned}$$

Thus it appears, that BG is contained thirteen times in AB, and five times in CD; therefore BG is a common measure of the two lines. Hence also we see, that the relation which AB bears to CD, in regard to magnitude, consists in the former containing thirteen such parts as the latter contains five.

In this example it has been supposed that a remainder is at last found, which is contained an exact number of times in the remainder immediately preceding. But this will not always happen. If the given lines be the diagonal of a square, and its side, and in innumerable other cases, it may be demonstrated, that no one of the succeeding remainders can be contained an exact number of times in that before it: therefore such quantities cannot have a common measure. Hence quantities are distinguished into two kinds, viz. such as admit of a common measure, and such as do not admit of a common measure. The former are said to be *commensurable*, and the latter *incommensurable.*

The doctrine of proportion, as delivered in the 5th book of Euclid's Elements, applies alike to commensurable and incommensurable quantities; the theory may, however, be rendered considerably easier, by confining it to commensurable quantities. It is this limited view of the subject that is here given. Experience proves that Euclid's fifth book is difficult to be understood by the generality of readers; and this fact may serve as an excuse for deviating, unwillingly, from the illustrious ancient.

DEFINITIONS.

I. When one quantity contains another a certain number of times, without a remainder, the former is said to be a *multiple* of the latter, and the latter a *part* of the former.

II. When several quantities are multiples of as many others, and each contains its part the same number of times, the former are called *equimultiples* of the latter, and the latter *like parts* of the former.

III. Between any two finite magnitudes of the same kind there subsists a certain relation, in respect of quantity, which is called their *ratio.* The two magnitudes compared are called the *terms* of the ratio. The first the *antecedent*, and the last the *consequent.*

IV. If there be four quantities, and if the first contain a part of the second (without a remainder) just as often as the third contains a like part of the fourth, the ratio of the first to the second is said to be equal to the ratio of the third to the fourth; or the first is said to have to the second the same ratio which the third has to the fourth.

V. The terms of any number of equal ratios are called *proportionals.*

> *Note.* When four quantities A, B, C, D, are proportionals, it is usual to say, that A is to B, as C to D, and to write them thus, $A : B :: C : D$; or thus, $A : B = C : D$.

VI. Quantities are said to be continual proportionals when the ratio of the first to the second, of the second to the third, of the third to the fourth, and so on, are all equal.

VII. When three quantities are continual proportionals, the second is said to be a mean proportional between the other two.

VIII. In proportionals, the antecedent terms are called homologous to one another; as also the consequents to one another.

IX. When there is any number of quantities of the same kind, the first is said to have to the last the ratio compounded of the ratio which the first has to the second, and of the ratio which the second has to the third, and of the ratio which the third has to the fourth, and so on, to the last magnitude.

X. If three magnitudes are continual proportionals, the ratio of the first to the third is said to be duplicate of the ratio of the first to the second.

XI. If four magnitudes are continual proportionals, the ratio of the first to the fourth is said to be triplicate of the ratio of the first to the second, or of the ratio of the second to the third, &c.

The following technical words are employed to signify certain ways of changing either the order or magnitude of proportionals, so as that they still continue proportionals.

XII. If four quantities are proportionals, they are said to be proportionals *by inversion*, when it is inferred that the second is to the first, as the fourth to the third.

XIII. They are proportionals by *alternation*, when the first is to the third, as the second to the fourth.

XIV. By *composition*, when the sum of the first and second is to the second, as the sum of the third and fourth to the fourth.

XV. By *division*, when the difference of the first and second is to the second, as the difference of the third and fourth to the fourth.

XVI. By *conversion*, when the first is to the difference of the first and second, as the third to the difference of the third and fourth.

XVII. By *mixing*, when the sum of the first and second is to their difference, as the sum of the third and fourth to their difference.

AXIOMS.

1. Equal quantities have the same ratio to the same quantity, and the same quantity has the same ratio to equal quantities.

2. Quantities having the same ratio to the same quantity, or to equal quantities, are equal among themselves; and those to which the same quantity has the same ratio are equal to one another.

3. Ratios equal to one and the same ratio are also equal one to the other.

THEOREM I.—Quantities have to one another the same ratio which their equimultiples have.

Let A and B be two quantities, and supposing m to denote any number, let mA and mB (that is, m times A and m times B) be any equimultiples of these quantities; the ratio of A to B is equal to the ratio of mA to mB; or $A : B = mA : mB$.

For, let A contain three such parts, each equal to X, as B contains four, so that

$$A = X + X + X;\ B = X + X + X + X.$$

Then $mA = mX + mX + mX$,

$$mB = mX + mX + mX + mX,$$

because a whole taken any number of times, is equal to the sum of its parts taken as often. Now, because A contains the one fourth of B three times, and mA evidently contains one fourth of mB also three times; A contains a part of B exactly as often as mA contains a like part of mB. Therefore (Def. 4), the ratio of A to B is equal to the ratio of mA to mB.

In the same manner, if A and B be supposed any other multiples of X, it may be proved that $A : B = mA : mB$.

COR. Like parts of magnitudes have to each other the same ratio as the whole; for A and B are like parts of mA and mB.

THEOREM II.—If four quantities be proportionals, they are proportionals also when taken inversely.

Let A, B, C, D be four quantities, such, that $A : B = C : D$; then $B : A = D : C$.

For, suppose that C contains two such equal parts as D contains three, then, because the ratio of A to B is equal to the ratio of C to D, A will contain two such parts as B contains three. (Def. 4.) Therefore B will contain three such parts as A contains two; and D will contain three such parts as C contains two. Thus B will contain a part of A as often as D contains a like part of C; therefore the ratio of B to A is equal to the ratio of D to C. (Def. 4.)

THEOREM III.—If four quantities of the same kind be proportionals, they will also be proportionals when taken alternately.

Let $A : B = C : D$, then, if the quantities be all of the same kind, $A : C = B : D$.

For, let C contain three such parts as D contains four; then (Def. 4) A will contain three such parts as B contains four. Let each of the equal parts contained in A and B be X, and let each of the equal parts contained in C and D be Y; then

$$A = 3X \qquad B = 4X$$
$$C = 3Y \qquad D = 4Y.$$

And because A and C contain X and Y the same number of times, A and C are equimultiples of X and Y. (Def. 2.) Also, because B and D contain X and Y the same number of times, B and D are equimultiples of X and Y.

$$\left.\begin{array}{ll}\text{Therefore} & A : C = X : Y \\ \text{And} & B : D = X : Y\end{array}\right\} \text{Prop. I.}$$

$$\text{Hence} \quad A : C = B : D \quad \text{(Axiom 3.)}$$

COR. If the first of four proportionals be greater than the third, the second shall be greater than the fourth; and if the first be equal to the third, the second shall be equal to the fourth; and if the first be less than the third, the second shall be less than the fourth.

THEOREM IV.—If four quantities be proportionals, they shall also be proportionals by composition.

Let $A : B = C : D$; then, by composition, $A + B : B = C + D : D$.

Let C contain five such parts as D contains three, then (Def. 4) A will contain five such parts as B contains three. Let each of the equal parts contained in A and B be X, and let each of the equal parts contained in C and D be Y. Then, because

$$A = 5X,\ B = 3X,\ C = 5Y,\ D = 3Y,$$

by adding, $A + B = 8X$, and $C + D = 8Y$.

Now, $B = 3X$, and $D = 3Y$;

Therefore $A + B$ contains one third of B eight times, and $C + D$ contains one third of D also eight times, and, in general, $A + B$ will contain a part of B as often as $C + D$ contains a like part of D; therefore (Def. 4) $A + B : B = C + D : D$.

THEOREM V.—If four quantities be proportionals, they will also be proportionals by division.

Let $A : B = C : D$, and let A be greater than B, and C greater than D; then $A - B : B = C - D : D$.

For, making the same supposition as in last proposition, so that $A = 5X$, $B = 3X$, $C = 5Y$, $D = 3Y$,

by subtracting, $A - B = 2X$, and $C - D = 2Y$.

Now, $B = 3X$, $D = 3Y$.

Thus it appears, that in this case $A - B$ contains one third of B twice, and that $C - D$ contains one third of D also twice; and, in general, that $A - B$ will always contain some part of B as often as $C - D$ contains a like part of D; therefore (Def. 4) $A - B : B = C - D : D$.

THEOREM VI.—If four quantities be proportionals, they shall also be proportionals by conversion.

Let $A : B = C : D$; then $A : A - B = C : C - D$.

For, making the same supposition as in the two last propositions, because

$$A = 5X,\ B = 3X,\ C = 5Y,\ D = 3Y,$$
$$\text{therefore } A - B = 2X,\ C - D = 2Y.$$

Hence it appears, that in this case A contains the half of $A - B$ five times, and that C contains the half of $C - D$ also five times; and, in general, that A will contain a part of $A - B$ as often as C contains a like part of $C - D$; therefore (Def. 4) $A : A - B = C : C - D$.

THEOREM VII.—If the first of four magnitudes has the same ratio to the second which the third has to the fourth, and if any equimultiples whatever be taken of the first and third, and any whatever of the second and fourth; the multiple of the first shall have the same ratio to the multiple of the second that the multiple of the third has to the multiple of the fourth.

Let $A : B = C : D$, and supposing m and n to denote any two numbers, let the antecedents A and C be taken each m times, and let the consequents B and D be taken each n times; $mA : nB = mC : nD$.

Suppose that C contains two such parts as D contains three, then (Def. 4) A will contain two such parts as B contains three. Let each of the equal parts contained in A and B be X, and let each of the equal parts contained in C and D be Y, so that $A = 2X$, $B = 3X$, $C = 2Y$, $D = 3Y$.

$$\text{Then } mA = 2mX \qquad nB = 3nX$$
$$mC = 2mY \qquad nD = 3nY.$$

From these expressions, it appears that X and Y are like parts of nB and nD; for each is contained in its multiple three n times; also, that mA and mC are equimultiples of X and Y; for each contains its part two m times. Therefore mA contains a part of nB, exactly as often as mC contains a like part of nD; and hence (Def. 4) $mA : nB = mC : nD$.

COR. If $A : B = C : D$, then $mA : B = mC : D$,
and $A : nB = C : nD$.

THEOREM VIII.—If there be any number of quantities, and as many others, which, taken two and two in order, have the same ratio; the first will have to the last of the first quantities the same ratio which the first of the others has to the last.

First, Let there be three quantities, A, B, C, and other three, H, K, L, such that $A : B = H : K$, and $B : C = K : L$; then $A : C = H : L$.

A, B, C,
H, K, L.

For, suppose that H contains two such parts as K contains three and L seven, then (Def. 4) A will contain two such parts as B contains three, and C seven.

Let the equal parts contained in A, B, C be X, and let the equal parts contained in H, K, L be Y, so that

$$A = 2X,\ B = 3X,\ C = 7X,$$
$$H = 2Y,\ K = 3Y,\ L = 7Y.$$

In this case, A contains one seventh of C twice, and H contains one seventh of L also twice; and, in general, A will contain a part of C as often as H contains the same part of L; therefore $A : C = H : L$ (Def. 4).

Next, let there be four quantities A, B, C, D, and other four H, K, L, M, such that $A : B = H : K$, and $B : C = K : L$, and $C : D = L : M$; then $A : D = H : M$.

A, B, C, D,
H, K, L, M.

For, since A, B, C are three quantities, and H, K, L other three quantities, which, taken two and two, have the same ratio; by the foregoing case, $A : C = H : L$. And because $A : C = H : L$, and $C : D = L : M$; therefore, by that same case, $A : D = H : M$. In the same way, the demonstration may be extended to any number of quantities.

Note. This proposition is usually cited by the words *ex æquali* or *ex æquo*.

Theorem IX.—If there be any number of quantities, and as many others, which, taken two and two, in a cross order, have the same ratio; the first will have to the last of the first quantities, the same ratio which the first of the others has to the last.

First, let there be three quantities A, B, C, and other three H, K, L, such that $A : B = K : L$, and $B : C = H : K$; then $A : C = H : L$.

A, B, C,
H, K, L.

For, suppose K to contain two such equal parts as L contains three, then A will contain two such parts as B contains three. (Def. 4.) Let each of the equal parts contained in A and B be X, and let each of the equal parts contained in K and L be Y, so that

$$A = 2X,\ B = 3X,\ K = 2Y,\ L = 3Y.$$

Also, let Z be the same part of C that Y is of L, and let V be the same part of H that X is of A; so that, in this case,

$$C = 3Z,\ H = 2V.$$

Then, because $B : C = H : K$; that is, $3X : 3Z = 2V : 2Y$, and (by Prop. I.) $3X : 3Z = X : Z$, and $2V : 2Y = V : Y$; therefore $X : Z = V : Y$ (Ax. 3). Hence (by Prop. VII.) $2X : 3Z = 2V : 3Y$; but $2X = A$, $3Z = C$, $2V = H$, $3Y = L$; therefore $A : C = H : L$.

Next, let there be four quantities, A, B, C, D, and other four H, K, L, M, such that $A : B = L : M$, and $B : C = K : L$; and $C : D = H : K$; then $A : D = H : M$. For since A, B, C are three quantities, and K, L, M other three, which, taken two and two in a cross order, have the same ratio; by the first case, $A : C = K : M$; but $C : D = H : K$; therefore, again, by the first case, $A : D = H : M$. In the same manner, the demonstration may be extended to any number of quantities.

A, B, C, D,
H, K, L, M.

Note. This proposition is usually cited by the words *ex æquali in proportione perturbata*, or *ex æquo* inversely.

Theorem X.—If the first has to the second the same ratio which the third has to the fourth, and the fifth to the second the same ratio which the sixth has to the fourth; the first and fifth together shall have to the second the same ratio which the third and sixth have to the fourth.

Let $A : B = C : D$,
and $E : B = F : D$;
then $A + E : B = C + F : D$.

Because $E : B = F : D$, by inversion, $B : E = D : F$ (2); but, by hypothesis, $A : B = C : D$; therefore *ex æquali* (Prop. VIII.), $A : E = C : F$; and, by composition, $A + E : E = C + F : F$. Again, by hypothesis, $E : B = F : D$, therefore *ex æq.* $A + E : B = C + D : F$.

Theorem XI.—If four quantities be proportionals, the sum of the first two is to their difference as the sum of the other two to their difference.

Let $A : B = C : D$; then, if A be greater than B, $A + B : A - B = C + D : C - D$.

For, since $A : B = C : D$,
by division (5) $A - B : B = C - D : D$,
and inversion (2) $B : A - B = D : C - D$,
and by composition (4) $A + B : B = C + D : D$,
therefore, *ex æq.* $A + B : A - B = C + D : C - D$.

In like manner, if B be greater than A, it may be proved that $A + B : B - A = C + D : D - C$.

Theorem XII.—If any number of quantities be proportionals; as one of the antecedents is to its consequent, so is the sum of all the antecedents to the sum of all the consequents.

Let $A : B = C : D = E : F$; then $A : B = A + C + E : B + D + F$. For, suppose that A contains two such parts, each $= X$, as B contains three, and that C contains two such parts, each $= Y$, as D contains three, and that E contains two such parts, each $= Z$, as F contains three, and so on; then

$$A = 2X \qquad B = 3X$$
$$C = 2Y \qquad D = 3Y$$
$$E = 2Z \qquad F = 3Z.$$

Hence, by addition,
$A + C + E = 2X + 2Y + 2Z = 2(X + Y + Z)$; $B + D + F = 3X + 3Y + 3Z = 3(X + Y + Z)$.

Thus it appears that A contains one third of B twice, and that $A + C + E$ contains one third of $B + D + F$ also twice; and, in general, that A will contain a part of B just as often as $A + C + E$ contains a like part of $B + D + F$; therefore $A : B = A + C + E : B + D + F$.

In treating of proportion, we have supposed that the antecedent contains some part of the consequent a certain number of times exactly, which part is therefore a common measure of the antecedent and consequent. But there are quantities which cannot have a common measure, and which are therefore said to be *incommensurable*; such, for example, are the sides of two squares one of which has its surface double that of the other.

Although the ratio of two incommensurable quantities cannot be expressed in numbers, yet we can always assign a ratio in numbers which shall be as near to that ratio as we please. For let A and B be any two quantities whatever, and suppose that x is such a part of A that $A = px$; then if q denote the number of times that x can be taken from B, and d the remainder, we have $B = qx + d$, and $qx = B - d$; and because $p : q = px : qx$, therefore $p : q = A : B - d$. Now, as d is less than x, by taking x sufficiently small, d may be less than any proposed quantity; so that $B - d$ may differ from B by less than any given quantity; therefore two numbers p and q may always be assigned, such, that the ratio of p to q shall be the same as the ratio of A to a quantity that differs less from B than by any given quantity, however small that quantity may be.

Hence we may conclude, that whatever has been delivered in this section relating to commensurable quantities, may be considered as applying equally to such as are incommensurable.

SECT. IV.—THE PROPORTIONS OF FIGURES.

Definitions.

I. *Equivalent Figures* are such as have equal surfaces.

Two figures may be equivalent, although very dissimilar; thus a circle may be equivalent to a square, a triangle to a rectangle, and so of other figures.

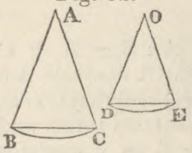
We shall give the denomination of *equal* figures to those which, being applied the one upon the other, coincide entirely: thus, two circles having the same radius are equal; and two triangles having three sides of the one equal to three sides of the other, each to each, are also equal.

Lines and Figures upon a Plane.

II. Two figures are *similar*, when the angles of the one are equal to the angles of the other, each to each; and the *homologous* sides proportionals. The homologous sides are those which have the same position in the two figures; or which are adjacent to the equal angles. The angles themselves are called *homologous angles*.

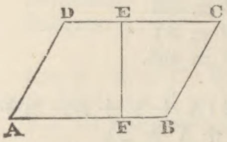
Two equal figures are always similar, but similar figures may be very unequal.

Fig. 62.



III. In two different circles, *similar sectors, similar arches, similar segments*, are such as correspond to equal angles at the centre. Thus the angle A being equal to the angle O, the arch BC is similar to the arch DE, and the sector ABC to the sector ODE, &c.

Fig. 63.



IV. The *Altitude of a parallelogram* is the perpendicular which measures the distance between the opposite sides or bases AB, CD.

V. The *Altitude of a triangle* is the perpendicular AD drawn from the vertical angle A upon the base BC.

Fig. 64.

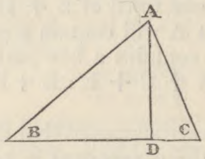


Fig. 65.

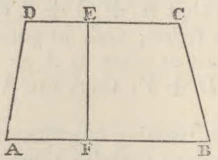


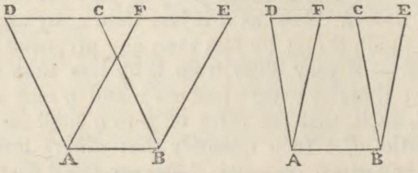
VI. The *Altitude of a trapezoid* is the perpendicular EF drawn between its two parallel bases AB, CD.

VII. The *Area* and the surface of a figure are terms of nearly the same signification. The term *area*, however, is more particularly used to denote the superficial quantity of the figure in respect of its being measured, or compared with other surfaces.

THEOREM I.—Parallelograms which have equal bases and equal altitudes are equivalent.

Let AB be the common base of the parallelograms ABCD, EBAF, which being supposed to have the same altitude, the sides DC, FE opposite to the bases will lie in DE a line parallel to AB. Now, from the nature of a parallelogram, AD = BC, and AF = BE; for the same reason DC = AB, and FE = AB; therefore DC = FE, and taking away DC and FE from the same line DE, the remainders CE and DF are equal; hence the triangles DAF, CBE have three sides of the one equal to three sides of the other, each to each; and consequently are equal (10, 1). Now, if from the quadrilateral ABED the triangle ADF be taken away, there will remain the parallelogram ABEF; and if from the same quadrilateral ABED, the triangle CBE, equal to the former, be taken away, there will remain the parallelogram ABCD; therefore the two parallelograms ABCD, ABEF, which have the same base and the same altitude, are equivalent.

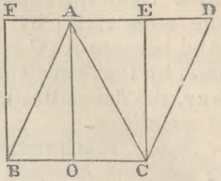
Fig. 66.



COR. Every parallelogram is equivalent to a rectangle of the same base and altitude.

THEOREM II.—Every triangle ABC is the half of a parallelogram ABCD, having the same base and altitude.

Fig. 67.



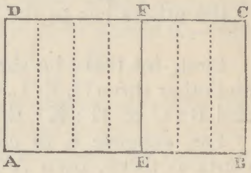
For the triangles ABC, ACD are equal (28, 1).

COR. 1. Therefore a triangle ABC is the half of a rectangle BCEF of the same base and altitude.

COR. 2. All triangles having equal bases and equal altitudes are equivalent.

THEOREM III.—Two rectangles of the same altitude are to each other as their bases.

Fig. 68.

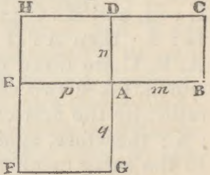


Let ABCD, AEFD be two rectangles, which have a common altitude AD; the rectangle ABCD shall have to the rectangle AEFD the same ratio that the base AB has to the base AE.

Let the base AB have to the base AE the ratio of the number p (which we shall suppose 7) to the number q (which may be 4), that is, let AB contain p (7), such equal parts as AE contains q (4); then, if perpendiculars be drawn to AB and AE at the points of division, the rectangles ABCD and AEFD will be divided, the former into p and the latter into q rectangles, which will be all equal (1); for they have equal bases and the same altitude. Thus the rectangle ABCD will also contain p such equal parts as the rectangle AEFD contains q; therefore the rectangle ABCD is to AEFD as the number p to the number q (Ax. 3, 3), that is, as the base AB to AE.

THEOREM IV.—Any two rectangles are to each other as the products of any numbers proportional to their sides.

Fig. 69.



Let the numbers m, n, p, q have among themselves the same ratios that the sides of the rectangles ABCD, AEFG have to each other; that is, let AB contain m such equal parts, whereof AD contains n; and AE contains p, and AG contains q, then shall ABCD : AEFG $= mn : pq$.

Let the rectangles be so placed that the sides AB, AE may be in a straight line, then AD and AG will also lie in a straight line (3, 1). Now (3)

$$\text{ABCD} : \text{AEHD} = \text{AB} : \text{AE} = m : p,$$

$$\text{but } m : p = nm : np \ (1, 3),$$

$$\text{therefore ABCD} : \text{AEHD} = nm : np.$$

$$\text{Again, AEHD} : \text{AEFG} = \text{AD} : \text{AG} = n : q;$$

$$\text{but } n : q = pn : pq;$$

$$\text{therefore AEHD} : \text{AEFG} = pn : pq;$$

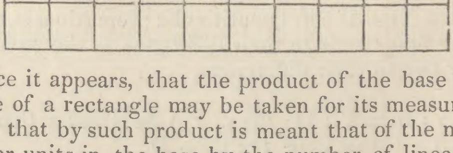
and it was shown that

$$\text{ABCD} : \text{AEHD} = nm : np \text{ or } pn,$$

$$\text{therefore } (8, 3) \text{ ABCD} : \text{AEFG} = mn : pq.$$

SCHOLIUM.

Fig. 70.



Hence it appears, that the product of the base by the altitude of a rectangle may be taken for its measure, observing that by such product is meant that of the number of linear units in the base by the number of linear units in the altitude. This measure is however not absolute, but relative; for it must be supposed, that in comparing

Lines and Figures upon a Plane.

one rectangle with another, the sides of both are measured by the same linear unit. For example, if the base of a rectangle A be three units, and its altitude 10, the rectangle is represented by 3 × 10, or 30; this number considered by itself has no meaning; but if we have a second rectangle B, the base of which is twelve units and the altitude seven, this second rectangle shall be represented by the number 12 × 7, or 84; and hence it may be concluded that the two rectangles are to each other as 30 to 84; therefore, if in estimating any superficies the rectangle A be taken for the measuring unit, the rectangle B shall have for its absolute measure $\frac{84}{30}$, that is, it shall be $\frac{84}{30}$ superficial units.

It is more common, as well as more simple, to take for a superficial unit a square, the side of which is an unit in length, and then the measure which we have regarded only as relative becomes absolute: for example, the number 30, which is the measure of the rectangle A, represents thirty superficial units, or thirty squares, each having its side equal to an unit. To illustrate this, see fig. 70.

Theorem V.—The area of any parallelogram is equal to the product of its base by its altitude. (Fig. 67.)

For the parallelogram ABCD is equivalent to the rectangle FBCE, which has the same base BC, and the same altitude AO (Cor. 1); but the measure of the rectangle is BC × AO (Schol. 4), therefore the area of the parallelogram is BC × AO.

Cor. Parallelograms having the same base, or equal bases, are to each other as their altitudes; and parallelograms having the same altitude are to each other as their bases; for in the former case put B for the common base, and A and A′ for the altitudes, then the areas of the figures are B × A and B × A′; and it is manifest that B × A : B × A′ = A : A′; and in the latter case, putting A for the common altitude, and B and B′ for the bases, it is evident that B × A : B′ × A = B : B′.

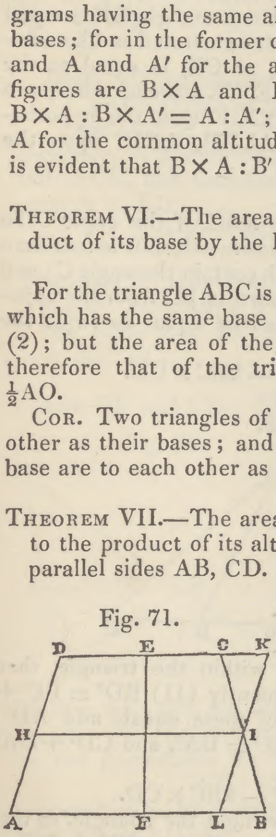
Theorem VI.—The area of a triangle is equal to the product of its base by the half of its altitude. (Fig. 67.)

For the triangle ABC is half of the parallelogram ABCD, which has the same base BC, and the same altitude AO (2); but the area of the parallelogram is BC × AO (5), therefore that of the triangle is $\frac{1}{2}$BC × AO, or BC × $\frac{1}{2}$AO.

Cor. Two triangles of the same altitude are to each other as their bases; and two triangles having the same base are to each other as their altitudes.

Theorem VII.—The area of a trapezoid ABCD is equal to the product of its altitude EF by half the sum of its parallel sides AB, CD.

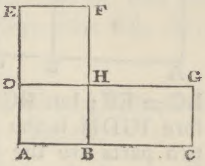
Fig. 71.



Through the point I, the middle of BC, draw KL parallel to the opposite side AD, and produce DC to meet KL. In the triangles IBL, ICK, IB is equal to IC by construction, and the angle CIK = BIL, and the angle ICK = IBL (21, 1); therefore these triangles are equal; and hence the trapezoid ABCD is equivalent to the parallelogram ALKD, and has for its measure AL × EF. But AL = DK, and because the triangle IBL is equal to the triangle KCI, the side BL = CK; therefore AB + CD = AL + DK = 2AL; hence AL is half the sum of the parallel sides AB, CD; and as the area of the trapezoid is equal to FE × AL, it is also equal to FE × $\left(\frac{AB+CD}{2}\right)$.

Theorem VIII.—If four straight lines AB, AC, AD, AE be proportionals; the rectangle ABFE, contained by the two extremes, is equivalent to the rectangle ACGD contained by the means. And conversely, if the rectangle contained by AB, AE, the extremes, be equivalent to the rectangle contained by AC, AD, the means, the four lines are proportionals.

Fig. 72.



Let the rectangles be so placed as to have the common angle A, and let BF, DG intersect each other in H. Because the rectangles ABHD, ACGD have the same altitude AD,

ABHD : ACGD = AB : AC (3);

and because the rectangles ABHD, ABFE have the same altitude AB, for the same reason,

ABHD : ABFE = AD : AE;

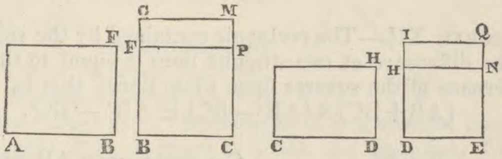
but by hypothesis AB : AC = AD : AE, therefore (Ax. 3, 3) ABHD : ACGD = ABHD : ABFE; therefore (Ax. 2, 3) the rectangle ACGD = ABFE.

Next suppose that the rectangle ACGD = ABFE; then ABHD : ACGD = ABHD : ABFE (Ax. 1, 3); but ABHD : ACGD = AB : AC (3), and ABHD : ABFE = AD : AE; therefore AB : AC = AD : AE.

Cor. If three straight lines be proportionals, the rectangle contained by the extremes is equal to the square of the mean; and if the rectangle contained by the extremes be equal to the square of the mean, the three straight lines are proportionals.

Theorem IX.—If four straight lines be proportionals, and also other four; the rectangles contained by the corresponding terms shall be proportionals; that is, if AB : BC = CD : DE, and BF : BG = DH : DI, then shall rectangle AF : rect. BM = rect. CH : rect. DQ.

Fig. 73.



For in BG and DI produced, if necessary, take BF = BF, and DH = DH, and let FP be parallel to BC, and HN to DE; then (3),

rect. AF : rect. BP = AB : BC,
and rect. CH : rect. DN = CD : DE;

but AB : BC = CD : DE (by hypothesis), therefore,

rect. AF : rect. BP = rect. CH : rect. DN;

now (3) rect. BP : rect. BM = BF : BG, and rect. DN : rect. DQ = DH : DI; but BF : BG = DH : DI (by hypoth.) therefore,

rect. BP : rect. BM = rect. DN : rect. DQ;

but it has been shown that

rect. AF : rect. BP = rect. CH : rect. DN,

therefore (8, 3),

rect. AF : rect. BM = rect. CH : rect. DQ.

Cor. Hence the squares of four proportional straight lines are themselves proportionals.

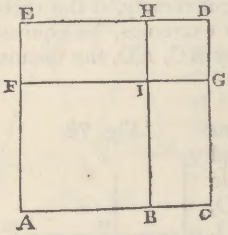
Theorem X.—If a straight line AC be divided into any two parts at B, the square made upon the whole line

Lines and Figures upon a Plane.

AC shall be equal to the squares made upon the two parts AB, BC, together with twice the rectangle contained by these two parts; which may be expressed thus,

$$AC^2 = AB^2 + BC^2 + 2AB \times BC.$$

Fig. 74.



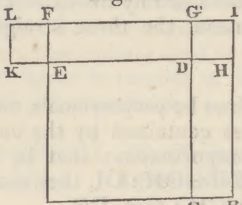
Suppose the square ACDE to be constructed; take $AF = AB$, draw FG parallel to AC, and BH parallel to CD.

The square ACDE is made up of four parts; the first ABIF is the square upon AB, because $AF = AB$; the second IGDH is the square upon BC, for $AC = AE$, and $AB = AF$; therefore $AC - AB = AE - AF$, that is, $BC = EF$; but $BC = IG$, and $EF = DG$ (26, 1); therefore IGDH is the square upon BC; and the remaining two parts are the two rectangles BCGI, FEHI, which have each for their measure $AB \times BC$; therefore the square upon AC is equal to the squares upon AB and BC, and twice the rectangle $AB \times BC$.

Theorem XI.—If a straight line AC be the difference of two straight lines AB, BC, the square made upon AC shall be equal to the excess of the two squares upon AB and BC above twice the rectangle contained by AB and BC; that is,

$$AC^2 = AB^2 + BC^2 - 2AB \times BC.$$

Fig. 75.

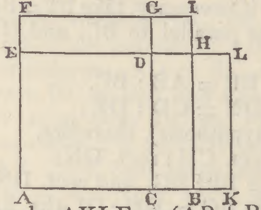


Construct the square ABIF, take $AE = AC$, and draw CG parallel to BI, and HK parallel to AB; and complete the square EFLK. The two rectangles CBIG, GLKD have each $AB \times BC$ for their measure; and if these be taken from the whole figure ABILKEA, that is, from $AB^2 + BC^2$, there will remain the square ACDE, that is, the square upon AC.

Theorem XII.—The rectangle contained by the sum and the difference of two straight lines is equal to the difference of the squares upon those lines; that is,

$$(AB + BC) \times (AB - BC) = AB^2 - BC^2.$$

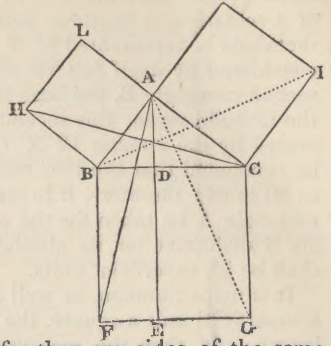
Fig. 76.



Construct upon AB and AC the squares ABIF, ACDE; produce AB, so that $BK = BC$, and complete the rectangle AKLE. The base AK of the rectangle is the sum of the two lines AB, BC; and its altitude AE is the difference of the same lines; therefore the rectangle $AKLE = (AB + BC)(AB - BC)$; but the same rectangle is composed of two parts $ABHE + BHLK$, of which BHLK is equal to the rectangle EDGF, for $BH = DE$, and $BK = FE$; therefore $AKLE = ABHE + EDGF$; but these two parts constitute the excess of the square ABIF above the square DHIG, the former of which is the square upon AB, and the latter the square upon BC; therefore $(AB + BC) \times (AB - BC) = AB^2 - BC^2$.

Theorem XIII.—The square upon the hypothenuse of a right-angled triangle is equal to the sum of the squares upon the two other sides.

Fig. 77.

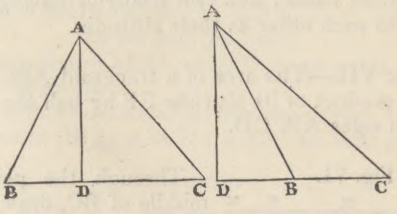


Let ABC be a right-angled triangle; having formed the squares upon its three sides, draw a perpendicular AD from the right angle upon the hypothenuse, and produce it to E, and draw the diagonals AF, CH. The angle ABF is evidently the sum of ABC and a right angle, and the angle HBC is also the sum of ABC and a right angle; therefore the angle $ABF = HBC$. Now $AB = BH$, for they are sides of the same square, and $BC = BF$ for the same reason; therefore the triangles ABF, HBC have two sides, and the included angle of the one equal to two sides, and the included angle of the other, each to each, therefore the triangles are equal (5, 1); but the triangle ABF is the half of the rectangle BDEF (which for brevity's sake we shall call BE), because it has the same base BF, and the same altitude BD (2); and the triangle HBC is in like manner half of the square AH; for the angles BAC, BAL being both right angles, CA and AL constitute a straight line parallel to BH (3, 1); and thus the triangle HBC and the square AH have the same base HB, and the same altitude AB; from which it follows that the triangle is half of the square (2). It has now been proved that the triangle ABF is equal to the triangle HBC; and that the rectangle BE is double of the former, and the square AH double of the latter; therefore the rectangle BE is equal to the square AH. It may be demonstrated in like manner that the rectangle CDEG, or CE, is equal to the square AI; but the rectangles BE, CE make up the square BCGF; therefore the square BCGF upon the hypothenuse is equal to the squares ALHB, AKIC upon the other two sides.

Theorem XIV.—In a triangle ABC, if the angle C be acute; the square of the opposite side AB is less than the squares of the sides which contain the angle C; and if AD a perpendicular be drawn to BC from the opposite angle, the difference shall be equal to twice the rectangle $BC \times CD$; that is,

$$AB^2 = AC^2 + CB^2 - 2BC \times CD.$$

Fig. 78.



First, suppose AD to fall within the triangle, then $BD = BC - CD$, and consequently (11) $BD^2 = BC^2 + CD^2 - 2BC \times CD$; to each of these equals add AD^2; then, observing that $BD^2 + DA^2 = BA^2$, and $CD^2 + DA^2 = CA^2$,

$$AB^2 = BC^2 + CA^2 - 2BC \times CD.$$

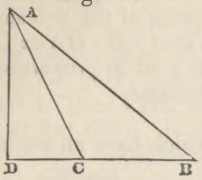
Next, suppose AD to fall without the triangle, so that $BD = CD - BC$, and therefore $BD^2 = CD^2 + BC^2 - 2BC \times CD$ (11), to each of these add AD^2 as before, and we get

$$AB^2 = BC^2 + CA^2 - 2BC \times CD.$$

Theorem XV.—In a triangle ABC, if the angle C be obtuse; the square of the opposite side AB is greater than the sum of the squares of the sides which contain the angle C; and if AD a perpendicular be drawn to BC from the opposite angle; the difference shall be equal to twice the rectangle BC × CD; that is,

$$AB^2 = AC^2 + BC^2 + 2BC \times CD.$$

Fig. 79.

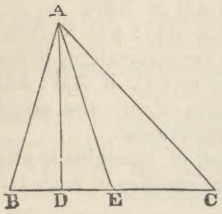


For BD = BC + CD, and therefore (10), $BD^2 = BC^2 + CD^2 + 2BC \times CD$; to each of these equals add AD^2, then, observing that $AD^2 + DB^2 = AB^2$, and $AD^2 + DC^2 = AC^2$,

$$AB^2 = BC^2 + CA^2 + 2BC \times CD.$$

Scholium. It is only when a triangle has one of its angles a right angle, that the sum of the squares of two of its sides can be equal to the square of the third side; for if the angle contained by those sides be acute, the sum of their squares is greater than the square of the opposite side, and if the angle be obtuse, that sum is less than the square of the opposite side.

Fig. 80.



Theorem XVI.—If a straight line AE be drawn from the vertex of any triangle ABC to the middle of its base BC; the sum of the squares of the sides is equal to twice the square of half the base, and twice the square of the line drawn from the vertex to the middle of the base; that is, $AB^2 + AC^2 = 2BE^2 + 2AE^2$.

Draw AD perpendicular to BC, then

$$AB^2 = BE^2 + EA^2 - 2BE \times ED\ (14),$$

$$\text{and } AC^2 = CE^2 + EA^2 + 2CE \times ED\ (15);$$

therefore, by adding equals to equals, and observing that BE = CE, and therefore $BE^2 = CE^2$, and 2BE × ED = 2CE × ED,

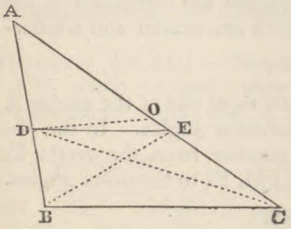
$$AB^2 + AC^2 = 2BE^2 + 2AE^2.$$

Theorem XVII.—A straight line DE drawn parallel to one of the sides of a triangle ABC, divides the other two sides AB, AC proportionally, so that AD : DB = AE : EC.

Join BE and CD. The triangles BDE, CDE, having the same base DE, and the same altitude, are equivalent (2), and the triangles ADE, BDE, having the same altitude, are to one another as their bases (6), that is, ADE : BDE = AD : DB; the triangles ADE, CDE, having also the same altitude, are to one another as their bases; that is, ADE : CDE = AE : EC, but the triangle BDE has been proved equal to CDE; therefore, because of the common ratio in the two proportions, we have (Ax. 3, 3)

$$AD : DB = AE : EC.$$

Fig. 81.



Cor. Hence, by composition, AB : AD = AC : AE; and AB : BD = AC : CE.

Theorem XVIII.—Conversely, if two of the sides AB, AC of a triangle be divided proportionally by the straight line DE, so that AD : DB = AE : EC; then shall the line DE be parallel to the remaining side BC.

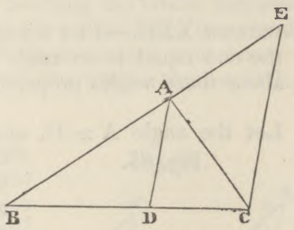
For if DE is not parallel to BC, suppose some other line DO to be parallel to BC; then, AB : BD = AC : CO (17), and since by hypothesis AD : DB = AE : EC, and consequently, by composition, AB : BD = AC : CE, therefore, AC : CO = AC : CE; therefore, CO = CE (2 Ax. 3), which is impossible; therefore DO is not parallel to BC.

Cor. If it be supposed that BA : AD = CA : AE; still DE will be parallel to BC; for by division BD : AD = CE : AE, this proportion being the same as in the theorem, the conclusion must be the same.

Theorem XIX.—A straight line AD, which bisects the angle BAC of a triangle, divides the base BC into two segments proportional to the adjacent sides BA, AC; that is, BD : DC = BA : AC.

Through the point C draw CE parallel to AD, so as to meet BA produced. In the triangle BCE, the line AD is parallel to one of its sides CE, therefore BD : DC = BA : AE; now the triangle CAE is isosceles, for, because of the parallels AD, CE, the angle ACE = DAC, and the angle AEC = BAD, (21, 1); but by hypothesis DAC = BAD, therefore ACE = AEC; and consequently, AE = AC (12, 1), therefore, substituting AC instead of AE in the above proportion, it becomes BD : DC = BA : AC.

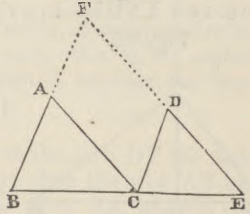
Fig. 82.



Theorem XX.—If two triangles be equiangular, their homologous sides are proportional, and the triangles are similar.

Let ABC, CDE be two equiangular triangles, which have the angle BAC = CDE, ABC = DCE, and ACB = DEC; the homologous sides, or the sides adjacent to the equal angles, shall be proportional; that is, BC : CE = AB : CD = AC : DE.

Fig. 83.



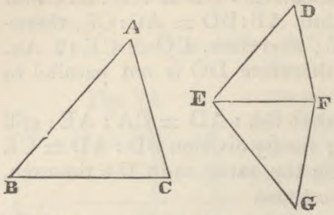
Place the homologous sides BC, CE in the same direction, and produce the sides BA, ED, till they meet in F. Because BCE is a straight line, and the angle BCA is equal to CED, the lines CA, EF are parallel (22, 1); and in like manner, because the angle ABC = DCE, the lines BF, CD are parallel; therefore the figure ACDF is a parallelogram, and hence AF = CD, and CA = DF (26, 1). In the triangle BFE the line AC is parallel to the side FE, therefore BC : CE = BA : AF; or since AF = CD, BC : CE = BA : CD. Again, in the same triangle, because CD is parallel to the side BF, BC : CE = FD : DE, or, since FD = AC, BC : CE = AC : DE; having now shown that BC : CE = BA : CD, and that BC : CE = AC : DE, it follows that BA : CD = AC : DE; therefore the equiangular triangles BAC, CDE have their homologous sides proportional, and hence (Def. 2) the triangles are similar.

Scholium. It is manifest that the homologous sides are opposite to the equal angles.

Theorem XXI.—If two triangles have their homologous sides proportional, they are equiangular and similar.

Suppose that BC : EF = AB : DE = AC : DF; then shall A = D, B = E, C = F. At the point E make the and angle $FEG = B$, and at the point F make $EFG = C$; then the third angle G shall be equal to the third angle A, and the two triangles ABC, GEF shall be equiangular; therefore, by the last theorem, $BC : EF = AB : GE$; but by hypothesis $BC : EF = AB : DE$; therefore $GE = DE$ (Ax. 2, 3). In like manner, because by the same theorem $BC : EF = CA : FG$; and by hypothesis $BC : EF = CA : FD$; therefore $FG = FD$; but it was shown that $EG = ED$, therefore, the triangles GEF, DEF, having the sides of the one equal to those of the other, each to each, are equal; but, by construction, the triangle GEF is equiangular to ABC, therefore also the triangles DEF, ABC are equiangular and similar.

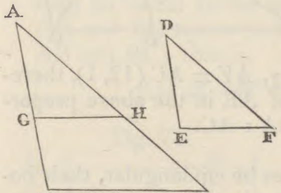
Fig. 84.



Theorem XXII.—Two triangles which have an angle of the one equal to an angle of the other, and the sides about these angles proportional, are similar.

Let the angle $A = D$, and let $AB : DE = AC : DF$, the triangle ABC is similar to DEF. Take $AG = DE$, and draw GH parallel to BC, then the angle $AGH = ABC$ (21, 1), therefore the triangle AGH is equiangular to ABC, and consequently (20) $AB : AG = AC : AH$; but by hypothesis $AB : DE = AC : DF$, and by construction $AG = DE$, therefore $AH = DF$; the two triangles AGH, DEF are therefore equal (5, 1), but the triangle AGH is similar to ABC, therefore DEF is similar to ABC.

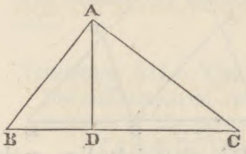
Fig. 85.



Theorem XXIII.—In a right-angled triangle, if a perpendicular AD be drawn from the right angle upon the hypothenuse, then,

1. The triangles ABD, CAD on each side of the perpendicular are similar to the whole triangle BAC, and to one another.
2. Each side AB or AC is a mean proportional between the hypothenuse BC, and the adjacent segment BD or DC.
3. The perpendicular AD is a mean proportional between the two segments BD, DC.

Fig. 86.



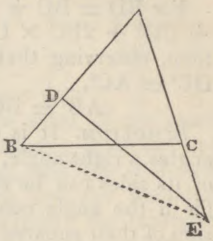
1. The triangles BAD, BAC have the common angle B; besides, the right angle BAC is equal to the right angle BDA, therefore the third angle BAD of the one is equal to the third angle BCA of the other; therefore, these triangles are equiangular and similar; and in the same manner it may be shown that the triangle DAC is equiangular and similar to BAC; therefore the three triangles are equiangular and similar to each other.

2. Because the triangle BAD is similar to the triangle BAC, their homologous sides are proportional. Now the side BD of the lesser triangle is homologous to the side BA of the greater, because they are opposite to the equal angles BAD, BCA; in like manner BA, considered as a side of the lesser triangle, is homologous to the side BC of the greater, each being opposite to a right angle; therefore, $BD : BA = BA : BC$. In the same manner it may be shown that $CD : CA = CA : CB$, therefore each side is a mean proportional between the hypothenuse and the segment adjacent to that side.

3. By comparing the homologous sides of the two similar triangles ABD, ACD, it appears that $BD : DA = DA : DC$; therefore the perpendicular is a mean proportional between the segments of the hypothenuse.

Theorem XXIV.—Two triangles which have an angle of the one equal to an angle of the other, are to each other as the rectangles of the sides which contain the equal angles; that is, the triangle ABC is to the triangle ADE as the rectangle $AB \times AC$ to the rectangle $AD \times AE$.

Fig. 87.



Join BE; because the triangles ABE, ADE, have a common vertex E, they have the same altitude, therefore $ABE : ADE = AB : AD$ (Cor. to 6); but $AB : AD = AB \times AE : AD \times AE$ (3), therefore,

$$ABE : ADE = AB \times AE : AD \times AE.$$

In the same manner, it may be demonstrated that

$$ABC : ABE = AB \times AC : AB \times AE;$$

therefore (8, 3) $ABC : ADE = AB \times AC : AD \times AE$.

Cor. Therefore the two triangles are equivalent, if the rectangle $AB \times AC = AD \times AE$, or (8), if $AB : AD = AE : AC$, in which case the sides about the equal angles are said to be *reciprocally* proportional.

Scholium. What has been proved of triangles is also true of parallelograms, they being the doubles of such triangles.

Theorem XXV.—Two similar triangles are to each other as the squares of their homologous sides. (See fig. 85.)

Let the angle $A = D$, the angle $B = E$, and therefore the angle $C = F$,

$$\text{then (20) } AB : DE = AC : DF;$$

$$\text{now } AB : DE = AB : DE,$$

for the two ratios are identical, therefore (9),

$$AB^2 : DE^2 = AB \times AC : DE \times DF;$$

$$\text{but } ABC : DEF = AB \times AC : DE \times DF \text{ (24)},$$

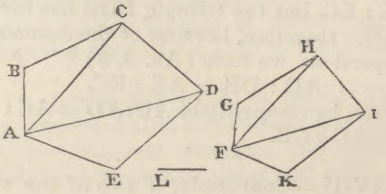
$$\text{therefore } ABC : DEF = AB^2 : DE^2 \text{ (Ax. 3, 3)},$$

therefore the two similar triangles ABC, DEF are to each other as the squares of the homologous sides AB, DE, or as the squares of any of the other homologous sides.

Theorem XXVI.—Similar polygons are composed of the same number of triangles which are similar and similarly situated.

In the polygon ABCDE, draw from one of the angles A the diagonals AC, AD to all the other angles. In the polygon FGHIK, draw in like manner from the angle F, homologous to A, the diagonals FH, FI to the other angles.

Fig. 88.



Because the polygons are similar, the angle ABC is equal to its homologous angle FGH (Def. 2), also the sides AB, BC are proportional to FG, GH; so that $AB : FG = BC : GH$, therefore the triangles ABC, FGH are similar (22);

therefore the angle BCA = GHF, and these being taken from the equal angles BCD, GHI, the remainders ACD, FHI are equal; but the triangles ABC, FGH being similar, AC : FH = BC : GH, besides, because of the similarity of the polygons, BC : GH = CD : HI; therefore AC : FH = CD : HI; now it has been already shown that the angle ACD = FHI, therefore the triangles ACD, FHI are similar (22). It may be demonstrated in the same manner that the remaining triangles are similar, whatever be the number of sides of the polygon; therefore two similar polygons are composed of the same number of triangles similar to each other, and similarly situated.

Theorem XXVII.—The perimeters of similar polygons are as the homologous sides; and the polygons themselves are as the squares of the homologous sides. (See fig. 88.)

For, since by the nature of similar figures AB : FG = BC : GH = CD : HI, &c. therefore (12, 3) AB + BC + CD, &c. the perimeter of the first figure, is to FG + GH + HI, &c. the perimeter of the second, as the side AB to its homologous side FG.

Again, because the triangles ABC, FGH are similar, $ABC : FGH = AC^2 : FH^2$ (25), in like manner $ACD : FHI = AC^2 : FH^2$; therefore,

$$ABC : FGH = ACD : FHI.$$

By the same manner of reasoning,

$$ACD : FHI = ADE : FIK,$$

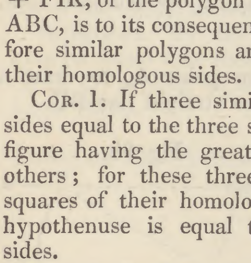
and so on if there be more triangles; hence, from this series of equal ratios, it follows (12, 3) that ABC + ACD + ADE, or the polygon ABCDE, is to FGH + FHI + FIK, or the polygon FGHIK, as one of the antecedents ABC, is to its consequent FGH, or as AB^2 to FG^2; therefore similar polygons are to each other as the squares of their homologous sides.

Cor. 1. If three similar figures have their homologous sides equal to the three sides of a right-angled triangle, the figure having the greatest side shall be equal to the two others; for these three figures are proportional to the squares of their homologous sides, and the square of the hypothenuse is equal to the squares of the other two sides.

Cor. 2. Similar polygons have to each other the duplicate ratio of their homologous sides. For let L be a third proportional to the homologous sides AB, FG, then (Def. 10, 3) AB has to L the duplicate ratio of AB to FG; but $AB : L = AB^2 : AB \times L$ (3), or since $AB \times L = FG^2$, (Cor. to 8) $AB : L = AB^2 : FG^2 = ABCDE : FGHIK$; therefore the figure ABCDE has to the figure FGHIK, the duplicate ratio of AB to FG.

Theorem XXVIII.—The segments of two chords AB, CD, which cut each other within a circle, are reciprocally proportional, that is, AO : DO = CO : OB.

Fig. 89.

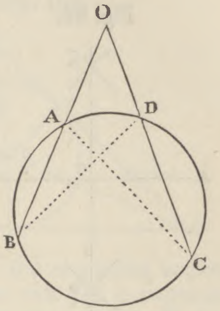


Join AC and BD; and because the triangles AOC, BOD have the angles at O equal (4, 1), and the angle A = D and the angle C = B (15, 2), the triangles are similar; therefore the homologous sides are proportional (20), that is, AO : DO = CO : BO.

Cor. Hence $AO \times BO = CO \times DO$ (8), that is, the rectangle contained by the segments of the one chord is equal to the rectangle contained by the segments of the other.

Theorem XXIX.—If from a point O without a circle two straight lines be drawn, terminating in the concave arch BC; the whole lines shall be reciprocally proportional to the parts of them without the circle, that is, OB : OC = OD : OA.

Fig. 90.

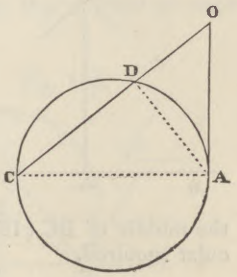


Join AC, BD; then the triangles OAC, OBD have the common angle O, also the angle B = C (15, 2), therefore the triangles are similar, and the homologous sides are proportional, that is, OB : OC = OD : OA.

Cor. Therefore (8) $OA \times OB = OC \times OD$, that is, the rectangles contained by the whole lines, and the parts of them without the circle, are equal to one another.

Theorem XXX.—If from a point O without a circle a straight line OA be drawn touching the circle, and also a straight line OC cutting it; the tangent shall be a mean proportional between the whole line which cuts the circle, and the part of it without the circle; that is, OC : OA = OA : OD.

Fig. 91.



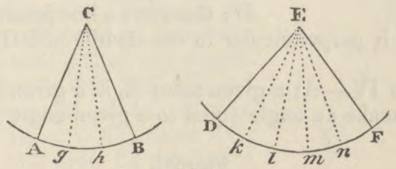
For if AC, AD be joined, the triangles OAD, OCA, have the angle at O common to both, also the angle ACD or ACO equal to DAO (18, 2), therefore the triangles are similar (20), and consequently CO : OA = OA : OD.

Cor. Therefore (Cor. to 8) $CO \times OD = OA^2$, that is, the square of the tangent is equal to the rectangle contained by the whole line which cuts the circle, and the part of it without the circle.

Theorem XXXI.—In the same circle, or in equal circles, any angles ACB, DEF are to each other as the arches AB, DF of the circles intercepted between the lines which contain the angles.

Suppose the arch AB to have to the arch DF the ratio of the number *p* to the number *q*; then the arch AB being supposed divided into equal parts A*g*, *gh*, *h*B, the number of which is *p*, the arch DF shall contain *q* equal parts D*k*, *kl*, *lm*, *mn*, *n*F, each of which is equal to any one of the equal parts into which AB is divided. Draw straight lines from the centres of the circles to the points of division; these lines will divide ACB into *p* angles and DEF into *q* angles, which are all equal (13, 2); therefore the angle ACB has to the angle DEF the ratio of the number *p* to the number *q*, which ratio is the same as that of the arch AB to the arch DF.

Fig. 92.

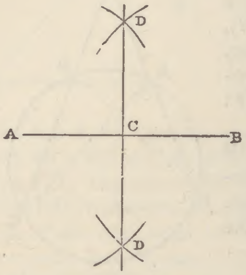


Cor. Hence it appears that angles may be measured and compared with each other by means of arches of circles described on the vertices of the angles as centres; observing, however, that the radii of the circles must be equal.

SECT. V.—PROBLEMS.

Problem I.—To bisect a given straight line AB; that is, to divide it into two equal parts.

Fig. 93.

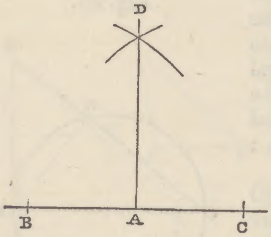


From the points A and B as centres, with any radius greater than the half of AB, describe arches, cutting each other in D and D on each side of the line AB. Draw a straight line through the points D, D, cutting AB in C; the line AB is bisected in C.

For the points D, D, being equally distant from the extremities of the line AB, are each in a straight line perpendicular to the middle of AB (16, 1), therefore the line DCD is that perpendicular, and consequently C is the middle of AB.

Problem II.—To draw a perpendicular to a given straight line BC, from a given point A in that line.

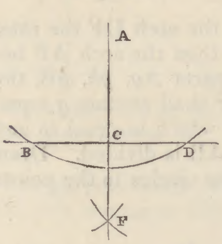
Fig. 94.



Take the points B and C at equal distances from A; and on B and C as centres, with any radius greater than BA, describe arches, cutting each other in D; draw a straight line from A through D, which will be the perpendicular required. For the point D, being at equal distances from the extremities of the line BC, must be in a perpendicular to the middle of BC (16, 1), therefore AD is the perpendicular required.

Problem III.—To draw a perpendicular to a given line BD, from a given point A without that line.

Fig. 95.

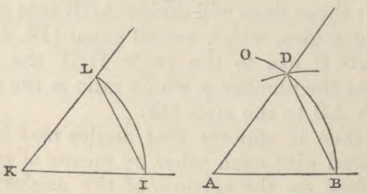


On A as a centre, with a radius sufficiently great, describe an arch, cutting the given line in two points B, D; and on B and D as centres, with a radius greater than the half of BD, describe two arches, cutting each other in F; draw a straight line through the points A and F, meeting BD in C; the line AC is the perpendicular required.

For the two points A and F are each at equal distances from B and D; therefore a line passing through A and F is perpendicular to the middle of BD (16, 1).

Problem IV.—At a given point A, in a given line AB, to make an angle equal to a given angle K.

Fig. 96.

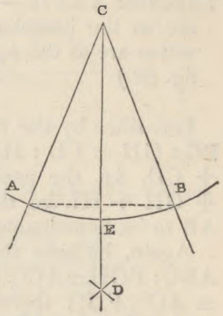


On K as a centre, with any radius, describe an arch to meet the lines containing the angle K in L and I; and on A as a centre, with the same radius, describe an indefinite arch BO; on B as a centre, with a radius equal to the chord LI, describe an arch, cutting the arch BO in D; draw AD, and the angle DAB shall be equal to K.

For the arches BD, LI having equal radii and equal chords, the arches themselves are equal (4, 2), therefore the angles A and K are also equal (13, 2).

Problem V.—To bisect a given arch AB, or a given angle C.

Fig. 97.



First, to bisect the arch AB, on A and B as centres, with one and the same radius, describe arches to intersect in D; join CD, cutting the arch in E, and the arch AE shall be equal to EB.

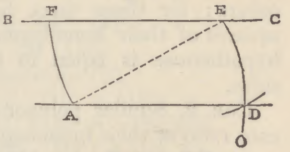
For, since the points C and D are at equal distances from A, and also from B, the line which joins them is perpendicular to the middle of the chord AB (16, 1), therefore the arch AB is bisected at E (6, 2).

Secondly, to bisect the angle C; on C as a centre, with any distance, describe an arch, meeting the lines containing the angle in A and B; then find the point D as before, and the line CD will manifestly bisect the angle C as required.

Scholium. By the same construction we may bisect each of the arches AE, EB; and again we may bisect each of the halves of these arches, and so on; thus, by successive subdivisions, an arch may be divided into four, eight, sixteen parts, &c.

Problem VI.—Through a given point A, to draw a straight line parallel to a given straight line BC.

Fig. 98.

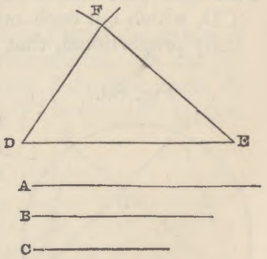


On A as a centre, with a radius sufficiently large, describe the indefinite arch EO; on E for a centre, with the same radius, describe the arch AF; in EO take ED equal to AF, draw a line from A through D, and AD will be parallel to BC.

For if AE be joined, the angle EAD is equal to AEB 13, 2), and they are alternate angles, therefore AD is parallel to BC (22, 1).

Problem VII.—To construct a triangle, the sides of which may be equal to three given lines A, B, C.

Fig. 99.



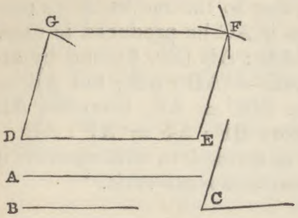
Take a straight line DE, equal to one of the given lines A; on D as a centre, with a radius equal to another of the lines B, describe an arch; on E as a centre, with a radius equal to the remaining line C, describe another arch, cutting the former in F; join DF and EF, and DEF will be the triangle required, as is sufficiently evident.

Scholium. It is necessary that the sum of any two of the lines be greater than the third line (7, 1).

Problem VIII.—To construct a parallelogram, the adjacent sides of which may be equal to two given lines A, B, and the angle they contain equal to a given angle C.

Lines and Figures upon a Plane.

Fig. 100.



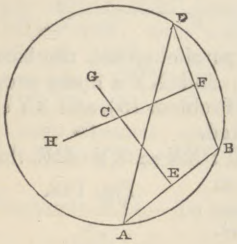
Draw the straight line $DE = A$; make the angle $GDE = C$, and take $DG = B$; describe two arches, one on G as a centre, with a radius $GF = DE$, and the other on E, with a radius $EF = DG$; then DEFG shall be the parallelogram required.

For by construction the opposite sides are equal; therefore the figure is a parallelogram (27, 1), and it is so constructed, that the adjacent sides and the angle they contain have the magnitudes given in the problem.

Cor. If the given angle be a right angle, the figure will be a rectangle; and if the adjacent sides be also equal, the figure will be a square.

Problem IX.—To find the centre of a given circle, or of a circle of which an arch is given.

Fig. 101.



Take any three points A, B, D, in the circumference of the circle, or in the given arch, and having drawn the straight lines AB, BD, bisect them by the perpendiculars EG, FH; the point C where the perpendiculars intersect each other is the centre of the circle, as is evident from Theorem VI. Sect. II.

Scholium. By the very same construction, a circle may be found that shall pass through three given points A, B, C; or that shall be described about a given triangle ADC.

Problem X.—To draw a tangent to a given circle through a given point A.

Fig. 102.

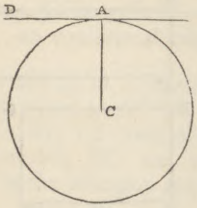


Fig. 103.

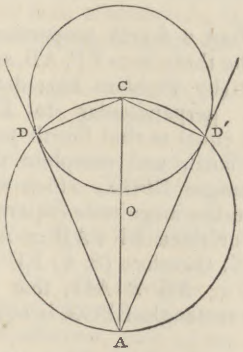


If the given point A be in the circumference (fig. 102), draw the radius AC; and through A, draw AD perpendicular to AC, and AD will be a tangent to the circle (9, 2). But if the given point A be without the circle (fig. 103), draw AC to the centre, and bisect AC in O, and on O as a centre, with OA or OC as a radius, describe a circle which will cut the given circle in two points D and D′; join AD and AD′, and each of the lines AD, AD′ will be a tangent to the circle.

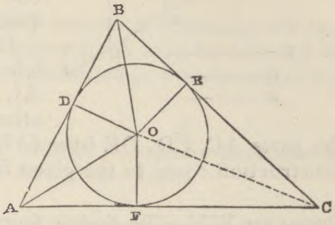
For, draw the radii CD, CD′, then each of the angles ADC, AD′C is a right angle (17, 2); therefore AD and AD′ are both tangents to the circle (9, 2).

Cor. The two tangents AD, AD′ are equal to one another (17, 1).

Problem XI.—To inscribe a circle in a given triangle ABC.

Lines and Figures upon a Plane.

Fig. 104.

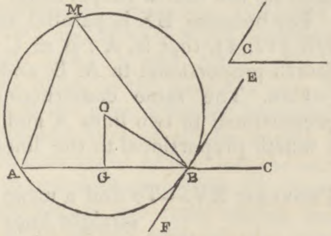


Bisect A and B any two angles of the triangle by the straight lines AO, BO, which meet each other in O; from O draw OD, OE, OF, perpendiculars to its sides; these lines shall be equal to one another.

For in the triangles ODB, OEB, the angle $ODB = OEB$, and the angle $OBD = OBE$; therefore, the remaining angles BOD, BOE, are equal; and as the side OB is common to both triangles, they are equal to one another (6, 1), therefore the side $OD = OE$; in the same manner it may be demonstrated, that $OD = OF$; therefore the lines OD, OE, OF, are equal to one another; and consequently a circle described on O as a centre, with OD as a radius, will pass through E and F; and as the sides of the triangle are tangents to the circle (9, 2), it will be inscribed in the triangle.

Problem XII.—Upon a given straight line AB, to describe a segment of a circle that may contain an angle equal to a given angle C.

Fig. 105.

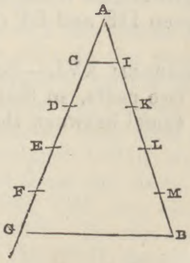


Produce AB towards D, and at the point B make the angle DBE equal to the given angle C; draw BO perpendicular to BE, and GO perpendicular to the middle of AB, meeting BO in O; on O as a centre, with OB as a radius, describe a circle, which will pass through A, and AMB shall be the segment required.

For since FE is perpendicular to BO, FE is a tangent to the circle; therefore the angle EBD (which is equal to C by construction) is equal to any angle AMB in the alternate segment (18, 2).

Problem XIII.—To divide a straight line AB into any proposed number of equal parts; or into parts having to each other the same ratios that given lines have.

Fig. 106.

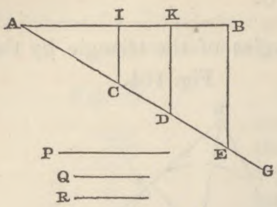


First, let it be proposed to divide the line AB (fig. 106) into five equal parts. Through the extremity A draw an indefinite line AG, take AC of any magnitude, and take CD, DE, EF, and FG, each equal to AC, that is, take AG equal to five times AC; join GB, and draw CI parallel to GB, the line AI shall be one fifth part of AB, and AI being taken five times in AB, the line AB shall be divided into five equal parts.

For since CI is parallel to GB, the sides AG and AB are cut proportionally in C and I; but AC is the fifth part of AG; therefore AI is the fifth part of AB.

Next, let it be proposed to divide AB (fig. 107) into parts, having to each other the ratios that the lines P, Q,

Fig. 107.

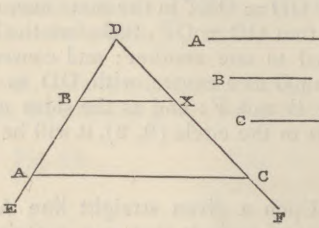


R have. Through A draw AG, and in AG take $AC = P$, $CD = Q$, $DE = R$; join EB, and draw CI and DK parallel to EB; the line AB shall be divided as required.

For, because of the parallels CI, DK, EB; the parts AI, IK, KB have to each other the same ratios that the parts AC, CD, DE have (17, 4), which parts are by construction equal to the given lines P, Q, R.

Problem XIV.—To find a fourth proportional to three given lines A, B, C.

Fig. 108.



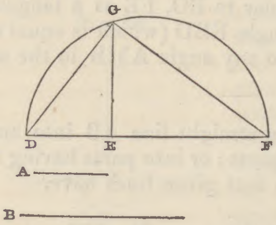
Draw two straight lines DE, DF, containing any angle; on DE take $DA = A$, and $DB = B$, and on DF take $DC = C$; join AC and draw BX parallel to AC; then DX shall be the fourth proportional required.

For because BX is parallel to AC, $DA : DB = DC : DX$ (17, 4), that is, $A : B = C : DX$; therefore DX is a fourth proportional to A, B, and C.

Cor. The same construction serves to find a third proportional to two lines A and B; for it is the same as a fourth proportional to the lines A, B, and B.

Problem XV.—To find a mean proportional between two straight lines A, B.

Fig. 109.

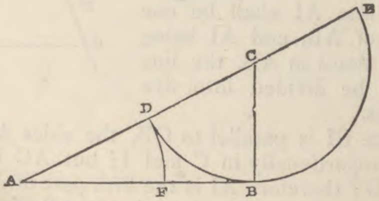


Upon any straight line DF take $DE = A$, and $EF = B$; and on DF as a diameter describe a semicircle DGF; draw EG perpendicular to DF, meeting the circle in G; the line EG shall be the mean proportional required.

For, if DG, FG be joined, the angle DGF is a right angle (17, 2), therefore, in the right-angled triangle DGF, GE is a mean proportional between DE and EF (23, 4).

Problem XVI.—To divide a given straight line AB into two parts, so that the greater may be a mean proportional between the whole line and the other part.

Fig. 110.



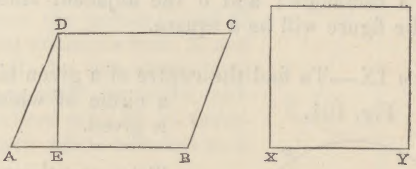
At B, one of the extremities of the line, draw BC perpendicular to AB, and equal to the half of AB; on C as a centre, with CB as a radius, describe a circle; join AC, meeting the circle in D; make $AF = AD$, and AB shall be divided at F in the manner required.

For since AB is perpendicular to the radius, it is a tangent to the circle (9, 2); and if AC be produced to meet the circle in E, $AB : AF = AE : AB$ (30, 4), and by division $AB - AF : AF = AE - AB : AB$; but $AB - AF = BF$; and since $DE = 2BC = AB$, therefore $AE - AB = AD = AF$, therefore $BF : AF = AF : AB$.

Scholium. When a line is divided in this manner, it is said to be divided in *extreme and mean ratio.*

Problem XVII.—To make a square equivalent to a given parallelogram, or to a given triangle.

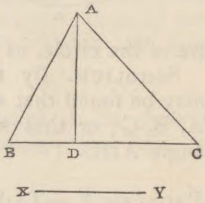
Fig. 111.



First, let ABCD be a given parallelogram, the base of which is AB, and altitude DE; find XY a mean proportional between AB and DE (by Problem 15), and XY shall be the side of the square required.

For since by construction $AB : XY = XY : DE$, therefore $XY^2 = AB \times DE$ (8, 4) = parallelogram ABCD (5, 4).

Fig. 112.

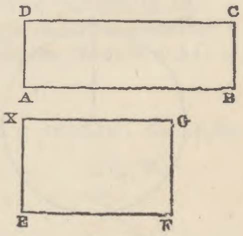


Next, let ABC be a given triangle (fig. 113), BC its base, and AD its altitude; find XY a mean proportional between half the base and the altitude, and XY shall be the side of the square required.

For since $\frac{1}{2}BC : XY = XY : AD$; therefore (8, 4) $XY^2 = \frac{1}{2}BC \times AD$ = triangle ABC (6, 4).

Problem XVIII.—Upon a given line EF, to construct a rectangle EFGX equivalent to a given rectangle ABCD.

Fig. 113.

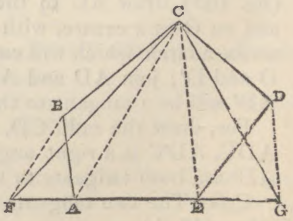


Find a fourth proportional to the three lines EF, AB, and AD (by Problem 14); draw EX perpendicular to EF, and equal to that fourth proportional, and complete the rectangle EFGX, which will have the magnitude required.

For since $EF : AB = AD : EX$, therefore (8, 4) $EF \times EX = AB \times AD$; that is, the rectangle EFGX is equal to the rectangle ABCD.

Problem XIX.—To make a triangle equivalent to a given polygon ABCDE.

Fig. 114.



First, draw the diagonal CE, so as to cut off the triangle CDE; draw DG parallel to CE, to meet AE produced in G; join CG, and the given polygon ABCDE shall be equivalent to another polygon ABCG, which has one side fewer.

For since DG is parallel to CE, the triangle CGE is equivalent to the triangle CDE (2 Cor. 2, 4); to each add the polygon ABCE, and the polygon ABCDE shall be equivalent to the polygon ABCG.

In like manner, if the diagonal CA be drawn, also BF parallel to CA, meeting EA produced, and CF be joined, the triangle CFA is equivalent to the triangle CBA, and thus the polygon ABCDE is transformed to the triangle CFG.

In this way a triangle may be found equivalent to any other polygon; for by transforming the figure into another equivalent figure that has one side fewer, and repeating the operation, a figure will at last be found which has only three sides.

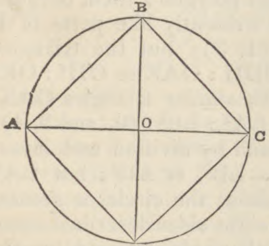
Scholium. As a square may be found equivalent to a triangle, by combining the problem with Prob. XVII. a square may be found equivalent to any rectilineal figure whatever.

Problem XX.—Upon a given line FG to construct a polygon similar to a given polygon ABCDE. (Fig. 88.)

Draw the diagonals AC, AD; at the point F make the angle GFH = BAC, and at the point G make the angle FGH = ABC; thus a triangle FGH will be constructed similar to ABC. Again, on FH construct in like manner a triangle FIH, similar to ADC and similarly situated; and on FI construct a triangle FKI similar to AED, and similarly situated; and these triangles FGH, FHI, FIK shall form a polygon FGHIK similar to ABCDE (26, 4).

Problem XXI.—To inscribe a square in a given circle.

Fig. 115.



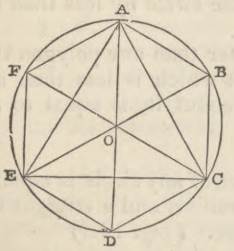
Draw two diameters AC, BD, so as to intersect each other at right angles; join the extremities of the diameters A, B, C, D, and the figure ABCD shall be a square inscribed in the circle.

For the angles AOB, BOC, &c. being all equal, the chords AB, BC, CD, DA are equal; and as each of the angles of the figure ABCD is in a semicircle, it is a right angle (17, 2), therefore the figure is a square.

Problem XXII.—To inscribe a regular hexagon, and also an equilateral triangle, in a given circle.

From any point A in the circumference, apply AB and BC each equal to AO the radius; draw the three diameters AD, BE, CF, and join their adjacent extremities by the lines AB, BC, &c. and the figure ABCDEF thus formed is the hexagon required.

Fig. 116.



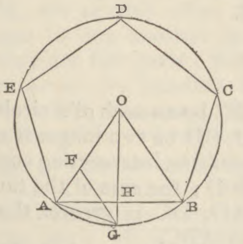
For the triangles AOB, BOC being by construction equilateral, each of the angles AOB, BOC is one third of two right angles (4, Cor. 24, 1); and since AOB + BOC + COD = two right angles, therefore COD = one third of two right angles; therefore the three angles AOB, BOC, COD are equal, and as these are equal to the angles AOF, FOE, EOD, the six angles at the centre are all equal; therefore the chords AB, BC, CD, DE, EF, FA are all equal; thus the figure is equilateral. It is also equiangular, for the angles FAB, ABC, &c. are in equal segments, each having for its base the chords of two sixths of the circumference; therefore the angles A, B, &c. are equal (15, 2).

If straight lines be drawn joining A, C, E, the vertices of the alternate angles of the hexagon, there will be formed an equilateral triangle inscribed in a circle, as is sufficiently evident.

Scholium. As the same manner of reasoning will apply alike to any equilateral polygon; it may be inferred that every equilateral polygon inscribed in a circle is also equiangular.

Problem XXIII.—To inscribe a regular pentagon and decagon in a given circle.

Fig. 117.

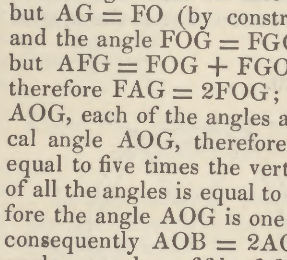


Draw any radius AO, and divide it into two parts AF, FO, such, that AO : OF = OF : AF (16); from A place AG in the circumference equal to OF; join OG, and draw the chord AHB perpendicular to OG, the chord AB shall be a side of the pentagon required.

Join GF, and because AO : OF = OF : AF, and that AG = OF, therefore AO : AG = AG : AF; now the angle A is common to the two triangles OAG, GAF, and it has been shown that the sides about that angle in the two triangles are proportionals; therefore (22, 4), the triangles are similar, and the triangle AOG being isosceles, the triangle AGF is also isosceles, so that AG = GF; but AG = FO (by construction), therefore, GF = FO, and the angle FOG = FGO, and FOG + FGO = 2FOG; but AFG = FOG + FGO (23, 1), and AFG = FAG, therefore FAG = 2FOG; hence in the isosceles triangle AOG, each of the angles at the base is double the vertical angle AOG, therefore the sum of all the angles is equal to five times the vertical angle AOG; but the sum of all the angles is equal to two right angles (24, 1), therefore the angle AOG is one fifth of two right angles, and consequently AOB = 2AOG = two fifths of two right angles, equal one fifth of four right angles, therefore the arch AB is one fifth of the whole circumference. If we now suppose straight lines BC, CD, DE, to be applied in the circle each equal to AB, the chord of one fifth of the circumference, and AE to be joined, the figure thus formed will be an equilateral pentagon, and it is also equiangular (Schol. 22). It is evident that AG is the side of a decagon inscribed in the circle.

Problem XXIV.—Having given ABCD, &c. a regular polygon inscribed in a circle; to describe a regular polygon of the same number of sides about the circle.

Fig. 118.



Draw GH a tangent to the circle at T the middle of the arch AB; do the same at the middle of each of the other arches BC, CD, &c.; these tangents shall form a regular polygon GHIK, &c. described about the circle.

Join OG, OH, &c. also OT and ON. In the triangles OTH, ONH, the side OT = ON, and OH is common to both, and OTH, ONH, are right angles, therefore the triangles are equal (17, 1) and the angle TOH = NOH; now B is the middle of the arch TN, therefore OH passes through B; and in the same manner it appears that I is in the line OC produced, &c. Now because OT bisects the arch AB, it is perpendicular to the chord AB (6, 2); therefore GH is parallel to AB (9, 2, and 18, 1), and HI to BC, therefore the angle $GHO = ABO$, and $IHO = CBO$, and hence $GHI = ABC$; and in like manner it appears that $HIK = BCD$, &c.; therefore the angles of the circumscribed polygon are equal to those of the inscribed polygon. And because of the parallels, $GH : AB = OH : OB$, and $HI : BC = OH : OB$, therefore $GH : AB = HI : BC$; but $AB = BC$; therefore $GH = HI$. For the same reason $HI = IK$, &c., therefore the polygon is regular, and similar to the inscribed polygon.

SECT. VI.—OF THE QUADRATURE OF THE CIRCLE.

Axiom.

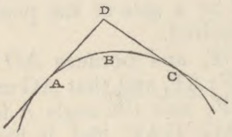


Fig. 119.

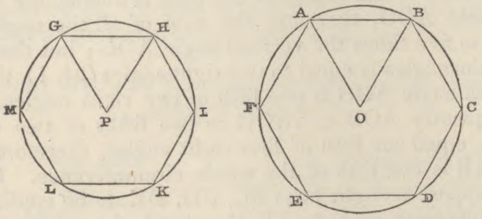
If ABC be an arch of a circle, and AD, CD be two tangents at its extremities, intersecting each other in D; the sum of the tangents AD, DC is greater than the arch ABC.

Cor. Hence the perimeter of any polygon described about a circle, is greater than the circumference of the circle.

Prop. I. Theorem.—Equilateral polygons, ABCDEF, GHIKLM, of the same number of sides inscribed in circles are similar, and are to one another as the squares of the radii of the circles.

Fig. 120.

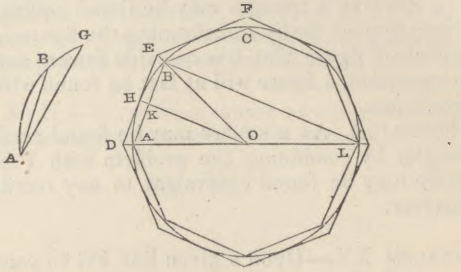


As each of the polygons is by hypothesis equilateral, it will also be equiangular (Schol. 22, 5). Let us suppose, for example, that the polygons are hexagons; then, as the sum of the angles is the same in both, viz. eight right angles (25, 1), the angle A will be one sixth part of eight right angles, and the angle G will be the same; therefore $A = G$; in like manner $B = H$, $C = I$, &c., and as the figures are equilateral, $AB : GH = BC : HI = CD : IK$, &c., therefore (2, Def. 4) the figures are similar. Draw AO, BO, GP, HP to the centres of the circles; then, because the angle AOB is the same part of four right angles that the arch AB is of the whole circumference, and the angle GPH the same part of four right angles that GH is of the whole circumference (13, 2), the angles AOB, GPH are each the same part of four right angles; therefore they are equal; the isosceles triangles AOB, GPH are therefore similar (22, 4), and consequently $AB : GH = AO : GP$; therefore (9 and 27, 4) polygon ABCDEF : polygon $GHIKLM = AO^2 : GP^2$.

Prop. II. Theorem.—A circle being given, two similar polygons may be found, the one inscribed in the circle, and the other described about it, which shall differ from each other by a space less than any given space.

Let AG be the side of a square equal to the given space; and let ABG be such an arch of the given circle, that AG is its chord. Bisect the fourth part of the circumference (5, 5), then bisect one of its halves, and proceed in this manner till, by repeated bisections, there will at length be found an arch AB less than AG. As the arch thus found will be contained in the circumference a certain number of times exactly, its chord AB is the side of a regular figure inscribed in the circle; apply lines in the circle, each equal to AB, thus forming the regular figure ABC, &c., and describe a regular figure DEF, &c. of the same number of sides about the circle. Then the excess of the circumscribed figure above the inscribed figure shall be less than the square upon AG. For draw lines from D and E to O the centre, these lines will pass through A and B (24, 5); also, a line drawn from O, to H the point of contact of the line DE, will bisect AB, and be perpendicular to it; and AB will be parallel to DE. Draw the diameter AL, and join BL, which will be parallel to HO (18, 4). Put P for the circumscribed polygon, and *p* for the inscribed polygon; then, because the triangles ODH, OAK are evidently like parts of P and *p*, $P : p = ODH : OAK$ (1, 3); but the triangles ODH, OAK being similar, $ODH : OAK = OH^2 : OK^2$ (25, 4); and on account of the similar triangles OAK, LAB, OA^2, or $OH^2 : OK^2 = LA^2 : LB^2$ (20, and 9, 4); therefore $P : p = LA^2 : LB^2$, and by division and inversion, $P : P - p = LA^2 : LA^2 - LB^2$, or AB^2; but LA^2, that is, the square described about the circle, is greater than the equilateral polygon of eight sides described about the circle, because it contains that polygon, and for the same reason the polygon of eight sides is greater than the polygon of sixteen sides, and so on; therefore $LA^2 > P$, and as it has been proved that $P : P - p = LA^2 : AB^2$, of which proportion the first term P is less than the third LA^2; therefore (2, 3) the second $P - p$ is less than the fourth AB^2; but $AB^2 \angle AG^2$, therefore $P - p \angle AG^2$.

Fig. 121.



Cor. 1. Because the polygons P and *p* differ from one another more than either of them differs from the circle, the difference between each of them, and the circle, is less than the given space, viz. the square of AG. And therefore, however small any space may be, a polygon may be inscribed in the circle, and another described about it, each of which shall differ from the circle by less than the given space.

Cor. 2. A space which is greater than any polygon that can be inscribed in a circle, but which is less than any polygon that can be described about it, is equal to the circle itself.

Prop. III. Theorem.—The area of any circle is equal to a rectangle contained by the radius, and a straight line equal to half the circumference. (Fig. 121.)

Let ABC, &c. be any equilateral polygon inscribed in the circle, and DEF, &c. a similar polygon described about it; draw lines from the extremities of AB and DE, a side of each polygon, to O the centre; and let OKH be perpendicular to these sides. Put P for the perimeter of

Lines and Figures upon a Plane.

the polygon DEF, &c. and p for the perimeter of the polygon ABC, &c. and n for the number of the sides of each. Then, because $n \times \frac{1}{2}\text{DE} = \frac{1}{2}\text{P}$, $n \times \frac{1}{2}\text{DE} \times \text{OH} = \frac{1}{2}\text{P} \times \text{OH}$, but $n \times \frac{1}{2}\text{DE} \times \text{OH} = n \times$ triangle DOE = polygon DEF, &c.; therefore, $\frac{1}{2}\text{P} \times \text{OH} =$ polygon DEF, &c.; and in like manner it appears that $\frac{1}{2}p \times \text{OK}$ = polygon ABC, &c. Now let Q denote the circumference of the circle, then, because $\frac{1}{2}\text{Q} > \frac{1}{2}p$, and $\text{OH} > \text{OK}$, therefore $\frac{1}{2}\text{Q} \times \text{OH} > \frac{1}{2}p \times \text{OK}$, that is, $\frac{1}{2}\text{Q} \times \text{OH}$ is greater than the inscribed polygon. Again, because $\frac{1}{2}\text{Q} < \frac{1}{2}\text{P}$ (Axiom), therefore $\frac{1}{2}\text{Q} \times \text{OH} \angle \frac{1}{2}\text{P} \times \text{OH}$, that is, $\frac{1}{2}\text{Q} \times \text{OH}$ is less than the circumscribed polygon. Thus it appears that $\frac{1}{2}\text{Q} \times \text{OH}$ is greater than any polygon inscribed in the circle, but less than any polygon described about it; therefore, $\frac{1}{2}\text{Q} \times \text{OH}$ is equal to the circle (2 Cor. to 2).

PROP. IV. THEOREM.—The areas of circles are to one another as the squares of their radii. (Fig. 120, 122).

Let ABCDEF and GHIKLM be equilateral polygons of the same number of sides inscribed in the circles, and OA, PG their radii; and let Q be such a space, that $\text{AO}^2 : \text{GP}^2 =$ circle ABE : Q; then, because $\text{AO}^2 : \text{GP}^2 =$ polygon ABCDEF : polygon GHIKLM, and $\text{AO}^2 : \text{GP}^2 =$ circle ABE : Q, therefore polygon ABCDEF : polygon GHIKLM = circle ABE : Q; but circle ABE $>$ polygon ABCDEF, therefore Q $>$ polygon GHIKLM: that is, Q is greater than any polygon inscribed in the circle GHL. In the same manner it is demonstrated that Q is less than any polygon described about the circle GHL; therefore Q is equal to the circle GHL (2). And because $\text{AO}^2 : \text{GP}^2 =$ circle ABE : Q, therefore $\text{AO}^2 : \text{GP}^2 =$ circle ABE : circle GHL.

Fig. 122.

COR. 1. The circumferences of circles are to one another as their radii. Put M for the circumference of the circle ABE and N for the circumference of GKL; then, circle ABE : circle GHL $= \text{AO}^2 : \text{GP}^2$; but $\frac{1}{2}\text{M} \times \text{AO}$ = circle ABE, also $\frac{1}{2}\text{N} \times \text{GP} =$ circle GHL (3), therefore $\frac{1}{2}\text{M} \times \text{AO} : \frac{1}{2}\text{N} \times \text{GP} = \text{AO}^2 : \text{GP}^2$, and by alternation $\frac{1}{2}\text{M} \times \text{AO} : \text{AO}^2 = \frac{1}{2}\text{N} \times \text{GP} : \text{GP}^2$, therefore (3, 4), $\frac{1}{2}\text{M} : \text{AO} = \frac{1}{2}\text{N} : \text{GP}$; and again, by alternation, $\frac{1}{2}\text{M} : \frac{1}{2}\text{N} = \text{AO} : \text{GP}$, therefore $\text{M} : \text{N} = \text{AO} : \text{GP}$.

COR. 2. A circle described with the hypothenuse of a right-angled triangle as a radius, is equal to two circles described with the other two sides as radii. Let the sides of the triangle be a, b and the hypothenuse h, and let the circles described with these lines as radii be A, B, and H.

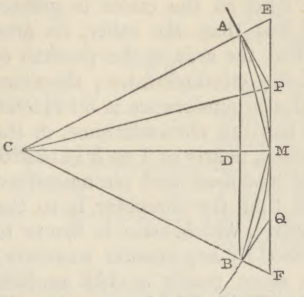
Because $\text{A} : \text{H} = a^2 : h^2$
and $\text{B} : \text{H} = b^2 : h^2$,
therefore $\text{A} + \text{B} : \text{H} = a^2 + b^2 : h^2$ (10, 3);
but $a^2 + b^2 = h^2$ (13, 4), therefore $\text{A} + \text{B} = \text{H}$.

PROP. V. PROBLEM.—Having given the area of a regular polygon inscribed in a circle, and also the area of a similar polygon described about it; to find the areas of regular inscribed and circumscribed polygons, each of double the number of sides.

Let AB be the side of the given inscribed polygon, and EF parallel to AB that of the similar circumscribed polygon, and C the centre of the circle; if the chord AM, and the tangents AP, BQ be drawn, the chord AM shall be the side of the inscribed polygon of double the number of sides; and PQ or 2PM that of the similar circumscribed polygon. Put A for the area of the polygon, of which AB is a side, and B for the area of the circumscribed polygon; also a for the area of the polygon of which AM is a side, and b for the area of the similar circumscribed polygon; then A and B are by hypothesis known, and it is required to find a and b.

Lines and Figures upon a Plane.

Fig. 123.



I. The triangles ACD, ACM, which have a common vertex A, are to one another as their bases CD, CM; besides, these triangles are to one another as the polygons, of which they form like parts, therefore $\text{A} : a = \text{CD} : \text{CM}$. The triangles CAM, CME, which have a common vertex M, are to each other as their bases CA, CE; they are also to one another as the polygons a and B, of which they are like parts; therefore, $a : \text{B} = \text{CA} : \text{CE}$; but because of the parallels DA, ME, $\text{CD} : \text{CM} = \text{CA} : \text{CE}$; therefore, $\text{A} : a = a : \text{B}$; therefore the polygon a, which is one of the two required, is a mean proportional between the two known polygons A and B, so that $a = \sqrt{\text{A} \times \text{B}}$.

II. The triangles CPM, CPE, having the same altitude CM, are to one another as PM to PE. But as CP bisects the angle MCE, $\text{PM} : \text{PE} = \text{CM} : \text{CE}$ (19, 4) $= \text{CD} : \text{CA} = \text{A} : a$; therefore $\text{CPM} : \text{CPE} = \text{A} : a$; and consequently $\text{CPM} + \text{CPE}$, or $\text{CME} : \text{CPM} = \text{A} + a : \text{A}$, and $\text{CME} : 2\text{CPM} = \text{A} + a : 2\text{A}$; but CME and 2CPM, or CMPA, are to one another as the polygons B and b, of which they are like parts; therefore $\text{A} + a : 2\text{A} = \text{B} : b$. Now the polygon a has been already found, therefore by this last proportion the polygon b is determined; that is,

$$b = \frac{2\text{A} \times \text{B}}{\text{A} + a}.$$

PROP. VI. PROBLEM.—To find nearly the ratio of the circumference of a circle to its diameter.

Let the radius of the circle = 1, then the sides of the inscribed square being the hypothenuse of a right-angled triangle of which the radii are the sides (see fig. 115), the area of the inscribed square will be 2 (13, 4), and the circumscribed square, being the square of the diameter, will be 4. Now, retaining the notation of last problem, if we make $\text{A} = 2$, and $\text{B} = 4$, the formulæ $a = \sqrt{\text{A} \times \text{B}}$, $b = \frac{2\text{A} \times \text{B}}{\text{A} + a}$ give us $a = 2{\cdot}8284271$, &c. the area of the inscribed octagon, and $b = 3{\cdot}31337085$, &c. the area of the circumscribed octagon. By substituting these numbers in the formula, instead of A and B, we shall obtain the areas of the inscribed and circumscribing polygons of 16 sides; and thence we may find those of 32 sides, and so on, as in the following table:

No. of Sides.	Ins. Polygons.	Circ. Polygons.
4	2·0000000	4·0000000
8	2·8284271	3·3137085
16	3·0614674	3·1825979
32	3·1214451	3·1517249
64	3·1365485	3·1441184
128	3·1403311	3·1422236
256	3·1412772	3·1417504
512	3·1415138	3·1416321
1024	3·1415729	3·1416025
2048	3·1415877	3·1415951
4096	3·1415914	3·1415133
8192	3·1415923	3·1415928
16384	3·1415925	3·1415927
32768	3·1415926	3·1415926

Hence it appears that the area of a regular polygon of 32768 sides inscribed in the circle, and of a similar polygon described about it, differ so little from each other that the numbers which express them are the same as far as the eighth decimal place. And as the circle is greater than the one polygon, and less than the other, its area will be nearly 3·1415926. But the area is the product of the radius and the half of the circumference; therefore the radius being unity, half the circumference is 3·1415926 nearly; and the radius is to half the circumference, or the diameter is to the circumference, nearly as 1 to 3·1415926.

Archimedes, by means of inscribed and circumscribed polygons of 96 sides, found that the diameter is to the circumference as 7 to 22 nearly, which ratio is nearer to the truth than can be expressed by any smaller numbers; and Metius found it to be more nearly as 113 to 355. Both of these expressions are convenient on account of the smallness of the numbers, but later mathematicians have carried the approximation to a much greater degree of accuracy. Dr Rutherford has lately calculated the ratio of the circumference of a circle to its diameter to the extent of 208 places of decimals, which is 58 places farther than it had been previously carried. The result is contained in a paper which was published in the Transactions of the Royal Society, and is as follows: $\pi=3·14159265358979$ 323846264338327950288419716939937510582097494459 230781640628620899862803482524211706798214808651 328230664709384460955058223172535940812848473781 392038633830215747399600825931259129401832806517 44, &c. The formula by which the above was calculated is $\frac{\pi}{4}=4\tan^{-1}\frac{1}{5}-\tan^{-1}\frac{1}{70}+\tan^{-1}\frac{1}{99}$.

PART II.—GEOMETRY OF SOLIDS.

SECT. I.—OF PLANES AND SOLID ANGLES.

DEFINITIONS.

I. A straight line is *perpendicular*, or at right angles, to a plane, when it is perpendicular to every straight line which it meets in that plane. The plane is also perpendicular to the line.

II. A line is *parallel* to a plane when they cannot meet each other, although both be produced. The plane is also parallel to the line.

III. Parallel planes are such as cannot meet each other, though produced.

IV. It will be demonstrated (Theor. 3) that the common section of two planes is a straight line; this being premised, the *inclination* of two planes is the angle contained by two straight lines drawn perpendicular to the line which is their common section, from any point in it, the one perpendicular being drawn in the one plane, and the other in the other plane.

This angle may be either acute or obtuse.

V. If it be a right angle, the two planes are perpendicular to each other.

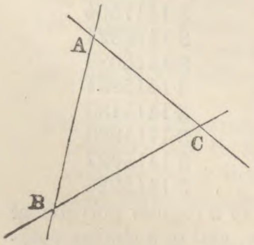
VI. A *solid angle* is that which is made by the meeting of more than two plane angles, which are not in the same plane, in one point. Thus the solid angle V is formed by the plane angles AVB, BVC, CVD, DVA. (Fig. 133.)

THEOREM I.—One part of a straight line cannot be in a plane and another part above it.

For from the definition of a plane (Sect. 1, Part 1), it is manifest, that if a straight line coincide with a plane in two points, it must be wholly in the plane.

THEOREM II.—Two straight lines which cut each other in a plane determine its position; that is, the plane can coincide with these lines only in one position.

Fig. 124.

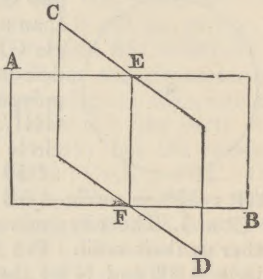


Let the straight lines AB, AC cut each other in A; conceive a plane to pass through AB, and to be turned about that line, till it pass through the point C; and this it can manifestly do only in one position; then, as the points A and C are in the plane, the whole line AC must be in the plane; therefore there is only one position in which the plane can coincide with the same two lines AB, AC.

COR. Therefore a triangle ABC, or three points A, B C, not in a straight line, determine the position of plane.

THEOREM III.—If two planes AB, CD intersect each other; their intersection is a straight line.

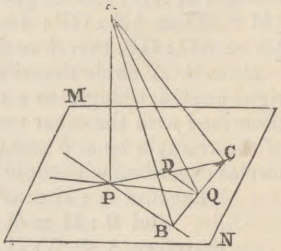
Fig. 125.



Let E and F be two points in the line of common section, and let a straight line EF be drawn between them; then the line EF must be in the plane AB (Def. 1), and the same line must also be in the plane CD; therefore it must be the common section of them both.

THEOREM IV.—If a straight line AP be perpendicular to two straight lines PB, PC at P, the point of their intersection; it will also be perpendicular to the plane MN, in which these lines are.

Fig. 126.



Draw any other line PQ in the plane MN, and from Q, any point in that line, draw QD parallel to PB; make DC = DP; join CQ, meeting PB in B; and join AB, AQ, AC. Because DQ is parallel to PB, and PD = DC; therefore BQ = QC, and BC is bisected in Q. Hence in the triangle BAC,

$$AB^2+AC^2=2AQ^2+2BQ^2\ (16,4),$$

and in the like manner, in the triangle PBC,

$$PB^2+PC^2=2PQ^2+2CQ^2;$$

therefore, taking equal quantities from equal quantities, that is, subtracting the two last quantities, which are put equal to each other, from the two first, and observing, that as APB, APC are by hypothesis right-angled triangles, $AB^2-BP^2=AP^2$, and $AC^2-CP^2=AP^2$, we have

$$AP^2+AP^2=2AQ^2-2PQ^2,$$

and therefore $AP^2=AQ^2-PQ^2$, or $AP^2+PQ^2=AQ^2$; therefore the triangle APQ is right-angled at P (Schol. 15, 4, Part 1), and consequently AP is perpendicular to the plane MN (Def. 1).

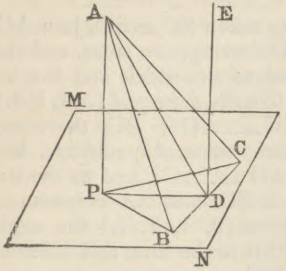
Cor. 1. The perpendicular AP is shorter than any oblique line AQ, therefore it measures the distance of the point A from the plane.

Cor. 2. From the same point P in a plane no more than one perpendicular can be drawn. For if it be possible that there can be two perpendiculars, conceive a plane to pass through them, and to intersect the plane MN in the straight line PQ; then these perpendiculars will be in the same plane, and both perpendicular to the same line PQ, at the same point P in that line, which is impossible.

It is also impossible that from a point without a plane two perpendiculars can be drawn to the plane; for if the straight lines AP, AQ could be two such perpendiculars, then the triangle APQ would have two right angles, which is impossible.

Theorem V.—If a straight line AP be perpendicular to a plane MN, every straight line DE parallel to AP is perpendicular to the same plane.

Fig. 127.



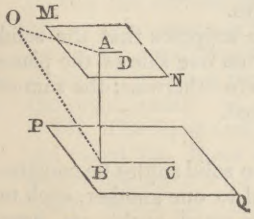
Let a plane pass through the parallel lines AP, DE, and intersect the plane MN in the line PD; through D draw BC at right angles to PD; take DC = DB, and join PB, PC, AB, AC, AD. Because DB = DC, therefore PB = PC (Cor. 5, 1, Part I.); and because AP is perpendicular to the plane MN, so that APB, APC are right angles, AB = AC, therefore ABC is an isosceles triangle; and since its base BC is bisected at D, BC is perpendicular to AD (Schol. 11, 1, P. I.); but by construction BC is perpendicular to PD; therefore (4) BC or BD is perpendicular to the plane passing through the lines AD and PD, or AP and DE; hence BD is perpendicular to DE, but PD is also perpendicular to DE (19, 1, P. I.), therefore DE is perpendicular to the two lines DP, DB; and therefore it is perpendicular to the plane MN passing through them.

Cor. 1. Conversely, if the straight lines AP, DE be perpendicular to the same plane MN, they are parallel; for if not, through D draw a parallel to AP; this parallel will be perpendicular to the plane MN (by the theorem), therefore, from the same point D two perpendiculars may be drawn to a plane, which is impossible (4).

Cor. 2. Two straight lines A and B which are parallel to a third line C, though not in the same plane, are parallel to each other. For suppose a plane to be perpendicular to the line C, the lines A and B parallel to this perpendicular are perpendicular to the same plane; therefore, by the preceding corollary, they are parallel between themselves.

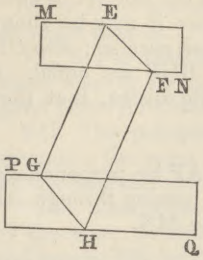
Theorem VI.—Two planes MN, PQ, perpendicular to the same straight line AB, are parallel to each other.

Fig. 128.



For, if they can meet each other, let O be a point common to both, and join OA, OB; then the line AB, which is perpendicular to the plane MN, must be perpendicular to AO, a line drawn in the plane MN from the point in which AB meets that plane. For the same reason AB is perpendicular to BO; therefore OA, OB are two perpendiculars drawn from the same point O, to the same straight line AB, which is impossible.

Fig. 129.



Theorem VII.—The intersections EF, GH of two parallel planes MN, PQ with a third plane FG, are parallel.

For if the lines EF, GH, situated in the same plane, are not parallel, they must meet if produced; therefore the planes MN, PQ, in which they are, must also meet, which is contrary to the hypothesis of their being parallel.

Theorem VIII.—Any straight line AB, perpendicular to MN one of two parallel planes MN, PQ, is also perpendicular to PQ the other plane. (Fig. 128.)

From B draw any straight line BC in the plane PQ, and let a plane pass through the lines AB, BC, and meet the plane MN in the line AD, then AD will be parallel to BC (7); and since AB is perpendicular to the plane MN, it must be perpendicular to the line AD, therefore it is also perpendicular to BC (19, 1, P. I.); hence (Def. 1) the line AB is perpendicular to the plane PQ.

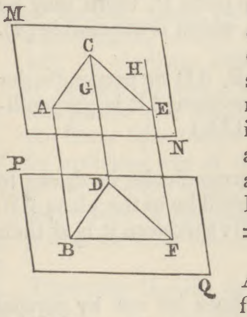
Theorem IX.—Parallel straight lines EG, FH, comprehended between two parallel planes MN, PQ, are equal. (Fig. 129.)

Let a plane pass through the lines EG, FH, and meet the parallel planes in EF and GH; then EF and GH are parallel (7) as well as EG and FH; therefore EGHF is a parallelogram, and EG = HF.

Cor. Hence two parallel planes are everywhere at the same distance from each other. For if EG and FH be perpendicular to the two planes, they are parallel (1 Cor. 5); therefore they are equal.

Theorem X.—If two straight lines CA, EA, meeting one another, be parallel to two other lines DB, FB, that meet one another, though not in the same plane with the first two; the first two and the other two shall contain equal angles, and the plane passing through the first two shall be parallel to the plane passing through the other two.

Fig. 130.



Take AC = BD, AE = BF, and join CE, DF, AB, CD, EF. Because AC is equal and parallel to BD, the figure ABDC is a parallelogram; therefore CD is equal and parallel to AB. For a similar reason EF is equal and parallel to AB; therefore also CE is equal and parallel to DF (Cor. 5, and 28, 1, P. I.); therefore the triangles CAE, DBF are equal (10, 1, P. I.), hence the angle CAE = DBF.

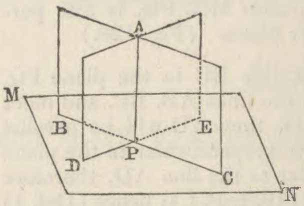
In the next place, the plane ACE is parallel to the plane BDF: for suppose that the plane parallel to BDF, passing through the point A, meets the lines CD, EF in any other points than C and E (for example in G and H), then (9) the three lines AB, GD, FH are equal; but the three lines AB, CD, EF have been shown to be equal; therefore CD = GD, and FH = EF, which is absurd, therefore the plane ACE is parallel to BDF.

Theorem XI.—If three straight lines AB, CD, EF, not situated in the same plane, are equal and parallel; the triangles ACE, BDF formed by joining the extremities of these lines are equal, and their planes parallel. (See fig. 130.)

For since AB is equal and parallel to CD, the figure ABDC is a parallelogram; therefore the side AC is equal and parallel to BD. In like manner it may be shown that the sides AE, BF are equal and parallel; also CE, DF; therefore the triangles CAE, BDF are equal. It may be demonstrated, as in last proposition, that their planes are parallel.

Theorem XII.—If a straight line AP be perpendicular to a plane MN; any plane APB, passing through AP, shall be perpendicular to the plane MN.

Fig. 131.



Let BC be the intersection of the planes AB, MN; if in the plane MN the line DE be drawn perpendicular to BP, the line AP, being perpendicular to the plane MN, shall be perpendicular to each of the straight lines BC, DE; therefore the angle APD is a right angle; now PA and PD are drawn in the planes AB, MN perpendicular to their common section, therefore (5 Def.) the planes AB, MN are perpendicular to each other.

Scholium. When three straight lines, such as AP, BP, DP, are perpendicular to each other, each is perpendicular to the plane of the two other lines.

Theorem XIII.—If the plane AB be perpendicular to the plane MN, and if in the plane AB a straight line PA be drawn perpendicular to BP, the common intersection of the planes; then shall PA be perpendicular to the plane MN. (Fig. 131.)

For, if in the plane MN, a line PD be drawn perpendicular to PB, the angle APD shall be a right angle, because the planes are perpendicular to each other; therefore the line AP is perpendicular to the two lines PB, PD, and therefore it is perpendicular to their plane MN.

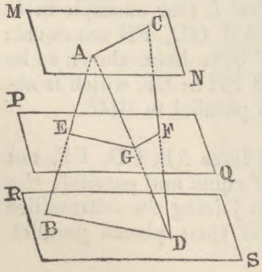
Cor. If the plane AB be perpendicular to the plane MN, and from any point P, in their common intersection, a perpendicular be drawn to the plane MN; this perpendicular shall be in the plane AB; for if it is not, a perpendicular AP may be drawn in the plane AB to the common intersection BP, which will be at the same time perpendicular to the plane MN; therefore, at the same point P, there may be two perpendiculars to a plane NM, which is impossible (4).

Theorem XIV.—If two planes AB, AD be perpendicular to a third; their common intersection AP is perpendicular to the third plane. (Fig. 131.)

For, if through the point P a perpendicular be drawn to the plane MN, this perpendicular shall be in the plane AB, and also in the plane AD (Cor. 12); therefore it is at their common intersection AP.

Theorem XV.—If two straight lines be cut by parallel planes; they shall be cut in the same ratio.

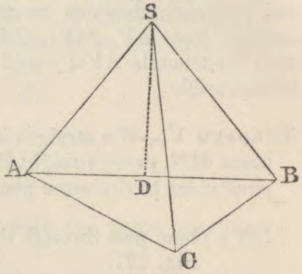
Fig. 132.



Let the line AB meet the planes MN, PQ, RS, in A, E, B; and let CD meet them in C, F, D, then shall AE : EB = CF : FD. For draw AD meeting the plane PQ in G, and join AC, EG, GF, BD; the lines EG, BD being the common sections of the plane of the triangle ABD and the parallel planes PQ, RS, they are parallel (7); and in like manner it appears, that AC, GF are parallel; therefore AE : EB (= AG : GD) = CF : FD.

Theorem XVI.—If a solid angle be contained by three plane angles; the sum of any two of these is greater than the third.

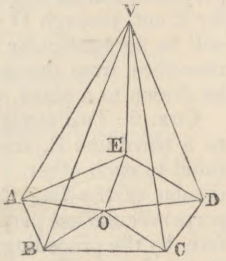
Fig. 133.



It is evidently only necessary to demonstrate the theorem, when the plane angle which is compared with the sum of the other two is greater than either of them; for, if it were equal to or less than one of them, the theorem would be manifest; therefore let S be a solid angle formed by three plane angles ASB, ASC, BSC, of which ASB is the greatest. In the plane ASB make the angle BSD = BSC; draw any straight line ADB, and having taken SC = SD, join AC, BC; the triangles BSC, BSD, having two sides, and the included angle of the one equal to two sides, and the included angle of the other, each to each, are equal (5, 1, P. I.), therefore BD = BC; now $AB \angle AC + BC$, therefore, taking BD from the first of these unequal quantities, and BC from the second, we get $AD \angle AC$; and as the triangles ASD, ASC have SD = SC, and SA common to both, and $AD \angle AC$, therefore (9, 1, P. I.) the angle $ASD \angle ASC$; and, adding DSB to the one, and CSB to the other, $ASB \angle ASC + BSC$.

Theorem XVII.—The sum of all the plane angles which form any solid angle is less than four right angles.

Fig. 134.



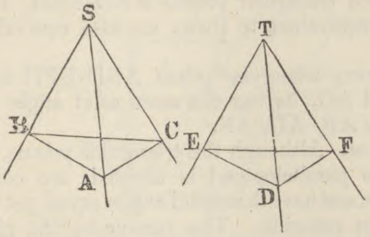
Let the solid angle V be cut by any plane ABCDE; from a point O taken in this plane, draw to all its angles the lines OA, OB, OC, OD, OE. The sum of all the angles of the triangles AVB, BVC, &c. formed about the vertex V is equivalent to the sum of the angles of a like number of triangles AOB, BOC, &c. formed about the point O. Now at B the angle ABC, which is the sum of OBA and OBC, is less than the sum of the angles VBA, VBC (16); in like manner at C, $OCB + OCD \angle VCB + VCD$, and so on with all the angles of the polygon ABCDE. Hence, in the triangles of which the common vertex is O, the sum of the angles at their bases is less than the sum of the angles at the bases of the triangles which have their vertex at V; therefore the sum of the angles about the point O is greater than the sum of the angles about the point V. But the sum of the angles about O is equal to four right angles, therefore the sum of the plane angles which form the solid angle about the vertex V is less than four right angles.

Scholium. This demonstration supposes that the solid angle is convex, or that it lies all on one side of the plane of any one of its faces. If it were otherwise, the sum of the solid angles would be unlimited.

Theorem XVIII.—If each of two solid angles be contained by three plane angles equal to one another, each to each; the planes in which the equal angles are, have the same inclination to one another.

Let the angle ASB = DTE, the angle ASC = DTF, and the angle BSC = ETF; the two planes ASB, ASC shall have to each other the same inclination as the two planes DTE, DTF.

Fig. 135.



Take A any point in SA, and in the two planes ASB, ASC draw AB and AC perpendiculars to AS, then (Def. 4) the angle BAC is the inclination of these planes; again, take TD = SA, and in the planes TDE, TDF draw DE and DF perpendiculars to TD, and the angle EDF shall be the inclination of these other planes; join BC, EF. The triangles ASB, DTE have the side AS=DT, the angle SAB = TDE and ASB = DTE, therefore the triangles are equal, and thus AB = DE, and SB = TE. In like manner it appears that the triangles ASC, DTF are equal, and therefore that AC = DF, and SC = TF. Now the triangles BSC, ETF, having BS = TE, SC = TF, and the angle BSC = ETF, are also equal, and therefore BC = EF; but it has been shown that AB = DE, and that AC = DF; therefore the triangles BAC, EDF are equal, and consequently the angle BAC = EDF; that is, the inclination of the planes ASB and ASC is equal to the inclination of the planes DTE and DTF. In the same manner it may be proved that the other planes have the same inclination to one another.

Scholium. If the three plane angles which contain the solid angles are equal, each to each; and if the angles are also *disposed in the same order* in the two solid angles, then these angles when applied to one another will coincide and be equal. But if the plane angles be *disposed in a contrary order*, the solid angles will not coincide, although the theorem is equally true in both cases. In this last case, the solid angles are called *Symmetrical angles*, and they must be accounted equal, because they are equal in every thing that determines their magnitude.

SECT. II.—OF SOLIDS BOUNDED BY PLANES.

Definitions.

I. A *Solid* is that which has length, breadth, and thickness.

II. A *Prism* is a solid contained by plane figures, of which two that are opposite are equal, similar, and parallel; and the others are parallelograms.

To construct this solid, let ABCDE be any polygon, fig. 136; if in a plane parallel to ABC there be drawn straight lines FG, GH, HI, &c. equal and parallel to the sides AB, BC, CD, &c. so as to form a polygon FGHIK equal to ABCDE, and straight lines AF, BG, CH, &c. be drawn, joining the vertices of the homologous angles in the two planes; the planes or faces ABGF, BCHG, &c. thus formed will be parallelograms; and the solid ABCDEFGHIK contained by these parallelograms and the two polygons is the prism itself.

III. The equal and parallel polygons ABCDE, FGHIK are called the *Bases* of the prism; and the distance between the bases is its *Altitude*.

IV. When the base of a prism is a parallelogram, and consequently the figure has all its faces parallelograms; it is called a *parallelopiped*. A parallelopiped is *rectangular*, when all its faces are rectangles.

V. A *Cube* is a rectangular parallelopiped contained by six equal squares.

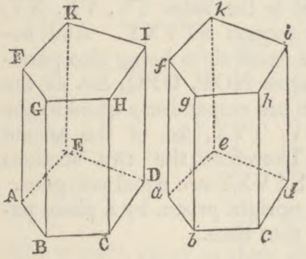
VI. A *Pyramid* is a solid contained by several planes, which meet in the same point V, and terminate in a polygonal plane ABCDE. Fig. 134.

VII. The polygon ABCDE is called the *Base* of the pyramid; the point V is its *Vertex*; and a perpendicular let fall from the vertex upon the base is called its *Altitude*.

VIII. Two solids are *similar* when they are contained by the same number of similar planes, similarly situated, and having like inclinations to one another.

Theorem I.—Two prisms are equal when the three planes which contain a solid angle of the one are equal to the three planes which contain a solid angle of the other, each to each, and are similarly situated.

Fig. 136.



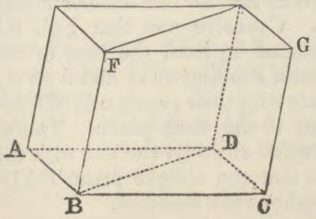
Let the base ABCDE be equal to the base *abcde*, the parallelogram ABGF equal to the parallelogram *abgf*, and the parallelogram BCHG equal to the parallelogram *bchg*; the prism ABCI shall be equal to the prism *abci*.

For let the base ABCDE be applied to its equal the base *abcde*, so that they may coincide with each other; then, because the three plane angles which form the solid angle B are equal to the three plane angles which form the angle *b*, each to each, viz. ABC = *abc*, ABG = *abg*, and GBC = *gbc*, and because these angles are similarly situated, the solid angles B and *b* are equal (15, 1), therefore the side BG shall fall upon the side *bg*; and because the parallelograms ABGF, *abgf* are equal, the side FG shall fall upon its equal *fg*; in like manner it may be shown that GH falls upon *gh*, therefore the upper base FGHIK coincides entirely with its equal *fghik*, and the two solids coincide with each other, or occupy the same space, therefore the prisms are equal.

Cor. Two right prisms which have equal bases and equal altitudes are equal to one another. If the equal angles of the lower bases follow each other in the same order, then the three planes which contain each solid angle of the one prism will be respectively equal to the three planes which contain a solid angle of the other prism, and will be similarly situated; and when the one solid angle is applied to the other, these planes will coincide, and the prisms will exactly coincide. If the equal angles of the lower base follow each other in a contrary order, then, by inverting one of the prisms, so that its upper may become its lower base, the angles of the two bases will follow each other in the same order; so that in either case the prisms coincide and are equal.

Theorem II.—In any parallelopiped, the opposite planes are equal and parallel.

Fig. 137.



From the nature of the solid (4 Def.), the bases ABCD, EFGH are equal parallelograms, and their sides are parallel; therefore the planes AC, EG are parallel; and because AD is equal and parallel to BC, and AE is equal and parallel to BF, the angle DAE = CBF, and the plane DAE is parallel to the plane CBF (10, 1); therefore also the parallelogram DAEH is equal to the parallelogram CBFG. It may in like manner be demonstrated that the opposite parallelograms ABFE, DCGH are equal and parallel.

Cor. Any two opposite faces of a parallelopiped may be taken for its bases.

Theorem III.—In every prism ABCDE-FGHIK, the sections NOPQR, STVXY, made by parallel planes, are equal polygons.

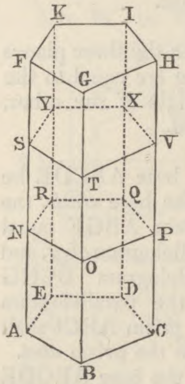


Fig. 138.

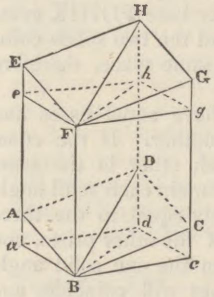
Because the parallel planes NOPQR, STVXY are cut by a third plane NOST; the sections NO, ST are parallel; and these lines are included between the parallels NS, OT, which are sides of the prism; therefore NO is equal to ST. For a like reason the sides OP, PQ, QR, &c. of the section NOPQR are respectively equal to the sides TV, VX, XY, &c. of the section STVXY. And besides, these equal sides being also parallel, the angles NOP, OPQ, &c. of the first section are respectively equal to the angles STV, TVX, &c. of the second section. Therefore the two sections NOPQR, STVXY are equal polygons.

Cor. Every section of an upright prism, by a plane parallel to the base, is equal to that base.

Theorem IV.—If a parallelopiped AG be cut by a plane passing through BD, FH, the diagonals of two of the opposite planes; it will be cut into two equivalent prisms ABDHEF, GHFBCD equal to one another.

Through B and F, the extremities of one of the sides, draw the planes B*adc*, F*ehg*, perpendicular to BF, to meet the three other sides of the solid in *a*, *d*, *c*, and in *e*, *h*, *g*. These sections are equal (3), because the planes are perpendicular to FB, and therefore parallel. They are also parallelograms (7, 1), because *a*B, *dc*, the opposite sides of the same section, are the intersections of two parallel planes ABFE, DCGH by the same plane. For a like reason, the figure B*ae*F is a parallelogram, as also the other lateral faces BFGC, *cdhg*, *adhe* of the solid B*adc*-F*ehg*. Therefore this solid is a prism (Def. 2), and it is a right prism, because BF is perpendicular to the plane of the base.

Fig. 139.



From the constitution of the figure, the right prism B*h* is divided into two right triangular prisms *a*B*d*-*e*F*h*, *c*B*d*-*g*F*h*, and it is now to be proved that the oblique triangular prism ABCD-EFGH is equal to the right triangular prism *a*B*d*-*e*F*h*. Since these two prisms have a common part ABD-*efh*, it is only necessary to prove that the remainders, viz. the solids B*a*AD*d*, F*e*FH*h* are equivalent to each other.

Because BAEF, B*ae*F are parallelograms, therefore AE = BF = *ae*; hence A*a* = E*e*. In like manner it may be proved that D*d* = H*h*. Conceive now that F*eh*, the base of the solid F*eh*, is placed on B*ad*, the base of the solid B*a*AD*d*; then, the point *e* falling on *a*, and *h* on *d*; the lines *e*E, *h*H will coincide with their equals *a*A, *d*D, because they are perpendicular to the same plane. Therefore, the two solids will coincide entirely, the one with the other; and hence it follows that the oblique prism BAD-FEH is equivalent to the right prism B*ad*-F*eh*.

In the same manner it may be demonstrated that the oblique prism BCD-FGH is equal to the right prism B*cd*-F*gh*. But the two prisms are equal (Cor. to 1), since they have the same altitude, BF and their bases are equal, they being halves of the same parallelogram; therefore the two triangular prisms BAD-FEH, BCD-FGH, which are equivalent to them, are also equivalent to each other.

Cor. Every triangular prism ABD-EFH is half a parallelopiped AG, having the same solid angle A with the same edges AB, AD, AE.

Scholium. Although the triangular prisms, into which the oblique parallelopiped is divided, are contained by equal planes, and have their solid angles equal, yet they cannot be made to coincide. The reason is, the plane angles about the corresponding solid angles are not placed in the same order. These solid angles are therefore symmetrical, and cannot be brought to coincide (18, 1). Two prisms, or two solids of any kind so constituted, are called *symmetrical solids.* An exact notion of their relation to each other may be acquired, by considering that any object, and its image reflected from a plane mirror, are symmetrical figures. They resemble each other exactly; but every part is placed in a reverse order; thus, the reflected image of a right hand is a left hand.

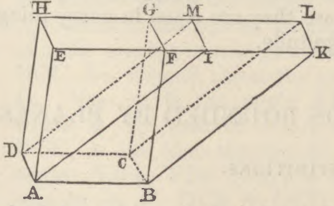
In symmetrical solids every circumstance on which the magnitude of each depends is the very same in both; hence it might be assumed, as an axiom in the geometry of solids, that they are equivalent.

Theorem V.—If two parallelopipeds AG, AL have a common base ABCD, and have their upper bases EFGH, IKLM in the same plane, and between the same parallels EK, HL; the two parallelopipeds are equivalent to each other.

There may be three cases, according as EI is greater or smaller than EF, or equal to it; but the demonstration is the same for them all. In the first place we shall prove that the triangular prism AEI-DHM is equal to the triangular prism BFK-CGL.

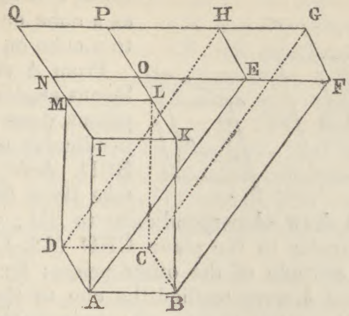
Since AE is parallel to BF, and HE to GF, the angle AEI = BFK, HEI = GFK, and HEA = GFB. Of these six angles, the three first form the solid angle E, and the three others form the solid angle F; therefore, since the plane angles are equal each to each, and similarly situated, the solid angles E and F are equal. Now, if the prism AEI-DHM be applied to the prism BFK-CGL, so that their bases AEI, BFK, which are equal, may coincide with each other; then, because the solid angle E is equal to the solid angle F, the side EH shall fall upon FG, and this is all that is necessary to prove that the two prisms coincide entirely; for the base AEI and the edge EH determine the prism AEM, and the base BFK and the edge FG determine the prism BFL (1); therefore the prisms are equal. Now, if from the solid AEL, the prism AEM be taken away, there will remain the parallelopiped AIL; and if from the same solid AEL, the prism BFL be taken away, there will remain the parallelopiped AEG; therefore the parallelopipeds AIL, AEG are equivalent to each other.

Fig. 140.



Theorem VI.—Two parallelopipeds upon the same base, and having the same altitude, are equivalent to one another.

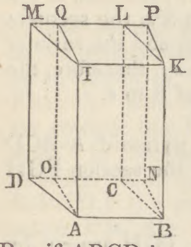
Fig. 141.



Let ABCD be the common base of the two parallelopipeds AG, AL, which, because they have the same altitude, will have their upper bases in the same plane. Then, because EF and AB are equal and parallel, as also IK and AB, EF is equal and parallel to IK (Cor. 2, 5, 1); for a similar reason GF is equal and parallel to LK. Let the sides EF, HG, as also the sides LK, IM, be produced, so as to form by their intersections the parallelogram NOPQ; it is manifest that this parallelogram is equal to each of the bases EFGH, IKLM. Now, if we suppose a third parallelopiped, which, with the same lower base ABCD, has for its upper base NOPQ, this third parallelopiped will be equivalent to the parallelopiped AG (4); for the same reason the third parallelopiped will be equivalent to the parallelopiped AL · therefore the two parallelopipeds AG, AL, which have the same base and the same altitude, are equivalent to one another.

Theorem VII.—Any parallelopiped may be changed into a rectangular parallelopiped having the same altitude, and an equivalent base. (Fig. 141 and 142.)

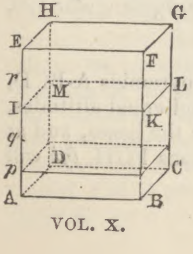
Fig. 142.



At the points A, B, C, D (fig. 141) let AI, BK, CL, DM, be drawn perpendicular to the plane ABCD, and terminating in the plane of the upper base; then, IK, KL, LM, MI, being joined, a parallelopiped AL will thus be formed, which will manifestly have its lateral faces AK, BL, CM, DI rectangles; and if the base AC be a rectangle, the solid AL will be a rectangular parallelopiped equivalent to the parallelopiped AG. But if ABCD be not a rectangle (fig. 142), draw AO and BN perpendicular to CD, and OQ and NP perpendicular to DC, meeting ML in Q and P; the solid ABNOIKPQ will manifestly be a rectangular parallelopiped, which will be equal to the parallelopiped AL; for they have the same base ABKI, and the same altitude, viz. AO; therefore the rectangular parallelopiped AP is equivalent to the parallelopiped AG (fig. 141), and they have the same altitude, and the base ABNO of the former is equivalent to the base ABCD of the latter.

Theorem VIII.—Two rectangular parallelopipeds AG, AL, which have the same base ABCD, are to each other as their altitudes AE, AI.

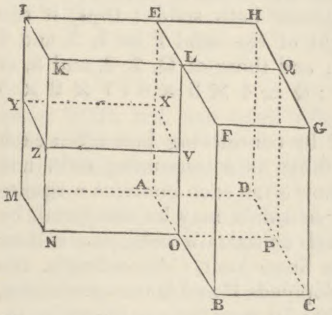
Fig. 143.



Suppose that the altitudes AE, AI are to each other as the numbers m and n, so that AE contains m such equal parts pq, &c. as AI contains n. Let AE and AI be divided into m and n equal parts respectively, and let planes pass through the points of division parallel to the base ABCD; thus the parallelopiped AG will be divided into m solids, which will also be parallelopipeds having equal bases (3) and equal altitudes, therefore they will be equal among themselves; and in like manner the parallelopiped AL will be divided into n equal solids; and as each of the solids in AG is equal to each of the solids in AL, the parallelopiped AG will contain m such equal parts as the parallelopiped AL contains n; therefore the parallelopiped AG will be to the parallelopiped AL as the number m to the number n, that is, as AE the altitude of the former to AI the altitude of the latter.

Theorem IX.—Two rectangular parallelopipeds AG, AK, which have the same altitude AE, are to each other as their bases ABCD, AMNO.

Fig. 144.



Let the two solids be placed, the one by the side of the other, as represented in the figure, and let the plane ONKI, be produced, so as to meet the plane DCGH in PQ, thus forming a third parallelopiped AQ, which may be compared with each of the parallelopipeds AG, AK. The two solids AG, AQ, having the same base ADHE, are to each other as their altitudes AB, AO (8); and, in like manner, the two solids AQ, AK having the same base AOLE, are to each other as their altitudes AD, AM; that is,

$$\text{solid AG} : \text{sol. AQ} = \text{AB} : \text{AO},$$
$$\text{sol. AQ} : \text{sol. AK} = \text{AD} : \text{AM};$$
but $\text{AB} : \text{AO} = \text{base AC} : \text{base AP}$ (3, 4, Part 1.)
and $\text{AD} : \text{AM} = \text{base AP} : \text{base AN}$,
therefore,
$$\text{sol. AG} : \text{sol. AQ} = \text{base AC} : \text{base AP},$$
$$\text{sol. AQ} : \text{sol. AK} = \text{base AP} : \text{base AN},$$
therefore, *ex æquo*,
$$\text{sol. AG} : \text{sol. AK} = \text{base AC} : \text{base AN}.$$

Theorem X.—Two rectangular parallelopipeds are to each other as the products of numbers proportional to their bases and altitudes, or as the products of the numbers which express their three dimensions. (Fig. 144.)

Let AG be a parallelopiped, the three dimensions of which are expressed by the lines AB, AD, AE, and AZ another parallelopiped the dimensions of which are expressed by the lines AO, AM, AX. Let the two solids AG, AZ be so placed, that their surfaces may have a common angle BAE; produce such of the planes as are necessary, so as to form a third parallelopiped AK, having the same altitude as the parallelopiped AG. By the last proposition,

$$\text{sol. AG} : \text{sol. AK} = \text{base AC} : \text{base AN},$$
and by the last theorem but one,
$$\text{sol. AK} : \text{sol. AZ} = \text{AE} : \text{AX};$$
but, considering the bases AC, AN as measured by numbers, as also the altitudes AE, AX, by 1 of Sect. III. Part I.
$$\text{base AC} : \text{base AN} = \text{AE} \times \text{base AC} : \text{AE} \times \text{base AN},$$
and $\text{AE} : \text{AX} = \text{AE} \times \text{base AN} : \text{AX} \times \text{base AN}$,
therefore,
$$\text{sol. AG} : \text{sol. AK} = \text{AE} \times \text{base AC} : \text{AE} \times \text{base AN},$$
$$\text{sol. AK} : \text{sol. AZ} = \text{AE} \times \text{base AN} : \text{AX} \times \text{base AN},$$
therefore, *ex æquo*,
$$\text{sol. AG} : \text{sol. AZ} = \text{AE} \times \text{base AC} : \text{AX} \times \text{base AN};$$
which proportion, by substituting for the bases AC, AN

their numerical values AB × AD and AO × AM, becomes sol. AG : sol. AZ = AB × AD × AE : AO × AM × AX.

Scholium. Hence it appears that the product of the base of a rectangular parallelopiped by its altitude, or the product of its three dimensions, may be taken as its numerical measure; and it is upon this principle that all other solids are estimated. When two parallelopipeds are compared by means of their bases and altitudes, their bases must be considered as measured by the same superficial unit, and their altitudes by the same linear unit; thus, if P and Q denote two parallelopipeds, and the base of P contain three such equal spaces as that of Q contains four; and the altitude of P contains two such equal lines as that of Q contains five, then P : Q = 3 × 2 : 4 × 5 = 6 : 20.

If all the dimensions of each solid be used in comparing them, then, the same linear unit must be employed in estimating all the dimensions of both solids; thus, if the length, breadth, and height of the solid P be 4, 3, and 6 linear units, respectively; and those of Q, 7, 2, and 5, of the same units; then P : Q = 4 × 3 × 6 : 7 × 2 × 5 = 72 : 70.

As lines are compared by considering how often each contains some other line taken as a measuring unit, and surfaces, by considering how often each contains a square whose side is that unit; so solids may be compared, by considering how often each contains a cube, the side or edge of which is the same linear unit. Accordingly, the dimensions of the parallelopipeds P and Q being as above, the proportion P : Q = 72 : 70 may be considered as indicating that P contains 72 such equal cubes as Q contains 70.

The magnitude of a solid, its bulk, or its extension, constitutes its *solidity*, or its *content;* thus, we say, that the solidity or the content of a rectangular parallelopiped is equal to the product of its base by its altitude, or to the product of its three dimensions.

Theorem XI.—The solidity of any parallelopiped, or in general of any prism, is equal to the product of its base by its altitude.

1. Any parallelopiped is equivalent to a rectangular parallelopiped of the same altitude, and an equivalent base (7); and it has been shown that the solidity of such a parallelopiped is equal to the product of its base by its altitude.

2. Every triangular prism is the half of a parallelopiped of the same altitude, but having its base double that of the prism (3); therefore the solidity of the prism is half that of the parallelopiped, or it is half the product of the base of the parallelopiped by its altitude, that is, it is equal to the product of the base of the prism by its altitude.

3. Any other prism may be divided into as many triangular prisms as there can be triangles in the polygon which forms its base; but the solidity of each prism is equal to the product of its base by their common altitude; therefore the solidity of the whole prism is equal to the product of the sum of all their bases by the common altitude, or it is equal to the product of the base of the prism, which is the sum of them all, by its altitude.

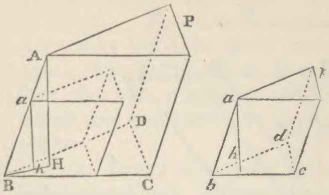
Cor. Two prisms having the same altitude are to each other as their bases; and two prisms having the same base are to each other as their altitudes.

Note. The cube of a line AB is expressed thus; AB × AB × AB, but more commonly by AB^3.

Theorem XII.—Similar prisms are to one another as the cubes of their homologous sides.

Let P and *p* be two prisms, of which BC, *bc* are the homologous sides; the prism P is to the prism *p* as a cube on the line BC to a cube on *bc*.

Fig. 145.



From A and *a*, homologous angles of the two prisms, draw AH, *ah* perpendicular to their bases BCD, *bcd*. Join BH; take B*a* = *ba*, and in the plane BHA draw *ah* perpendicular to BH; then *ah* shall be perpendicular to the plane CBD (13, 1), and equal to *ah*, the altitude of the other prism; for if the solid angles B and *b* were applied the one to the other, the planes which contain them, and consequently the perpendiculars *ah*, *ah* would coincide (Schol. 18, 1).

Now, because of the similar triangles ABH, *abh*, and the similar figures AC, *ac*,

$$AH : ah = AB : ab = BC : bc;$$

and because of the similar bases,

$$\text{base } BCD : \text{base } bcd = BC^2 : bc^2 \text{ (25, 4, Part I.)}$$

From these two proportions, by considering all the quantities, as expressed by numbers (by 11, 3, Part I.),

$$AH \times \text{base } BCD : ah \times \text{base } BCD = BC^3 : bc \times BC^2,$$
$$ah \times \text{base } BCD : ah \times \text{base } bcd = bc \times BC^2 : bc^3,$$

therefore, *ex æquo*,

$$AH \times \text{base } BCD : ah \times \text{base } bcd = BC^3 : bc^3.$$

But AH × base BCD expresses the content of the prism P; and *ah* × base *bcd* expresses that of the other prism *p;* therefore

$$\text{prism } P : \text{prism } p = BC^3 : bc^3.$$

Cor. Similar prisms are to one another in the triplicate ratio of their homologous sides. Let S and *s* denote the homologous sides of two similar prisms P and *p*. It is manifest that

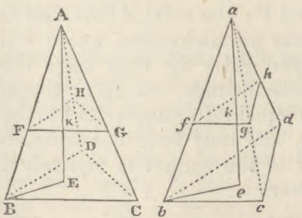
$$S^3,\ S^2s,\ Ss^2,\ s^3,$$

are four continual proportionals; therefore (Def. 11, Sect. III. Part I.), the ratio of S^3, the first, to s^3, the last, is the triplicate of the ratio of S^3, the first, to S^2s, the second; now, by the proposition, $P : p = S^3 : s^3$, and the ratio of S^3 to S^2s is the same as the ratio of S to *s;* therefore, the ratio of P to *p* is triplicate of the ratio of S to *s*.

Prop. XIII. Theor.—If a triangular pyramid A-BCD be cut by a plane parallel to its base, the section FGH is similar to the base.

For because the parallel planes BCD, FGH are cut by a third plane ABC, the sections FG, BC are parallel (7, 1). In like manner it appears that FH is parallel to BD; therefore the angle HFG is equal to the angle DBC (10, 1.) And because the triangle ABC is similar to the triangle AFG, and the triangle ABD is similar to the triangle AFH, we have

Fig. 146.



$$BC : BA = FG : FA, \text{ and } BA : BD = FA : FH.$$

Therefore, *ex æquali*, BC : BD = FG : FH; now the angle DBC has been shown to be equal to the angle HFG; therefore the triangles DBC, HFG are equiangular (20, 4, Part I.)

Prop. XIV. Theor.—If two triangular pyramids A-BCD, *a-bcd*, which have equivalent bases and equal altitudes, be cut by planes that are parallel to the bases, and at equal distances from them; the sections FGH, *fgh* will be equal. (Fig. 146.)

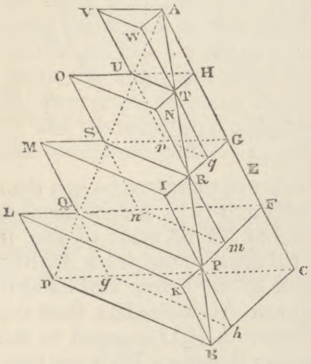
Draw AKE, ake perpendicular to the bases BCD, bcd, meeting the cutting planes in K and k; then, because of the parallel planes, we have $AE : AK = AB : AF$, and $ae : ak = ab : af$ (15, 1); but, by hypothesis, $AE = ae$, and $AK = ak$; therefore, $AB : AF = ab : af$. Again, because of similar triangles, $AB : AF = BC : FG$, and $ab : af = bc : fg$; therefore $BC : FG = bc : fg$; and hence $BC^2 : FG^2 = bc^2 : fg^2$ (23, 4, Part I.); but because of the similar triangles BDC, FHG, $BC^2 : FG^2 =$ trian. BDC : trian. FHG, and in like manner $bc^2 : fg^2 =$ trian. bcd : trian. fgh (25, 4, Part I.), therefore

trian. BCD : trian. FGH = trian. bcd : trian. fgh.

Now, trian. BCD = trian. bcd (by hypothesis), therefore the triangle FHG is equal to the triangle fhg.

THEOREM XV.—A series of prisms of the same altitude may be circumscribed about any pyramid ABCD, such, that the sum of the prisms shall exceed the pyramid by a solid less than any given solid Z.

Fig. 147.

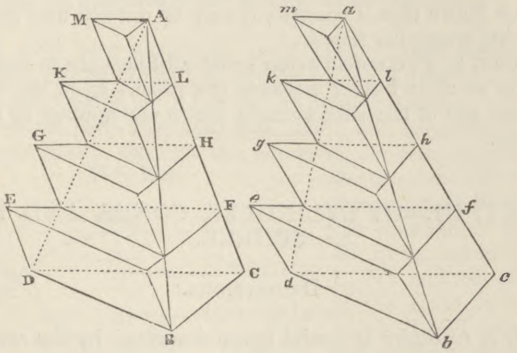


Let Z denote a prism standing on the same base with the pyramid, viz. the triangle BCD, and having for its altitude the perpendicular drawn from a certain point E in the line AC upon the plane BCD. It is evident that CE multiplied by a certain number m will be greater than AC; divide CA into as many equal parts as there are units in m, and let these be CF, FG, GH, HA, each of which will be less than CE. Through each of the points F, G, H, let planes be made to pass parallel to the plane BCD, making with the sides of the pyramid the sections FPQ, GRS, HTU, which will be all similar to one another, and to the base BCD (13). From the point B draw in the plane of the triangle ABC the straight line BK parallel to CF, meeting FP produced in K. In like manner, from D draw DL parallel to CF, meeting FQ in L; join KL, and it is plain that the solid KBCDLF is a prism. By the same construction let the prisms PM, RO, TV be described. Also let the straight line IP, which is in the plane of the triangle ABC, be produced till it meet BC in h; and let the line MQ be produced till it meet DC in g. Join hg, then hCg QFP is a prism; and is equal to the prism PM (Cor. 11). In the same manner is described the prism mS equal to the prism RO, and the prism qU equal to the prism TV. The sum, therefore, of all the inscribed prisms hQ, mS, and qU is equal to the sum of the prisms PM, RO, and TV, that is, to the sum of all the circumscribed prisms except the prism BL; wherefore, BL is the excess of the prisms circumscribed about the pyramid above the prisms inscribed within it. But the prism BL is less than the prism which has the triangle BCD for its base, and for its altitude the perpendicular from E upon the plane BCD, which prism is, by hypothesis, equal to the given solid Z; therefore the excess of the circumscribed above the inscribed prisms is less than the solid Z. But the excess of the circumscribed prisms above the inscribed is greater than their excess above the pyramid ABCD, because ABCD is greater than the sum of the inscribed prisms; much more therefore is the excess of the circumscribed prisms above the pyramid less than the solid Z. A series of prisms of the same altitude has therefore been circumscribed about the pyramid ABCD exceeding it by a solid less than the given solid Z.

PROP. XVI. THEOR.—Pyramids that have equal bases and altitudes are equal to one another.

Let A-BCD, a-bcd be two pyramids that have equal bases BCD, bcd, and equal altitudes; viz. the perpendiculars drawn from the vertices A and a upon the planes BCD, bcd, the pyramid A-BCD is equal to the pyramid a-bcd.

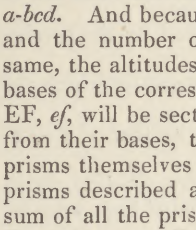
Fig. 148.



For if they are not equal, let Z represent the solid which is equal to the excess of one of them, a-bcd, above the other A-BCD; and let a series of prisms CE, FG, HK, LM, of the same altitude be circumscribed about the pyramid A-BCD, so as to exceed it by a solid less than Z, which is always possible (15); also let a series of prisms, ce, fg, hk, lm, equal in number to the other, and of the same altitude, be circumscribed about the pyramid a-bcd. And because the pyramids have equal altitudes, and the number of prisms described about each is the same, the altitudes of the prisms will be all equal, and the bases of the corresponding prisms in the two pyramids, as EF, ef, will be sections of the pyramids at equal distances from their bases, therefore they are equal (14), and the prisms themselves are equal (1), and the sum of all the prisms described about the one pyramid is equal to the sum of all the prisms described about the other pyramid. To abridge, put P and p to denote the pyramids A-BCD, and a-bcd respectively, and Q and q to express the sums of the prisms described about them. Then, because by hypothesis $Z = p - P$, and by construction $Z > Q - P$, therefore $p - P > Q - P$, hence p must be greater than Q; but Q is equal to q, therefore p must be greater than q, that is, the pyramid p is greater than q, the sum of the prisms described about it, which is impossible; therefore the pyramids P, p are not unequal, that is, they are equal.

THEOREM XVII.—Every prism having a triangular base may be divided into three pyramids that have triangular bases, and that are equal to one another.

Fig. 149.



Let ABC, DEF be the opposite bases of a triangular prism. Join AE, EC, CD; and because ABED is a parallelogram, of which AE is the diameter, the triangle ADE is equal to the triangle ABE; therefore the pyramid of which the base is the triangle ADE and vertex the point C, is equal to the pyramid of which the base is the triangle ABE, and vertex the point C. But the pyramid of which the base is the triangle ABE and vertex the point C, that is, the pyramid ABCE, is equal to the pyramid DEFC (16), for they have equal bases, viz. the triangles ABC, DFE, and the same altitude, viz. the altitude of the prism ABCDEF. Therefore, the three pyramids ADEC, ABEC, DFEC are equal to one

Geometry of Solids.

another; but these pyramids make up the whole prism ABCDEF; therefore, the prism ABCDEF is divided into three equal pyramids.

Cor. 1. From this it is manifest that every pyramid is the third part of a prism which has the same base and the same altitude with it; for if the base of the prism be any other figure than a triangle, it may be divided into prisms having triangular bases.

Cor. 2. Pyramids having equal altitudes are to one another as their bases; because the prisms upon the same bases, and of the same altitude, are to one another as their bases.

SECT. III.—OF CYLINDERS, CONES, AND THE SPHERE.

Definitions.

I. A *Cylinder* is a solid figure described by the revolution of a right-angled parallelogram about one of its sides, which remains fixed.

The *Axis* of the cylinder is the fixed straight line about which the parallelogram revolves.

The *Bases* of the cylinder are the circles described by the two revolving opposite sides of the parallelogram.

II. A *Cone* is a solid figure described by the revolution of a right-angled triangle about one of the sides containing the right angle, which side remains fixed.

The *Axis* of the cone is the fixed line about which the triangle revolves.

The *Base* of the cone is the circle described by that side containing the right angle which revolves.

III. A *Sphere* is a solid figure described by the revolution of a semicircle about a diameter.

The *Axis* of a sphere is the fixed line about which the semicircle revolves.

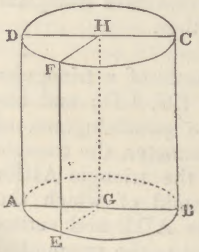
The *Centre* of a sphere is the same with that of the semicircle.

The *Diameter* of a sphere is any straight line which passes through the centre, and is terminated both ways by the superficies of the sphere.

IV. *Similar* cones and cylinders are those which have their axes and diameters of their bases proportional.

Theorem I. If from any point E in the circumference of the base of a cylinder ABCD, a perpendicular EF be drawn to the plane of the base AEB; the straight line EF is wholly in the cylindric superficies.

Fig. 150.

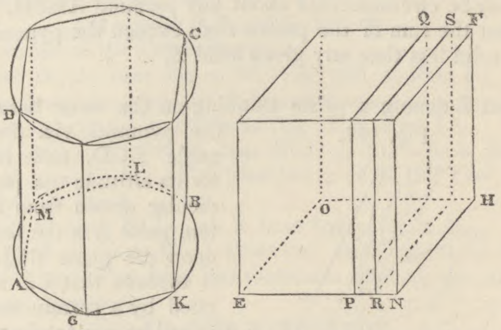


Let GH be the axis, and AGHD the rectangle, which by its revolution describes the cylinder. Because HG is perpendicular to AG in every position of the revolving rectangle, it is perpendicular to the plane of the circle described by AG; and because AD, the line which describes the cylindric superficies, is parallel to GH, it is also perpendicular to the plane of that circle (5, 1). Now when by the revolution of the rectangle AGHD the point A coincides with the point E, the line EF will coincide with AD, and thus will be wholly in the cylindric superficies; for otherwise two perpendiculars might be drawn to the same plane, from the same point, which is impossible (2 Cor. 4, 1).

Theorem II.—A cylinder and a parallelopiped having equivalent bases, and the same altitude, are equal to one another.

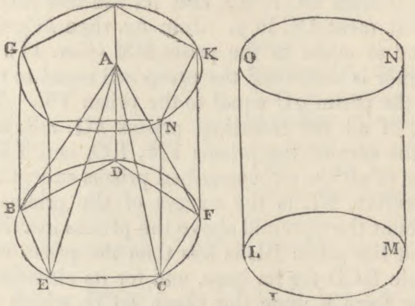
Let ABCD be a cylinder and EF a parallelopiped having equivalent bases, viz. the circle AGB and the parallelogram EH, and having also equal altitudes; the cylinder ABCD is equal to the parallelopiped EF. If not, let them be unequal; and first let the cylinder be less than the parallelopiped EF; and from the parallelopiped EF let there be cut off a part EQ by a plane PQ parallel to NF, equal to the cylinder ABCD. In the circle AGB inscribe the polygon AGKBLM that shall differ from the circle by a space less than the parallelogram PH (1 Cor. 2, 6, P. I.), and cut off from the parallelogram EH a part OR equal to the polygon AGKBLM, then it is manifest that the parallelogram OR is greater than the parallelogram OP, therefore the point R will fall between P and N. On the polygon AGKBLM let an upright prism be constituted of the same altitude with the cylinder, which will therefore be less than the cylinder, because it is within it (1); and if through the point R a plane RS parallel to NF be made to pass, it will cut off the parallelopiped ES equal to the prism AGBC, because its base is equal to that of the prism, and its altitude is the same. But the prism AGBC is less than the cylinder ABCD, and the cylinder ABCD is equal to the parallelopiped EQ, by hypothesis; therefore, ES is less than EQ, and it is also greater, which is impossible. The cylinder ABCD therefore is not less than the parallelopiped EF; and in the same manner it may be shown not to be greater than EF, therefore they are equal.

Fig. 151.



Theorem III.—If a cone and cylinder have the same base and the same altitude; the cone is the third part of the cylinder.

Fig. 152.

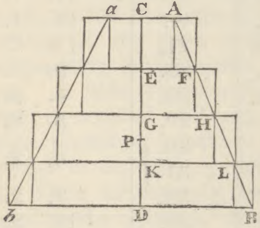


Let the cone ABCD and the cylinder BFKG have the same base, viz. the circle BCD, and the same altitude, viz. the perpendicular from the point A upon the plane BCD; the cone ABCD is the third part of the cylinder BFKG. If not, let the cone ABCD be the third part of another cylinder LMNO having the same altitude with the cylinder BFKG; but let the bases BCD, LIM be unequal, and first let BCD be greater than LIM. Then, because the circle BCD is greater than the circle LIM, a polygon may be inscribed in BCD that shall differ from it less than LIM does (1 Cor. 2, 6, P. I.), and which therefore will be greater than

LIM. Let this be the polygon BECFD, and upon BECFD let there be constituted the pyramid ABECFD, and the prism BCFKHG. Because the polygon BECFD is greater than the circle LIM, the prism BCFKHG is greater than the cylinder LMNO, for they have the same altitude, but the prism has the greater base. But the pyramid ABECFD is the third part of the prism BCFHG (17, 1); therefore it is greater than the third part of the cylinder LMNO. Now the cone ABECFD is by hypothesis the third part of the cylinder LMNO; therefore, the pyramid ABECFD is greater than the cone ABCD, and it is also less, because it is inscribed to the cone, which is impossible. Therefore the cone ABCD is not less than the third part of the cylinder BFKG. And in the same manner, by circumscribing a polygon about the circle BCD, it may be shown, that the cone ABCD is not greater than the third part of the cylinder BFKG; therefore, it is equal to the third part of the cylinder.

Theorem IV.—Let ABDC be a plane figure, bounded by a straight line CD, a line of any kind AB, which is terminated by perpendiculars at the extremities of CD, and by these perpendiculars AC, BC. Let AB *b a* be a solid generated by the revolution of this figure about CD as an axis; a series of cylinders may be described about the solid, and another series may be inscribed in it, having all the same altitude, and such that the sum of the circumscribed cylinders shall exceed the sum of the inscribed cylinders by less than any given solid S.

Fig. 153.



Let S denote a solid which is a cylinder, having B*b* for the diameter of its base, and DP for its height. Suppose the fixed axis CD to be divided into a number of equal parts DK, KG, GE, EC, each less than DP. In the plane of the figure ABDC, draw perpendiculars EF, GH, KL to meet the line AB in F, H, L. Construct the inscribed rectangles AE, FG, HK, LD, also the circumscribed rectangles CF, EH, GL, KB. By the rotation of the plane figure about the axis CD, these rectangles will evidently generate a series of cylinders inscribed in the solid, and another series described about it. Let the circumscribed cylinders, reckoned from the bottom of the solid to the top, be denoted by V, X, Y, Z, and the inscribed cylinder by v, x, y, z, then the sums of the circumscribed and inscribed cylinder will be

$$V + X + Y + Z,$$

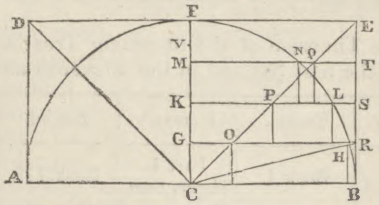
$$\text{and} \qquad v + x + y + z.$$

Now by the nature of the figure, each circumscribed cylinder is equal to the inscribed cylinder next below it; therefore $X = v$, $Y = x$, and $Z = y$, and hence the excess of the sum of all the circumscribed above the inscribed cylinders will be the same as the excess of the greatest circumscribed above the least inscribed cylinder; that is, it will be equal to $V - z$, and consequently will be less than V; but the lowest circumscribed cylinder V is less than the solid S, because it has the same base (viz. the circle having for its diameter B *b*), and a less altitude KD, by construction; therefore the excess of the series of circumscribed above the series of inscribed cylinders is less than the given solid S.

Cor. The difference between the solid AB *ba* and either of the two series of cylinders will be less than the greatest circumscribed cylinder: For the solid AB *ba* is greater than the one series of cylinders and less than the other; therefore it will differ from either series by a quantity less than the difference between the two.

Theorem V.—If a cone and hemisphere have equal bases and altitudes, and if a series of cylinders be described about the cone, and another series be inscribed in the hemisphere, and the cylinders have all the same altitude; the sum of the two series will be equal to a cylinder having the same base and altitude as the hemisphere.

Fig. 154.



Let AFB be a semicircle, and CFDA, CFEB, squares described on the radius CF, and let CE be the diagonal of one of the squares BF: Let CF be divided into any number of equal parts CG, GK, KM, MF; and let perpendiculars be drawn through the points of division, meeting the diagonal CE, in the points O, P, Q; the quadrantal arc BF in the points H, L, N; and the side of the square in the points R, S, T; construct the rectangles CO, GP, KQ, ME, which will circumscribe the triangle CFE; construct also the rectangles CH, GL, KN, which will be inscribed in the quadrant CFB. Suppose now the plane of the square to revolve about its side CF as an axis; the triangle CFE will then generate a cone, which will have DE for the diameter of its base, and C for its vertex; the quadrant CFB will generate a hemisphere, having for its base a circle of which AB is a diameter; and the square CBEF will generate a cylinder, having the same base and altitude as the hemisphere: also, the rectangles described about the triangle CFE will manifestly generate a series of cylinders circumscribing the cone; the rectangles inscribed in the quadrant will generate a series of cylinders inscribed in the hemisphere; and the rectangles CR, GS, KT, ME will generate a series of cylinders which will compose a cylinder having the same base and altitude as the hemisphere.

The triangles CFE, CGO are manifestly similar, and $CF = FE$; therefore $CG = GO$. In like manner, it may be proved that $CK = KP$ and that $CM = MQ$.

Join CH, and because CGH is a right-angled triangle, a circle described with CH as a radius will be equal to two circles described with CG and GH as radii (2 Cor. 4, 6, Part I.), but $CG = GO$, and $CH = GR$; therefore a circle described with GR as a radius will be equal to two circles described with GO and GH as radii; hence again it follows, that the cylinder generated by the rectangle CR will be equal to both the cylinders generated by the rectangles CO and CH, for they have all the same altitude, and the base of the first is equal to the sum of the bases of the other two. It may be demonstrated in the same manner that the cylinder generated by the rectangle GS is equal to the sum of the cylinders generated by the rectangles GP and GL, and the same of all the rest; therefore the sum of the cylinders generated by the rectangles CR, GS, KT, ME is equal to the two series of cylinders, one generated by the rectangles CO, GP, KQ, ME, and the other generated by the rectangles CH, GL, KN; that is, a cylinder having the same base and altitude as the hemisphere, is equal to the sum of the two series of cylinders, one described about the cone, and the other described in the hemisphere.

Theorem VI.—Every sphere is two thirds of the circumscribing cylinder. (Fig. 154.)

Let a figure be constructed exactly as is last proposition; and to abridge, let C denote the cone, *c* the series of cylinders described about it, H the hemisphere, *h* the cylinders described in it, and K the cylinder having the same base and altitude as the hemisphere, or cone. Moreover, put *d* for the difference between the cone and its circumscribed cylinders, and d' for the difference between the hemisphere and its inscribed cylinders; then we have

$$C + d = c, \text{ and } H = h + d',$$

and adding equals to equals,

$$C + H + d = c + h + d'.$$

But $c + h = K$ (5); therefore, $C + H + d = K + d'$, and $C + H + d - d' = K$, also $C + H = K + d' - d$. Hence it appears that the difference between $C + H$ and K is equal to the difference between d and d'. Now d is less than the cylinder generated by the rotation of the rectangle ME (Cor. to Prop. 4), and d' is less than the cylinder generated by the rectangle CR, which is equal to ME; therefore the difference between d and d' must be less than the same rectangle; hence the difference between $C + H$ and K is less than the cylinder generated by the revolution of the rectangle ME, or is less than a cylinder having the same base as the cone, and the line FM for its altitude. From this we may infer, that $C + H$ is exactly equal to K; for if there can be any difference, let it be a cylinder having the same base as the cone, and its altitude equal to FV; then FM must be greater then FV; but the number of parts into which FC is divided may be so great that FM may be less than FV; therefore $C + H$ cannot be unequal to K; and since $C + H = K$, and $C = \frac{1}{3}K$ (3), therefore $H = \frac{2}{3}K$; that is, the hemisphere is two thirds of its circumscribing cylinder; and taking the doubles of these, the whole sphere is two thirds of its circumscribing cylinder.

A Table showing the Theorem of the foregoing Treatise, that corresponds to each of the principal Propositions in the first Six and in the Eleventh and Twelfth Books of Euclid's *Elements*.

ANALYTICAL GEOMETRY.

1. The branch of science which has obtained the name of analytical geometry owes its origin to Descartes. It consists in the application of algebra to geometry, not merely by using algebraic symbols as the representatives of magnitude, but by employing these in such a manner that the position of a point is indicated by referring it to fixed lines or planes, just as the position of a point on the earth's surface is defined by referring it to the equator and the first meridian. For example, if we suppose the positions of two lines at right angles to one another to be fixed and known, then the position of any point in the same plane is sufficiently determined by its distances from these two lines, just as the position of a place on a given map is denoted by its latitude and longitude.

This science, like that of ordinary geometry, is divided into two parts, plane and solid, or *analytical geometry of two and of three dimensions.*

ANALYTICAL GEOMETRY OF TWO DIMENSIONS.

2. As every line or area is supposed to be situated in one plane, we may, whenever it is convenient to do so, imagine that plane to be the paper before us, which, for convenience of phraseology, we may further suppose to be standing

upright, so that any one line of print is horizontal, whilst the successive lines lie vertically under each other. The simplest way, under these circumstances, in which the position of a point can be indicated, will be by its distances from two lines at right angles to each other, the one horizontal, the other vertical. If we know the positions of these lines, then we know the position of every point in this plane whose distances from these two lines have been given us. But it is frequently necessary to adopt lines of reference inclined to one another. In this case, the position of a point is determined by its two distances from these lines respectively, each measured in a direction parallel to the other. The lines of reference are called the *co-ordinate axes;* their point of intersection is called the *origin;* the distances of any other point from the lines, measured in the way stated above are called the *co-ordinates of that point;* of these one is called the *abscissa*, the other the *ordinate*, the former being usually the designation of the *horizontal* distance.

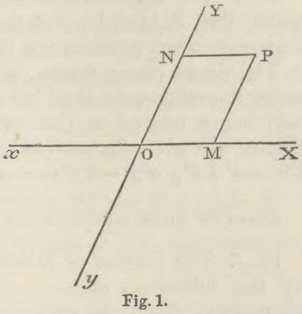

Fig. 1.

In this figure, OX, OY, at right angles or not, are called the co-ordinate axes; O the origin; PM, PN (or its equal OM), drawn parallel to OY and OX, the co-ordinates of the point P; OM the abscissa, PM the ordinate. The line OM is usually written by the letter x, and MP by y. We may thus form some idea of the meaning of the symbols by considering the letter x as the abbreviation for the general *word* longitude, and the letter y as that for latitude. Thus when the latitude and longitude are both specified, the point referred to is determined. If, on the other hand, there is stated merely a relation between them, such, for example, as that the latitude is equal to the longitude, it is clear that no one point is determined thereby, since the same property is applicable to an innumerable series of points. A little consideration will show that some line, straight or crooked, will pass through all such points. The relation, therefore, is said to determine this line, and when expressed in algebraic symbols, is called *the equation to the line.* Thus, for example, the relation, "that the abscissa is equal to the ordinate," or the longitude equal to the latitude, understood as above, indicates a straight line; and the corresponding equation, $x=y$, is the equation to a straight line.

3. The requirements of analysis demand that attention should be paid to the *sign* as well as to the *magnitude* of the algebraic symbol which expresses an abscissa or an ordinate. We lay it down as a rule, deduced at once from the algebraic definitions of the symbols $+$ and $-$, that if one of them denotes a line measured in one direction, the other will denote a line measured in the opposite direction. Thus if $x = +a$ be an abscissa measured to the right of O, $x = -a$ will be an equal abscissa measured to the left; if $y = +b$ be an ordinate measured above O, $y = -b$ will be an equal ordinate measured below it; and these are the directions which we shall usually assign to the positive and negative abscissas and ordinates.

4. Besides the method of representation which we have described, there is another very unlike it in form, but equally important in the solution of mechanical and astronomical problems. In this system, the position of a point is determined by its distance from a given point, and the direction in which the line measuring that distance lies with respect to a given line. This system is called the system of *polar co-ordinates.* The given point to which all others are referred is called the *pole*, and the distance from that point the *radius vector.*

5. The subject before us naturally divides itself into three distinct branches,—1°, the determination of the equations to curves from the knowledge of their properties; 2°, the determination of the forms and properties of curves from their equations; and, 3°, the deduction of one property of a curve from another, or from several others. The third branch being the combination and extension of the other two, we propose briefly to illustrate the first and second, and then to include under the third a discussion of some of the more important properties of the Conic Sections in the form in which the requirements of science demand their exhibition.

SECTION I.—THE DETERMINATION OF THE EQUATIONS TO CURVES FROM THE KNOWLEDGE OF THEIR PROPERTIES.

6. *a. The Straight Line.*—The property of the straight line which we shall employ is this—that if two series of parallel lines be drawn from any points in it so as to form with the given line a series of triangles, the sides of these triangles will be proportionals.

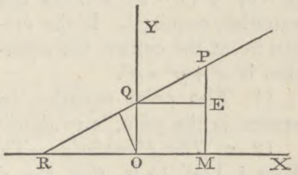

Fig. 2.

Let PQR be the straight line; OX, OY the co-ordinate axes; PM parallel to OY, and QE parallel to OX: the triangles PQE, QRO are similar, $\therefore$ PE : EQ :: QO : OR.

Let OM be called x, or OM $= x$, MP $= y$, OQ $= b$; and let the ratio QO : OR be $a : 1$.

then $y - b : x :: a : 1$;

or $y = ax + b$ is the equation to the line PR.

Hence it is clear that any simple equation between y and x will represent a straight line. If the axes of co-ordinates are at right angles to each other—in which case they are called rectangular axes—a is the trigonometrical tangent of the angle PRO, in which the given line cuts the axis of x.

7. The equation to a straight line may be written in a different form, which is frequently convenient, thus:

Let the perpendicular from O on the line PR be called p, the angle PRM α; then it is evident that

$$y \cos \alpha - x \sin \alpha - p = 0,$$

which is the equation to the line.

This equation is abbreviated by writing for it simply $\alpha = 0$; or, when multiplied by a constant a, by $u = 0$; where u is a function of x, y, α, p, and a constant which is arbitrary. We shall give an instance of the use of this form of the equation in the sequel.

If the axes of co-ordinates are not at right angles, the equation becomes slightly changed in form.

Let the line make the angles θ and ϕ with the axes of x and y respectively; then

$$\text{QO} : \text{OR} :: \sin\theta : \sin\phi;$$

$$\therefore y = \frac{\sin\theta}{\sin\phi}x + b \text{ is the equation;}$$

$$\text{or} \quad y \sin\phi - x\sin\theta = b\sin\phi;$$

consequently all lines which are parallel to the given line, or for which θ and ϕ are the same, have the relative magnitudes of the co-efficients of x and y the same, and *vice versâ.*

8. Cor. 1.—If the line pass through a given point of which the co-ordinates are x', y', we shall have $y = ax + b$ generally,

and $y' = ax' + b$ for the given point;

$\therefore y - y' = a(x - x')$,

or b is determined.

Cor. 2.—If the line pass through a second given point whose co-ordinates are y'', x'', we shall have $y' - y'' = a(x' - x'')$, or a is determined,

$$\text{and} \therefore \; y - y' = \frac{y' - y''}{x' - x''}(x - x') \text{ is the equation.}$$

Analytical Geometry.

9. To express the polar equation to the straight line.

Let O be the pole, OY perpendicular to PR; and suppose OP joined. Let OP $= r$, OY $= p$, $\angle$ POR $= \theta$, $\angle$ YOR $= \alpha$; then OP cos POY $=$ OY, or $r \cos(\theta - \alpha) = p$ is the equation required.

10. *b.* *The Circle.*—The property of the circle is, that the lines drawn from the centre to the circumference are equal.

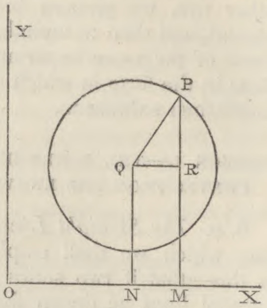

Fig. 3.

Let us suppose the axes to be rectangular, Q the centre, QP the radius $= a$; OM $= x$, PM $= y$, the co-ordinates of P; ON $= b$, NQ $= c$, the co-ordinates of the centre; then PR^2 + QR^2 = PQ^2; or $(y - c)^2 + (x - b)^2 = a^2$ is the equation required. If the origin be at the centre, the equation is $x^2 + y^2 = a^2$.

11. The polar equation in its simplest form, when the centre is the pole, is evidently $r = a$.

12. *c.* *The Parabola.*—The property (Conic Sections, Part 1, Def. 1) is, that the distance of any point from the focus is equal to its distance from the directrix.

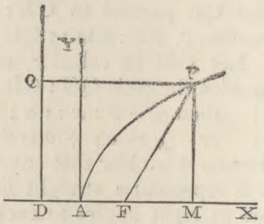

Fig. 4.

Let F be the focus, DQ the directrix, then FP = PQ. Suppose the vertex A to be the origin, and AFX the *axis* of the parabola to be the axis of x.

Let AM $= x$, MP $= y$, AF $=$ AD $= a$, then PM^2 + MF^2 = PF^2 = PQ^2 = MD^2; or $y^2 + (x - a)^2 = (x + a)^2$, which gives $y^2 = 4ax$, the equation required.

13. To find the polar equation, the focus being the pole.

Let FP $= r$, DFP $= \theta$;

$$\text{then FP} \cos \text{PFM} = \text{FM} = \text{DM} - \text{DF} = \text{PQ} - \text{DF}$$
$$= \text{FP} - \text{DF} = r - 2a$$

$$\therefore r = \frac{2a}{1 - \cos \text{PFM}} = \frac{a}{\sin^2 \dfrac{\text{PFM}}{2}} = \frac{a}{\cos^2 \dfrac{\theta}{2}} \text{ is the equation}$$

required.

14. *d.* *The Ellipse.*—The property (Conic Sections, Part 2, Def. 1) is, that the sum of the two lines drawn from any point to the two foci is constant.

Let the centre C be the origin: CA which passes through the focus S, called the semi-axis major, or the semi-transverse axis, the axis of x; CB perpendicular to CA, the semi-axis minor, or the semi-conjugate axis, the axis of y; CM $= x$, MP $= y$, CA $= a$, CB $= b$; then it is evident that CF^2 = CS$^2 = a^2 - b^2$; and the condition FP + SP $= 2a$ gives

$$\text{FP}^2 = (2a - \text{SP})^2 = 4a^2 - 4a \,.\, \text{SP} + \text{SP}^2,$$
$$\text{or} \quad (\text{FC} + x)^2 + y^2 = 4a^2 - 4a \,.\, \text{SP} + (\text{CS} - x)^2 + y^2;$$
$$\text{whence} \quad 2\text{FC} \,.\, x = 4a^2 - 4a \,.\, \text{SP} - 2\text{CS} \,.\, x,$$
$$\text{or } a \,.\, \text{SP} = a^2 - \text{CS} \,.\, x;$$
$$\text{that is, } a^2(\text{SM}^2 + \text{MP}^2) = a^4 - 2a^2 \,.\, \text{CS} \,.\, x + \text{CS}^2 \,.\, x^2,$$

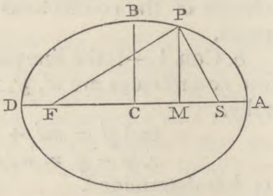

Fig. 5.

or $a^2(x - \text{CS})^2 + a^2 y^2$
$= a^4 - 2a^2 \,.\, \text{CS} \,.\, x + \text{CS}^2 \,.\, x^2$;
whence $a^2 x^2 + a^2 \,.\, \text{CS}^2 + a^2 y^2$
$= a^4 + \text{CS}^2 \,.\, x^2$,
or $a^2y^2 + b^2x^2 = a^2b^2$, the equation required.

15. Cor.—Since $a \,.\, \text{SP} = a^2 - \text{CS} \,.\, x$, if CS $= ae$, we shall have SP $= a - ex$; and since SP + FP $= 2a$, FP $= a + ex$. Also it is evident that $a^2e^2 = a^2 - b^2$, or $e^2 = 1 - \dfrac{b^2}{a^2}$.

e is called the *eccentricity*.

Analytical Geometry.

16. To find the polar equation to the ellipse, the focus being the pole.

Let SP $= r$, PSA $= \theta$, then PSD $= \pi - \theta$. But (Art. 15) SP $= a - ex$,

$$\text{where } x = \text{CM} = \text{CS} - \text{SM} = ae - r \cos \text{PSM};$$
$$\therefore \quad r = a - ae^2 + er \,.\, \cos \text{PSM};$$
$$r = \frac{a(1 - e^2)}{1 - e \cos \text{PSM}} = \frac{a(1 - e^2)}{1 + e \cos \theta}$$

is the equation required.

17. *e.* *The Hyperbola.*—The property is (Conic Sections, Part 3, Def. 1), that the difference of the two lines drawn from any point to the two foci is constant.

The figure being drawn, and the same letters retained as for the ellipse, we shall have FP − SP $= 2a$, which equation being treated as the corresponding equation for the ellipse, will give, first, $a \,.\, \text{SP} = \text{CS} \,.\, x - a^2$; and, finally (if CS$^2 = a^2 + b^2$), $a^2y^2 - b^2x^2 = -a^2b^2$ is the equation required.

18. The polar equation is $r = \dfrac{a(e^2 - 1)}{1 + e \cos \theta}$.

19. *f.* *The Cissoid of Diocles.*—This curve is generated by the following construction: AQB is a semi-circle, of which AB is the diameter; AQ is any chord; QN perpendicular to the diameter; PM is drawn parallel to QN at such a distance that AM = BN: the point P, in which the chord AQ and the line PM intersect one another, is a point in the cissoid APD: the cissoid is said to be the *locus* of the point P.

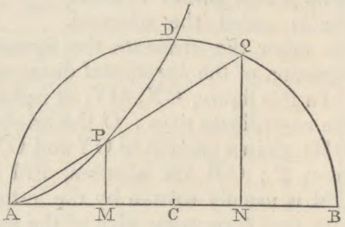

Fig. 6.

Let AB $= 2a$, AM $= x$, MP $= y$,

$$\text{then } y^2 : x^2 :: \text{QN}^2 : \text{AN}^2 :: \text{AN} \,.\, \text{NB} : \text{AN}^2$$
$$:: \text{NB} : \text{AN} :: x : 2a - x;$$

$$\therefore y^2 = \frac{x^3}{2a - x} \text{ is the equation required.}$$

20. To find the polar equation.

Join BQ; let AP $= r$, $\angle$ PAM $= \theta$; then because AQB is a right angle,

$$\text{AQ} = \text{AB} \cos \theta, \;\therefore\; \text{AN} = \text{AB} \cos^2 \theta,$$
$$\text{and AM} = r \cos \theta, \;\therefore\; r \cos \theta = \text{AB} - \text{AB} \cos^2 \theta = \text{AB} \sin^2 \theta,$$
$$\text{and } r = \frac{2a \sin^2 \theta}{\cos.\, \theta} \text{ is the equation required.}$$

21. *g.* *The Conchoid of Nicomedes.*—This curve is generated as follows:—

A line of indefinite length revolves on and also slides in a fixed pivot; whilst a constant portion of the line always projects beyond a given fixed straight line,—the extremity of the projecting line traces out a conchoid; or the conchoid is the locus of the extremity.

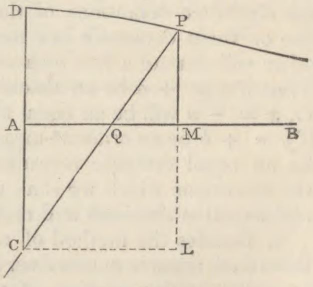

Fig. 7.

Let C be the pivot, AB the fixed line; PQ the constant portion of the revolving line which projects above it. Draw CA perpendicular to AB. Let PQ $= a$, CA $= b$, AM $= x$, MP $= y$.

By similar triangles,—

$$\text{PL}^2 : \text{LC}^2 :: \text{PM}^2 : \text{MQ}^2 :: \text{PM}^2 : \text{PQ}^2 - \text{PM}^2;$$
$$\text{or} \quad (y + b)^2 : x^2 :: y^2 : a^2 - y^2;$$
$$\text{or} \quad x^2y^2 = (y + b)^2\,(a^2 - y^2);$$ which is the equation required.

22. To find the polar equation. Let C be the pole,

$CP=r$, $\angle ACP=\theta$; then since $CQ\cos\theta=CA$, we get $(r-a)\cos\theta=b$, the polar equation.

23. *h. The Cycloid.*—This curve is described by a point in the circumference of a circle which rolls along a straight line.

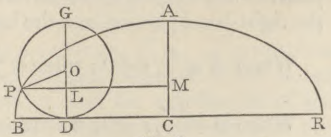

Fig. 8.

Let GPD be the circle which rolls along the straight line BR, the point P in the circumference of the circle will trace out a curve BAR, which is the cycloid.

Let A be the highest point of the curve; $GD=2a$ the diameter of the generating circle $=AC$; $AM=x$, $MP=y$; O the centre of the circle; $\angle POG=\theta$; then it is evident that the circumference of the circle coincides by succession with the straight line BR; therefore arc $PD=BD$, arc $GPD=BC$, and arc $GP=DC$; hence

$$x=GL=a\ \text{vers}\ \theta,$$
$$y=ML+LP=PG+PL=a\theta+a\sin\theta,$$

or $y=a\ \text{vers}^{-1}\frac{x}{a}+\sqrt{2ax-x^2}$ is the equation required.

24. *i. The Lemniscate.*—The property of this curve is that the product of the two lines drawn from any point of it to the two foci is always equal to the square of half the distance between the foci.

Let F and S be the foci, $FC=CS=a$, $CM=x$, $MP=y$; the property is that $FP\times SP=a^2$.

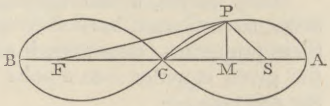

Fig. 9.

Hence $\sqrt{(a+x)^2+y^2}\times\sqrt{(a-x)^2+y^2}=a^2$;

or $(y^2+x^2+a^2+2ax)(y^2+x^2+a^2-2ax)=a^4$;

or $(y^2+x^2+a^2)^2-4a^2x^2=a^4$;

or $(y^2+x^2)^2+2a^2y^2-2a^2x^2=0$;

or $(y^2+x^2)^2=2a^2(x^2-y^2)$ is the equation required.

25. To find the polar equation. Let $CP=r$, $\angle PCS=\theta$;

then $FP^2=r^2+a^2+2ar\cos\theta$;

$SP^2=r^2+a^2-2ar\cos\theta$;

$FP^2\times SP^2$, or $a^4=(r^2+a^2)^2-4a^2r^2\cos^2\theta$;

whence $r^2=4a^2\cos^2\theta-2a^2$

$=2a^2(2\cos^2\theta-1)$

$=2a^2\cos 2\theta$ is the equation required.

26. Besides the cycloid there are other curves which are generated by a point in a rolling circle. The *trochoid* differs from the cycloid in having the generating point within the circle at a distance b from the centre. Its equations are

$$x=a-b\cos\theta$$
$$y=a\theta+b\sin\theta.$$

The *epicycloid* is traced out by a point in the circumference of a circle which rolls on the convex circumference of another circle.

The *hypocycloid* is traced out by a point in the circumference of a circle which rolls on the concave circumference of a larger circle.

If the describing point is not in the circumference of the rolling circle, the curves become the *epitrochoid* and *hypotrochoid* respectively.

SECTION II.—THE DETERMINATION OF THE FORMS AND PROPERTIES OF CURVES FROM THEIR EQUATIONS.

27. Since very few curves can be described by a continuous motion, it is evident that, with rare exceptions, the determination of the form of a curve must resolve itself either into the expression of the numerical values of all coordinates corresponding to given abscissas, or into a general investigation of the number and nature of the branches of the curve, their flexure and mutual intersections. It is under the latter aspect that we are about to regard this subject. With respect to those few curves which can be described by a continuous motion, the modes of description of some of the most important have been already given in the treatise on CONIC SECTIONS, whilst others, such as the cycloid, involve a mechanical process so obvious that it is quite superfluous to waste words in attempting to make it plain. We proceed then at once to describe the general features of a few curves from their equations. This description we shall designate as TRACING THE CURVE.

28. *a.* The *cubical parabola* of which the equation is $a^2y=x^3$.

When $x=0$, $y=0$, which shows that the curve passes through the origin. When x is positive, y is positive, which shows that to the right the curve lies *above* the axis of x. When x is negative, y is negative, which shows that to the left the curve lies *below* the axis of x.

Since $a^2\frac{dy}{dx}=3x^2$, it follows that at the origin the axis of x is a tangent to the curve (FLUXIONS, Art. 65, Equation 3). The form of the curve is therefore as in the figure.

29. *b.* The *semi-cubical parabola*, of which the equation is $ay^2=x^3$.

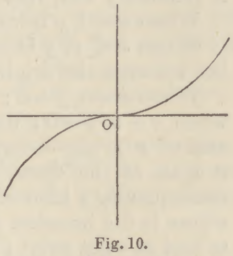

Fig. 10.

When $x=0$, $y=0$. When x is positive y^2 is positive, or y has two equal values, one + the other −; which shows that there are two similar branches of the curve to the right of the origin, the one above and the other below the axis of x. When x is negative y^2 is negative, and y is impossible; or there is no portion of the curve to the left of the axis of x. The figure is like the outline of the head of a spear, or is a cusp.

30. *c.* The curve whose equation is $y=\frac{x^3}{x^2+1}$. It is evident that its general form will be something like that of the cubical parabola already traced. But the equation may be thrown under the form $y=x-\frac{1}{x}+$ &c.; which shows that as x increases the value of y tends continually to be equal to it; which is equivalent to the fact that the curve constantly approaches a straight line whose equation is $y=x$. This straight line is called an *asymptote* to the curve. An example of a similar line has already been given in the article CONIC SECTIONS (iii. 15) in the case of the hyperbola. A more instructive example will be seen in the conchoid already described, where, from the nature of the case, it is at once evident that the curve continually approaches the straight line AB, without ever reaching it.

To ascertain whether a curve has an asymptote or not, it is sufficient to expand its equation in a descending series of powers of x.

If the portion which remains, after excluding that which becomes 0 on x becoming infinite, be in the form of a simple equation, that equation represents the asymptote. In addition to this there may be an asymptote parallel to the axis of y, which can be ascertained by y becoming infinite for some finite value of x.

31. *d.* There is another circumstance to be noted respecting the curve we have been discussing. Near the origin where the axis of x is a tangent, it is evidently convex to that axis; but from the nature of the case it is clear that at a considerable distance from the origin it must be convex towards its asymptote, and consequently concave towards the axis of x. The point at which it changes from convex to concave is called a *point of inflexion* or a *point of contrary flexure*. To ascertain the position of this point, it is necessary to find the value of x which shall render $\frac{d^2y}{dx^2}=0$.

On solving this equation we shall obtain $x = \pm\sqrt{3}$, which gives the point of inflexion. The curve is therefore as follows (fig. 11), OB being the asymptote, and P the point of inflexion.

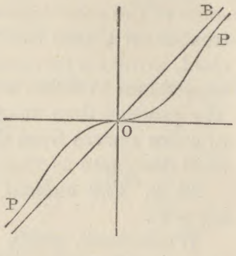

Fig. 11.

32. *e.* To trace the curve of which the equation is

$$xy^2 = (x-a)(x-b)(x-c).$$

Suppose a the least, and c the greatest of the three magnitudes. We have

$$y = \sqrt{\frac{(x-a)(x-b)(x-c)}{x}};$$

from which it is clear that in all cases there are two values of y equal and with opposite signs; or, in other words, there is symmetry with respect to the axis of x.

When $x=0$, y is infinite, or the axis of y is an asymptote.

When $x < a$, y is impossible, or no branch of the curve lies between the origin and the distance a to the right.

When $x=a$, $y=0$; when $x > a < b$, y is possible; and when $x=b$, $y=0$; the curve accordingly starts from the axis of x at the distance a from the origin, and returns to it again at the distance b. This branch of the curve is consequently a kind of oval. If it be required to ascertain where is the broadest part of the oval, it will be necessary to find at what point y is a *maximum* by the method given in FLUXIONS, art. 60. The result is obtained by the solution of a cubic equation.

When $x > b < c$, y is impossible.

When $x=c$, $y=0$; when $x > c$, y is possible; and when x is infinite, y is infinite—the branch beyond the distance c consequently starts from the axis of x, and extends to infinity, somewhat in the form of a parabola. When x is negative, y is always possible; and it is infinite both when x is 0 and when x is infinite—diminishing from the first point and then increasing to the second. At some point it must attain a *minimum* value, which can be ascertained as the *maximum* above. The branch to the left of the origin accordingly bears some faint resemblance to an hyperbola. The whole curve is as in the figure where O is the origin—$OA=a$, $OB=b$, $OC=c$.

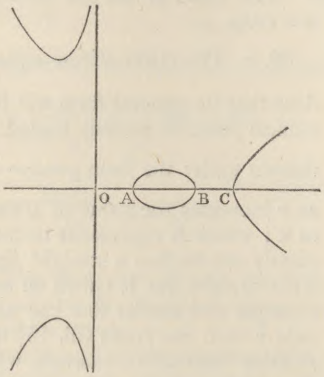

Fig. 12.

33. *f.* In the last example we assumed that a, b, and c are all different from each other. If we suppose $a=b$, we have the equation $y=(x-a)\sqrt{\frac{x-c}{x}}$. The peculiarity in this equation is this—that when $x=a$, $y=0$, which gives a *possible* point A; but when x is a little greater or less than a, y is impossible, so that no branch of the curve lies near the point. This point, an isolated point where co-ordinates satisfy the equation, but which does not belong to any branch of the curve, is called a *conjugate* point. By comparing this example with the last, of which it is a particular case, we shall be able to trace the origin of such a point in the oval AB, which has collapsed.

We will now give an example or two of the use of polar co-ordinates.

34. *g.* The *Lemniscate*, of which the equation (i) is $r^2 = 2a^2 \cos 2\theta$.

When $\theta=0$, $r^2=2a^2$, $r=\pm a\sqrt{2}$; or r has two equal values, CA and CB in the figure of Art. 24.

When $\theta < \frac{\pi}{4}$, r is possible, having two equal values, positive and negative, the former giving the upper half of the right-hand portion, and the latter the lower half of the left.

When $\theta = \frac{\pi}{4}$, $r=0$; when $\theta > \frac{\pi}{4} < \frac{3\pi}{4}$, r is impossible.

When $\theta = \frac{3\pi}{4}$, $r=0$; when $\theta=\pi$, $r=\pm a\sqrt{2}$, thus giving the upper portion of the left-hand figure, and the lower portion of the right.

35. *h.* The *Cardioide*, of which the equation is

$$r = a\cos^2\frac{\theta}{2}.$$

When $\theta=0$, $r=a$; when θ is $< \pi$, r is positive; when $\theta=\pi$, $r=0$; and the same is true in a reverse order between π and 2π. The curve, therefore, starts at its greatest distance from the origin, and returns to the origin by having positive radii throughout a whole circumference—a portion of it accordingly lies to the left of the axis of y. The curve is in the shape of a heart, thus: O being the origin; $OA=a$.

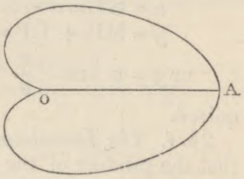

Fig. 13.

Many curves, whose equations are presented between linear co-ordinates, have their general form, and some of their properties, determined most readily by converting the given equation into a polar equation, as in the following example:—

36. *i.*— $$x^4 - ax^2y + ay^3 = 0.$$

Let $x=r\cos\theta$, $y=r\sin\theta$; then the equation gives $r=a\frac{\sin\theta}{\cos^4\theta}(\cos^2\theta-\sin^2\theta)$.

When $\theta=0$, $r-0$; when $\theta < \frac{\pi}{4}$, r is positive; when $\theta=\frac{\pi}{4}$, $r=0$: hence there is an oval in the first octant, having its extremity at the origin.

When $\theta > \frac{\pi}{4} < \frac{\pi}{2}$, r is negative; when $\theta = \frac{\pi}{2}$, r is infinite; hence there is no branch of the curve in the second octant, but one extending back from the origin to infinity in the sixth octant.

When $\theta > \frac{\pi}{2} < \frac{3\pi}{4}$, r is negative; when $\theta = \frac{3\pi}{4}$, $r=0$; hence there is no branch of the curve in the third octant, but a branch returning from infinity to the origin in the seventh.

When $\theta > \frac{3\pi}{4} < \pi$, r is positive; when $\theta=\pi$, $r=0$; hence there is an oval in the fourth octant, having its extremity at the origin. The *maximum* radius vector occurs at about 30. The curve is therefore in the annexed form.

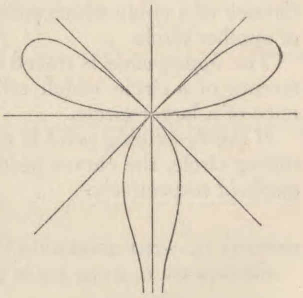

Fig. 14.

37. These examples will suffice to illustrate the general determination of the FORM of a curve from its equation. We have next to discuss the determination of the PROPERTIES of curves from their equations. This we shall do very briefly, confining ourselves to curves of the second degree. As a preliminary it will be requisite to point out the method employed to transfer our reference from one system of co-ordinates to another. This method is called

Transformation of Co-ordinates.

38. It is supposed that the equation to a curve referred to a certain system of co-ordinates x, y, is given; and it is required to determine what its equation becomes when referred to another system of co-ordinates x', y'. The problem obviously resolves itself into the determination of the values of x and y in terms of x' and y', and the substitution of the latter in place of the former. The formulæ are thus obtained.

39. 1°. If the new axes are parallel to the old, the origin alone being changed—it is evident that nothing is required but to write $x' + a$ in place of x, and $y' + b$ in place of y; where a and b are the co-ordinates of the new origin referred to the old.

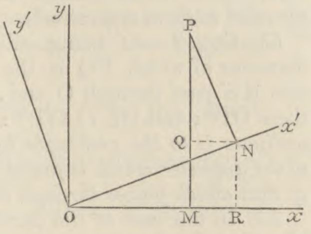

Fig. 15.

40. 2°. Suppose the origin unchanged, and both the old and new axes rectangular, the axis of x' being inclined to that of x by the angle θ. Let $OM=x$, $MP=y$, $ON=x'$, $NP=y'$. Draw NR, NQ parallel to Oy and Ox respectively;

then
$$x=OR-QN=x'\cos\theta-y'\sin\theta.$$
$$y=NR+PQ=x'\sin\theta+y'\cos\theta.$$

41. 3°. Suppose the origin to be unchanged; and neither the old nor the new axes to be necessarily rectangular.

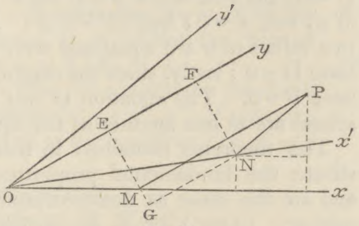

Fig. 16.

Let $OM=x$, $MP=y$, $ON=x'$, $NP=y'$. Draw ME, NF perpendicular to Oy, and let NG be parallel to Oy and meet EM produced in G; then $ME=NF-GM$,

or $$x\sin xOy = x'\sin x'Oy - y'\sin y'Oy.$$

Similarly, by drawing perpendiculars from P and N on Ox, we get
$$y\sin yOx = x'\sin x'Ox + y'\sin y'Ox.$$

42. 4°. When both the origin and the direction of the axes are to be changed, we have only to unite the processes of No. 1 and Nos. 2 and 3 to effect the transformation.

43. 5°. To obtain a polar equation, let $OP=r$;

then
$$x=r\frac{\sin OPM}{\sin PMx}=r\frac{\sin POy}{\sin xOy}$$
$$y=r\frac{\sin POM}{\sin PMx}=r\frac{\sin POx}{\sin xOy}.$$

Properties of Curves of the Second Degree, as deduced from the general equation.

The general equation of the second degree is
$$Ay^2+2\,Bxy+Cx^2+2\,Dy+2\,Ex+F=0.$$

44. Prop. I.—No straight line can cut a curve of the second degree in more than two points.

Let $y=mx+n$ be the equation to a straight line, then by substituting this value of y in the given equation, we have a quadratic for the determination of the values of x at the points where the co-ordinates are common to it and to the straight line. A similar process gives a quadratic equation in y. Consequently there are but two solutions, and therefore but two points of intersection.

By referring to the equations to the conic sections given above, it will be seen that they are curves of the second degree

45. Prop. II.—Admitting that the above equation represents a conic section, it is required to determine the particular one.

If we solve the equation with respect to y, we obtain
$$Ay=-(Bx+D)\pm\sqrt{(B^2-AC)x^2+2\,(BD-AE)x+D^2-AF}.$$

Now, I. If B^2-AC be *negative*, this value of y is impossible when x is infinite; which shows that the curve does not extend to an infinite distance. It is therefore a *circle* or an *ellipse*, according as C is equal to A or not. The ellipse, however, may be simply a point, and the equation may be impossible.

II. If B^2-AC be *positive*, y has two real roots when x is infinite, whether x be positive or negative. The curve has consequently four infinite branches as in the *hyperbola* or in *two intersecting straight lines.*

III. If $B^2-AC=0$; then if $BD-AE$ is positive, y will be possible when x is positive and infinite, but impossible when x is negative, and *vice versâ.* The curve is consequently a *parabola.* If $BD-AE=0$, the equation represents two straight lines or one, or is impossible.

IV. If the quantity under the radical is a complete square, *i. e.*, if $(B^2-AC)\,(D^2-AF)=(BD-AE)^2$ the equation represents two straight lines; for it is the product of two simple equations.

46. Prop. III.—To find the centre of the curve.

The *centre* is that point which bisects every chord which can be drawn through it. Let a, b be the co-ordinates of the centre; x', y', the co-ordinates when the centre is the origin; then (Art. 39) we have $x=x'+a$, $y=y'+b$; whence $A(y'+b)^2+2B(x'+a)\,(y+b)+C(x'+a)^2+2D(y'+b)+2E\,(x'+a)+F=0.$

Now when $y'=0$, this equation must give two values of x', equal and with opposite signs, because the chord of x' is bisected at the centre. Hence their sum is equal to 0;

or $$Bb+Ca+E=0;$$
similarly, $$Ab+Ba+D=0;$$
whence $$a=-\frac{BD-AE}{B^2-AC},\ b=-\frac{BE-CD}{B^2-AC},$$

which are the co-ordinates of the centre.

In the case of the parabola these co-ordinates are infinite, for (Art. 45) $B^2-AC=0$: hence we may say that the parabola has no centre. In analysis, however, it is desirable to regard the centre as existing at an infinite distance.

47. Prop. IV.—To find the locus of the middle points of parallel chords.

Let a, b be the co-ordinates of one of those middle points, and let the origin be transferred to that point by writing $x'+a$, $y'+b$ for x and y. Let also $y'=m\,x'$ be the equation to this chord; then the points in which it intersects the curve will be those for which x' and y' are the same in the equation to the curve and to the chord. Hence
$$A\,(mx'+b)^2+2B\,(x'+a)\,(mx'+b)+C\,(x'+a)^2$$
$$+2D\,(m\,x'+b)+2E\,(x'+a)+F=0$$
is the equation for determining the values of x' at the points of section; but since these are by hypothesis equal and with opposite signs, the co-efficient of x' must be equal to 0;

therefore $$Amb+Bb+Bma+Ca+Dm+E=0.$$

Now m remains the same for all chords which are parallel. This equation is therefore a simple equation between a and b; consequently if a and b be considered as the co-ordinates of middle points generally, the equation which connects them is the equation to a straight line. *The locus of the middle points of all parallel chords is therefore a straight line.*

48. Every straight line which bisects a system of parallel chords is called a *diameter*, and the chords themselves are called *ordinates* to that diameter.

49. Cor.—From the definition of a centre it is evident that every diameter passes through it.

In the case of the parabola, which has no finitely situated centre, we observe that $B^2 = AC$. Now the equation to the diameter (Art. 47) is

$$Bb + Ca + m\,(Ab + Ba) + E + mD = 0;$$

$$\text{or}\qquad Bb + Ca + m\left(\frac{B^2}{C}b + Ba\right) + E + mD = 0;$$

$$\text{or}\qquad \left(1 + \frac{mB}{C}\right)(Bb + Ca) + E + mD = 0;$$

$$\textit{i.e.}\qquad Bb + Ca + \frac{C}{1 + mB}(E + mD) = 0;$$

in which the co-efficients of the co-ordinates a and b are independent of m, which shows (Art. 8) that *all diameters of the parabola are parallel to one another.*

50. Prop. V.—If two diameters of a curve of the second degree be such that one of them bisects all chords parallel to the other, then the latter also will bisect all chords parallel to the former.

By Art. 47 the equation to the line which bisects all chords parallel to the line whose equation is $y = mx$, is

$$(Am + B)\,b + (Bm + C)\,a + Dm + E = 0,$$

$$\text{or}\qquad y + \frac{Bm + C}{Am + B}\,x + \frac{Dm + E}{Am + B} = 0,$$

by writing y and x for the symbols which stand for the *general* phrases latitude and longitude of a point in the line. Let this be abbreviated by $y = m'x +$ &c.,

$$\text{where}\qquad m' = -\frac{Bm + C}{Am + B}.$$

In the same manner the diameter which bisects all chords parallel to $y = m'x$ is $y = m''x$;

$$\text{where } m'' = -\frac{Bm' + C}{Am' + B}$$

$$= -\frac{-\dfrac{B^2m + BC}{Am + B} + C}{-\dfrac{ABm + AC}{Am + B} + B}$$

$$= m$$

i.e. (Art 8), this diameter is parallel to the original chord; hence the truth of the proposition. Diameters so related to each other are called *conjugate diameters.*

51. Prop. VI.—If through any point O two chords be drawn, meeting the curve in the points P, Q, and R, S, respectively; then, the ratio of the rectangle OP . OQ, to the rectangle OR . OS, is a ratio which is the same whatever be the point O, provided the direction of the chords remain unchanged.

Let the co-ordinates of O be a and b; the polar radius through O $= r$; then (Art. 43) we have

$$x = r\frac{\sin POy}{\sin xOy} + a, \qquad y = r\frac{\sin POx}{\sin xOy} + b$$

$$= mr + a \text{ suppose} \qquad = nr + b,$$

where m and n depend on the direction of the radius or chord.

The general equation becomes, by substitution,

$$A\,(nr + b)^2 + 2B\,(mr + a)\,(nr + b) + C\,(mr + a)^2$$
$$+ 2D\,(nr + b) + 2E\,(mr + a) + F = 0;$$

which gives two values of r, viz. OP, OQ. Their product is the last term of the equation, viz.

$$\frac{Ab^2 + 2Bab + Ca^2 + 2Db + 2Ea + F}{An^2 + 2Bmn + Cm^2}$$

similarly the product OR, OS is

$$\frac{Ab^2 + 2Bab + Ca^2 + 2Db + 2Ea + F}{An'^2 + 2Bm'n' + Cm'^2}.$$

Consequently $OP.OQ : OR.OS :: An'^2 + 2\,Bm'n' + Cm'^2 : An^2 + 2\,Bmn + Cm^2$;

a ratio which is independent of a and b, and therefore of the position of the point O. If O′ be any other point, and O′P′ be parallel to OP, O′R′ to OR, &c.; then

$$OP.OQ : OR.OS :: O'P'.O'Q' : O'R'.O'S'.$$

52. Cor. 1.—If O′ be the centre; $O'P' = O'Q'$, $O'R' = O'S'$; then $OP.OQ : OR.OS :: O'P'^2 : O'R'^2$. That is, if *two chords intersect one another, the rectangles by their segments are to one another as the squares of the diameters parallel to them respectively.*

53. Cor. 2.—O′ being still the centre, let O′O be the diameter of which PQ is the ordinate; and let RS and also R′S′ pass through O′ and ∴ coincide with one another; then $OP^2 : OR.OS :: O'P'^2 : O'R'^2$; or *the square of the ordinate is to the rectangle by the abscissas, as the square of the diameter which is parallel to the former to the square of that which passes through the latter.*

54. In the case of the parabola this proposition is inapplicable; for the diameter and the chord parallel to it are both infinite. To determine the corresponding ratio for this case, let the axes be transformed to x', y' such that the axis of x' is parallel to the diameter, and the axis of y' to a bisected chord. Let also the origin be on the curve—the equation will then assume the form $A'y'^2 + 2\,Ex' = 0$; for $C' = 0$; because when $y = '0$ there must be only one value of x', viz., $x' = 0$; but $B'^2 = 4\,A'C'$ ∴ $B' = 0$: and sincc the two values of y are equal and with opposite signs we must have $D = 0$: lastly, since the origin is on the curve we must have $F = 0$. The equation in this form shows that the abscissas are to one another as the squares of the ordinates.

The theorems contained in this second corollary constitute the fundamental properties of the conic sections, and are the same as demonstrated in the treatise on that subject. (Arts. i. 12, ii. 13, iii. 12.)

55. Prop. VII.—To find the equation to the tangent.

The *tangent* is that line to which a line cutting the curve in two points continually approaches as its limit, as the points of section approach to each other.

The equation to a line which meets the curve in the two points $x'y'$, $x''y''$ is

$$y - y' = \frac{y' - y''}{x' - x''}(x - x') \qquad \text{(Art. 8, Cor. 2.)}$$

Now $Ay'^2 + 2\,Bx'y' + Cx'^2 + 2\,Dy' + 2\,Ex' + F = 0$.........(1)

and $Ay''^2 + 2\,Bx''y'' + Cx''^2 + 2\,Dy'' + 2\,Ex'' + F = 0$;

∴ by subtraction,

$$A(y'^2 - y''^2) + B\{x'(y' - y'') + y'(x' - x'') + x''(y' - y'')$$
$$+ y''(x' - x'')\} + C(x'^2 - x''^2) + 2\,D(y' - y'')$$
$$+ 2\,E(x' - x'') = 0;$$

$$\text{whence}\ \frac{y' - y''}{x' - x''} = -\frac{B\,(y' + y'') + C\,(x' + x'') + 2\,E}{A\,(y' + y'') + B\,(x' + x'') + 2\,D};$$

and the equation to the cutting line is

$$y - y' = -\frac{B\,(y' + y'') + C\,(x' + x'') + 2\,E}{A\,(y' + y'') + B\,(x' + x'') + 2\,D}(x - x').$$

The equation to the tangent is derived from this by writing y' for y'' and x' for x''. It is therefore

$$y - y' = -\frac{By' + Cx' + E}{Ay' + Bx' + D}(x - x')\text{............(2)}$$

Those who are familiar with the differential calculus will obtain this result at once from the equation

$$y - y' = \frac{dy'}{dx'}(x - x').$$

If we multiply out equation (2), and substitute for $Ay'^2 +$

$2\,\mathrm{B}x'y' + \mathrm{C}x'^2 + \mathrm{D}y' + \mathrm{E}x'$ its value $-\mathrm{D}y' - \mathrm{E}x' - \mathrm{F}$ from equation (1), we shall have

$$\mathrm{A}yy' + \mathrm{B}\,(xy' + x'y) + \mathrm{C}xx' + \mathrm{D}\,(y+y') + \mathrm{E}\,(x+x') + \mathrm{F} = 0$$

as the equation to the tangent. The equation to the tangent is therefore to be got from the equation to the curve by writing xx' for x^2, yy' for y^2, $x+x'$ for $2\,x$, $y+y'$ for $2\,y$, and $x'y+xy'$ for $2\,xy$; or by changing one of the x's into x', and one of the y's into y'.

56. Cor.—Since the equation to the tangent is symmetrical in x and x', y and y', if we abbreviate it by $\varphi\,(x, y, x', y')$, we shall have the equation $\varphi(x, y, x', y') = \varphi(x', y', x, y)$; x and y being interchangeable with x' and y'.

57. Prop. VIII.—To find the equation to the straight line which joins the points of contact of two tangents, real or imaginary.

Abbreviate the equation to the curve by $f(x, y) = 0$, and to the tangent by $\varphi(x, y, x', y') = 0$.

Let X, Y be the co-ordinates of the point of intersection of two tangents; then the equations $f(x', y') = 0$, $\varphi(x', y', \mathrm{X}, \mathrm{Y}) = 0$ give the values of x', y', the co-ordinates of the point of contact of the one tangent.

Also the equations $f(x'', y'') = 0$, $\phi(x'', y'', \mathrm{X}, \mathrm{Y}) = 0$, give the co-ordinates x'', y'' of the point of contact of the other tangent which passes through the point X, Y.

Now, of the equations constituting these respective pairs, one is a simple equation, and the other a quadratic. Each pair will therefore give *two* values of the variables. But each pair is the same as the other; therefore the *two* roots of the one are the roots of both; or x', y', x'', y'' are the roots of the equations $f\,(x, y) = 0$, $\varphi(x, y, \mathrm{X}, \mathrm{Y}) = 0$.

Again, let $\psi\,(x, y, \mathrm{X}, \mathrm{Y}) = 0$ be the equation to the chord which passes through the points $(x', y';\ x'', y'')$ of contact; then will x', y', x'', y'' be the roots of the equations $f\,(x, y) = 0$, $\psi(x, y, \mathrm{X}, \mathrm{Y}) = 0$.

But it has been already proved that

$$f\,(x, y) = 0, \quad \phi\,(x, y, \mathrm{X}, \mathrm{Y}) = 0$$

have the same roots. Moreover, one of the equations, $f\,(x, y) = 0$, is common to both pairs; therefore the other two equations must be identical; or $\psi\,(x, y, \mathrm{X}, \mathrm{Y}) = 0$ is the same as $\phi\,(x, y, \mathrm{X}, \mathrm{Y}) = 0$; *i.e., the equation to the line which joins the points of contact of two tangents is of the same form as the equation to the tangent;* or if the equation to the tangent at the point x', y' *in* the curve is $\phi\,(x, y, x', y') = 0$; the equation to the line which joins the points of contact of two tangents which meet in a point x', y', *out* of the curve is $\phi\,(x, y, x', y') = 0$.

58. The line which joins the points of contact of two tangents is called the *polar* of their point of intersection; and that point accordingly is called the *pole* of the line.

59. Prop. IX.—If the point B is in the polar of A, then is A also in the polar of B.

Let x', y' be the co-ordinates of A,
x'', y'', ... B.

The equation to the polar of A is $\phi\,(x, y, x', y') = 0$; but by hypothesis B (x'', y'') is a point in this line; therefore $\varphi\,(x'', y'', x', y') = 0$. Hence also (Art. 56) $\varphi\,(x', y', x'', y'') = 0$. But $\phi\,(x, y, x'', y'') = 0$ is the equation to the polar of B; the equation $\varphi\,(x', y', x'', y'') = 0$ consequently shows that x', y' are the co-ordinates of a point in that line; *i.e.*, A *is a point in the polar of* B.

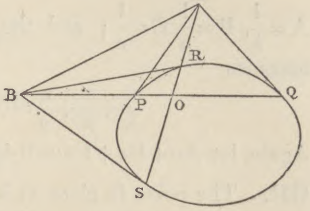

Fig. 17.

60. Cor. 1.—If *any number* of points be taken in the polar of A, their polars will all pass through A; *i.e., the polars of every point in a straight line all pass through the pole of that line.*

61. Cor. 2.—If A and B are the poles of two lines PQ and RS which meet in O, the line AB is the polar of the point O.

For the polar of O passes through A (by the Proposition) and through B; it is therefore the straight line AB.

62. Prop. X.—To find the condition that the straight line whose equation is $m\,y + n\,x + p = 0$ may touch a given conic section.

The equation to the conic section may, by properly selecting the co-ordinates, be thrown into one or other of the two forms,

$$\frac{x^2}{a} + \frac{y^2}{b} = 1 \quad \text{or} \quad \frac{2x}{a} + \frac{y^2}{b} = 1.$$

The tangents to these have for their respective equations (Art. 55),

$$\frac{x\,x'}{a} + \frac{y\,y'}{b} = 1, \text{ and } \frac{x+x'}{a} + \frac{y\,y'}{b} = 1.$$

In order that the former of these may coincide with the equation $m\,y + n\,x + p = 0$, we must have

$$-\frac{n}{p} = \frac{x'}{a}, \qquad -\frac{m}{p} = \frac{y'}{b}.$$

But $\dfrac{x'^2}{a} + \dfrac{y'^2}{b} = 1$; whence $a\,n^2 + b\,m^2 = p^2$..............(1)

is the resulting condition.

In order that the latter of the above equations may coincide with the equation $m\,y + n\,x + p = 0$, we must have

$$-\frac{n}{p} = \frac{\frac{1}{a}}{1 - \frac{x'}{a}} \text{ and } -\frac{m}{p} = \frac{\frac{y'}{b}}{1 - \frac{x'}{a}}$$

$$\therefore \quad \frac{x'}{a} = 1 + \frac{p}{an}, \qquad \frac{y}{b} = \frac{m}{an}:$$

which being substituted in the equation

$$\frac{2\,x'}{a} + \frac{y'^2}{b} = 1, \text{ there results}$$

$$a^2\,n^2 + 2\,a\,n\,p + b\,m^2 = 0 \text{.................(2)}$$

as the condition required.

63. Prop. XI.—Given that chords to a curve of the second degree always touch a conic section, it is required to prove that the locus of their poles is a conic section.

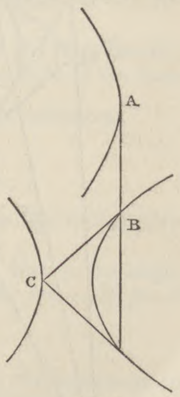

Fig. 18.

Let A be the conic section to which the chords are always tangents; B the curve of the second degree (a conic section) to which the chords are drawn; C the curve which is the locus of the poles of the chords to B.

Let x', y' be the co-ordinates of a point in C, the equation to the polar of this point is

$$\phi\,(x, y, x', y') = 0 \text{ (Art. 57) or}$$

$$(\mathrm{A}y' + \mathrm{B}x' + \mathrm{D})\,y + (\mathrm{B}y' + \mathrm{C}x' + \mathrm{E})\,x + \mathrm{D}y' + \mathrm{E}x' + \mathrm{F} = 0 \text{ (Art. 55).}$$

In order that this line may be a tangent to the conic section A, whose equation we shall suppose to be either

$$\frac{x^2}{a} + \frac{y^2}{b} = 1 \quad \text{or} \quad \frac{2x}{a} + \frac{y^2}{b} = 1,$$

we have to satisfy one or other of the two conditions obtained in the last proposition, viz.

Analytical Geometry.

$$a(\mathrm{B}y' + \mathrm{C}x' + \mathrm{E})^2 + b(\mathrm{A}y' + \mathrm{B}x' + \mathrm{D})^2 = (\mathrm{D}y' + \mathrm{E}x' + \mathrm{F})^2 \quad (1)$$

or

$$a^2(\mathrm{B}y' + \mathrm{C}x' + \mathrm{E})^2 + 2a(\mathrm{B}y' + \mathrm{C}x' + \mathrm{E})(\mathrm{D}y' + \mathrm{E}x' + \mathrm{F}) + b(\mathrm{A}y' + \mathrm{B}x' + \mathrm{D})^2 = 0 \;\ldots\ldots\ldots\ldots (2)$$

as necessary to be fulfilled.

If the requisite one of these relations between x' and y' hold true, the polar to every point in C will touch A. But these conditions are both expressed in the form of a quadratic equation between x' and y'. Hence the curve C is a curve of the second degree or a conic section.

64. PROP. XII.—Given that C is generated by A through the intervention of B, as in the last proposition, to prove that A would be generated by C through the intervention of the same curve B.

Let two tangents be drawn to A, forming chords to B, and let the poles of those chords be C and C′ in the curve C: then (Art. 61) the point of intersection of those tangents is the pole of CC′ (a chord in C). But as the tangents become indefinitely near each other, their point of intersection tends to become the point A in the curve A; and the points C, C′ also tend to become indefinitely near each other, or the chord CC′ tends to become a tangent. Hence the point A on the curve A is the pole of the tangent to a point C on the curve C.

65. The curves A and C are therefore reciprocal, and the process which employs this method of demonstration is termed *the method of reciprocal polars*. We shall confine ourselves to a single application of this method, that of connecting two theorems relative to the conic sections which are known as PASCAL's and BRIANCHON's theorem respectively.

Pascal's Theorem.

66. PROP. XIII.—If any hexagon be inscribed in a conic section, and the opposite sides be produced to meet in three points, those points are in a straight line.

Let ABCDEF be a hexagon inscribed in a conic section, and let the opposite sides produced meet in the points G, H, and K; viz., AB and ED in G: BC and EF in H; CD and AF in K: then the points G, H, and K are in a straight line. Let $u=0$, $v=0$, $w=0$, be three simple equations between x and y, each multiplied by an arbitrary constant, as in Art. 7; and let $u=0$ (1) be the equation to the line AB, $v=0$ (2) to the line CD, and $w=0$ (3) to the line EF.

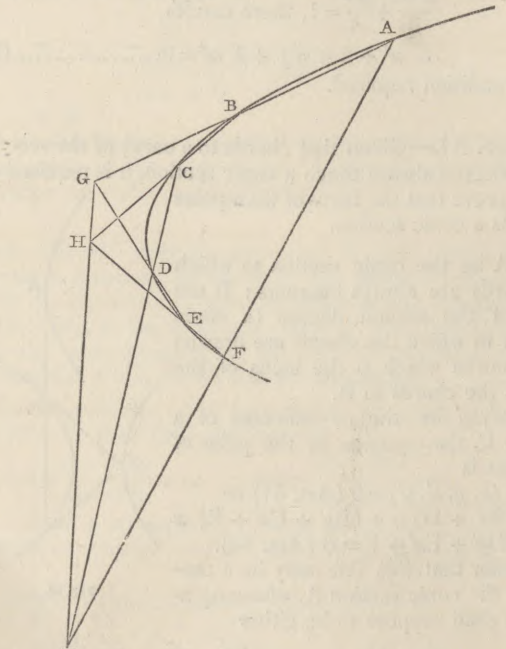

Fig. 19.

Analytical Geometry.

Now since u, v, w, involve x and y, u^2, v^2, w^2, &c., will involve x^2, y^2, &c., consequently

$$u^2 + v^2 + w^2 - (\lambda + \frac{1}{\lambda})vw - (\mu + \frac{1}{\mu})uw - (\nu + \frac{1}{\nu})uv = 0 \ldots\ldots (4)$$

is an equation between x, y, x^2, y^2 &c., containing six arbitrary constants; and is therefore the general equation of the second degree which represents any conic section.

At the points A and B, where the straight line represented by equation (1) intersects the conic section represented by (4), the same values of x and y render both equations identical, or u is the same in fact as well as in form in both equations:

We must have, therefore,

$$v^2 + w^2 - (\lambda + \frac{1}{\lambda})vw = 0,$$

$$\text{or } v = \lambda w \text{ and } v = \frac{1}{\lambda}w$$

at those points respectively. Similarly at the points D and C we must have $u = \mu w$, $u = \frac{1}{\mu}w$ respectively, and at the points E and F, $u = \nu v$ and $u = \frac{1}{\nu}v$. Hence the points are thus determined, viz.:

A by the equations $u = 0,\ v = \lambda w$ ....(5)

B ... ... $u = 0,\ v = \frac{1}{\lambda}w$ ....(6)

C ... ... $v = 0,\ u = \frac{1}{\mu}w$ ....(7)

D ... ... $v = 0,\ u = \mu w$ ....(8)

E ... ... $w = 0,\ u = \nu v$ ....(9)

F ... ... $w = 0,\ u = \frac{1}{\nu}$ ....(10)

Let $u = \mathrm{A}v + \mathrm{B}w$ be the equation to the line which passes through the points B and C; then, by (6) we must have $0 = \frac{\mathrm{A}}{\lambda} + \mathrm{B}$; and by (7) $\frac{1}{\mu} = \mathrm{B}$: consequently

$$u = \frac{1}{\mu}(-\lambda v + w) \ldots\ldots\ldots (11)$$

is the equation to the line BC. Similarly $u = \nu v + \mu w$ (12) is the equation to the line DE, and $u = \frac{1}{\nu}(v - \lambda w)$ (13) is the equation to the line FA.

Let $\mathrm{A}u + \mathrm{B}v + \mathrm{C}w = 0$ be the equation to GK.

This equation and the equations to AB and ED must be simultaneously satisfied at the point G. Combining then (1) and (12) with this equation we get $\frac{\mu}{\mathrm{C}} = \frac{\nu}{\mathrm{B}}$.

In like manner the equation must be satisfied simultaneously with those to AF and CD, at the point K. The equations (2) and (13) combined with it give $\frac{\nu}{\mathrm{A}} = \frac{\lambda}{\mathrm{C}}$, whence $\mathrm{A} = \frac{1}{\lambda}$, $\mathrm{B} = \frac{1}{\mu}$, $\mathrm{C} = \frac{1}{\nu}$; and the equation to the line GK becomes

$$\frac{u}{\lambda} + \frac{v}{\mu} + \frac{w}{\nu} = 0 \;\ldots\ldots\ldots (14).$$

Again, let $\mathrm{A}u + \mathrm{B}v + \mathrm{C}w = 0$ be the equation to the line GH. The point G gives as before $\frac{\mu}{\mathrm{C}} = \frac{\nu}{\mathrm{B}}$: at the point H the equation must be satisfied simultaneously with the equations to BC and EF. Combining (3) and (11) with it, we get $\frac{\mu}{A}=\frac{\lambda}{B}$: whence we obtain $A=\frac{1}{\lambda}$, $B=\frac{1}{\mu}$, $C=\frac{1}{\nu}$; and the equation to GH is $\frac{u}{\lambda}+\frac{v}{\mu}+\frac{w}{\nu}=0$, the same as the equation to GK. Hence GH and GK are in the same straight line.

67. Cor.—It is evident that the demonstration does not require any order of position amongst the points, or, in other words, that the points are interchangeable. Consequently, if for *hexagon* we read *six points*, and admit every variety of modes of joining them, we shall obtain a great number (sixty) of different straight lines in which three points of intersection of joining lines lie.

Brianchon's Theorem.

68. Prop. XIV.—If any hexagon be described about a conic section, the three diagonals which join opposite angles meet in a point.

Let two tangents be drawn to a conic section A as in Art. 63, meeting in the point P, and let their poles in the conic section C be *a*, *b*; then (Art. 61) P is the pole of the line *ab*. The same is true of any other pair of tangents; consequently, if six tangents be drawn to A forming a hexagon about it, their points of intersection will be the poles of a hexagon in C.

Let us designate the angles of the hexagon described about A by P, Q, R, S, T, U; and the sides of the hexagon described in C to which they are respectively poles by *p*, *q*, *r*, *s*, *t*, *u*.

Let *p* and *s* meet in G; *q* and *t* in H, and *r* and *u* in K; then, by the last proposition, G, H, and K are in a straight line.

Now (Art. 61) G is the pole of PS, H of QT, and K of RU; and since G, H, and K are in a straight line, their polars PS, QT, RU pass through the pole of that line (Art. 60); or meet in a point.

SECTION III.—DEDUCTION OF PROPERTIES OF CURVES FROM THEIR EQUATIONS AND KNOWN PROPERTIES.

We propose in this section to deduce some of the more important properties of the conic sections from their equations, combined with their known geometrical figures. The axes of co-ordinates will be supposed rectangular unless otherwise expressed.

1. *The Straight Line.*

69. Prop. I.—To find the equation to a straight line which shall be perpendicular to a given straight line.

Let $y=ax+b$ be the equation to the given straight line.
$y=px+q$ that of the required line.

If θ, φ be the angles in which those lines respectively cut the axis of x; it is evident that the condition imposed requires that

$$\varphi=\frac{\pi}{2}+\theta;$$

$$\therefore \tan\varphi=-\cot\theta=-\frac{1}{\tan\theta};$$

$$\text{or } p=-\frac{1}{a}\text{ (Art. 6)};$$

hence $y=-\frac{1}{a}x+q$ is the equation required.

70. Prop. II.—To find the length of the perpendicular from a given point on a given line.

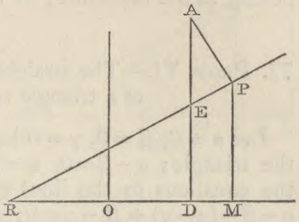

Fig. 20.

Let x', y' be the co-ordinates of the given point A;
$y=ax+b$ the equation to the given line PR.

Draw AP perpendicular to the given line, and let y' cut RP in E;

$$\text{then } AE=AD-ED$$
$$=y'-(ax'+b)$$
$$\text{and } AP=AE\sin AEP=AE\cos PRM$$
$$=\frac{AE}{\sqrt{1+\tan^2 PRM}}=\frac{y'-(ax'+b)}{\sqrt{1+a^2}}$$

71. We may exhibit this result in a very different form by adopting the equation to a straight line given in Art. 7.

Let AP = P; then the equation to a line through A parallel to RP is $y\cos\alpha-x\sin\alpha-(p+P)=0$; and since A is a point in this line,

$$y'\cos\alpha-x'\sin\alpha-(p+P)=0;$$
$$\text{or } P=y'\cos\alpha-x'\sin\alpha-p;$$
$$=\alpha\text{ (Art. 7) when } x', y' \text{ are written for } x \text{ and } y.$$

72. Prop. III.—If $\alpha=0$, $\beta=0$ be the equations to two straight lines, agreeably to the abbreviated notation of Art. 7; then $l\alpha+m\beta=0$, or $\alpha-k\beta=0$ will represent a line which passes through their point of intersection.

For the co-ordinates which render both $\alpha=0$ and $\beta=0$ render $l\alpha+m\beta=0$, or $\alpha-k\beta=0$; and are therefore co-ordinates of a point in the last line as in the other two.

73. Prop. IV.—If $\alpha=0$ be the equation to the line QA, $\beta=0$ to the line QB, and $\alpha-k\beta=0$ to the line QC;

$$\text{then } k=\frac{\sin AQC}{\sin BQC}.$$

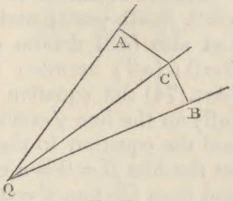

Fig. 21.

Let x', y' be the co-ordinates of C.

Draw CA, CB perpendicular to QA, QB; then (Art. 71)

$$CA=y'\cos\alpha-x'\sin\alpha-p.$$
$=\alpha$, when x', y' are written in place of the co-ordinates.

$CB=\beta$, when x', y' are written for the co-ordinates.

But since x', y' is a point in the line $\alpha-k\beta=0$, we have $k=\frac{\alpha}{\beta}$ when x', y' are written for the co-ordinates,

$$=\frac{CA}{CB}=\frac{QC\sin AQC}{QC\sin BQC}=\frac{\sin AQC}{\sin BQC}.$$

74. Cor. 1.—The equation to the line QC is therefore $\alpha\sin BQC-\beta\sin AQC=0$.

75. Cor. 2.—The straight line which bisects the angle between two straight lines whose equations are $\alpha=0$, $\beta=0$ is $\alpha-\beta=0$.

76. Prop. V.—If $\alpha=0$, $\beta=0$, $\gamma=0$ be the equations to three straight lines, and it be possible to find three numerical quantities, l, m, and n, such that $l\alpha+m\beta+n\gamma$ shall be equal to 0; the three straight lines shall meet in one point.

At the point where two of them whose equations are $\alpha=0$, $\beta=0$ intersect, the co-ordinates render $l\alpha+m\beta=0$. But, by hypothesis, $l\alpha+m\beta+n\gamma=0$ for all co-ordinates;

Analytical Geometry.

$\therefore n\gamma = 0$ for the co-ordinates of the point where the first and second lines meet; consequently the same co-ordinates belong to the third line; or the three meet in that point.

77. Prop. VI.—The straight lines which bisect the angles of a triangle meet in a point.

Let $\alpha = 0$, $\beta = 0$, $\gamma = 0$ be the equations to the sides of the triangle; $\alpha - \beta = 0$, $\alpha - \gamma = 0$, $\beta - \gamma = 0$ (Art. 75) are the equations to the lines which bisect the angles. But $\alpha - \beta - (\alpha - \gamma) + \beta - \gamma = 0$; consequently (Art. 76) these lines meet in a point.

78. Prop. VII.—The perpendiculars from the angles of a triangle on the opposite sides meet in a point.

Let the angle between the lines whose equations are $\alpha = 0$, $\beta = 0$ be denoted by $(\alpha\beta)$, &c.; then (Art. 74) the equation to the perpendicular from the angle in which these two meet is

$$u = \alpha \cos(\beta\gamma) - \beta \cos(\alpha\gamma) = 0.$$

Similarly the equations to the other two perpendiculars are

$$v = \gamma \cos(\alpha\beta) - \alpha \cos(\gamma\beta) = 0,$$

$$w = \beta \cos(\gamma\alpha) - \gamma \cos(\beta\alpha) = 0.$$

Hence we have $u + v + w = 0$, therefore (Art. 76) the three lines meet in a point.

79. Prop. VIII.—If there be two triangles such that the perpendiculars from the angles of the one on the sides of the other meet in a point, then the perpendiculars from the angles of the latter on the sides of the former will also meet in a point.

Let the equations to the sides of the former triangle be $\alpha = 0$, $\beta = 0$, $\gamma = 0$; and of the latter $\alpha' = 0$, $\beta' = 0$, $\gamma' = 0$. Let also $(\alpha\beta)$ denote the angle between the lines $\alpha = 0$, $\beta = 0$; $(\alpha\beta')$ between the lines $\alpha = 0$, $\beta' = 0$, &c. Then (Art. 74) the equation to the perpendicular from the point $(\alpha\beta)$ on the line $\gamma' = 0$ is $\alpha \cos(\beta\gamma') - \beta \cos(\alpha\gamma') = 0$.....(1) and the equation to the perpendicular from the point $(\alpha\gamma)$ on the line $\beta' = 0$ is $\alpha \cos(\gamma\beta') - \gamma \cos(\alpha\beta') = 0$; ....(2) and from $(\beta\gamma)$ on $\alpha' = 0$, $\beta \cos(\gamma\alpha') - \gamma \cos(\beta\alpha') = 0$.....(3) Now at the point where these three lines meet, α is the same in (1) and (2), β in (1) and (3), and γ in (2) and (3). Hence by elimination between (1) and (3), we get

$$\alpha \cos(\beta\gamma') \cos(\gamma\alpha') - \gamma \cos(\beta\alpha') \cos(\alpha\gamma') = 0;$$

which, when combined with (2), gives

$$\cos(\beta\gamma') \cos(\gamma\alpha') \cos(\alpha\beta') = \cos(\beta\alpha') \cos(\alpha\gamma') \cos(\gamma\beta') \text{......} (4)$$

Now, if we change α into α', β into β', γ into γ', and conversely, we obtain the equations to the perpendiculars from the angles of the latter triangle on the sides of the former. At the point where the first and third of these lines intersect, we shall have, as before,

$$\alpha' \cos(\beta'\gamma) \cos(\gamma'\alpha) - \gamma' \cos(\beta'\alpha) \cos(\alpha'\gamma) = 0;$$

and the equation to the second line is

$$\alpha' \cos(\gamma'\beta) - \gamma' \cos(\alpha'\beta) = 0.$$

But because, by equation (4),

$$\cos(\beta'\gamma) \cos \gamma'\alpha) \cos(\alpha'\beta) = \cos(\beta'\alpha) \cos(\alpha'\gamma) \cos(\gamma'\beta),$$

the same values of α' and γ' satisfy both these equations. Hence the three lines meet in one point.

2. *The Circle.*

We shall confine ourselves to two properties only of the circle, both because of their more simple geometric deduction, and because they are included in the properties of the ellipse.

80. Prop. I.—If TPQ be a tangent to a circle; CT, BQ perpendiculars to the diameter from its extremities; then the rectangle PT.PQ = rad².

When the centre is the origin, the equation to the circle is $x^2 + y^2 = a^2$ (Art. 10), and that of the tangent is $xx' + yy' = a^2$ (Art. 55).

$$\begin{aligned} \text{Hence}\quad & ax' + \text{BQ}.y' = a^2 \\ & -ax' + \text{CT}.y' = a^2 \\ & \therefore \text{CT.BQ}.y'^2 = a^2(a^2 - x'^2) \\ & \qquad\qquad = a^2y'^2 \\ \text{or}\quad & \text{CT.BQ} = a^2 \end{aligned}$$

but CT = PT, BQ = PQ, $\therefore$ PT. PQ = a^2.

81. Prop. II.—If through a fixed point chords are drawn to a circle, and tangents are drawn at the extremities of those chords, the locus of the points of intersection of the tangents is a straight line.

Let b, c be the co-ordinates of the fixed point, x', y' the co-ordinates of a point in which two tangents to the circle intersect one another; then (Art. 57) the equation to the chord which joins the points of contact is $xx' + yy' = a^2$. But, by hypothesis, b, c are co-ordinates of a point in this line, $\therefore bx' + cy' = a^2$. Now this is a simple equation between x' and y'. Hence the truth of the proposition.

3. *The Parabola.*

82. Prop. I.—To find the latus rectum of the parabola.

The *latus rectum* is the ordinate to the axis drawn through the focus.

By Art. 12 the equation to the parabola is $y^2 = 4ax$. Now, when $x = a$, y is half the chord through the focus; $\therefore$ that half-chord² $= 4a^2$, or the *latus rectum* $= 4a$.

83. Prop. II.—To find the subtangent of the parabola.

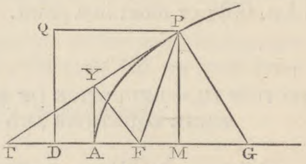

Fig. 22.

The *subtangent* is the portion of the diameter included between the ordinate and the tangent.

Let PT be the tangent meeting the axis in T; MT is the subtangent.

The equation to the tangent PT is (Art. 55) $yy' = 2a(x + x')$.

Now, at the point T, $y = 0$, $\therefore x = -x'$, or AT = AM; hence *the subtangent is double the abscissa.*

84. Cor.—Since AT = AM and AF = AD; by addition, FT = DM = PQ = FP; $\therefore \angle$ FPT $= \angle$ FTP $= \angle$ QPT, or *the tangent bisects the angle between two lines drawn from the point of contact, the one to the focus, the other perpendicular to the directrix.*

This is the property of the tangent employed in the treatise on Conic Sections, to which the reader is referred for the geometrical properties to which it leads.

85. Prop. III.—To find the equation to the normal of the parabola.

The *normal* is the straight line which is perpendicular to the tangent at the point of contact.

Let PT be the tangent at the point P, PG perpendicular to PT is the normal.

The equation to PT is

$$yy' = 2a(x + x'), \text{ or } y = \frac{2a}{y'}x + \frac{2ax'}{y'};$$

and the equation to a line perpendicular to this is (Art. 69)

$$y = -\frac{y'}{2a}x + q.$$

Now the point P, whose co-ordinates are x', y', is a point in this line; therefore

$$y' = -\frac{y'}{2a}x' + q,$$

and by subtraction $y - y' = -\frac{y'}{2a}(x - x')$,

which is the equation to the normal.

86.—Cor. At the point G, $y = 0$, $x = AG$. Hence $AG = x' + 2a = AM + 2a$; $\therefore MG = 2a$.

The line MG is called the *subnormal;* and it follows that the subnormal is equal to half the latus rectum.

87. Prop. IV.—The perpendicular from the focus on the tangent intersects the tangent in the axis of y.

The equation to the tangent is

$$yy' = 2a(x + x')$$
$$= 2ax + \frac{y'^2}{2}$$

or $$y'\left(y - \frac{y'}{2}\right) = 2ax; \ldots\ldots\ldots\ldots(1)$$

and the equation to the perpendicular from F on the tangent is

$$y = -\frac{y'}{2a}(x - a)$$
$$= -\frac{y'x}{2a} + \frac{y'}{2}$$
$$\text{or } y - \frac{y'}{2} = -\frac{y'x}{2a}. \ldots\ldots\ldots\ldots(2)$$

At their point of section x and y are the same in both. Now if x be not 0, $y - \frac{y'}{2}$ is positive in equation (1) and negative in equation (2), or *vice versâ*, which is impossible; $\therefore x = 0$, or the point of intersection is in the axis of y.

88. Cor.—FP : FY : : FY : FA,

or $$FP = \frac{FY^2}{FA} = \frac{FY^2}{FA^2}FA = \frac{FA}{\sin^2 T}.$$

89. Prop. V.—To find the locus of the intersection of the tangent with the perpendicular on it from the vertex.

The equation to the tangent is $yy' = 2a(x + x')$,......(1) and the equation to the perpendicular on it from the vertex is $y = -\frac{y'}{2a}x$; ....(2)

Also the equation to the parabola is $y'^2 = 4ax'$............(3)

From equation (2), $y' = -2a\frac{y}{x}$, and hence, from equation (1) $2ax' = -\frac{2ay^2}{x} - 2ax$. Substituting these values in (3), there is obtained

$$\frac{4a^2y^2}{x^2} = -\frac{4ay^2}{x} - 4ax$$

or $$y^2 = -\frac{x^3}{a + x};$$

which shows (Art. 19) that the locus is a cissoid, the diameter of whose generating circle is AD.

90. Prop. VI.—To find the equation to the parabola when the axes are any diameter and the tangent at its extremity.

Let PN be the diameter parallel to AM; QN the ordinate parallel to the tangent at P; x', y' the co-ordinates of P; x, y of Q referred to the axis; x'', y'' the co-ordinates PN, NQ referred to the diameter PN and the tangent tP. Hence, $x = x' + x'' + y'' \cos T$,

$$y = y' + y'' \sin T;$$

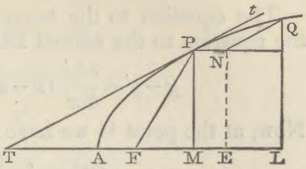

Fig. 23.

therefore the equation $y^2 = 4ax$ becomes

$$(y' + y''\sin T)^2 = 4a(x' + x'' + y''\cos T),$$

or $y'^2 + 2y'y''\sin T + y''^2\sin^2 T = 4ax' + 4ax'' + 4ay''\cos T$.

Now $\tan T = \frac{2a}{y'}$ (Art. 6); $\therefore 2y'y''\sin T = 4ay''\cos T$; and $y'^2 = 4ax'$; hence the equation is reduced to $y''^2\sin^2 T = 4ax''$.

But $\frac{4a}{\sin^2 T} = 4\,FP$ (Art. 88); hence $y''^2 = 4\,FPx''$ is the equation required.

The equation when the curve is referred to any diameter and its bisected chords is consequently of the same form as the equation when the curve is referred to the axis. The conclusions arrived at in the one case are very easily adapted to the other.

91. Prop. VII.—The semi-latus-rectum is an harmonic mean between the segments of any chord drawn through the focus.

Let PFR be a chord through the focus; then (Art. 13),

$$\frac{1}{FP} = \frac{1}{2a}(1 - \cos PFM);$$

similarly $$\frac{1}{FR} = \frac{1}{2a}(1 - \cos RFM).$$

Now, $\cos PFM + \cos RFM = 0$; $\therefore \frac{1}{FP} + \frac{1}{FR} = \frac{2}{2a}$, which proves the proposition.

4. *The Ellipse.*

92. Prop. I.—If a circle be described about the axis major, then ordinates to the ellipse and the circle to the same abscissa, have to one another the proportion of the axis minor to the axis major.

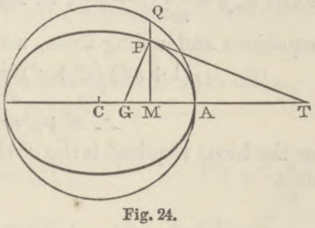

Fig. 24.

Let MPQ be an ordinate to the abscissa CM; then

$$MP^2 = \frac{b^2}{a^2}(a^2 - x^2) \text{ (Art 14)},$$

and $MQ^2 = a^2 - x^2$ (Art. 10);

$\therefore$ $MP^2 : MQ^2 :: b^2 : a^2$,

or $MP : MQ :: b : a$.

93. Prop. II.—To find the subtangent of the ellipse.

The equation to the tangent PT is $a^2yy' + b^2xx' = a^2b^2$.

At the point T, $y = 0$; $\therefore xx' = a^2$, or $CT.CM = CA^2$; whence the subtangent

$$MT = CT - CM = \frac{CA^2}{CM} - CM = \frac{CA^2 - CM^2}{CM}.$$

94. Cor.—If a tangent be drawn to the circle at Q, it will cut the axis in the same point T, for CT is independent of b.

95. Prop. III.—To find the value of the subnormal.

The equation to the tangent being $a^2yy' + b^2xx' = a^2b^2$, the equation to the normal PG will be

$$y - y' = \frac{a^2y'}{b^2x'}(x - x') \text{ (Art. 69).}$$

Now, at the point G we have $y = 0$;

$$\therefore \text{CG} = x' - \frac{b^2x'}{a^2} = e^2x' = e^2\text{CM}.$$

96. Prop. IV.—The normal bisects the angle between the two focal distances.

For, retaining the letters placed at the foci in Art. 14, we have

$\text{FG} = \text{FC} + \text{CG} = ae + e^2x'$;
and $\text{SG} = \text{SC} - \text{CG} = ae - e^2x'$.
Also $\text{SP} = a - ex'$ (Art. 15), and therefore
$\text{FP} = a + ex'$; whence
$\text{FG} : \text{SG} :: \text{FP} : \text{SP}$,

and (Euc. vi. 3) the angle FPS is bisected by the line PG.

97. Cor.—Hence also the tangent bisects the angle between one of the focal distances and the other produced.

98. Prop. V.—To find the locus of the intersection of the tangent with the perpendicular on it from the focus.

If we write $m = \frac{b^2x'}{a^2y'}$, we shall have as the equation to the tangent, $y + mx = \frac{b^2}{y'}$.

Now
$$\left(\frac{b^2}{y'}\right)^2 = m^2\left(\frac{a^2}{x'}\right)^2 = \frac{m^2a^2}{1 - \frac{y'^2}{b^2}};$$

hence $\left(\frac{b^2}{y'}\right)^2 - b^2 = m^2a^2$, and $y + mx = \sqrt{b^2 + m^2a^2}$ is the equation to the tangent.

Also the equation to the perpendicular on it from the focus is, $y = \frac{1}{m}(x - ae)$; or $my - x = -ae$. Squaring the equations and adding them, we get

$$(1 + m^2)(x^2 + y^2) = b^2 + m^2a^2 + a^2e^2,$$
$$= (1 + m^2)\, a^2;$$
$$\therefore x^2 + y^2 = a^2;$$

or the locus required is the circle described about the major axis.

99. Prop. VI.—The rectangle by the two perpendiculars from the foci on the tangent is equal to the square of the semi-axis minor.

The length of the perpendicular from a point whose co-ordinates are x_1, y_1, on a straight line whose equation is $y = -mx + c$ is (Art. 70) $\frac{y_1 + mx_1 - c}{\sqrt{1 + m^2}}$;

Now, the co-ordinates of S are $x_1 = ae$, $y_1 = 0$; hence the perpendicular from S on the tangent is equal to

$$\frac{mae - c}{\sqrt{1 + m^2}}, \text{ where } c = \sqrt{b^2 + m^2a^2}.$$

In the same way the length of the perpendicular from F on the tangent is $\frac{-mae - c}{\sqrt{1 + m^2}}$; consequently their rectangle is $\frac{c^2 - m^2a^2e^2}{1 + m^2} = b^2$.

100. Prop. VII.—To find the equation to the ellipse when referred to two diameters as axes, of which the one is parallel to a tangent at the extremity of the other.

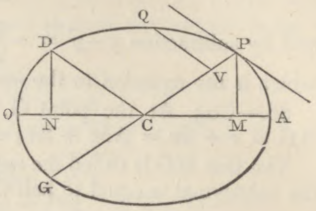

Fig. 25.

Let CP be one diameter, and CD parallel to the tangent at P the extremity of the other.

Let the co-ordinates of P, referred to the axes as before, be x', y'; of Q, x_1, y_1, and let the co-ordinates of Q referred to CP and CD be x and y, or $\text{CV} = x$, $\text{QV} = y$; also let the angle $\text{PCA} = \theta$, $\text{DCO} = \varphi$; then $\tan\varphi = \frac{b^2x'}{a^2y'}$, and $\tan\theta = \frac{y'}{x'}$;

$$\therefore \tan\theta\tan\varphi = \frac{b^2}{a^2}; \text{ i. e., } a^2\sin\theta\sin\varphi = b^2\cos\theta\cos\varphi.$$

And (Art. 41) $\quad x_1 = x\cos\theta - y\cos\varphi$,
$\quad y_1 = x\sin\theta + y\sin\varphi$.

Substituting these values in the equation $a^2y_1{}^2 + b^2x_1{}^2 = a^2b^2$, there results

$$a^2(x\sin\theta + y\sin\varphi)^2 + b^2(x\cos\theta - y\cos\varphi)^2 = a^2b^2,$$

or $a^2(x^2\sin^2\theta + y^2\sin^2\varphi) + b^2(x^2\cos^2\theta + y^2\cos^2\varphi) = a^2b$.
or $a'^2y^2 + b'^2x^2 = a'^2b'^2$, where

$$a'^2 = \frac{a^2b^2}{a^2\sin^2\theta + b^2\cos^2\theta}, \quad b'^2 = \frac{a^2b^2}{a^2\sin^2\varphi + b^2\cos^2\varphi}.$$

101. Cor. 1.—Since only the squares of x and y appear in the equation, the line CP bisects all chords parallel to CD, or (Art. 50) *the diameters* CP, CD *are conjugate diameters*, and CP is parallel to the tangent at D.

102. Cor. 2.—By making successively $x = 0$ and $y = 0$, we obtain $\text{CP} = a'$, $\text{CD} = b'$. Hence the equation is exactly the same as when referred to the principal axes; and the results obtained in that case are easily adapted to the present.

103. Cor. 3.—We have

$$a'^2\sin^2\theta : b'^2\cos^2\varphi :: a^2\tan^2\varphi + b^2 : a^2 + b^2\cot^2\theta,$$
$$:: \frac{b^4x'^2}{a^4y'^2} + b^2 : a^2 + \frac{b^2 + {}'^2}{y'^2},$$
$$:: b^2 \quad : a^2,$$

$\therefore \quad \text{PM} : \text{CN} :: b \quad : a.$
Similarly $\quad \text{DN} : \text{CM} :: b \quad : a,$
$\therefore \quad \text{PM} : \text{CN} :: \text{DN} : \text{CM}.$

104. Cor. 4.—$\text{CP}^2 + \text{CD}^2 = \text{CM}^2 + \text{MP}^2 + \text{CN}^2 + \text{ND}^2$

$$= \text{CM}^2 + \text{MP}^2 + \frac{a^2}{b^2}\text{MP}^2 + \frac{b^2}{a^2}\text{CM}^2$$
$$= (a^2 + b^2)\left(\frac{\text{CM}^2}{a^2} + \frac{\text{MP}^2}{b^2}\right)$$
$$= a^2 + b^2;$$

or *the sum of the squares of any two conjugate axes is the same as the sum of the squares of the principal axes.*

105. Cor. 5.—$\text{CD}^2 = \frac{a^2}{b^2}y'^2 + \frac{b^2}{a^2}x'^2$,

$$= a^2\left(1 - \frac{x'^2}{a^2}\right) + \frac{b^2}{a^2}x'^2$$
$$= a^2 - e^2x'^2$$
$$= \text{FP} \,.\, \text{SP (Art. 15).}$$

106. Prop. VIII.—All parallelograms circumscribing the ellipse are equal.

If tangents be drawn at the extremities of conjugate diameters, they will form a parallelogram of which the area is $4\,a'b'\sin(\theta+\phi)$

$$=4\,a'b'\sin\theta\cos\phi+4\,a'b'\cos\theta\sin\phi$$
$$=4\,\mathrm{PM}\,.\,\mathrm{CN}+4\,\mathrm{CM}\,.\,\mathrm{DN}$$
$$=4\frac{a}{b}\mathrm{PM}^2+4\frac{b}{a}\mathrm{CM}^2\ \text{(Art. 103)}$$
$$=4\,ab\left(\frac{\mathrm{PM}^2}{b^2}+\frac{\mathrm{CM}^2}{a^2}\right)=4\,ab.$$

107. Prop. IX.—The ellipse is the curve generated by a point whose distance from the focus is to its distance from the directrix as $e:1$.

Let EQ be the directrix at a distance from the centre $\mathrm{CE}=\frac{a}{e}$; then

$$\mathrm{PQ}=\mathrm{ME}=\mathrm{CE}-\mathrm{CM}$$
$$=\frac{a}{e}-x=\frac{a-ex}{e}=\frac{\mathrm{FP}}{e}$$

(Art. 15); $\therefore\ \mathrm{FP}:\mathrm{PQ}::e:1$.

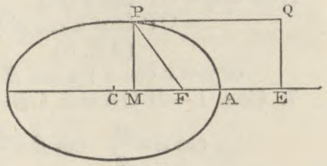

Fig. 26.

5. *The Hyperbola.*

The equation to the hyperbola differs from that to the ellipse only in having $-b^2$ in place of b^2. With this limitation, the properties given above and their demonstrations are common to both curves, and it would be superfluous to repeat them. We shall, accordingly, confine ourselves to that property of the hyperbola which has no parallel in the ellipse—the asymptote and its consequences.

108. Prop. I.—To find the equation to the asymptote of the hyperbola.

We have already (Art. 30) shown that if the values of y be expressed in a descending series of powers of x, the equation to the asymptote may be obtained from it by omitting all negative powers.

Now in the hyperbola (Art. 17)—

$$y^2=\frac{b^2}{a^2}(x^2-a^2)$$
$$=\frac{b^2}{a^2}x^2\left(1-\frac{a^2}{x^2}\right)$$
$$\therefore\ y=\pm\frac{b\,x}{a}\left(1-\frac{1}{2}\frac{a^2}{x^2}+\ \&\text{c.}\right)$$

Hence the straight line whose equation is $y=\pm\frac{bx}{a}$ is an asymptote to the curve.

If the curve be referred to conjugate diameters, the same reasoning will show that the equation to the asymptotes is $y=\pm\frac{b'}{a'}x$.

It is evident that the asymptotes are the diagonals of a parallelogram of which the conjugate diameters are the lines joining the points of bisection of opposite sides.

109. Prop. II.—If any chord of the hyperbola be terminated by the asymptotes, the rectangle by its segments is equal to the square of the semi-axis parallel to that chord.

Let RPQH (fig. 27) be a chord terminated by the asymptotes; then $\mathrm{RP}\,.\,\mathrm{PH}=b'^2$.

Let the curve be referred to conjugate diameters, of which one is parallel to RH; its equation is

$$y^2=\frac{b'^2}{a'^2}(x^2-a'^2);$$

and the equation to the asymptote

$$y'^2=\frac{b'^2}{a'^2}x^2.$$
$$\therefore\ y'^2-y^2=\frac{b'^2}{a'^2}a'^2=b'^2;$$
$$\text{i.e.}\qquad \mathrm{MR}^2-\mathrm{MP}^2=b'^2.$$

Now $\mathrm{MP}=\mathrm{MQ}$ being respectively $\pm\frac{b'}{a'}\sqrt{x^2-a'^2}$, and

$\mathrm{MR}=\mathrm{MH}$ being respectively $\pm\frac{b'}{a'}x$;

$\therefore$ the above equation gives $\mathrm{RP}\,.\,\mathrm{PH}=b'^2$.

110. Prop. III.—To find the equation to the curve when referred to the asymptotes as axes.

Draw NP parallel to CR, and let $\mathrm{CN}=x'$, $\mathrm{NP}=y'$. Suppose CM in the direction of the transverse* axis $=x$, MP perpendicular to it $=y$, the angle $\mathrm{RCM}=\theta$; then $x=x'\cos\theta+y'\cos\theta$,

$$y=y'\sin\theta-x'\sin\theta;$$
$$\therefore\ a^2(y'-x')^2\sin^2\theta-b^2(x'+y')^2\cos^2\theta=-a^2b^2.$$

Now $\tan\theta=\frac{b}{a}$;

$$\therefore\qquad \sin^2\theta=\frac{b^2}{a^2+b^2},$$
$$\cos^2\theta=\frac{a^2}{a^2+b^2};$$

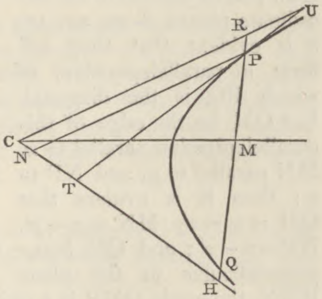

Fig. 27.

hence $$\frac{a^2b^2}{a^2+b^2}\left\{(y'-x')^2-(x'+y')^2\right\}=-a^2b^2;$$

or $$x'y'=\frac{a^2+b^2}{4},\ \text{the equation required.}$$

111. Prop. IV.—If any tangent be produced to meet the two asymptotes, the area of the triangle contained by the tangent and the two asymptotes is always the same.

Let UPT be the tangent; its equation (Art. 55);

$$xy'+yx'=\frac{a^2+b^2}{2}.$$

Now, when $y=0$, $x=\mathrm{CT}$; $\therefore\ \mathrm{CT}=\frac{a^2+b^2}{2y'}$;

and when $x=0$, $y=\mathrm{CU}$; $\therefore\ \mathrm{CU}=\frac{a^2+b^2}{2x'}$.

Hence $$\mathrm{CT}\,.\,\mathrm{CU}=\frac{(a^2+b^2)^2}{4\,x'y'}=a^2+b^2;$$

and as the angle TCU is constant, the area TCU is always the same, whatever be the point P.

We cannot close this portion of our subject without acknowledging our obligations to Mr Salmon, whose masterly treatise can hardly be too highly recommended.

ANALYTICAL GEOMETRY OF THREE DIMENSIONS; OR SOLID CO-ORDINATE GEOMETRY.

1. As in plane co-ordinate geometry, the position of a point in a plane is denoted by its distances from two given lines, so in solid geometry the position of a point in space

---

* The terms transverse and conjugate are more appropriate than major and minor in the case of the hyperbola.

is denoted by its distances from three given planes. The direction in which the distance from any one plane is measured is parallel to the line of intersection of the other two. The planes of reference are called the *co-ordinate planes*, and their lines of intersection the *co-ordinate axes;* the point in which the three intersect one another being the *origin*.

SECTION I.—PROPERTIES OF THE PLANE AND STRAIGHT LINE.

We shall at present confine ourselves to rectangular axes.

2. PROP. I.—To find the distance between two points in terms of their co-ordinates.

Let Ox, Oy, Oz be the axes of co-ordinates; P, Q the two points; x, y, z the co-ordinates of P; x', y', z' the co-ordinates of Q. Through P, Q draw planes parallel to the co-ordinate planes of xy, xz, yz; it is evident that they will form a parallelepipedon, of which PQ is the diagonal. Let QM be the edge of this parallelepipedon parallel to x, MN parallel to y, and NP to z: then it is evident that $\text{QM} = x - x'$, $\text{MN} = y - y'$, $\text{NP} = z - z'$: and QM being perpendicular to the plane PMN, the angle QMP is a right angle.

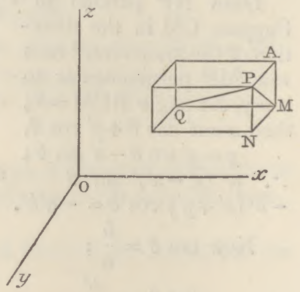

Fig. 28.

$$\therefore\ \text{PQ}^2 = \text{QM}^2 + \text{MP}^2 = \text{QM}^2 + \text{MN}^2 + \text{NP}^2$$
$$= (x - x')^2 + (y - y')^2 + (z - z')^2.$$

3. COR. 1.—If α, β, γ be the angles which PQ makes with the axes of x, y, z, we shall have

$$x - x' = \text{QM} = \text{PQ} \cos \text{PQM} = \text{PQ} \cos \alpha,$$
$$y - y' = \text{PQ} \cos \beta,$$
$$z - z' = \text{PQ} \cos \gamma;$$
$$\therefore\quad \text{PQ}^2 = \text{PQ}^2 \cos^2 \alpha + \text{PQ}^2 \cos^2 \beta + \text{PQ}^2 \cos^2 \gamma,$$
$$\text{and}\quad \cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1;$$

consequently the angles which a straight line makes with the axes are not all three arbitrary, but where two are given, the third is determined by the above equation.

4. COR. 2.—If we take the three equations,

$$x - x' = \text{PQ} \cos \alpha, \quad y - y' = \text{PQ} \cos \beta, \quad z - z' = \text{PQ} \cos \gamma,$$

and multiply the first by $x - x'$, the second by $y - y'$, and the third by $z - z'$, and add the results, we shall get

$$(x - x') \cos \alpha + (y - y') \cos \beta + (z - z') \cos \gamma = \text{PQ}.$$

5. PROP. II.—To find the angle between two straight lines in terms of the angles which the lines make with the axes.

Draw through the origin two lines OP, OQ parallel to the given lines, and let OP make with the axes the angles α, β, γ, and OQ the angles α', β', γ'.

Take $\text{OP} = 1$, $\text{OQ} = 1$, and let the angle POQ be θ; then $x = \text{OP} \cos \alpha = \cos \alpha$, $y = \cos \beta$, &c.

$$\text{Now } \text{PQ}^2 = \text{OP}^2 + \text{OQ}^2 - 2\ \text{OP} \cdot \text{OQ} \cos \theta,$$
$$= 2 - 2 \cos \theta.$$
$$\text{But } \text{PQ}^2 = (x - x')^2 + (y - y')^2 + (z - z')^2$$
$$= (\cos \alpha - \cos \alpha')^2 + (\cos \beta - \cos \beta')^2$$
$$+ (\cos \gamma - \cos \gamma')^2$$
$$= \cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma + \cos^2 \alpha' + \cos^2 \beta' + \cos^2 \gamma'$$
$$- (2 \cos \alpha \cos \alpha' + \cos \beta \cos \beta' + \cos \gamma \cos \gamma')$$
$$= 2 - 2 (\cos \alpha \cos \alpha' + \cos \beta \cos \beta' + \cos \gamma \cos \gamma');$$
$$\therefore\ \cos \theta = \cos \alpha \cos \alpha' + \cos \beta \cos \beta' + \cos \gamma \cos \gamma'.$$

6. PROP. III.—To find the equation to a plane.

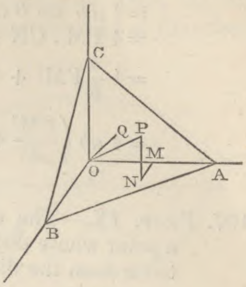

Fig. 29.

Let ABC be the plane, P any point in it, of which the co-ordinates are x, y, z; OQ perpendicular to the plane $= p$, making with the axes of x, y, and z the angles α, β, and γ.

Let also OP make with the axes the angles α', β', γ': then, as in Art. 3, we have $x = \text{OP} \cos \alpha'$, $y = \text{OP} \cos \beta'$, $z = \text{OP} \cos \gamma'$.

$$\text{Now OQ} = \text{OP} \cos \text{POQ}$$
$$= \text{OP} (\cos \alpha \cos \alpha' + \cos \beta \cos \beta' + \cos \gamma \cos \gamma)$$
$$(\text{Art. } 5),$$
$$\text{or } p = x \cos \alpha + y \cos \beta + z \cos \gamma.$$

7. COR. 1.—If $\text{OA} = a$, $\text{OB} = b$, $\text{OC} = c$, we have

$$\cos \alpha = \frac{p}{a}, \quad \cos \beta = \frac{p}{b}, \quad \cos \gamma = \frac{p}{c};$$
$$\therefore\ x \cos \alpha + y \cos \beta + z \cos \gamma = \frac{xp}{a} + \frac{yp}{b} + \frac{zp}{c};$$

hence $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$, is another form of the equation.

8. COR. 2.—Any simple equation in x, y, z of which the general form is $\text{A}x + \text{B}y + \text{C}z = \text{D}$ will represent a plane.

9. COR. 3.—If the equation be written in the form exhibited in the last corollary, we must have

$$\frac{\cos \alpha}{p} = \frac{\text{A}}{\text{D}}, \quad \frac{\cos \beta}{p} = \frac{\text{B}}{\text{D}}, \quad \frac{\cos \gamma}{p} = \frac{\text{C}}{\text{D}};$$
$$\therefore\ (\text{Art. } 3) \quad \frac{1}{p^2} = \frac{\text{A}^2 + \text{B}^2 + \text{C}^2}{\text{D}^2},$$
$$\text{or } p = \frac{\text{D}}{\sqrt{\text{A}^2 + \text{B}^2 + \text{C}^2}},$$
$$\cos \alpha = \frac{\text{A}}{\sqrt{\text{A}^2 + \text{B}^2 + \text{C}^2}}, \qquad \cos \beta = \frac{\text{B}}{\sqrt{\text{A}^2 + \text{B}^2 + \text{C}^2}},$$
$$\cos \gamma = \frac{\text{C}}{\sqrt{\text{A}^2 + \text{B}^2 + \text{C}^2}}.$$

10. COR. 4.—If $z = 0$ in Cor. 1, we get $\frac{x}{a} + \frac{y}{b} = 1$, which is obviously the equation to the line AB. This line is called the *trace* of the plane on the plane of xy. In like manner, AC, BC are the traces of the plane or the planes of xz and yz.

11. COR. 5.—If the plane be parallel to the axis of z or perpendicular to the plane of xy, the line OQ is in the place of xy; $\therefore\ \gamma = \frac{\pi}{2}$ and $\cos \gamma = 0$; hence the equation to the plane becomes $x \cos \alpha + y \cos \beta = p$, or the equation to the plane is the same as the equation to its trace on the plane of xy.

12. PROP. IV.—To find the equations to a straight line.

A straight line is the intersection of two planes, consequently the equations to those planes will be satisfied simultaneously for the line. These are therefore the equations to the line.

If the two equations be $\text{A}x + \text{B}y + \text{C}z = \text{D}$ and $\text{A}'x + \text{B}'y + \text{C}'z = \text{D}'$, we may obtain by elimination

$$x = az + p, \quad y = bz + q$$

as the form of the equations required.

13. The equations are sometimes obtained in the following manner:—

Let planes pass through the line respectively perpendicular to the planes of xz and yz. Their equations will have the form (Art. 11) $x=az+p$, $y=bz+q$, which are the equations to the line.

14. Cor. 1.—It is evident that if perpendiculars be drawn from every point in the given line to the plane of xz, they will intersect that plane in the line whose equation is $x=az+p$. This latter line is called the *projection* of the given line on the plane of xz. Consequently, the equations to a line are the equations to its projections on two of the co-ordinate planes.

15. Prop. V.—To express the angles which a straight line makes with the co-ordinate axes in terms of a and b.

Let PQ, fig. of Art. 2, be the line, $x=az+p$, $y=bz+q$ its equations; then because the point Q, of which the co-ordinates are x', y', z', is a point in the line, we have

$$x-x'=a\,(z-z'),\quad y-y'=b\,(z-z'),$$

and
$$\cos\alpha=\frac{x-x'}{\mathrm{PQ}},\quad \cos\beta=\frac{y-y'}{\mathrm{PQ}},\quad \cos\gamma=\frac{z-z'}{\mathrm{PQ}};$$

i.e.
$$\cos\alpha=\frac{x-x'}{\sqrt{(x-x')^2+(y-y')^2+(z-z')^2}}=\frac{a}{\sqrt{a^2+b^2+1}};$$

$$\cos\beta=\frac{b}{\sqrt{a^2+b^2+1}},\quad \cos\gamma=\frac{1}{\sqrt{a^2+b^2+1}}.$$

16. Cor. 1.—$a=\dfrac{\cos\alpha}{\cos\gamma}$, $b=\dfrac{\cos\beta}{\cos\gamma}$.

17. Cor. 2.—$\dfrac{x-x'}{a}=\dfrac{y-y'}{b}=z-z'$;

$$\text{or}\quad \frac{x-x'}{\cos\alpha}=\frac{z-z}{\cos\gamma}\quad\text{and}\quad\frac{y-y'}{\cos\beta}=\frac{z-z'}{\cos\gamma};$$

which are the equations to a straight line in terms of the angles which it makes with the co-ordinate axes.

18. Cor. 3.—If $x=a'z+p'$, $y=b'z+q'$ be the equations to another straight line; then, if θ be the angle between them, we shall have

$$\cos\theta=\cos\alpha\cos\alpha'+\cos\beta\cos\beta'+\cos\gamma\cos\gamma'\ \text{(Art. 5)}$$
$$=\frac{aa'+bb'+1}{\sqrt{a^2+b^2+1}\,\sqrt{a'^2+b'^2+1}}.$$

19. Cor. 4.—In order that the two straight lines may be at right angles to one another, we must have $\cos\theta=0$, or $aa'+bb'+1=0$.

20. Prop. VI.—To find the conditions that a straight line may be at right angles to a plane.

It is evident that the angles determined in Art. 9, which the perpendicular to the plane makes with the axes, must be equal to those determined in Art. 15, which the straight line makes with them; or

$$\frac{\mathrm{A}}{\sqrt{\mathrm{A}^2+\mathrm{B}^2+\mathrm{C}^2}}=\frac{a}{\sqrt{a^2+b^2+1}},\quad\frac{\mathrm{B}}{\sqrt{\mathrm{A}^2+\mathrm{B}^3+\mathrm{C}^2}}=\frac{b}{\sqrt{a^2+b^2+1}}$$
$$\frac{\mathrm{C}}{\sqrt{\mathrm{A}^2+\mathrm{B}^2+\mathrm{C}^2}}=\frac{1}{\sqrt{a^2+b^2+1}};$$

$\therefore$ $\mathrm{A}=a\mathrm{C}$, $\mathrm{B}=b\mathrm{C}$ are the conditions required.

21. Prop. VII.—To find the conditions that a straight line may coincide with a plane.

Let $x=az+p$, $y=bz+q$ be the equations to the line; $\mathrm{A}x+\mathrm{B}y+\mathrm{C}z=\mathrm{D}$ the equation to the plane; then, since they coincide, we must have $\mathrm{A}\,(az+p)+\mathrm{B}(bz+q)+\mathrm{C}z=\mathrm{D}$, whatever be z; hence $\mathrm{A}a+\mathrm{B}b+\mathrm{C}=0$ and $\mathrm{A}p+\mathrm{B}q=\mathrm{D}$ are the conditions required.

22. Cor.—The condition that the straight line may be parallel to the plane is $\mathrm{A}a+\mathrm{B}b+\mathrm{C}=0$; being the condition that a line and plane parallel to these through the origin shall coincide.

23. Prop. VIII.—To find the length of the perpendicular from a given point on a given plane.

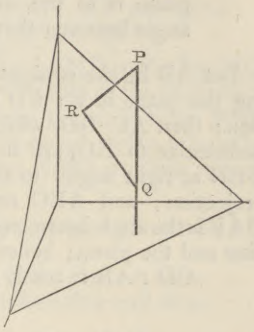

Fig. 30.

Let P be the point of which the co-ordinates are x', y', z'; PR perpendicular to the plane whose equation is $\mathrm{A}x+\mathrm{B}y+\mathrm{C}z=\mathrm{D}$.

Draw PQ parallel to the axis of z, meeting the plane in Q: then

$$\mathrm{PR}=\mathrm{PQ}\cos\mathrm{QPR}$$
$$=\mathrm{PQ}\frac{\mathrm{C}}{\sqrt{\mathrm{A}^2+\mathrm{B}^2+\mathrm{C}^2}}\ \text{(Art. 9)};$$

$$\text{But }\mathrm{PQ}=z'-\frac{\mathrm{D}-\mathrm{A}x'-\mathrm{B}y'}{\mathrm{C}},$$

$$\therefore\ \mathrm{PR}=\frac{\mathrm{A}x'+\mathrm{B}y'+\mathrm{C}z'-\mathrm{D}}{\sqrt{\mathrm{A}^2+\mathrm{B}^2+\mathrm{C}^2}}.$$

24. If from every point in the boundary of a given surface, straight lines be drawn parallel to a given line and meeting a fixed plane, they form the boundary of the *projection* of the surface on that plane. When the lines are drawn perpendicular to the plane, the projection is called an *orthogonal projection.* It is with this class alone that we are concerned here.

Prop. IX.—The projection of a plane area is to the area itself, as the cosine of the angle between the two planes is to unity.

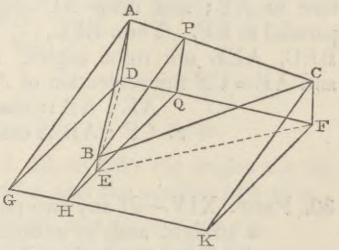

Fig. 31.

Suppose the area divided into triangles, indefinitely small if necessary. Let ABC be one of these triangles, DEF its projection; and let the line of intersection of the planes of ABC, DEF be GK. Through A, B, C draw planes at right angles to GK, and therefore passing through D, E, and F; each of the angles AGD, PHQ, CKF is equal to the angles between the planes.

Now the triangles ABP, DEQ have BP, EQ as their bases, and GH as their common altitude;

$$\therefore\ \mathrm{DEQ}:\mathrm{ABP}::\mathrm{EQ}:\mathrm{BP}$$
$$::\cos\mathrm{PHQ}:1.$$

Similarly of the other triangles. Hence the truth of the proposition.

25. Prop. X.—The square of any plane area is equal to the sum of the squares of its projections on the three co-ordinate planes.

Let A_x, A_y, A_z represent the projections of A on the planes of yz, xz, and xy; α, β, γ, the angles which the perpendicular on A makes with the axes of x, y, and z; then α is the angle which the area makes with the plane of yz. $\therefore$ $\mathrm{A}_x=\mathrm{A}_y\cos\alpha$. Similarly $\mathrm{A}_y=\mathrm{A}\cos\beta$, $\mathrm{A}_z=\mathrm{A}\cos\gamma$. Now $\cos^2\alpha+\cos^2\beta+\cos^2\gamma=1$; $\therefore$ $\mathrm{A}_x^2+\mathrm{A}_y^2+\mathrm{A}_z^2=\mathrm{A}^2$.

26. Prop. XI.—To find the equation to a plane in terms of the area and its projections on the co-ordinate planes.

As in the last proposition $\mathrm{A}=\mathrm{A}_x\cos\alpha$, &c.

$$\therefore\ \cos\alpha=\frac{\mathrm{A}_x}{\mathrm{A}},\quad\cos\beta=\frac{\mathrm{A}_y}{\mathrm{A}},\quad\cos\gamma=\frac{\mathrm{A}_z}{\mathrm{A}}$$

Now (Art. 6) the equation to the plane is

$$x\cos\alpha+y\cos\beta+z\cos\gamma=p;$$

hence it becomes $$x\text{A}_x+y\text{A}_y+z\text{A}_z=p\text{A}.$$

28. Prop. XII.—The projection of a straight line on a plane is to the straight line, as the cosine of the angle between them is to unity.

Let AB be the straight line meeting the plane in E; CD the projection; then AC, BD, which are perpendicular to ED, are in the plane BED at right angles to the plane of projection; and AEC or its equal BAF is the angle between the straight line and the plane; hence

CD : AB :: cos E : 1.

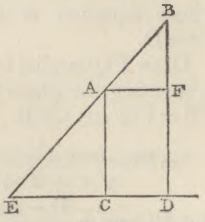

Fig. 32.

29. Prop. XIII.—The projection of a straight line on another straight line is to the straight line itself, as the cosine of their angle of inclination is to unity.

When two lines are not in the same plane, their angle of inclination is the angle which one of them makes with a straight line drawn through it parallel to the other.

Let AB be the line to be projected; CD the line on which it is to be projected. Draw AE parallel to CD; then BAE is the angle of inclination of the lines. Through B draw the plane BFE perpendicular to CD, and therefore to AE; and draw AC parallel to EF. Then EFC, BFC, AEB are right angles, ∴ AF is a parallelogram and AE = CF the projection of AB on CD. But

AE : AB :: cos BAE : 1;

∴ CF : AB :: cos BAE : 1.

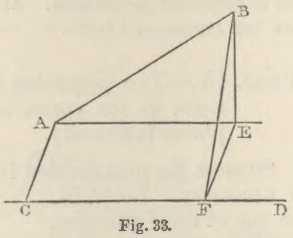

Fig. 33.

30. Prop. XIV.—If any two points be connected both by a straight and by a broken line, the projection of the former on a given line is equal to the sum of the projections of every part of the latter.

The projection of PQ on the line AB is equal to the sum of the projections of PM, MN, NR, RQ. Through P, M, N, R, Q draw planes perpendicular to AB; the intercepted portions of AB are the projections of PM, MN, &c.; hence the proposition is evidently true provided none of the intercepted portions lap over each other or are negative, as would be the case with the projection of MN in the following figure. But the cosines employed will rectify this, provided we attend to the directions of the lines as indicated in the figure by the arrows. For the projection of MN will be negative, because the angle is greater than a right angle, whilst all the others will be positive, including that of RQ, for which the angle is negative, but its cosine positive.

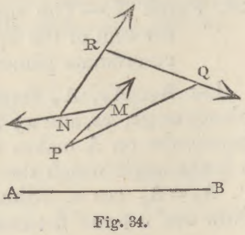

Fig. 34.

31. By a similar process, and retaining the same restriction as to direction, we may show that if an area be connected with any number of areas, having common edges with the former area and with each other, the projection of the former on any plane is equal to the sum of the projections of all the others.

SECTION II.—EQUATIONS TO SURFACES OF THE SECOND DEGREE DEDUCED FROM THEIR PROPERTIES.

32. *a.—The Sphere.*

The characteristic property is that every point is equally distant from the centre.

Let a, b, c, be the co-ordinates of the centre, and r the radius. The equation is evidently

$$(x-a)^2+(y-b)^2+(z-c)^2=r^2.$$

33. *b.—Oblique Cylinder on a Circular Base.*

We shall give the simplest form of the equation, by supposing the circular base to be in the plane of xy with its centre at the origin, so that its equation is $x^2+y^2=r^2$. This circle is called the *directrix.* A straight line moves parallel to itself in such a way as always to pass through the circumference of this circle. This line is called the *generatrix.* Let $x=az+p$, $y=bz+q$ be its equation. Then a, b, r are known constants. Now p, q are the values of x and y when $z=0$; they are therefore the co-ordinates of a point in the circumference of the directrix, or $p^2+q^2=r^2$, *i. e.* $(x-az)^2+(y-bz)^2=r^2$, which is the equation required.

34. Cor.—A similar process will determine the equation to the cylinder whatever be the equation to the directrix.

35. *c.—Oblique Cone on a Circular Base.*

We shall suppose the circle to be the same as in Art. 33. The generatrix is now required to pass through a fixed point called the vertex of the cone. Let a, b, c be the co-ordinates of this point; $x=\text{A}z+p$, $y=\text{B}z+q$, the equations to the generatrix: then we must have $a=\text{A}c+p$, $b=\text{B}c+q$, from which equations we obtain

$$p=\frac{az-cx}{z-c}, \qquad q=\frac{bz-cy}{z-c},$$

and, since $p^2+q^2=r^2$, the equation required is

$$(az-cx)^2+(bz-cy)^2=r^2\,(z-c)^2.$$

36. *d.—The Ellipsoid.*

The directrices are two ellipses at right angles to each other, having a common axis. We shall suppose their planes to be those of xy and xz. The generatrix is a variable ellipse, such that its semi-axes are the ordinates of the directrices.

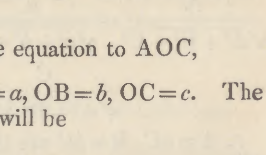

Fig. 35.

Let $\frac{x^2}{a^2}+\frac{\text{MQ}^2}{b^2}=1$ (1) be the equation to AOB,

$\frac{x^2}{a^2}+\frac{\text{MR}^2}{c^2}=1$ (2) the equation to AOC,

the two directrices; so that OA $=a$, OB $=b$, OC $=c$. The equation to the generatrix RPQ will be

$$\frac{y^2}{\text{MQ}^2}+\frac{z^2}{\text{MR}^2}=1\text{.........................}(3)$$

But by equations (1) and (2) $\text{MQ}^2=b^2\left(1-\frac{x^2}{a^2}\right)$, $\text{MR}^2=c^2\left(1-\frac{x^2}{a^2}\right)$. Hence (3) becomes

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}+\frac{z^2}{c^2}=1.$$

37. Cor.—If $b=c$, the ellipsoid becomes a spheroid, prolate or oblate according as b is less or greater than a.

38. *e.—Paraboloid of Revolution.*

The directrix is a parabola, which we shall suppose to be in the plane of xz, the axis of x being its axis, so that its equation is $z^2=4ax$. The generatrix is a variable circle in the plane of yz, such that its radius is always the ordinate of the parabola. The equation to the generatrix is $y^2+z^2=\text{radius}^2$, $\therefore\ y^2+z^2=4ax$ is the equation required.

39. *f.—Hyperboloid of One Sheet.*

This surface differs from the ellipsoid only in having the directrices two hyperbolas, with a common conjugate axis. Hence a^2 is negative, and the equation is therefore

$$\frac{y^2}{b^2}+\frac{z^2}{c^2}-\frac{x^2}{a^2}=1.$$

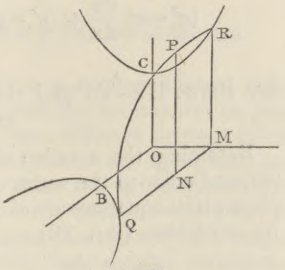

Fig. 36.

40. *h.—Hyperboloid of Two Sheets.*

This surface differs from the ellipsoid only in having the directrices hyperbolas with their transverse axis common. Hence b^2 and c^2 are negative, and the equation is therefore

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}-\frac{z^2}{c^2}=1.$$

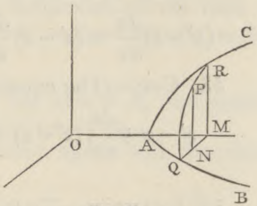

Fig. 37.

41. *h.—Elliptic Paraboloid.*

The directrices are here two parabolas placed as the two ellipses were in the case of the ellipsoid. The generatrix is a variable ellipse as before.

In the figure of last Article, if we suppose AB, AC to be two parabolas whose equations are $\text{MQ}^2=4ax$, $\text{MR}^2=4bx$, the origin being at A, we shall have as the equation to the ellipse RPQ

$$\frac{y^2}{\text{MQ}^2}+\frac{z^2}{\text{MR}^2}=1.$$

$$\frac{y^2}{4a}+\frac{z^2}{4b}=x \text{ is the equation required.}$$

42. *i.—Hyperbolic Paraboloid.*

The directrices are the same as in the last Article, but the generatrix is a variable hyperbola, whose semi-axes are the ordinates of the two parabolas. The equation to the hyperbola is therefore

$$\frac{y^2}{\text{MQ}^2}-\frac{z^2}{\text{MR}^2}=1.$$

Hence the equation to the surface is

$$\frac{y^2}{4a}-\frac{z^2}{4b}=x.$$

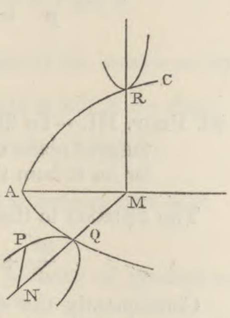

Fig. 38.

SECTION III.—TRANSFORMATION OF CO-ORDINATES.

Hitherto we have supposed the system of co-ordinates to be rectangular. This is indeed the fundamental system; but for the solution of certain problems it is necessary to pass to an oblique system. The investigation of the requisite formulæ will constitute the subject of the present section.

43. Prop. I.—To find the distance between two points in terms of their oblique co-ordinates.

Retaining the figure of Art. 2, and supposing the axes not to be at right angles, we have

$$\begin{aligned}\text{PQ}^2&=\text{QM}^2+\text{MP}^2-2\,\text{QM}\,.\,\text{MP}\cos\text{QMP}\\&=\text{QM}^2+\text{MN}^2+\text{NP}^2-2\,\text{MN}\,.\,\text{NP}\cos\text{MNP}\\&\qquad-2\,\text{QM}\,.\,\text{MP}\cos\text{QMP}.\end{aligned}$$

Now MP cos QMP is the projection of MP on the line MQ, and is therefore (Art. 29) equal to the sum of the projections of MN and NP on the same line, *i.e.*, to MN cos NMQ + NP cos AMQ. But if α, β, γ be the angles yOz, xOz, xOy, it is evident that MNP, AMQ, and NMQ are their respective supplements; hence

$$\begin{aligned}\text{PQ}^2&=\text{QM}^2+\text{MN}^2+\text{NP}^2+2\,\text{MN}\,.\,\text{NP}\cos\alpha+2\,\text{QM}\,.\,\text{NP}\cos\beta\\&\qquad+2\,\text{QM}\,.\,\text{MN}\cos\gamma\\&=(x-x')^2+(y-y')^2+(z-z')^2+2(y-y')(z-z')\cos\alpha\\&\qquad+2(x-x')(z-z')\cos\beta+2(x-x')(y-y')\cos\gamma.\end{aligned}$$

44. Prop. II.—To change the origin without altering the directions of the axes.

It is evident that this is effected by writing $x'+a$, $y'+b$, $z'+c$ for x, y, z.

45. Prop. III.—To pass from a rectangular system to any other, the origin remaining unchanged.

Let $\text{OM}=x$, $\text{MN}=y$, $\text{NP}=z$; $\text{OM}'=x'$, $\text{M}'\text{N}'=y'$, $\text{N}'\text{P}=z$. If the line OP be projected on the line Ox, the projection is OM or x; and if the broken line OM′, M′N′, N′P be projected on Ox, the projection is equal to

$$x'\cos x'x+y'\cos y'x+z'\cos z'x,$$

$$\therefore\ x=x'\cos x'x+y'\cos y'x+z'\cos z'x,$$

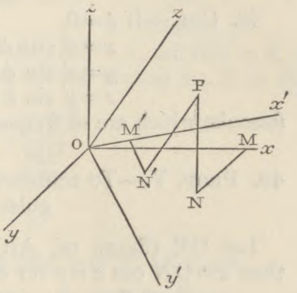

Fig. 39.

care being taken, as in Art. 30, to take the angles $x'x$, &c. between the *positive* axis of x' and the *positive* axis of x.

Similarly
$$\begin{aligned}y&=x'\cos x'y+y'\cos y'y+z'\cos z'y,\\z&=x'\cos x'z+y'\cos y'z+z'\cos z'z.\end{aligned}$$

Of the nine angles $x'x$, $y'x$, &c. employed above, six only are independent of one another; since by Art. 3 we have the three following relations between them, as conditions to be satisfied, viz.:—

$$\begin{aligned}&\cos^2 x'x+\cos^2 x'y+\cos^2 x'z=1,\\&\cos^2 y'x+\cos^2 y'y+\cos^2 y'z=1,\\&\cos^2 z'x+\cos^2 z'y+\cos^2 z'z=1.\end{aligned}$$

46. Cor.—If the new axes are rectangular as well as the old, we have three other equations of condition amongst the angles, to be satisfied, viz.:—$\cos x'y'=0$, $\cos x'z'=0$, $\cos y'z'=0$, which give (Art. 5)

$$\begin{aligned}&\cos x'x\cos y'x+\cos x'y\cos y'y+\cos x'z\cos y'z=0,\\&\cos x'x\cos z'x+\cos x'y\cos z'y+\cos x'z\cos z'z=0,\\&\cos y'x\cos z'x+\cos y'y\cos z'y+\cos y'z\cos z'z=0.\end{aligned}$$

These make up the six equations of condition.

47. Prop. IV.—To pass from one rectangular system to another in a form which shall involve only three angles.

To avoid the six equations of condition exhibited above, Euler devised the following beautiful method of transformation, which is of frequent use in the solution of *Mechanical Problems.*

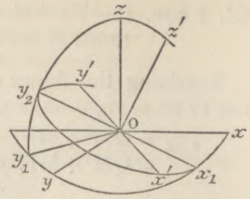

Fig. 40.

Let the angle between the planes of xy and $x'y'$ be called θ: let also these two planes intersect in the line Ox_1, which makes with the axis of x the angle $xOx_1=\phi$, and with the axis of x' the angle $x'Ox_1=\psi$.

(1.) Transform the co-ordinates to x_1y_1 in the plane of xy, the axis of z remaining unchanged; there results (PLANE GEOMETRY, Art. 40)

$$x=x_1 \cos\phi - y_1 \sin\phi,$$
$$y=x_1 \sin\phi + y_1 \cos\phi.$$

2.) Transform the co-ordinates to y_2z' in the plane y_1z, the axis of x_1 remaining unchanged; there results

$$y_1=y_2 \cos\theta - z' \sin\theta,$$
$$z=y_2 \sin\theta + z' \cos\theta.$$

(3.) Transform the co-ordinates to $x'y'$ in the plane x_1y_2, the axis of z' remaining unchanged; there results

$$x_1=x' \cos\psi - y' \sin\psi,$$
$$y_2=x' \sin\psi + y' \cos\psi.$$

By substitution, we obtain

$$x=(x'\cos\psi - y'\sin\psi)\cos\phi - (x'\sin\psi + y'\cos\psi)\sin\phi\cos\theta + z'\sin\phi\sin\theta,$$
$$y=(x'\cos\psi - y'\sin\psi)\sin\phi + (x'\sin\psi + y'\cos\psi)\cos\phi\cos\theta + z'\cos\phi\sin\theta,$$
$$z=(x'\sin\psi + y'\cos\psi)\sin\theta + z'\cos\theta,$$ the requisite formulæ.

48. COR.—If $\psi=0$,

$$x=x'\cos\phi - (y'\cos\theta - z'\sin\theta)\sin\phi,$$
$$y=x'\sin\phi + (y'\cos\theta - z'\sin\theta)\cos\phi,$$
$$z=y'\sin\theta + z'\cos\theta,$$

formulæ which are of frequent use.

49. PROP. V.—To transform the co-ordinates from rectangular to polar.

Let OP (figure of Art. 45)$=r$, $POz=\theta$, $NOx=\varphi$; then $x=ON\cos\varphi=r\sin\theta\cos\varphi$, $y=r\sin\theta\sin\varphi$, and $z=r\cos\theta$ are the requisite formulæ.

SECTION IV.—TANGENT PLANES AND NORMALS TO SURFACES.

50. PROP. 1.—To find the equation to the tangent plane to a surface.

If such a plane exists, it must have the property that if a section of it and of the surface be made by a plane parallel to any of the co-ordinate planes, the section of the plane will be a tangent line to the section of the surface.

Let x, y, z be the co-ordinates of the point of contact, x', y', z' those of any point in the tangent plane; and let the equation to that plane be

$$z'-z=p(x'-x)+q(y'-y).$$

Put $y'=y$ in the plane and in the surface; then, since the resulting line is a tangent to the resulting curve, we have

$$z'-z=\frac{dz}{dx}(x'-x),$$ y being constant;

$$\therefore p=\frac{dz}{dx}$$ the partial differential co-efficient.

Similarly $q=\dfrac{dz}{dy}$.

51. COR.—If the equation to the surface be written under the form $u=0$; and $\dfrac{du}{dx}, \dfrac{du}{dy}, \dfrac{du}{dz}$ represent the partial differential co-efficients of u with respect to x, y, and z respectively; since the total differential co-efficient of u with respect to x, when y is constant, must $=0$, we shall have

$$\frac{du}{dx}+\frac{du}{dz}\cdot\frac{dz}{dx}=0.$$ Similarly $$\frac{du}{dy}+\frac{du}{dz}\cdot\frac{dz}{dy}=0.$$

Hence $$\frac{dz}{dx}=-\frac{\dfrac{du}{dx}}{\dfrac{du}{dz}}, \qquad \frac{dz}{dy}=-\frac{\dfrac{du}{dy}}{\dfrac{du}{dz}},$$

and the equation to the tangent plane becomes

$$(x'-x)\frac{du}{dx}+(y'-y)\frac{du}{dy}+(z'-z)\frac{du}{dz}=0.$$

52. PROP. II.—To find the equation to the normal to a surface.

Retaining the notation of Art. 51; since the normal is perpendicular to the surface, and therefore to the tangent plane; if its equations are $x'-x=a(z'-z)$, $y'-y=b(z'-z)$, we must have (Art. 20)

$$\frac{du}{dx}-a\frac{du}{dz}=0, \qquad \frac{du}{dy}-b\frac{du}{dz}=0:$$

whence the equations to the normal are,

$$(x'-x)\frac{du}{dz}=(z'-z)\frac{du}{dx}, \quad (y'-y)\frac{du}{dz}=(z'-z)\frac{du}{dy}.$$

53. COR.—The equations may also be written

$$x'-x+\frac{dz}{dx}(z'-z)=0, \qquad y'-y+\frac{dz}{dx}(z'-z)=0.$$

54. EXAMPLE.—To find the equation to the tangent plane to the ellipsoid.

We have $$\frac{x^2}{a^2}+\frac{y^2}{b^2}+\frac{z^2}{c^2}-1;$$

$$\therefore \quad \frac{dz}{dx}=-\frac{c^2x}{a^2z}, \quad \frac{dz}{dy}=-\frac{c^2y}{a^2z},$$

and the equation to the tangent plane becomes

$$z'-z+\frac{c^2x}{a^2z}(x'-x)+\frac{c^2y}{a^2z}(y'-y)=0;$$

$$\text{or } \frac{zz'}{c^2}+\frac{yy'}{b^2}+\frac{xx'}{a^2}=\frac{z^2}{c^2}+\frac{y^2}{b^2}+\frac{x^2}{a^2}=1.$$

55. If p be the perpendicular from the centre on the tangent; we have (Art. 23)

$$p=\frac{1}{\sqrt{\dfrac{x^2}{a^4}+\dfrac{y^2}{b^4}+\dfrac{z^2}{c^4}}}.$$

56. PROP. III.—To find the locus of the intersection of the tangent plane of the ellipsoid with the perpendicular on it from the centre.

The equation to the tangent plane is

$$\frac{xx'}{a^2}+\frac{yy'}{b^2}+\frac{zz'}{c^2}=1 \text{.......................}(1)$$

Consequently the equations to the perpendicular on it from the centre are (Art. 20)

$$x'=\frac{c^2x}{a^2z}z', \quad y'=\frac{c^2y}{b^2z}z'; \text{ ....}(2)$$

also $$\frac{x^2}{a^2}+\frac{y^2}{b^2}+\frac{z^2}{c^2}=1 \text{.....................}(3)$$

From equations (2), $\dfrac{x}{a^2}=\dfrac{z}{c^2z'}x'$ and $\dfrac{y}{b^2}=\dfrac{z}{c^2z'}y'$;

$$\therefore \quad \frac{xx'}{a^2}+\frac{yy'}{b^2}+\frac{zz'}{c^2}=\frac{z}{c^2z'}(x'^2+y'^2+z'^2),$$

Analytical Geometry.

which, by equation (1), gives

$$z = \frac{c^2z'}{x'^2 + y'^2 + z'^2}. \quad \text{Similarly } y = \frac{b^2y'}{x'^2 + y'^2 + z'^2};$$

$$x = \frac{a^2x'}{x'^2 + y'^2 + z'^2}$$: and these values being substituted in equation (3), there results $a^2x'^2 + b^2y'^2 + c^2z'^2 = (x'^2 + y'^2 + z'^2)^2$, an equation which occurs in the *undulatory theory of light.*

SECTION V.—ON THE CURVATURE OF SURFACES.

57. If through the normal to a surface different planes be drawn, their intersections with the surface will be plane curves, which will generally have different degrees of curvature depending on the direction of the tangent line; and, further, if other sections than those through the normal are drawn, they will determine curves which have different degrees of curvature for the same direction of the tangent line. We proceed to determine the radius of curvature of any such section.

58. Prop. I.—The sum of the reciprocals of the radii of curvature of any two normal sections at right angles to each other is constant.

Let the normal be taken as the axis of z, and consequently the tangent plane as the plane of xy.

Let also the angle which a section makes with the plane of xz be θ.

It is evident that $\frac{dz}{dx}=0$, $\frac{dz}{dy}=0$. Put r for $\frac{d^2z}{dx^2}$, s for $\frac{d^2z}{dxdy}$, t for $\frac{d^2z}{dy^2}$; and let OM $= k$, MN $=$ K; then if R be the radius of curvature of this section,

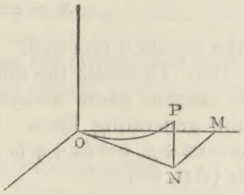

Fig. 41.

$$\text{R} = \frac{1}{2} \text{ limit of } \frac{\text{ON}^2}{\text{PN}} = \frac{1}{2} \text{ limit of } \frac{k^2 + \text{K}^2}{\frac{rk^2}{2} + sk\text{K} + t\frac{\text{K}^2}{2} + \&\text{c.}}$$

$$= \frac{1 + \tan^2\theta}{r + 2s\tan\theta + t\tan^2\theta},$$

and $\frac{1}{\text{R}} = r\cos^2\theta + 2s\sin\theta\cos\theta + t\sin^2\theta.$

Let $\frac{1}{\text{R}'}$ be the radius of curvature of the section at right angles to this, or for which the angle is $90° + \theta$; then

$$\frac{1}{\text{R}'} = r\sin^2\theta - 2s\sin\theta\cos\theta + t\cos^2\theta;$$

$$\therefore \quad \frac{1}{\text{R}} + \frac{1}{\text{R}'} = r + t, \text{ which is independent of } \theta.$$

59. Prop. II.—To determine the sections of greatest and least curvature.

Retaining the notation of the last article, we have

$$\frac{1}{\text{R}} = r\cos^2\theta + 2s\sin\theta\cos\theta + t\sin^2\theta,$$

which will be a *maximum* or a *minimum*, when

$$-r\sin\theta\cos\theta + s(\cos^2\theta - \sin^2\theta) + t\sin\theta\cos\theta = 0,$$

or $\tan 2\theta = \frac{2s}{r-t}$; an equation which gives two values of θ, viz., $\theta = \alpha$, $\theta = 90° + \alpha$, or the maximum and minimum sections are at right angles to each other. These are called the *principal sections.*

60. Prop. III.—The curvature of any normal section (measured by the reciprocal of the radius of curvature) is equal to the sum of the products of the curvatures of the two principal sections by the cosines of the angles which they respectively make with it.

Let one of the principal sections be the plane of xz, or let the two values of θ be $\theta=0$, $\theta=90°$. Let also ρ, ρ' be the two principal radii of curvature;

$$\text{then when } \theta = 0, \text{ we have } \frac{1}{\rho} = r,$$

$$\text{and when } \theta = 90°, \quad \frac{1}{\rho'} = t.$$

Also, since $\tan 2\theta = 0$, we have $s = 0$,

$$\therefore \quad \frac{1}{\text{R}} = \frac{1}{\rho}\cos^2\theta + \frac{1}{\rho'}\sin^2\theta.$$

61. Prop. IV.—If through a given tangent line at any point, both a normal and an oblique section be made, the radius of curvature of the oblique section is equal to the projection on its plane of the radius of curvature of the normal section.

Let the axis of x be the given tangent, the plane of xz the normal section, that of xz' the oblique section.

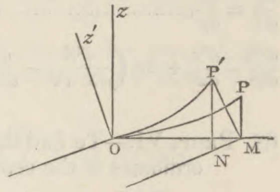

Fig. 42.

Let OM $= h$, MP $= z$, MN $= k'$, NP$' = z'$, $\angle zOz' = \theta$, R the radius of curvature in the normal section zx, R$'$ in the oblique section $z'Ox$.

$$\text{Then R} : \text{R}' :: \text{limit of } \frac{\text{OM}^2}{\text{MP}} : \frac{\text{OM}^2}{\text{MP}'}$$

$$:: \text{limit of MP}' : \text{MP}$$

$$:: \text{limit of } \frac{z'}{\cos\theta} : z$$

$$:: \text{limit of } (rh^2 + 2shk' + tk'^2) : rh^2\cos\theta$$

$$:: 1 : \cos\theta, \text{ because the limit of } \frac{k'}{h} = 0;$$

therefore $\quad \text{R}' = \text{R}\cos\theta.$

This is called Meunier's Theorem, and it establishes the fact, that if the diameter of a circle in the plane of yz be that of the circle of curvature of the normal section, the chord of the same circle in the direction of the oblique section will be the diameter of the circle of curvature of that section; and consequently if the diameter of a sphere be the diameter of curvature of any normal section, the chord of the same sphere made by an oblique section through the same tangent line will be the diameter of the circle of curvature of that section; or the sections of the sphere by planes through the same tangent line will all be circles of curvature of the corresponding sections of the surface; and conversely.

62. Prop. V.—To find the conditions that a section of a surface may have a contact of the second order with a circle.

We shall suppose the touching circle to be determined by the section of a sphere, the cutting plane which is common to it and the given surface being supposed to pass through their ordinate z, so as to have for its equation $y' - y = m(x' - x)$; or if $x + h$, $y + k$ are the co-ordinates of a point in the section of either surface near their point of contact, the increments are connected by the equation $k = mh$.

Let $f(x, y, z) = 0$ be the equation to the given surface; $(\text{X} - \alpha)^2 + (\text{Y} - \beta)^2 + (\text{Z} - \gamma)^2 = \text{R}^2$ the equation to the sphere of which the section has a contact of the second order with

Analytical Geometry.

the given surface at the point whose co-ordinates are x, y, z. Let z_1, Z_1 be the ordinates of points in the common section of the two surfaccs near their point of contact; then at the point in the *curve* of which the co-ordinates are $x+h$, $y+k$, we have

$$z_1 = z + \frac{dz}{dx}h + \frac{dz}{dy}k + \frac{1}{2}\left(\frac{d^2z}{dx^2}h^2 + 2\frac{d^2z}{dx\,dy}hk + \frac{d^2z}{dy^2}k^2\right) + \&c.$$

$$= z + \frac{dz}{dx}h + \frac{dz}{dy}k + \frac{h^2}{2}\left(\frac{d^2z}{dx^2} + 2m\frac{d^2z}{dx\,dy} + m^2\frac{d^2z}{dy^2}\right) + \&c.;$$

and at the corresponding point in the *circle*,

$$Z_1 = Z + \frac{dZ}{dX}h + \frac{dZ}{dy}k + \frac{h^2}{2}\left(\frac{d^2Z}{dX^2} + 2m\frac{d^2Z}{dX\,dY} + m^2\frac{d^2Z}{dY^2}\right) + \&c.$$

But the requirement for a contact of the second order is, that to the extent of h^2 these two expressions shall be coincident.

The conditions to be fulfilled are, therefore,

$$\frac{dZ}{dx} = \frac{dz}{dx}, \ldots\ldots (1)$$

$$\frac{dZ}{dY} = \frac{dz}{dy}, \ldots\ldots (2)$$

$$\frac{d^2Z}{dx^2} - \frac{d^2z}{dx^2} + 2m\left(\frac{d^2Z}{dX\,dY} - \frac{d^2z}{dx\,dy}\right) + m^2\left(\frac{d^2Z}{dY^2} - \frac{d^2z}{dy^2}\right) = 0 \ldots\ldots (3)$$

63. Prop. VI.—To find the radius of curvature and the co-ordinates of the centre of a normal section.

By differentiation, we obtain from the equation to the sphere of which the section of the normal plane is the circle of curvature

$$(X-\alpha)^2 + (Y-\beta)^2 + (Z-\gamma)^2 = R^2 \ldots\ldots (1)$$

$$X - \alpha + (Z - \gamma)\frac{dZ}{dX} = 0 \ldots\ldots (2)$$

$$Y - \beta + (Z - \gamma)\frac{dZ}{dY} = 0 \ldots\ldots (3)$$

$$1 + \left(\frac{dZ}{dX}\right)^2 + (Z - \gamma)\frac{d^2Z}{dX^2} = 0 \ldots\ldots (4)$$

$$\frac{dZ}{dX}\frac{dZ}{dY} + (Z-\gamma)\frac{d^2Z}{dX\,dY} = 0 \ldots\ldots (5)$$

$$1 + \left(\frac{dZ}{dY}\right)^2 + (Z - \gamma)\frac{d^2Z}{dY^2} = 0 \ldots\ldots (6)$$

Now the conclusion arrived at in Art. 61 enables us to apply the conditions of the last Article; for if the section of the sphere by one plane is a section of curvature, every section is so. Hence if we write $\frac{dz}{dx} = p$, $\frac{dz}{dy} = q$, $\frac{d^2z}{dx^2} = r$, $\frac{d^2z}{dx\,dy} = s$, $\frac{d^2z}{dy^2} = t$, we shall have, by equations (1) and (2) of the last Article compared with (4), (5), and (6) of the present,

$$\frac{d^2Z}{dX^2} = -\frac{1+p^2}{Z-\gamma}, \quad \frac{d^2Z}{dX\,dY} = -\frac{pq}{Z-\gamma}, \quad \frac{d^2Z}{dY^2} = -\frac{1+q^2}{Z-\gamma},$$

and consequently equation (3) of the last Article gives

$$\left(\frac{1+p^2}{Z-\gamma} + r\right) + 2m\left(\frac{pq}{Z-\gamma} + s\right) + m^2\left(\frac{1+q^2}{Z-\gamma} + t\right) = 0.$$

Whence $Z - \gamma = -\dfrac{1 + p^2 + 2m\,pq + m^2(1 + q^2)}{r + 2m\,s + m^2 t} \ldots\ldots (7)$

Also by equations (2) and (3) we have

$$(X - \alpha)^2 = p^2(Z - \gamma)^2 \ldots\ldots (8)$$

$$(Y - \beta)^2 = q^2(Z - \gamma)^2 \ldots\ldots (9)$$

and hence by equation (1)

$$R^2 = (1 + p^2 + q^2)(Z - \gamma)^2$$

$$R = \sqrt{1 + p^2 + q^2}\,\frac{1 + p^2 + 2m\,pq + m^2(1 + q^2)}{r^2 + 2m\,s + m^2 t} \ldots (10)$$

Equations (7), (8), and (9) determine the co-ordinates of the centre; and equation (10) gives the value of the radius of curvature of the section.

SECTION VI.—THE GENERATION OF SURFACES BY THE MOTION OF LINES.

We propose in the present section to determine the ordinary and differential equations to cylindrical, conical, and conoidal surfaces, and to surfaces of revolution.

Cylindrical Surfaces.

64. To determine the ordinary equation, we adopt the definition, that cylindrical surfaces are generated by the motion of a straight line which always moves parallel to itself.

Let $x = az + p$, $y = bz + q$ be the equations to the generating line, where a and b are the same for all the lines; and let $x = F(z)$, $y = \varphi(z)$ be the equations to the directing curve: then at the points where the straight line meets the curve we have

$$x' = az' + p, \quad y' = bz' + q, \quad x' = F(z'), \quad y' = \varphi(z');$$

from which equations we may eliminate x', y', and z', and obtain a relation between p and q and the constants a and b. Let this relation be $p = f(q)$; *i.e.*

$$x - az = f(y - bz),$$

the equation required.

65. To obtain the differential equation, we observe that a tangent plane always touches the curve along one of the generating lines. Hence the line whose equation is $x = az + p$, $y = bz + q$ is parallel to the plane whose equation is (Art. 50)

$$z' - z = \frac{dz}{dx}(x' - x) + \frac{dz}{dy}(y' - y).$$

The condition is (Art. 22) $a\frac{dz}{dx} + b\frac{dz}{dy} = 1$, which is the differential equation required.

Conical Surfaces.

66. A conical surface is generated by a straight line which passes through a given point, and always meets a given curve.

Let a, b, c be the co-ordinates of the given point; $x = F(z)$, $y = \varphi(z)$, the equations to the given curve, the directrix; the equations to the generatrix are $x - a = m(z - c)$, $y - b = n(z - c)$; also at the point where the line meets the directrix we shall have $x' - a = m(z' - c)$, $y' - b = n(z' - c)$, $y' = F(z')$, $y' = \varphi(z')$, from which equations x', y', z' may be eliminated, and there will remain

$$m = f(n), \quad \text{or} \quad \frac{x-a}{z-c} = f\left(\frac{y-b}{z-c}\right),$$

the equation required.

67. To find the differential equation, it is only necessary to observe, that the tangent plane passes through the given point; hence $z - c = \frac{dz}{dx}(x - a) + \frac{dz}{dy}(y - b)$ is the differential equation required.

Geometric Progression || George of Cappadocia.

Cross of St George || Knights of St George.

Right Conoidal Surfaces.

68. A right conoidal surface is generated by a straight line which passes through a given curve, and is at right angles to a fixed axis.

We shall suppose the fixed axis to be that of z, so that the equations to the generatrix are $z=p$, $y=mx$. Let the equations to the directrix be $x=\mathrm{F}(z)$, $y=\varphi(z)$; then at the point where the line meets the directrix we must have $z'=p$, $y'=mx'$, $x'=\mathrm{F}(z')$, $y'=\varphi(z')$, from which if x', y', z' be eliminated, there will remain

$p=f(m)$, or $z=f\left(\frac{y}{x}\right)$ is the equation required.

69. To find the differential equation, we observe that the tangent plane always contains the generating line. Retaining the same notation, the equation to the tangent plane is

$$z'-z=\frac{dz}{dx}(x'-x)+\frac{dz}{dy}(y'-y).$$

Now when $x'=0$, $y'=0$, we must have $z'=z$,

$\therefore\ x\frac{dz}{dx}+y\frac{dz}{dx}=0$ is the requisite condition, or the equation required.

Surfaces of Revolution.

70. A surface of revolution is generated by a variable circle whose plane is always perpendicular to a given fixed line through its centre; and whose circumference passes through a given curve.

Let $\mathrm{A}x+\mathrm{B}y+\mathrm{C}z=\mathrm{D}$ be the equation to the plane in which the circle lies: where $\frac{\mathrm{A}}{\mathrm{C}}$ and $\frac{\mathrm{B}}{\mathrm{C}}$ are known (Art. 20); α, β, γ the co-ordinates of any known point in the axis in which the centre of the generating circle lies; the equation to a sphere whose centre is in this line will be $(x-\alpha)^2+(y-\beta)^2+(z-\gamma)^2=\mathrm{R}^2$, and the intersection of the plane $\mathrm{A}x+\mathrm{B}y+\mathrm{C}z=\mathrm{D}$ with this sphere will give the generating circle, provided D and R be properly selected. Let also the equations to the directrix be $x=\mathrm{F}(z)$, $y=\varphi(z)$; then at the point of junction of the generatrix and directrix we must have

$$\begin{gathered}\mathrm{A}x'+\mathrm{B}y'+\mathrm{C}z'=\mathrm{D}\\(x-\alpha)^2+(y'-\beta)^2+(z'-\gamma)^2=\mathrm{R}^2\\x'=\mathrm{F}(z')\\y'=\varphi(z);\end{gathered}$$

whence by eliminating x', y', z', we obtain the relation

$$\mathrm{R}^2=f(\mathrm{D})$$

or $(x-\alpha)^2+(y-\beta)^2+(z-\gamma)^2=f(\mathrm{A}x+\mathrm{B}y+\mathrm{C}z)$, the equation required.

71. To find the differential equation, we observe that the normal always passes through the axis of revolution.

Let $x'-a=m(z'-c)=0$, $y'-b=n(z'-c)=0$ be the equation to the axis of revolution;

$$x'-x+\frac{dz}{dx}(z'-z)=0,\quad y'-y+\frac{dz}{dy}(z'-z)=0,$$

(Art. 53), the equations to the normal; then since x', y', z are the same in all the four equations; we have, by elimination,

$$y-b+nc-nz=\left(\frac{dz}{dy}+n\right)(z'-z),$$

$$x-a+mc-mz=\left(\frac{dz}{dy}+m\right)(z'-z);$$

and therefore

$$\left(\frac{dz}{dy}+m\right)(y-b+nc-nz)=\left(\frac{dz}{dy}+n\right)(x-a+mc-mz),$$

the equation required.

For further details, the reader is referred to Hymers's *Analytical Geometry of Three Dimensions*, Gregory's *Solid Geometry*, or Leroy's *Géométrie des Trois Dimensions*.

GEOMETRIC PROGRESSION. See PROGRESSION.

GEORGE I., II., III., and IV., kings of Great Britain. See BRITAIN.

GEORGE, ST, one of the Bermudas, and also a town there. See BERMUDA.

GEORGE of Cappadocia, or ST GEORGE, the patron saint of England, was born about the beginning of the fourth century—according to some accounts, at Epiphania, in Cilicia; according to others, in Cappadocia. His father was a fuller; and the future saint himself had long a severe struggle to maintain against the disadvantages of his humble birth. According to Gregory of Nazianzen, George distinguished himself in his early career as a parasite of so mean a type that he would sell himself for a cake. By these arts he obtained the contract for supplying bacon to the troops; but he fulfilled its terms so ill, that he with difficulty escaped death at the hands of the indignant soldiers. He then fled to Alexandria, where he entered the public service, embraced Christianity, and finally became bishop of the city. Arianism was at that time rampant, and George became an Arian. Indeed, he owed his episcopate to the pliancy of his conscience, and the readiness with which he lent himself to further the political views of the court. On taking possession of his see, he found a fierce persecution going on against the Trinitarians. Instead of mitigating this evil, he carried it to such an extreme as at length to raise a rebellion against him. He fled for his life; but being soon after re-instated by the court, he returned to Egypt and signalized himself by redoubled cruelties. As might have been expected, his conduct raised up numerous enemies against him, even among his own partizans. His downfall could not be long delayed. A tyrannical act which he perpetrated towards the heathens in his diocese, shortly after the accession of Julian, irritated the people so keenly that they rose up *en masse*, dragged him out of the prison to which he had retired for safety, paraded him through the streets on the back of a camel, and after tearing him to pieces, burnt his remains. It is a mystery how this George was ever admitted into the calendar at all. Some writers, such as Papebroche and Heylyn, deny altogether that the patron saint of England is the same person as the bishop of Alexandria. Other stories, however, give a version of George's history which explain to a certain extent the honour in which he is now held. One of these makes him a soldier in the service of Diocletian, in whose reign he suffered martyrdom along with many other thousands of Christians. Among the Greeks St George became known as the Victorious; and in England his renown gradually increased after the era of the Crusades to such an extent, that by the time of Edward III. he had become the patron saint of the kingdom. (*Acta Sanctorum;* Heylyn, *History of St George;* Gibbon, *Decline and Fall*, chap. xxi., &c.)

Cross of ST GEORGE, a red cross in a field argent, forming part of the British standard. See HERALDRY.

Knights of ST GEORGE. See GARTER. There have been various other orders of this denomination, most of which are now extinct. Among these may be noticed one founded by the Emperor Frederick III., in 1470, to guard the frontiers of Bohemia and Hungary against the Turks; that of St George of Alfama, founded by the kings of

Aragon; and another in Austria and Carinthia. (See Ashmole *On the Garter, &c.*)

Religious Orders of ST GEORGE. Of these there were different orders and congregations, particularly canons regular of St George in Alga, at Venice, established by authority of Pope Boniface IX. in 1404. The foundation of this order was laid by Bartolomeo Colonna, who preached in 1396 at Padua and some other places in the state of Venice. Pope Pius V., in 1570, gave these canons precedence over all other religious orders.

GEORGE LAKE, a beautiful mountain lake in the state of New York, 10 miles S. of Lake Champlain, into which it discharges its surplus waters. It is 36 miles in length, with a breadth varying from three-quarters of a mile to 4 miles. It is remarkable for the transparency of its water, and the surrounding scenery is of the most picturesque description. It is studded with numerous islands of various forms and sizes, amounting, with islets and rocks, to more than 300.

GEORGETOWN (formerly *Stabröek*), the capital of British Guiana, is situated on the E. bank of the Demerara, at its mouth, which is there about 3 miles wide, in N. Lat. 6. 49. 30.; W. Long. 58. 11. 30. The town itself is one of the prettiest in the West Indies; and its streets are wide and straight, intersecting each other at right angles. The houses are of wood, with open verandahs in front, and neatly painted in cool and quiet colours; they are shaded and almost hidden by trees and shrubs, and look more like a collection of villas than a town. The street along the river side—where all the stores and shops are situated, and where business is chiefly transacted—forms, however, an exception; there everything is plain, bare, and businesslike. The ships lie alongside the wharfs or at a short distance in the stream, which is also crowded with numerous smaller vessels engaged in the island trade, or in bringing produce from the more distant estates. The hall of the legislative council, courts of justice, custom-house, treasury, and all the other public offices, are in one building of considerable extent and architectural beauty, with shady porticoes and marble-paved galleries or verandahs supported on cast-iron columns. The chief of the other public edifices are the cathedral and churches, several liberally maintained hospitals, barracks, market-place, and ice-house. Below the town is the "Fort," as it is called, but which looks more like a green field, with a few guns pointing towards the sea, and a house or two for a single officer and a dozen artillerymen. Pop. (1851) 25,508.

GEORGETOWN, a city in the United States of North America, district of Columbia, on the left bank of the Potomac river, 2 miles W.N.W. of Washington city, from which it is separated by Rock Creek. It is beautifully situated on a range of hills rising above the river and undulating along its banks. The "heights" are lofty eminences overlooking the city, and occupied by splendid villas and extensive gardens in the highest state of cultivation. On the heights is Oak Hill cemetery, tastefully laid out and surrounded by a massive iron railing. Georgetown has a Roman Catholic university, with a library of 25,000 vols., an extensive philosophical apparatus, and a museum of natural history; a nunnery, with a female academy; botanic garden, and various other literary institutions. The aqueduct which conveys the Chesapeake and Ohio canal over the Potomac is a stupendous work, 1446 feet in length; the piers, nine in number, and 36 feet above high-water, are of granite, resting upon the solid rock 17 feet below the bottom of the river. The manufactures are considerable and flourishing. In 1850 there were 59 establishments in operation, among which were numerous flour-mills, a rolling-mill, and a cotton-factory. Georgetown carries on an extensive foreign and coasting trade. On 30th June 1852 its registered shipping amounted to 2955 tons, and its enrolled and licensed to 23,241 tons. Pop. (1850) 8366.

GEORGETOWN, the capital of a district of the same name in the State of South Carolina, North America, stands on the W. shore of Winyaw Bay, a little below the confluence of the Great Pedee, the Black, and the Waccamaw rivers, about 15 miles from the sea. The confluence of these three navigable rivers renders its position advantageous for trade, but the entrance to its harbour is obstructed by a bar. The shipping of the port on 30th June 1852 amounted to 1896 tons registered, and 2696 tons enrolled and licensed. It has a court-house, jail, several churches and seminaries, a bank, &c. Pop. (1850) 1628.

Extent and boundaries.

GEORGIA, one of the original states of the United States of North America, in the southern division of the union, lies between N. Lat., 30. 22. and 35., and between W. Long. 81. and 85. 53. from Greenwich. It is bounded on the N. by the States of Tennessee and North Carolina, N.E. by South Carolina, from which it is separated by the Savannah river, S.E. by the Atlantic Ocean, S. by Florida, and W. by Alabama. It is about 300 miles long from N. to S., and 256 broad, containing 58,000 square miles. The population in 1800 was 162,101, in 1850, 906,101; 521,488 whites, 2931 free coloured, 381,682 slaves. The state is divided into 97 counties.

Face of the country.

Islands.

The coast of Georgia, for four or five miles inland, is a salt marsh, mostly uninhabited. In front of this, towards the sea, there is a chain of islands of gray, rich soil, covered, in their natural state, with pine, hickory, and evergreen oak, and yielding, when cultivated, sea-island cotton. The principal of these islands are Tybee, Warsaw, Ossabaw, St Catherine's, Sapello, St Simon's, Jekyl, and Cumberland. The land bordering on the salt marsh is of nearly the same quality as that of the islands. In the rear of this margin commence the pine barrens. The rivers and creeks are bordered with swamps or marshes, which, at every tide, for 15 or 20 miles from the coast, are either wholly or partially overflowed. These constitute the rice plantations. The pine barrens extend from 60 to 90 miles from the sea, beyond which the country becomes uneven, diversified with hills and mountains, and possesses a strong rich soil. This section produces cotton, tobacco, Indian corn, wheat, and other kinds of grain. The north-western part of the state is mountainous, and abounds in sublime and picturesque scenery.

Historical sketch.

Georgia was the last settled of the original thirteen states of the American confederacy, the first colony having been planted by Oglethorpe at Yamacraw Bluff (now called Savannah) in 1733, more than 100 years after the settlement of most of the original colonies, and 63 years after that of South Carolina, her nearest neighbour. Three years afterwards some Germans founded Ebenezer-on-the-River, about 25 miles above Savannah. The settlement of Darien was commenced about the same time by some Scotch Highlanders. The infant colony was involved in some severe contests with the Spaniards of Florida, who claimed the country as far as the thirty-third degree of north latitude. In 1739 Oglethorpe invaded Florida, took Fort Diego, and besieged St Augustine, but was obliged to raise the siege and return. The Spanish in turn invaded Georgia in 1742, but being alarmed by a stratagem of Oglethorpe's, they retreated without coming to blows. Slaves were first admitted into the colony in 1749. The proprietors, harassed by the difficulties that surrounded them, gave up the province to the crown in 1752, when Dr Franklin was appointed its agent near the British government. In 1761 the Cherokee Indians were attacked by Colonel Montgomery, on which occasion the savages so bravely resisted, that, though Montgomery claimed the victory, he thought it advisable to retreat. The following year Colonel Grant burned their towns, laid waste their country, and reduced them to sue for peace. Georgia entered warmly into the revolution, and during parts of 1778, 1779, and 1780, was in the hands of the British troops. Savannah was captured by them

December 29, 1778; and the combined American and French armies were repulsed in an attempt to retake it in October 1779, with a loss to the allies of 1100 men. In 1838 the Cherokee Indians were removed from the state to the Indian territory, beyond the Mississippi, and Georgia came into the possession of the long coveted Indian reservation.

Rivers.

The rivers are the Savannah, 500 miles long, bounding the state on the N.E., navigable for ships 17 miles to Savannah, and for steamboats 250 miles to Augusta; the Altamaha, which is navigable for large vessels 12 miles to Darien, is formed by the junction of the Oconee and the Ocmulgee, which are navigable to Macon and Milledgeville for steamboats; the Ogeechu 200 miles long, and navigable for sloops 40 miles; Flint River, which rises in the N.W. part of the state, and after a course of about 300 miles, joins the Chattahoochee, forming the Appalachicola; the Chattahoochee, on the west border of the state, is navigable 300 miles by steamboat to Columbus; the St Mary River is in the S.E. part of the state. Savannah is the largest and chief commercial town. Pop. (1853) 20,000. Augusta is on the Savannah River, just below the falls, and is the enterpôt for the agricultural exports of the upper country. Pop. (1853) 12,000.

Chief towns.

Milledgeville, the seat of the state government, is situated near the centre of Georgia. Pop. (1850) 2216. The other principal towns are Athens, Atlanta, Columbus, and Griffin.

Minerals.

Previous to the discovery of the gold mines of California, Georgia was one of the El-Dorados of America; but though her mines are almost forgotten by the richer yields of the new state on the Pacific, a time may come again when slow and patient industry may be content to develop the golden treasures of this region. The tract containing the gold mines has its centre in Lumpkin county, in the northern part of the state; and at Dahlonega, in this county, a branch mint has been established, which coined in 1851 $351,592 in gold. Besides this precious metal, Georgia contains some silver, copper, iron, lead, manganese, titanium, graphite, antimony, and zinc; also granite, marble, gypsum, limestone, coal, syenite, marl, burrstone, soapstone, asbestos, slate, shale, tripoli, fluor-spar, barytes, tourmaline, arragonite, kaolin, epidote, porcelain clay, ruby, opal, augite, cyanite, emerald, prase, cornelians, chalcedony, agate, jasper, amethyst, precious garnets, schorl, zircon, rose quartz, beryl, and even diamonds. Fossils are found in abundance in the S.E. counties near the sea.

Climate, soil, and productions.

While the inhabitants of southern and middle Georgia are being parched with heat, frequently so intense as to prevent comfortable rest, even at night, the more northern climate among the mountains is such as to render necessary a blanket in order to comfortable repose. A more lovely heaven does not smile upon the classic land of Italy than upon the favoured inhabitants of Georgia. The diversity of soil is not less than that of climate, from the rich alluvions near the sea-coast and rivers, to the thinner soil of the pine barrens (not nearly so sterile as their name implies), and the rougher mountain regions. The good and bad lands of Georgia are so intermingled that it is difficult to describe them by districts. In the south, on the coast, are the islands with their light sandy soil, but fertile in sea-island cotton and on the mainland are the rich alluvions, but interspersed with swamps, which, however, yield rice in abundance. The bottom lands of the rivers are exceedingly fertile, and produce rice, cotton, Indian corn, and sugar.

Further west, about 60 miles from the coast, commence the pine barrens, at present mostly valuable for their timber and naval stores, but easily cultivated and productive, should occasion require. In the south-west the soil is light and sandy, but fertile and productive in cotton; the sugar cane is also sometimes cultivated successfully. The middle region consists of a red loamy soil, once productive, but owing to a bad system of culture, much impoverished. Its products are cotton, tobacco, and the various kinds of grain. The Cherokee country in the north, once in possession of the Indians of that name, and containing land among the most fertile in the state, particularly in its valleys, which, though worked by the Indians for ages past, are still capable of producing from 50 to 70 bushels of grain to the acre. Our summary of the natural resources and physical characteristics of this state, bring us to the conclusion that it is surpassed by no Atlantic or Gulf state, to say the least, in the elements of a rapid growth in agriculture, manufactures, and commerce. The prime articles of cultivation in Georgia are cotton, rice, sweet potatoes, and Indian corn; besides which large quantities of live stock, wheat, oats, tobacco, wool, peas, beans, Irish potatoes, fruits, market products, butter, cheese, hay, sugar, molasses, bees' wax and honey, and some rye, barley, buckwheat, wine, grass seeds, hops, flax and silk, are produced. In 1850 there were on this state 51,759 farms, containing 6,378,475 acres of improved land, averaging about 120 acres to a farm, and producing 1,088,534 bushels of wheat, 53,750 of rye, 30,080,099 of Indian corn, 3,820,044 of oats, 1,142,011 of peas and beans, 227,379 of Irish potatoes, 6,986,428 of sweet potatoes, 11,501 of barley, 38,950,691 pounds of rice, 432,924 of tobacco, 199,636,400 of cotton, 990,019 of wool, 4,640,559 of butter, 46,976 of cheese, 23,449 tons of hay, 1,644,000 pounds of cane sugar, 732,514 of honey and bees' wax, 216,150 gallons of molasses, live stock valued at $25,728,416, orchard products at $92,776, market goods at $76,500, and slaughtered animals at $6,339,762.

Manufactures.

There were in the state in 1850, 35 cotton factories, with a capital invested of $1,736,156, employing 873 males and 1399 females, and producing 7,209,292 yards of sheetings, and 4,198,351 lbs. of yarn, valued at $2,135,044; 3 woollen factories, with a capital of $68,000, employing 40 males and 38 females, manufacturing 340,660 yards of cloth, valued at $88,750; 3 establishments making pig-iron, with a capital of $26,000, employing 138 persons, producing 900 tons of pig-iron, &c., valued at $57,300; 4 establishments, with a capital of $35,000, employing 39 persons, and making 415 tons of castings, valued at $46,200; 3 establishments, with a capital of $9,200, employing 27 persons, and manufacturing 90 tons of wrought iron, valued at $15,384; 330 flouring and grist mills, 389 saw mills, 49 printing offices, 5 daily, 3 tri-weekly and semi-weekly, and 37 weekly newspapers, and 6 monthly publications. Capital invested in manufactures $5,363,490; value of manufactured articles $7,084,585.

Railroads.

On the first of January 1854, there were 15 railroads, 884 miles of which were completed and in operation, and 445 miles in course of construction.

Education, &c.

There are five colleges in Georgia—Franklin College at Athens, Oglethorpe College at Milledgeville, Emory College at Oxford, Mercer University at Penfield, and Wesleyan Female College at Macon, having an aggregate number of students in 1852 of 596. There is also a theological seminary at Penfield, and a medical school at Augusta. There were also 219 academies, 9059 pupils, 1254 schools, 32,705 scholars, 38 libraries, 31,788 volumes. There are also an institution for the blind, an asylum for the deaf and dumb, and the Georgia State Lunatic Asylum. There were in the state in January 1853, 17 banks, with an aggregate capital of $5,329,515.

Banks.

Religion.

There were in the state in 1850, 821 Baptist churches, 5 Christian, 1 Congregational, 19 Episcopal, 5 Free, 2 Friends, 8 Lutheran, 735 Methodist, 1 Moravian, 92 Presbyterian, 8 Roman Catholic, 16 Union, 3 Universalist, and 7 other sects, the whole having 1723 churches; total value of church property $1,269,159.

Government.

The governor is elected by the people for two years, and receives a salary of $3000 per annum. The Senate consists of 47 members, and the House of Representatives of 139, both elected for each session of the legislature, each member receiving $5 a-day. The legislature meets biennially on the first Monday of November (odd years), at Milledgeville. All the free white male inhabitants, 21 years old and upwards, who shall have resided within the county in which they vote six months preceding the election, and shall have paid taxes in the state for the year previous, have the right of suffrage. The state of Georgia is entitled to eight members in the national House of Representatives, and to ten electoral votes for the president of the United States.

The judges of the supreme court are elected for six years (one every two years) by the general assembly, and are removable upon address of two-thirds of each house. Judges of the superior court are elected for four years by the people of the district over which they preside, with jurisdiction exclusive in criminal cases and in land cases, and concurrent in all other civil cases. Justices of the inferior courts are elected by the people for four years; justices of the peace are elected by the people in districts. Each county elects an ordinary, who holds office for four years, and has the ordinary jurisdiction of a judge of probate, and is paid by fees.

In the year 1837 a branch of the United States mint was established at Dahlonega in Georgia; since which period the production of gold in that state has averaged about $300,000 per annum.

Georgia is one of the great cotton-producing states of the south. We annex the official returns of acres in cultivation, &c., in the year 1852:—

Number of bales of 400 lbs. each	740,000
Labourers employed	187,000
Acres in cultivation	1,500,000
Additional area suitable to cotton cultivation	3,000,000
Number of labourers needed	375,000
Gross additional bales of 400 lbs.	1,500,000

GEORGIA is a kingdom on the southern slopes of Mount Caucasus, remarkable not only for the excellence of its climate and the fertility of its valleys, but as having subsisted as a separate kingdom for more than 2000 years, notwithstanding the various invasions and spoliations to which it has been exposed. Georgia Proper is the Iberia of the ancients, but the territory of its kings was at one time extended over the whole Caucasian isthmus south of the chain of the Caucasus. The origin and date of its present appellation does not seem as yet to have been very satisfactorily ascertained. The Georgi mentioned by Pliny and Pomponius Mela were merely agricultural tribes, so designated in order to distinguish them from their nomadic neighbours on the other side of the river *Panticapes;* they were besides far to the N.W. of the Caucasus, near the Tauric Chersonese or Crimea. The true origin of the present name seems to be the designation given to this country in the 11th and 12th centuries by the Arabs and Persians, who called it Gurj, Gurj-i-stán, or Gurg-i-stan, *i.e.*, "Land of Wolves;" a name most appropriate to a region so thickly wooded. Wahl, however, in his *Vorder und Mittel Asien*, derives it from *Kur* or *Gur*, the Persian for the river called Cyrus (Κῦρος) by the Greeks. But that stream was never called *Gurj.* By the Georgians themselves, their country was called Khartli, but now Virk; by the Armenians it is named Vrastan; and by the Russians, Grusín, and the inhabitants Grus-ya; but the native historians preserve the name *Iveria*, *i. e.*, Iberia, which was introduced by the ecclesiastics whose profession led them to study Greek.

Georgia Proper.

Name.

Divisions, ancient and modern.

The whole territory was anciently divided into Upper and Lower Iberia,—the former comprehending Khartli, Khakheti, and part of Sa-atabago; the latter, the remainder of Sa-atabago with Imerethi, Ming-reli, and Guriel. Georgia, however, taken in its largest sense, may be said to be bounded on the N. by the snowy ridges of the Caucasus, on the E. and W. by the Caspian and the Euxine seas, and on the S by the rivers Choroki, Kur, and Eresn, anciently called respectively the *Bathys*, the *Cyrus*, and the *Araxes.* The area, anciently divided into Colchis, Iberia, and Albania, now embraces the following territories:—Lazheti, Guriel, Ming-reli, Imerethi, Khartli or Georgia Proper, Kacheti, Ganjah, Karabagh, Shekhí or Nukhá, Shirván, Mughán, and Tálish.

Area and population.

Georgia Proper has an area of about 26,000 square miles, with an estimated population (in 1855) of 600,000. The principal town is Tiflis, the ancient metropolis of Georgia, the chief seat of the commerce of the country, and at present the seat of government for all the Caucasian provinces of Russia. (See TIFLIS.) The physical features of Georgia will be found under the articles CAUCASUS and TRANS-CAUCASIA; and the trade and commerce under TIFLIS.

History.

Adopting the Armenian genealogies, the Georgians trace their origin to Thurgamos, a great-grandson of Noah. Considering this, however, as fabulous, or at least very improbable, we may safely conclude that they are the descendants of the aborigines of the mountains of Pambaki. Their earliest emigrants pushed northwards and occupied the fertile valleys which extend from this chain to the Caucasus. Georgian historians tell us that their country Khartli derives its name from Khartlos, one of their earliest chieftains, and that all their tribes are called Thargamossiani—names which they have adopted since the introduction of Christianity in order to give a biblical origin to their race. According to the Armenian traditions, Thargamos, the grandson of Japhet, had eight sons, of whom the second was Khartlos, who established himself on the southern declivities of the Caucasus, and was the founder of the Georgian nation. Stephen Orpetian, archbishop of Sioony, who lived in the third century, alleged that this son of the patriarch built at the foot of Mount Armaz a fortress to which he gave the name of Orpeth. This circumstance is worthy of being noted, as it will serve for a starting point in the history of the race of the Orpetians, veritable mayors of the palace of the kings of Georgia. Mtskethos, the eldest son of Khartlos, founded, near the confluence of the Aragvi and the Kur, a town to which he gave his own name, and which served as the capital to his successors down to the year 470 A.D. Some fragments of the chronology of the kings of Georgia are found scattered through the historians of Persia and Byzantium; but we shall not help to rescue their obscure names from the oblivion which cannot too soon shroud their useless lives. Only the most remarkable personages and events merit our notice as falling in with general authentic history.

The Georgian chronicles mention Farnavaz as the first chieftain who took the title of king in Georgia. He lived about 300 B.C. One of his successors, of the name of Aderki, divided his dominions into two states—Armazel and Mtsket, which, at his death, he bequeathed to his two sons; but in the sixth generation the king of Armazel united them again. A king named Mirvan built the fortress of Dariel, and threw up a rampart in order to protect Georgia against the invasions of the Alans and the Khazars. This, however, did not prevent the Alans, in the following century (B.C. 100), from twice crossing the Caucasus from N. to S. in order to overrun Armenia and Media. At the end of the third century A.D., King Aspagur abolished the custom of immolating children to the idols, and thus prepared the way for the reception of Christianity among his subjects. From 265 till 318 Mirian was king, when a female slave, whom the Armenian chronicles call Nina, came into Georgia, and brought with her the faith of Christ which she exemplified most attractively in her whole life. The king Mtsketha caused a chapel to be erected in a wood, where precious relics were deposited; and Mirdat, his son, replaced this edifice by a stone church. In A.D. 469, the king, Vakhtang Gurgastan, abandoned his capital of Mtsketha for a new city which he had raised on the site of an ancient village named Tphilissi or Tphiliskalaki, *i. e.*, the "warm town," on account of its *thermal* springs. This town still continues the capital of the kingdom, and now bears the abbreviated name Tiflis. During the seventh century Islamism was introduced among the Georgians as well as among the other surrounding nations; and in A.D. 684 the Kalif Valid sent into the Caucasus an army of 3000 men, under the command of his brother Muslimeh, who seized Derbend after a memorable battle in which the famous Mussulman hero Kriklar was slain. His mausoleum is yet to be seen near Derbend, and the Lesghians still perform their pilgrimage to it. From this time down to the end of the ninth century the Arabs continued their incursions into Georgia, Shirvan, and Daghistan, where they compelled those who fell into their power to embrace Mohammedanism. In the year 861 they seized Tiflis; but soon after this exploit their power and influence began to decline. They had, however, transferred several colonies into Caucasus; and even now there is an Arab people to the north of Derbend, whose location there dates back to this colonization. Passing over a long catalogue of petty sovereigns, concerning whom even their own historians are not agreed, we come to some events concerning the interesting race of the Orpetians. The Georgians long groaned under the yoke of the infidels. Their sovereigns, compelled to follow the dictates of a foreign despot, no longer retained the shadow of authority, nor dared to assume the title of king; they called themselves simply *patricks* (*i. e.*, patricians) or *mamasakhlisi* (*i. e.*, *patres-familias*). During these times of their subjection, a great revolution broke out in the eastern countries bordering on Tâtary, and extended even to the mountains of Caucasus. In consequence of this revolution one part of the reigning family emigrated, and passing from one country to another, arrived at the foot of the Caucasus. The chief of these illustrious travellers was a prince of noble mien, brave and courageous, who, becoming aware of the sad position of the Georgians, still more and more oppressed by the Persians, proffered them his services, and laid his plans for their immediate deliverance from their tyrants. Fortune seconding his courage, he soon accomplished his design for the deliverance of the Georgians, who, recognising the immense obligation which the illustrious strangers had conferred upon them, decreed great honours for them all, but especially for their noble chief. Among other domains the king granted him the fortress of Orpeth, whence was conferred upon him and his descendants the surname of Orpetian. This noble family has ever since rendered to Georgia the most signal services; it has furnished to the crown its firmest supporters, and to the people their bravest defenders. Converted to the Christian faith, the Orpetians have at all times nobly defended it against the attacks of the Mohammedans, and thus acquired so much renown that their power was sufficient alone to place upon the throne the weak kings who succeeded obscurely under their protection. In A.D. 1049, during the reign of the Georgian king David, the Seljook Turks made an irruption into Asia Minor and the Caucasian provinces. David in terror retired to the mountain fastnesses for safety; but the *sbalasar* or constable, Libarid Orpetian, bravely advanced to meet the host of the infidel, followed only by a handful of soldiers to whom were united some battalions of Armenians and Greeks. He gave battle to an army at least twenty times more numerous than his own, routed them completely, and bore away their standards as a trophy of total victory. This brilliant exploit excited violent jealousy among the Georgian nobles, who, with deep ingratitude, leagued against the deliverer of their country and assassinated him. This dastardly deed was not long unavenged. The army of the Turks was scattered but not destroyed; and when it returned to the charge, the Christians, deprived of the Orpetian, dared not to make head against it, and were mostly cut to pieces. Thus Georgia fell under the power of the Seljooks; Tiflis had a garrison thrown into it, and the shattered remains of the Georgian army took refuge in the mountains. Libarid, however, had left one son, Ivané I. This inheritor of paternal renown was recalled by king David "the Brave" (second of the name), and re-instated not only in possession of his patrimony, but besides received the fortress of Lorhi. In A.D. 1160, David III., who had governed with wisdom and moderation, died and left a son, still a youth, named Temna, whom he entrusted to the sbalasar, Ivané Orpetian III., leaving the regency to George his own brother. At the time of the prince attaining to his majority, the nobles, discontent with the administration of George, sought out Orpetian, and pressed him to cause the true king to be proclaimed. Ivané acceded to their wish; but the regent, not wishing to surrender his power to the heir, it was necessary to have recourse to arms. George retired into Tiflis, where Ivané besieged him; but, obliged to retreat, he retired with his ward into the fortress of Lorhi, and sent his brother Libarid and his two sons to ask succours from the Atabeks of Persia and Armenia. The regent immediately laid siege to Lorhi, which he reduced to the last extremity. The presence of the young prince alone still inspired the besieged to continue the desperate defence, when he, seized with a panic, deserted his own cause, and letting himself fall to the foot of the ramparts, ran to cast himself at the feet of his uncle, imploring his pity, and begging only life. The conqueror, whom we may now call George III., granted his request; but deprived him of his eyes, and so mutilated his person that all hope of his leaving offspring was taken away. The war was thus rendered unnecessary; and Orpetian therefore consented to surrender on condition that no evil was to come to him. George assented that it should be so; and yet as soon as he had him in his power he treated him in all respects as brutally as he had done his own nephew. Not even content with that, he drew forth the relations of Ivané and massacred them all, regarding neither age, sex, nor infancy. At last, wishing to annihilate, if possible, even the remembrance of the race of the Orpetians, he caused their names to be effaced from all the inscriptions in the churches, as well as from the chronicles and histories. Libarid, the brother of the unfortunate Ivané, quitted the country; his two nephews followed him into exile; and one took refuge with the Atabek Ildigooz, the other with the Emir of Kondsag. It was not long after, during the reign of Thamar, daughter and heir of George III., that one of them, named Libarid, consented to re-enter Georgia and the fortress of Orpeth was restored to him. He was the progenitor of the succeeding and still distinguished Orpetians. The reign of Thamar is the most glorious period in the history of Georgia. This princess, whom her grateful subjects called *Mep'hé*, a name only suitable to the sovereigns of the other sex, acquired great historic celebrity. She might rank with Semiramis of Babylon, Catherine of Russia, and Elizabeth of England. She called into her service the illustrious scions of the famous house of the Orpetians, expelled the Persians who had invaded her territories, conquered all the country lying between the Kur and the Araxes, rendered several neighbouring princes tributary to her, and extended her dominion from the Black to the Caspian Sea. Her son George IV., surnamed Lascha (thick-lipped), seconded by Ivané Orpetian, undertook several successful wars against the tribes lying beyond the southern boundary of Georgia, and compelled them to embrace Christianity. But in A.D. 1220, the Mongols, whom the generals of Zinghis-Khan conducted, entered Armenia, and crossed over the Caucasus, which they traversed completely, spreading devastation and death in every direction. The old age of George IV. was embroiled and embittered by a succession of sad misfortunes which present no historic interest. He left a son in his minority (who afterwards reigned under the name of David IV.), and entrusted his education to his sister Rusudan. This princess seized the crown in 1224. During her reign, the Mongols again entered the Caucasian isthmus and committed dreadful ravages. From this time up to the foundation of the new Persian kingdom (A.D. 1500), the history of Georgia is mixed up with that of the conquests of Zenghis-Khan and of Timoor-Lang (Tamerlane). Only now and then may be seen the flash of some heroic attempt to free the country from its oppressors, inspired rather by the despair of the oppressed than by any determined hopeful effort to regain their independence. Momentary successes left to the oppressed a time to breathe; but ever and anon the cruel conquerors returned with the destructive sweep of the tempest. Several heroic combats, from 1305 till 1346, obtained for George VI. the title of "Most Illustrious." Again, in 1388, Timoor ravaged Georgia and carried away the king Bagrat, who, during his captivity, feigned conversion to Islamism; and thus having gained the confidence of his conqueror, he requested an army in order to re-enter his own kingdom for the purpose of restoring the inhabitants to the faith of Mohammed. The Mongol warrior fell into the snare and granted the army. As soon as Timoor discovered the treachery, he became furious as a lion, and re-entered Georgia, where, in three successive expeditions, he devastated the towns, the cultivated lands, and the monasteries; slaughtered the inhabitants; destroyed not fewer than 700 villages; while George VII., son and successor of Bagrat, concealed himself in the most inaccessible fastnesses of the Caucasus. At last, in 1404, Timoor finally abandoned this unfortunate country, and George descended from his mountain terreat, taking in succession Tiflis and the principal fortresses occupied by the Persians, and had the pleasure of reigning a few years in tranquillity over his beloved but desolated country, still reeking with the blood of its slaughtered inhabitants. Ten years afterwards, Alexander, of the house of Bagrat, united under his dominion all the Georgian countries.

From 1500 to 1703, *i. e.*, to the reign of Vakhtang VI., the last king of the chief branch of the family of Bagrat, twelve princes reigned, of the name of David, Luarsab, Simon, or George, all tributaries to Persia, sometimes in a state of rebellion, but always the unhappy victims of intestine dissension. In 1618 Shah-Abbas carried captive 50,000 Georgians of both sexes, and dispersed them over all the Persian territories. The kingdoms of Khakheti, and of Khartli were formed from the fragments of Georgia, but have since been dismembered and again re-united. At this epoch the provinces were governed by khans. At length (1703) Vakhtang VI., who attached his name to a code long venerated, and one of the most warlike sovereigns of the Caucasus, broke from obscurity by displaying the most brilliant virtues, until he was conquered, and, having exhausted all his resources, he threw himself into the arms of Russia, and retired to Astrakhan to die in peace. For a long period the religious zeal of the Georgians, and the horror they have always manifested of Mohammedanism, led them secretly to court the alliance of Russia. This wary power had, since the reign of Ivan Vassilievitch, extended her dominions even to the foot of the Caucasus; and from the year A.D. 1555, several Cheerokeese tribes had recognised themselves as her vassals. In 1586 a king of the Khakheti put himself under the protection of the Czar Fodor; and three years afterwards a Georgian ambassador was sent to implore his aid against the Turks. Such solicitations being often repeated, the Russians soon coveted the possession of these Caucasian provinces, and in recent times have amply gratified their desires. In 1722 Peter the Great crossed the defile of Derbend and laid siege to Old Shamaki, where some of his subjects had been treacherously assassinated by the Persians. A treaty granted him the possession of the provinces bordering on the Caspian Sea; but some years after they were restored to Nadir-Shah. At last, Heraclius II. came to the throne of Georgia. He, wishing to rid himself of the domination of the Persians, constituted himself a vassal of Catherine II. of Russia by the treaty of Georgievsk (July 24, 1783). Twelve years afterwards a Persian army ravaged his estates in order to avenge his desertion; Aga-Mohammed Khan besieged Tiflis, gave it up to pillage, put all to fire and sword, and carried off 20,000 prisoners. From Russia, Heraclius received only an inefficient assistance; he soon sank, however, overwhelmed with grief, and died in 1798. His son George had a reign equally unhappy and turbulent, constantly engaged in fighting against the mountain tribe of the Lesghis and the Persians, until at length he implored the protection of Paul I., and then died with the sad certainty that he was the last king of Georgia. At first the queen Maria, his widow, wished to oppose the pretensions of Russia, and even stabbed the officer Tzitzianoff, who was sent to conduct her to Moscow, but she at length surrendered; and shortly afterwards her son David (A.D. 1800) gave up the entire kingdom, and with his mother retired to St Petersburg.

From this date Georgia merges into the history of the Russian empire. In 1810 the chief of Imeréthi made an abortive attempt to shake off the Russian yoke, but he was compelled to flee to Turkey, and his principality thence became a province of Russia. Under her all-grasping dominion fell several other petty states successively; and her conquests during her last wars with Persia and Turkey have been confirmed by the treaty of Turkmanchai in 1828 with Persia, and by that of Adrianople in 1829 with Turkey. Since these treaties were signed Russia has been engaged in endeavouring to subjugate the highland tribes in order to consolidate her power, and to assimilate the education, laws, and government to that of the rest of the empire. In this she was steadily working out her purpose when the war broke out which has already wrought many changes in this country, and is likely to work many more before the restoration of peace.

Villages. In almost all the large villages of Khakheti stand strong stone towers, which are said to have been built by the nobles of the country as a defence against the Lesghians. In the palmy days of Georgia, not only the mountains of Lesghistan, but those of Daghistan (Schamyl's country), were subject to it; but since the conquest by Timoor, Georgia has become more and more enfeebled, while the hardy mountaineers in their turn made continual attacks on their neighbours, especially the rich Khakhetians, whom they regarded with the same feelings of contempt and envy that Roderick Dhu may have felt for a thriving Lowland farmer on the banks of the Forth.

Natives. The natives of Georgia—forming about four-fifths of the entire population—belong to the pure Caucasian race, and have always been as much celebrated as the Circassians for the fine athletic frames of the men and the beauty of the women. For both sexes these qualities have created a large demand—the males to serve in the armies, and the females to become inmates of the harems of the Turks. From this horrid traffic the Georgian nobles long derived their chief revenue, valuing their serfs only for the money which they could obtain for them in the Turkish markets. Since the interference of the western powers of Britain and France in 1854 the traffic has been much checked. Large numbers of the celebrated Mamelukes were Georgians. Under the Russian dominion, the distinction which divided the whole population into the two classes, nobles and serfs (nearly the same as masters and slaves), though still subsisting, has been much modified. The power of life and death which the nobles claimed, and exercised without scruple, has been expressly abolished. The Georgians

Religion. belong nominally to the Greek Church; but both clergy and people are fearfully ignorant. The Bible was translated into their native tongue as early as the beginning of the fifth century; and the benefits, though as yet little perceptible, promise to become greatly extended by means of a good printing press which the Russians have established at Tiflis.

Language. The Georgians pretend that their language, so far as etymology is concerned, is a perfectly complete and independent idiom. Monsieur Brosset, however, shows that the Georgian tongue is one of the great Indo-Germanic family, and proves this by a careful comparison of the roots appearing in Georgian writings of different ages, especially those found in their most ancient books. Accordingly, this language may fairly be stated to hold a middle place between Sanscrit and Pehlvi or ancient Persian. But in its formation there has been a large implantation of Indian radicals on the ancient Median stock. In the present Georgian language there is a large intermixture of Armenian, but only as borrowed words from a foreign idiom. The accumulation of consonants in Georgian gives a rugged harshness to the pronunciation, which renders it an excellent language for public speaking. There are certain fixed laws for the formation of their compound words; and it is especially rich in grammatical inflexions. Its declensions are very simple, being the same for nouns, adjectives, and pronouns; but it employs some pronouns either isolated or inseparable, either in the nominative or accusative, which are subject to very complicated rules. The theme or root of the verb is found in the third person singular of the perfect tense, as in the Shemitic tongues, and consists of from one to five radical consonants, with one or two vowels having uniform sounds. Each person has its peculiar characteristic; and the tenses of the indicative mood are seven, of which three are past and three future; while certain particles serve to give the indicative a conditional or subjunctive meaning. In Georgia

Dialects. there are five principal dialects—the Khakhethi, the Imeréthi, the Ming-reli, the Guri, and the Khartli. The purest, say the native scholars, is spoken by the Phchavs and the Khvsovs, who dwell north of the Khakhethi, on whom they depend. The knowledge of Turkish and Persian is so general in Georgia, that writers often use the synonymous terms from these languages instead of the pure Georgian. There are often to be met with also, especially in the journals of Tiflis, many French and Latin words, mostly bor-

Prosody. rowed from Russian sources. "The prosody of Georgian poetry is similar to that of the Greek and Latin—founded on the tones and accents," says Eugenius, in his *Tableau Historique de la Géorgie*. "The limited number of the syllables," on the contrary, according to Brosset, "with the final rhyme, which has been borrowed from the Turks, is the only rule of Georgian versification. The most ancient

Books. Georgian book now known is the translation of the Bible, executed in the eighth century by St Euphemius or Euthymius; and the most celebrated original monument of this

Poem of Tariel. literature is the *Poem of Tariel*, composed by General Rustevel, who lived in the reign of Thamar. The complete title of this curious poem is, "The Man Clothed in the Skin of a Tiger," or, "The Amours of Tariel and of Nestan Darejan." It displays a rare fecundity of invention, and a singular richness of imagination; and it seems to be in great part drawn from Persian sources. In another composition the same poet has celebrated the exploits of Thamar. The Georgians have two heroic poems—the *Baramiani*, and the *Rostomiani*. They also still hold in high estimation *Visramiani* and *Darejaniani*, two prose romances whose respective authors were Sarg of Thmogvi, and Mosi of Khoni. The collection of hymns, religious as well as national, by the patriarch Antoni, enjoys deservedly great popularity. The *Code of Vakhtang*, and also the *Chronicle of Vakhtang*, are among the most important prose remains in the Georgian language.

Klaproth, *Tableau Historique, Géographique, Ethnographique, et Politique du Caucase*, 8vo, Paris, 1827; *Chronique Géorgienne*, translated by Brosset the younger, 8vo, Paris, 1831; Vakhucht, *Description de la Géorgie*, translated by M. Brosset, 8vo, St Petersburg, 1841; Sir Robert Ker Porter, *Travels in Georgia*, London; Eichwald, *Reise in den Kaukasus*; Gamba, *Voyage dans la Russie Méridionale*; Baron von Haxthausen, *Transcaucasia—Sketches of the Nations and Races between the Black Sea and the Caspian*, London, 1854; Guldenstädt, *Reisen nach Georgien*; *Missionary Researches in Armenia*, 8vo, London, 1834; *Dictionnaire Géographique*, Paris, 1828; Spencer's *Travels in the Western Caucasus*, 2 vols., London, 1838; Paolini and Irbach, *Georgian and Italian Dictionary*, Rome, 1629; Ghai, *Georgian Grammar* in Russ, 8vo, Petersburg, 1802; J. S. Vater, *Grusinsche oder Georgische Sprachlehre*, 8vo, Halle, 1822; &c., &c.

GEORGIA, *Gulf of*, an inlet of the sea on the W. coast of North America, separating the island of Vancouver from the mainland, and communicating with the Pacific on the N. by Queen Charlotte's Sound, and on the S. by the Strait of Juan de Fuca.

GEORGIC (Lat. *georgicus*, γεωργικός, rustic—derived from γη, *earth*, and ἔργον, *work*), a poetical composition on the subject of husbandry, containing rules expressed in a pleasing manner, and embellished with all the beauties and elegancies of poetry. Virgil has particularly excelled in this style of composition.

GEORGIUM SIDUS. See HERSCHEL.

GERA, the capital of a cognominal lordship in the principality of Reuss, stands in a valley on the banks of the Elster, 35 miles S.S.W. of Leipzig. In 1780 Gera was almost wholly destroyed by fire, and since that time it has been rebuilt in a more regular manner; the streets are in general wide, crossing each other at right angles, and many of the houses are handsome edifices. It has several public squares, a fine town-hall, five churches, two hospitals, a gymnasium, normal school, orphan asylum, house of correction, and a public library. Gera has long been noted for its industrial activity. Its manufactures comprise woollen, cotton, and silk goods, oilcloth, leather, hats, tobacco, soap, beer, porcelain and other earthenware, bricks, musical instruments, carriages, &c. In the neighbourhood are some baths much frequented. Pop. 11,255.

GERACE, a town of Naples, province of Calabria Ultra, on a hill near the coast, 30 miles N.N.E. of Cape Spartivento. In the middle ages this was a place of great strength, but frequent earthquakes, and particularly that of 1783, have reduced its citadel to ruins. The cathedral, a handsome Gothic edifice, was overwhelmed by the same catastrophe, and now only a small portion of its crypt remains available for public worship. In the vicinity are the remains of the ancient city of *Locri Epizephyrii*. Gerace seems to have been built in a great measure of the materials of the ancient city,—the fine marble columns of the cathedral are evidently spoils of ancient temples. Pop. 4800.

GERANIUM, a genus of plants of the nat. ord. Geraniaceæ, containing a vast number of species, many of which are cultivated in our gardens for the beauty of their flowers. Most of the cultivated species belong to the sub-genus *Pelargonium*, and are natives of southern Africa, where they abound, and form a striking feature in the peculiar vegetation of that region. See BOTANY, vol. v., p. 187.

GERARD, ALEXANDER, author of the *Essays on Taste and Genius*, was born at Chapel-Garioch, in Aberdeenshire, in 1728. After the usual preliminary studies he graduated as M.A. at Marischal College, and then began the study of theology, which he prosecuted at Aberdeen and Edinburgh. In 1752 he was appointed professor of natural philosophy in Marischal College, and contributed powerfully, by his voice and pen, to remodel the system of academic study then pursued in Aberdeen. Eight years later he exchanged that chair for the more honourable one of divinity, and in 1771 left Marischal for King's College, where he remained till his death in 1795.

Gerard is chiefly remembered by his *Essay on Taste* (which was rewarded with the gold medal of the Edinburgh Philosophical Society in 1756), and his *Essay on Genius.* These and the other works of their author exhibit a sound judgment and extensive reading. They exhibit, however, no rare or valuable qualities of mind, and are seldom or never relieved by a ray of fancy or a burst of eloquence. Besides these works, Gerard published two volumes of Sermons and a Dissertation on the Evidences of Christianity.

GÉRARD, *François*, a distinguished French historical painter, born at Rome of humble parents in 1770, died at Paris in 1837. He was a pupil of the celebrated David, whom he followed for a time as his model both in politics and art. Abandoning the sphere of politics, however, he finally devoted himself heart and soul to painting, and under the first Napoleon attained high eminence. The best of his ideal pieces are probably his *Belisarius* and his *Psyche*, the first of which is well known in Europe by engravings. Equally popular were his *Battle of Austerlitz* and his *Entrance of Henry IV. into Paris.* All these pictures are now in the public galleries of France. Though they still look well, they have evidently suffered from the lapse of time; some of them even seem doomed to share the fate of Reynolds' masterpieces, and disappear altogether from the canvas. Gérard was a remarkable portrait painter; and some of the best likenesses of the distinguished personages of his time are by his hand. It is perhaps too much to claim for Gérard the possession of great original genius, but he had a fine fancy and an exquisite taste, grouped his figures admirably, and, though far from being a striking or even a correct colourist, he yet disposed his colours so well as generally to produce a harmonious effect.

GERARDE, JOHN, a surgeon in London, and the greatest herbalist of his time, was many years chief gardener to Lord Burghley, who had the best collection of plants in the kingdom, among which were a great number of exotics introduced by Gerarde. In 1597 the latter published his *Herbal*, which was printed at the expense of J. Norton, who procured from Frankfort the same blocks in wood which were used in the *Herbal* of Tabernæmontanus. In 1663 Dr Thomas Johnson published an improved edition of Gerarde's book, which met with such approbation in the university of Oxford that they conferred upon him the degree of doctor of physic. The descriptions in the *Herbal* are plain and familiar; and both these authors have laboured more to make their readers understand the characters of the plants than to inform them that they themselves understood Greek and Latin. The *Herbal* of Gerarde is now considered only as a literary curiosity. The figures in general express very accurately the characters of the plants which they are intended to represent. Gerarde died about the year 1607.

GEREZ, SERRA DE, in Portugal, a mountain chain, consisting of a spur of the mountains of Asturias, and running between the basins of the Douro and the Minho to the W. of Montalegre. This Serra is the finest in N. Portugal, except the Scajo. It is generally composed of a succession of lofty granite peaks, and stretches about 20 miles from N. to S. The Murro de Buragciro, 4296 feet above sea-level, is the culminating point. On his retreat before Wellington in 1809, Marshal Soult led his army through a terrific gorge forming one of the passes in this chain.

GERGAL, a secular town of Spain, province of Granada, and bishopric of Almeria, is situted at the foot of the Sierra de Baza, on a rugged site in the form of an amphitheatre. Gergal contains the Santa Fuente, celebrated as a cure for cutaneous eruptions, besides a large parish church, a chapel, a granary, a prison, and a town-house. The principal manufactures are counterpanes, glass, oil, white wax, earthenware, &c.; and the trade consists chiefly in oil, wine, and hardware, with Castile, Galicia, and Murcia. The distance from Almeria is 24 miles, and the pop. (1855) nearly 6000.

GERMAIN-EN-LAYE, ST, a town of France, department of Seine-et-Oise, on an eminence on the left bank of the Seine, 10 miles W.N.W. of Paris. The streets are wide, handsome, and well paved, and the houses lofty and well built. It originated in a chapel and monastery of St Germanus, built by King Robert in the eleventh century, in the midst of the forest then called *Silva Ledia.* The royal palace, for which the town is chiefly noted, was originally built by Charles V. in 1370. It was rebuilt by Francis I., and improved and embellished by succeeding monarchs, and especially by Louis XIV. This was the favourite residence of Marguerite de Valois, Henry II., Henry IV., and Francis I., and the birth-place of Charles IX. and Louis XIV. James II. of England spent here the last years of his life. It is now used as a military prison. A fine terrace, about a mile and a half in length, and nearly 100 feet wide, extends along the brow of the hill and commands a delightful prospect. The parish church contains a monument, erected at the expense of George IV., over part of the remains of James II., which were found in making some alterations in the church. St Germain has three handsome squares, a corn market, theatre, and public library; and manufactures of woollens, leather, and horse-hair goods. Pop. 12,527. The forest of St Germain occupies an area of 8900 acres, and is traversed by numerous roads, the aggregate length of which is estimated at about 1180 miles.

GERMAN (Lat. *germanus*, a brother), in matters of genealogy implies whole, entire, or own. Thus *brother-german* denotes a brother by the same father and mother. *Cousins-german* are those in the first degree, *i.e.*, the children of brothers or sisters. Among the Romans we find no instance of marriage between cousins-german before the time of the emperor Claudius, when it became common. Theodosius prohibited such marriages under severe penalties, including even fine and proscription.

GERMAN, SAN, a town in the island of Porto Rico, near the west coast. In the vicinity cotton and coffee are are produced; and cattle are reared in large numbers. The town stands on the Guanajive or Guadianilla, and was founded in 1511. The jurisdiction of San German comprises fourteen parishes, with nearly 12,000 inhabitants. The species of resin which answers the purposes of pitch is produced here from the tabernaculo tree.

GERMAN SILVER, the name given to an alloy of nickel, zinc, and copper, which is much used as a substitute for silver plate, &c. Its beauty and resemblance to silver depend on the preponderance of nickel, up to a certain point. The imitation may be so perfect as to evade detection by the eye; but friction applied to this alloy at once develops a coppery odour. The proportions recommended are—nickel 25, zinc 25, copper 50.

GERMANICUS, CÆSAR, an illustrious Roman general, and one of the most virtuous and noble characters in the history of the empire, was born 15 B.C. He was the son of Claudius Drusus Nero and Antonia, daughter of Mark Antony, and niece of the emperor Augustus. He was thus the brother of the emperor Claudius, and the nephew of the emperor Tiberius, who adopted him in compliance with the request of Augustus. In his twenty-second year he went to assist his uncle in the war against the Dalmatians and Pannonians. For his services in these campaigns he was rewarded with a triumph on his return to Rome. About this time he married; and by his wife Agrippina, who was a granddaughter of Augustus, he had nine children, two of whom afterwards became notorious—Caius Caligula as emperor, and Agrippina as mother of Nero. After another campaign against the Germans in A.D. 11, Germanicus returned to Rome, where he was made consul without having held the

Germanicus.

St Germans ‖ Germantown.

lower grades of public office. In the following year he was sent by Augustus to take command of the legions on the Rhine. When the news of Augustus' death reached these troops in A.D. 14, they broke out into open mutiny, the veterans claiming their discharge, and the young soldiers demanding an increase of pay. It was only with the utmost difficulty, and the use of fictitious letters purporting to have been received from Tiberius, that Germanicus was enabled to crush the outbreak. Hardly was it quelled when another, still more formidable, broke out. The general threw up his command in disgust, and prepared to leave the camp with his wife and family. This conduct brought the soldiers to their senses. Discipline was restored, the ringleaders of the mutiny were put to death by the soldiers themselves, while the legions demanded to be led forthwith to battle against the Marsi and Bructeii on the other side of the Rhine. Seizing the moment of enthusiasm, Germanicus marched upon the foe, and routed them with great slaughter. Similar success attended his arms in the following year when he marched against Arminius, the conqueror of Varus; but another campaign and two bloody battles had to be fought before full vengeance could be taken for the slaughtered legions. On the trophy which commemorated the rout of the famous German chief, the Roman general, modestly and prudently omitting all mention of himself merely inscribed "The army of Tiberius Cæsar, having conquered the nations between the Rhine and the Elbe, consecrates this monument to Mars, Jupiter, and Augustus." Jealous of these successes, and alarmed by Germanicus' increasing popularity with the army, Tiberius recalled him to Rome; and though he prayed for one year more to finish the work he had so well begun, the tyrant was inflexible. In A.D. 17 Germanicus returned to Rome, and was honoured with a splendid triumph. In the following year he shared the consulate with Tiberius, and was sent to the east to quell the tumults and insurrections there. His movements, however, were watched and checked by the spies and creatures of his imperial master. One of these, Cn. Piso, governor of Syria, a man of haughty and violent temper, strained every nerve to thwart the plans and embitter the life of Germanicus, and succeeded only too well in his design. After accomplishing his mission to the east, Germanicus suddenly fell ill at Antioch, and on his deathbed declared to his wife and family that he believed himself the victim of hostile intrigue and malice. His friends, whether rightly or not cannot now be known, construed his words into a suspicion of poison. Certain it is, that with his dying words he called upon his family and friends to avenge his murder. Tacitus, however, to whose graphic pen we owe the best narrative of Germanicus' life, seems to incline to the opinion that poison was not found necessary to shorten the days of him to whom the Romans looked forward with hope and faith as their future sovereign. The insults and annoyances to which he was hourly exposed were found enough.

The character of Germanicus shows with a double lustre in the dark era of tyranny and cruelty in which he lived. Though, as a commander, he was fierce and stern in carrying out the orders of Tiberius against the enemies of the empire, as a man he displayed remarkable clemency towards his foes. His military talents were of the first order, and his successes in war were as brilliant as they were useful. But it was chiefly his personal virtues that endeared him to the Roman people. That he was disinterested is shown by his obstinate refusal to contest the imperial crown with his uncle, though he might have secured it without much difficulty. His sense of duty, his chastity, his munificent liberality, his attachment to his friends, and his great personal accomplishments, made his early death the subject of universal lamentation throughout the whole Roman empire. At the time of his death, which happened in A.D. 19, he had only reached his thirty-fourth year. The grief in every part of the world to which his fame had reached was intense, and the honours paid to his memory were almost without example in Roman history. Germanicus long enjoyed a considerable reputation as an author. There have been various editions of his remains. The best is that of Orelli, appended to the *Phædrus* of that critic, Zurich, 1831. (Tacitus, *Annal.* i., ii.; *Dion Cassius*, lib. xxxvii.; Beaufort's *Historie de Germanicus Cæsar*, &c., &c.)

GERMANS, ST, a market-town and parish of England, county of Cornwall, 22 miles E.S.E. of Bodmin. It stands on the slope of an eminence near the river Tidi, and consists chiefly of one street. From 931 to 1049 it was the seat of a bishopric, afterwards united with that of Crediton, and from this union arose the see of Exeter. The parish church, formerly conventual, was once much more extensive. It consists of a nave and two aisles. The W. front has two towers, between which is the entrance formed by a deep Norman arch. The inhabitants are engaged chiefly in agriculture and fishing. Previous to the Reform act it returned two members to parliament. Market-day, Friday. Pop. of parish (1851) 2967.

GERMANTOWN, a post-town in Philadelphia county, state of Pennsylvania, North America, on the Germantown branch railroad, 6 miles N.W. of Philadelphia. It consists of one broad street, 4 miles in length, with several others crossing it at right angles. Many of the upper classes of Philadelphia have country seats here, some of which are of great beauty and elegance. Pop. (1853) about 7000.

GERMANY.

THIS name was given by the Romans to a country inhabited by various tribes of different names, but nearly alike in manners, customs, language, and religion. But they comprehended under it not only the country now called Germany, but also Denmark, Norway, Sweden, Finland, Livonia, and Prussia. The modern inhabitants call themselves *Deutsch*, and their country *Deutschland ;* but, as to the origin, meaning, and primary application of both names (German and Deutsch), German antiquaries are far from being agreed, though most of them seem to be of opinion that *German* is a genuine Deutsch word, compounded of *ger*, or *gerra*, a spear, and *man*, and consequently meaning spearman, or warrior. *Deutsch* seems to have been known to the Carlovingians, and it first occurs in a document of the year 813 ; but it is only since the time of the emperor Otto I. (A.D. 936–73) that it has been in use as the general name of the German nation.

The Rhine on the west, and the Vistula on the east, seem to have been generally considered as the boundaries of Germany ; whilst on the north it extended along the ocean and the Baltic Sea, and on the south was terminated by the river Danube. But such boundaries were by no means definite ; for many German tribes inhabited the southern banks of the Rhine as far as the Scheldt. Between the Rhine and the Moselle were the Ubii ; and higher up, but beyond the latter river, were the Treviri, and then the Triboci, the Neimetes, and the Vangiones. The Mediomatrici were planted along the Moselle, near the site of the present city of Metz ; and above them, on the Rhine, in the present Swiss canton of Basel, were the Raurici or Rauraci. The ancient nations of Vindelicia were settled between the sources of the Rhine and of the Danube. Noricum was inhabited by several tribes between the rivers Drave and Danube, and comprehended the provinces now known by the names of Austria, Styria, Carinthia, Tyrol, and Bavaria. Beyond the Danube, to the westward of the Marcomanni, the country was occupied by the Hermunduri, and extended to the north along the Hercynian Mountains to the river Sala. A nation beyond the Hercynian Mountains, known then as the Boiohemum, and in modern times as Bohemia, were in contact with the Quadii, whose territory, now called Moravia, touched, on its southern part, the Danube. These two tribes, with the Marcomanni, and some smaller clans, were comprehended under the general name of Suevi, a people who at a subsequent period forced their way into Spain, and established themselves in that peninsula as a warlike and independent nation. The Suevi were a powerful nation, who extended themselves along the Hercynian Forest, through which they penetrated, and occupied a tract of land extending from the Vistula to the Elbe. Among their possessions were the divisions which subsequently obtained the names of Saxony, Brandenburg, Lusatia, and Silesia. One subdivision of them, called the Semnones, grew sufficiently powerful to seize some of the richest provinces of Gaul ; whilst another, the Æstii, possessed the borders of the Baltic Sea, whence they drew much amber, of which they made use in traffic with the surrounding tribes. These last, according to Tacitus, were worshippers of the mother of the gods, and relied on her for protection. They are said to have been more industrious than the rest of the Germans in the cultivation of their lands, and at a very early period produced corn. Their amber was reported to have been obtained by diving in the rivers and the sea. This substance was then highly estimated ; and at a subsequent period, in the reign of Nero, a Roman knight is stated to have purchased for that emperor, of the Æstii, at one time thirteen thousand pounds weight, amongst which was a single piece weighing thirteen pounds. At a still later period, a letter is found in Cassiodorus, in which Theodoric, king of the Goths, gives thanks to the Æstii for a present of amber, and in return assures them of his friendship and protection.

In the interior of Germany, the Cimbri and the Saxons were possessed of the country north of the Elbe ; whilst on the south side of that stream the Chauci were the masters of the district through which the Weser flows, and were in contact with the two smaller tribes of the Cherusci and Chamavi. The Frisii were distinguished as the Upper and the Lower, and were separated from the Chauci by the river Ems, and from each other by a branch of the Rhine ; whilst beyond the Yssel were some migratory tribes, the Bruckteri and the Marsi. The Uspetes were established on the river Luppia, now the Lippe ; and beyond that stream were the Usipetes, who were celebrated for changing their residence, and were thence to be found in other districts. The Teucteri were settled on the Rhine, in the country of the Menopii ; and next to them the Jubones, near the modern Juliers. The Catti or Cotti inhabited parts of Hesse and Thuringia, extending from the Hartz Mountains to the Rhine and the Weser. Their southern neighbours were the Sedusi, bordering on Suabia, where they came in contact with the Marcomanni, who have been already mentioned.

Such are the best accounts which can be collected from Cæsar, Tacitus, and Ptolemy, respecting the localities of the various tribes who inhabited Germany before the period of the intercourse between them and the Romans. It has been justly remarked, that whilst modern nations are fixed and permanent societies, connected amongst themselves by laws and government, and bound to their native soil by arts and agriculture, the German tribes were only voluntary and fluctuating associations of soldiers, almost of savages ; and the same territory often changed its inhabitants in the course of conquest or of emigration. A victorious state often communicated its own name to a vanquished people. Sometimes crowds of volunteers flocked from all parts to the standard of a victorious leader ; his camp became their country, and some event soon gave a new but general name to the mixed community. Thus the distinctions of ferocious invaders were perpetually varied by themselves, and naturally confounded the astonished subjects of the Roman empire.

It is probable that the accounts of the numbers of the German people, as transmitted by early writers, are grossly exaggerated. In great and civilized states, millions of subjects pursue their peaceful avocations in silence and obscurity ; but in a state of rude republicanism, or of civil commotions, almost every member of the community is called into active exertion ; and thus, with their irregular divisions, their restless motions, their profusion of kings and warriors, and numerous contests, they present to our minds an appearance of numbers very far beyond the reality, which is still further strengthened by the most splendid appellations being frequently and repeatedly applied to inconsiderable objects. When the Romans first became acquainted with Germany, about the year 640 from the building of their capital, or more than 100 years before the commencement of the Christian era, the natives had advanced but a few steps from the savage state. Even in the subsequent age, as Tacitus affirms, they were so ignorant of the use of letters as to be unable to transmit from one generation to another any annals of their country, or any knowledge of the agreeable or useful arts of life. In an extent very far surpassing modern Germany, Ptolemy speaks of ninety towns or cities; whilst Tacitus asserts, as a well-known fact, that in his time they had no cities, and that they affected to despise the buildings constructed by Roman industry, as places of confinement rather than of security. Their dwellings were not even contiguous, nor formed into villages, but each of these barbarians fixed his independent dwelling on any spot which a plain, a wood, or a stream of good water, invited him to settle on; and in constructing his hut, neither stone, brick, nor tiles were employed. Built of timber, they were very low, and covered with straw, having a hole to allow of the emission of the smoke.

The clothing was of the simplest kind, notwithstanding the inclemency of the climate in a territory covered with woods, and not ameliorated by cultivation. In the more northern parts scanty garments of furs were used; and in the south some coarse linen, spun and woven by the females. Their food consisted chiefly of wild animals, or of the flesh of their large herds of cows and of horses, which were nearly in the state of their original wildness. A small quantity of corn was the only produce of the soil; the use of gardens, orchards, and artificial meadows, was unknown; nor could any great improvement in agriculture have existed, where a new division of the land took place annually, and a great part lay waste and without any tillage. The Germans seem to have learned the process of brewing or of distillation, as they made intoxicating liquors from wheat and barley, in the use or abuse of which they indulged to the greatest excess in social meetings and public assemblies. Drinking and gambling were their highest gratifications. They gloried in passing whole days and nights at the table; and the blood of guests, often of friends and relations, stained their drunken assemblies. The desperate gamester often staked his person and his liberty on the cast of a dice, and then patiently submitted to the decision, and was sold into slavery by his more fortunate competitor.

Notwithstanding the grossness of manners amongst the German tribes, the females were held in high estimation; and whilst the men were brave, the women were chaste. Polygamy was not in use excepting amongst the princes; and amongst them only for the sake of multiplying their alliances. Divorces were prohibited by manners rather than by laws. Adulteries were punished as rare and inexpiable crimes; nor was seduction justified by example and fashion. The unpolished wives of the Germans partook of few of those gratifications which tend to inflame the passions, and their fidelity was in some measure secured by the exposure to which they were subject in the open huts, and by poverty, solitude, and the painful cares of domestic occupation. Besides these restraints, the Germans treated their women with esteem and confidence, consulted them on every occasion of importance, and fondly believed that in their breasts resided a sanctity and wisdom more than human. Some of these interpreters of fate, such as Velleda in the Batavian war, governed, in the name of the deity, the fiercest nations of Germany. The rest of the sex were respected as the free and equal companions of soldiers, associated even by the ceremony of marriage to a life of toil, of danger, and of glory. In their great invasions, the camp of the barbarians was filled with a multitude of women, who remained firm and undaunted amidst the sound of arms, the various forms of destruction, and the honourable wounds of their sons and husbands. Fainting armies of Germans have more than once been driven back upon the enemy by the generous despair of the women, who dreaded death much less than servitude. If the day was irrecoverably lost, they well knew how to deliver themselves and their children, with their own hands, from an insulting victor. Heroines of such a description may claim admiration, but they can scarcely inspire the passion of love. They who attempt to imitate the sterner virtues of man must lose the attractive softness of their own sex, which is their principal charm. Conscious pride taught the German matrons to suppress every tender emotion which stood in competition with honour; and the first honour of the sex has ever been that of chastity.

The Germans were a warlike people, notwithstanding which their government was a species of democracy, although a few of the tribes on the shores of the Baltic acknowledged the authority of kings; but such kings owed their power as frequently to their valour or their eloquence as to their descent; and with all of them the power was tempered by the prevalence of popular assemblies. The assembly of the warriors of the tribe was convened at stated seasons, or on sudden emergencies. When a youth had attained the age of manhood, he was introduced into the general council of his countrymen, solemnly invested with a shield and a spear, and adopted as an equal and worthy member of the commonwealth. In such assemblies, the trial of public offences, the election of magistrates, and the great affairs of peace or war, were determined by independent votes. Sometimes these important questions were previously considered and prepared in a committee or select council of the principal chieftains. The magistrates might deliberate and persuade, but the people only could resolve and execute; and hence the resolutions were for the most part hasty and violent. They too often turned away with indignant contempt from the remonstrances of justice and policy, and signified by a hollow murmur their dislike of such timid councils. But when a popular orator proposed to vindicate the meanest citizen from either foreign or domestic injury, or called upon his countrymen to follow some enterprise of danger and of glory, the applause of the assembly was displayed by a loud clashing of shields and spears; for the Germans always assembled in arms, and it was to be dreaded lest an irregular multitude, inflamed by faction and strong liquors, should use their arms to enforce as well as to declare their furious resolutions.

A general of the tribe was elected on occasions of danger; and if the danger was pressing and extensive, several tribes concurred in the choice of the same general. The bravest warrior was named to lead his countrymen into the field by his example rather than by his commands; but this power, however limited, was still invidious. It expired with the war, and in time of peace the German tribes acknowledged not any supreme chief. Princes were, however, appointed in the general assembly, to administer justice, or rather to compose differences, in their respective districts. In the choice of these magistrates, as much regard was shown to birth as to merit. To each was assigned by the public a guard and a council of a hundred persons; and the first of the princes appears to have enjoyed a pre-eminence of rank and honour which sometimes tempted the Romans to compliment them with the regal title.

The comparative view of the powers of the magistrates, in two remarkable instances, is alone sufficient to represent the whole system of German manners. The disposal of the landed property within their district was absolutely vested in their hands, and they distributed it every year according to a new division. At the same time they were not authorized to punish with death, to imprison, or even to strike, a private citizen.

The Germans respected only those duties which they imposed on themselves. The most obscure soldier resisted with disdain the authority of the magistrates. "The noblest youths," says Tacitus, "blushed not to be numbered amongst the faithful companions of some renowned chief, to whom they devoted their arms and service. A noble emulation prevailed among the companions to obtain the first place in the esteem of their chief, among the chiefs to acquire the greatest number of valiant companions. The glory of such heroes diffused itself beyond the narrow limits of their own tribe. Presents and embassies solicited their friendship, and the fame of their arms often ensured victory to the party they espoused. In the hour of danger it was shameful for the chief to be surpassed in valour by his companions, and shameful for the companions not to equal the valour of their chief. To survive his fall in battle was indelible infamy. The chiefs combated for victory, the companions for the chief. The noblest warriors, whenever their native country was sunk in the laziness of peace, maintained their numerous bands in some distant scene of action, to exercise their restless spirit, and to acquire renown by voluntary dangers. Gifts worthy of soldiers, the warlike steed, the bloody and ever-victorious lance, were the rewards which the companions claimed from the liberality of their chief. The rude plenty of his hospitable board was the only pay which he could bestow, or they would accept. War, rapine, and the freewill offerings of his friends, supplied the materials of this munificence." This institution, however it might accidentally weaken the several republics, invigorated the general character of the Germans, and even ripened amongst them all the virtues of which barbarians are susceptible; the faith, valour, and hospitality so conspicuous long afterwards in the ages of chivalry.

The religion of the Germans was as gross as that of other nations in the same low stage of civilization. They adored the sun and the moon, the fire and the earth, together with those imaginary deities who were supposed to preside over the most important occupations of human life. They were persuaded that, by some ridiculous arts of divination, they could discover the will of the superior beings, and that human sacrifices were the most precious and acceptable offering to their altars. They seem to have adopted no images as visible objects of worship, nor to have constructed any edifices for the celebration of religious rites. Their only temples were dark and ancient groves, consecrated by the reverence of successive generations. Their secret gloom, the imagined residence of an invisible power, by presenting no distinct object of fear or worship, impressed the mind with a still deeper sense of religious horror; and the priests, rude and illiterate as they were, had been taught by experience the use of every artifice which could preserve and fortify impressions so well suited to promote their own interest.

The German priests had assumed a jurisdiction even in temporal concerns which the magistrate could not venture to exercise; and the haughty warrior submitted to the lash of correction, when it was inflicted, not by any human power, but by the immediate order of the god of war. Thus the defects of civil policy were sometimes supplied by the interposition of ecclesiastical authority. The latter was constantly exerted to maintain silence and decency in the popular assemblies, and was sometimes extended to a more enlarged concern for the national welfare. A solemn procession was occasionally celebrated in what are now the countries of Mecklenburg and Pomerania. The unknown symbol of the earth, covered with a thick veil, was placed on a carriage drawn by cows; and in this manner the goddess, whose common residence was in the island of Rugen, visited several adjacent tribes of her worshippers. During her progress the sound of war was hushed, quarrels were suspended, arms laid aside, and the restless Germans had an opportunity of tasting the blessings of peace and of harmony. The truce of God, so often and so ineffectually proclaimed by the clergy of the eleventh century, was an obvious imitation or continuation of this ancient custom.

But the influence of religion was far more powerful to inflame than to moderate the fierce passions of the Germans. The consecrated standards, long preserved in the groves of superstition, were placed in the front of the battle; and the hostile army was devoted with dire execrations to the gods of war and of thunder. With the Germans cowardice was the most unpardonable of sins. A brave man was the worthy favourite of the martial deities. He who had lost his shield was banished alike from the civil and the religious assemblies of his countrymen. Some of the northern tribes seem to have embraced the doctrine of transmigration; others imagined a gross paradise of immortal drunkenness. All agreed that a life spent in arms, and a glorious death in battle, were the best preparations for a happy futurity, either in this or another world.

That singular order of men, the bards, have attracted to them the attention of all who have attempted to investigate the antiquities of the Celts, the Scandinavians, and the Germans. It is not easy, however, to calculate the enthusiasm of arms and glory which they kindled in the breasts of their audience. It was in the hour of battle, or in the feast of victory, that the bards celebrated the glory of the heroes of ancient days, the ancestors of those warlike chieftains who listened with transport to their artless but animated strains. The view of arms and of danger heightened the effect of the military song; and the passions which it tended to excite, the desire of fame, and the contempt of death, were the habitual sentiments of a German mind.

Such is the description of the manners, characters, and propensities of the ancient Germans, as delineated by Tacitus, and by which, in spite of their climate, their want of learning and the arts, and the absence of fixed laws, they were formed into a people of military heroes, and enabled to carry on formidable hostilities, during more than two centuries, with the mighty power of the Romans.

The early history of the Germans, like that of all nations who had no written records, is involved in much obscurity. The first knowledge of their transactions was that of the invasion of the country by the Gauls, commanded by Segovesus, king of the Celtæ; whilst his brother Bellovesus marched with another army into Italy; both of which divisions are said to have been directed by the flight of birds. Segovesus crossed the Rhine, and gained a settlement near the Hercynian Forest. The Germans, however, soon acted on the offensive, and expelled the Gauls, and, by the assistance of the Belgæ, one of their most warlike tribes, gained possession of some territory to the west of the Rhine, where they were enabled to fix and maintain themselves so firmly as never to be driven out, and whence they extended themselves to the sea-coasts of Britain, and even drove its inhabitants into the interior. The Germans and the Gauls, thus brought into contact with each other, continued to hold vacillating intercourse, sometimes at war, at other times in alliance in opposition to the power of the conquering and disciplined Romans. The Germans, under the name of Cimbri, then invaded the territory of Rome, and spread such terror, that Marius, by a deviation from the law, was appointed consul to command an army against them. After various marches during some years, in 102 before Christ, Marius, with an army of 52,000 men, attacked the barbarians on the banks of the Rhone, and, though they are said to have mustered 300,000 foot and 15,000 horse, completely defeated them, with a loss of 150,000 killed and 60,000 prisoners. Many, preferring death to slavery, underwent military execution; and a few were scattered over Gaul, or crossed the Danube, and so escaped to their own country.

After Julius Cæsar had completed the subjugation of Gaul, and extended his conquest to the Rhine, he first became acquainted with the German name. Ariovistus, the leader of a tribe that dwelt to the south of the Danube, attempted to fix his establishment in Gaul, but was defeated by Cæsar, and, with the loss of 80,000 men, was driven across the Rhine, though two tribes of his followers remained on the west side of that river; and the fugitives who returned augmented the numbers of the German tribe of the Marcomanni. Cæsar built a bridge over the Rhine, and twice passed that river at the head of his army, not with the view of permanent conquest, but to secure his province of Gaul against the attacks of the barbarians; and he also took many of the Germans into his pay, first in the war with the Gauls, and afterwards in the civil contest with Pompey. The civil wars, which occupied first Cæsar and Pompey, and afterwards Mark Antony and Brutus and Cassius, left the Germans opportunities to attempt incursions. The confederation of the Segambri passed the Rhine, and having repelled the attack of Agrippa, settled themselves on the western side of that river; but a few years afterwards they were defeated by Lollius the legate of Augustus, when, 14 years before Christ, Drusus, the son-in-law of the emperor, constructed several fortresses along that river, to prevent the incursions of the Germans. He proceeded with success, and penetrated as far as the Elbe. He died in the year 8 before Christ, and was succeeded by Tiberius, who during his command not only sustained the power which Drusus had acquired, but extended it towards the north; and, by intrigues among the natives, as much as by his force, induced many of the tribes to solicit peace, and excited others to enter into the military service of Rome. The body-guard of Augustus was composed of German volunteers, amongst whom was the distinguished noble whose name has descended to posterity, being sometimes called Hermanus, and at others Arminius, who received the privileges of a Roman citizen and the dignity of a Roman knight. He was the son of Sigmer, a prince of the Cherusci, and had been educated in Rome, and early appointed an officer in the army of Augustus, but is said never to have lost the relish for the customs of his ancestors, nor his zeal for the independence of his country; and during the course of his instruction in arts and in arms he warmly cherished the hope of adapting these instructions to the purpose of freeing his country from the Roman yoke. He felt a confidence that all the discipline of the Roman armies would be unable in a fair field to resist the raw bravery of his unpolished countrymen.

The best legions of Rome were intrusted to the command of Quintilius Varus, with the superintendence of the territories on the right bank of the Rhine, which had been added by Drusus to the Roman dominion. He was confident in the power of his military superiority, and thought, in addition to that, to secure obedience by changing the customs and principles of the Germans, and thus converting them into useful subjects. For this purpose he took with him a great number of civil officers, lawyers, and men of letters, to introduce the new order of things. These measures roused the jealousy of a people enamoured of their freedom, and disseminated the seeds of insurrection amongst all the tribes situated between the Rhine and the Elbe. Arminius availed himself of this spirit to form alliances in opposition to Varus, amongst all the military leaders of the districts. It happened most opportunely for the purpose of Arminius, that, in the year 9 A. D., a general revolt broke out on the Roman frontiers of Dalmatia and Pannonia. It is doubtful if this was connected with the plans of Arminius, but it helped to strengthen the confederacy which had been entered into by those tribes which were in possession of the country bounded by the Rhine, the Saale, and the Elbe. This confederacy was not broken up by the treason of one of the chiefs, Segestes, the leader of the Catti, who communicated to the Roman commander the plan and the detail of the intended insurrection, which was received by Varus with the contempt which reliance upon the numbers and discipline of his troops had inspired. Arminius redoubled his assiduities to remove suspicion, if any existed, of his fidelity to the Roman cause, and succeeded, by pointing the attention of Varus to some irruptions which, at the instigation of the confederacy, had broken out on the banks of the Weser. These small but concerted disturbances were intended to inveigle the Roman commander to advance into the interior of the country; and the leaders of the German troops in the pay of Rome, who were involved in the confederacy with Arminius, by the display of unbounded zeal and obedience, agreed in urging the Roman commander not to wait for further displays of resistance, but to advance with his three legions and the auxiliaries, and to extinguish the rebellion in its focal point. In vain did Segestes repeat his warnings. Nothing could shake the confidence of Varus in Arminius, and the confederates and the Romans plunged deeper and deeper into the heart of the country, where the snares had been laid for their destruction. Near the sources of the river Lippe, in the country of the Bructeri, after a long and wearisome march through woods and morasses, the Romans saw themselves enclosed on every side in a hollow surrounded by hills whose summits were all occupied by the natives. At this moment intelligence arrived that Arminius with the rear division, consisting of stipendaries, which he commanded, had declared against the Romans, and had been the moving spring of the whole operations. Varus saw clearly destruction before him; for though discipline and courage might prolong the contest, it could inspire no hopes of a successful issue.

Three days of suffering and ineffectual hostilities compelled the Romans to submit. Varus chose death rather than disgrace. Three Roman eagles were taken; and a limit was thus set to the advances of the Romans towards the north, which they were never afterwards enabled to pass. The Germans disgraced their victory by useless cruelties. Some of the men of letters and artists who were taken had their hands cut off, and others were blinded. The site of this memorable event cannot be clearly ascertained by any records, but it is generally placed by the antiquarians of Germany near the sources of the rivers Lippe and Ems, not far from where now stands the small city of Detmold. The event occurred in the ninth year of our era.

When Arminius had thus restored the ancient freedom to his country, he destroyed the fortresses which the Romans had constructed on the Rhine, the Elbe, and the Weser, and exerted himself to rouse the military spirit of the Germans, and taught them to rely on that spirit rather than on the strongest fortifications. A civil war soon broke out amongst the natives themselves, and the party opposed to Arminius was headed by Segestes. That prince applied to the Romans for assistance, and was aided by their general Germanicus, when he was surrounded by the troops of Arminius. His deliverance was effected with but little loss on either side; but the wife of Arminius was taken prisoner by Segestes, and on being carried before the Roman general, maintained a spirit and dignity which is highly applauded by Tacitus. The treachery of Segestes animated the exertions of Arminius, and he was offered assistance by his uncle Inguiomar, a leader of a tribe, and celebrated as a warrior. Arminius attempted also to gain to his party his brother Flavius, who like himself had been educated in Italy, but who resolutely maintained his fidelity to the Roman power. Arminius desired a meeting with Flavius, and they saw and conversed with each other across the river Weser. The expostulations and the inducements of Arminius were ineffectual; the brothers became exasperated against each other, and would have proceeded to feats of arms if they had not been separated by the stream, and at length been borne away from the scene by their respective partisans.

Germanicus the Roman commander once more attacked the army of Arminius, and gained a splendid but useless victory on the plain of Idistavius, on the banks of the Weser; but having excited the suspicious jealousy of the Emperor Tiberius, the necessary succours were withheld, and Arminius was soon enabled again to make head against the Romans, and caused them to suspend their attempts on the freedom of Germany. This temporary tranquillity, however, gave rise to an intestine war.

Marobodus, a leader of the Marcomanni, but who had been educated in the court of Augustus, was enabled by his address and his power to unite many tribes of the Suevi in a confederacy with his own nation, which collectively assumed the name of the Marcomanni. At the head of this powerful league he attacked and conquered the nation of the Boii, seated in the south of Bohemia and a part of Franconia, and founded a formidable state, which extended over the Hermundurins, the Quadi, the Longobards, and the Semnones, and could bring into the field 70,000 warriors. Augustus had given orders to Tiberius to suppress with twelve legions the power of Marobodus, but a general insurrection of the Dalmatian tribes compelled him to conclude a peace which secured to him no benefit. The subsequent disasters of the Romans in Western Germany suspended all attacks on the Marcomanni, who continued to excite insurrections in the south of Germany.

Two great powers were thus formed, the Marcomanni and the Cherusci, the one under Marobodus and the other under Arminius. Between these, dissensions speedily arose. On one side the Longobards and the Semnones, wearied by the oppressions of Marobodus, deserted his party and united with the Cherusci; and on the other side Inguiomer, the uncle of Arminius, from jealousy of his nephew, was induced to pass from his party to that of the Marcomanni. After a war between these two confederations, which was carried on with all that systematic regularity which the two commanders had learned in the Roman legions, the Cherusci remained conquerors. Tiberius, instead of giving that aid to Marobodus which he eagerly asked, left him exposed during two years to the attacks of Catualda the Goth, who compelled him to abandon his territory and seek refuge amongst the Romans; and Catualda was soon exposed to the same fate by the hostilities of the Hermundurins, who had obtained the lead among the confederates which were headed by Arminius.

The death of Arminius occurred in the year 21 A. D., at the age of thirty-seven years, during the twelve last of which he had gloriously and happily conducted the affairs of his country with the applause of his followers, to whom, after his death, he continued an object of the highest veneration. He was indeed suspected of designs to introduce royalty and to assume the kingly dignity, but it is now impossible to confirm or refute the charge which has been brought against his memory.

After the death of their leader, the Cherusci, owing to internal disputes, gradually lost the rank they had held, and at length allowed the Romans to nominate a king of their country, who assumed the name of Italicus, and was the last branch of the family of Arminius. Under him they quarrelled with their allies the Longobards, and soon sunk down into an insignificant tribe, inhabiting the district to the south of the Hartz Mountains. About the same time, in the west of Germany, the Catti raised themselves to a state of some consideration, and, whilst the Romans were occupied in suppressing an insurrection of the Frisii, seized the fortresses constructed on the Rhine. They were assailed by Galba, and induced to cede the territory included between the Lahn, the Maine, and the Rhine, to the Romans, who parcelled it out among the most meritorious of their warriors. In the year 58 the Catti and the Hermunduri contended for the salt springs on the river Saale in Franconia. The numerous followers of Marobodus and of Catualda had established themselves about the same time on the Danube, between the rivers Gran and Morava, and there, under Vannius, whom they had received as a king from the Romans, founded a new kingdom, which was soon felt to be oppressive to the people. Although Vannius had found allies in the Sarmatian Jaziges, yet he could not resist the confederacy formed against him by the Hermunduri, Lygerii, and the Western Quadi, but fled from his kingdom and took refuge with the Romans, when he was succeeded by his nephew Sido, who had performed some important services for the Emperor Vespasian. In the west the Batavians, by an obstinate struggle, shook the Roman power, which was only retained by extraordinary exertions. About this period began the war which finally terminated in the downfall of Rome. The Suevi were attacked by the Lygerii, and applied for aid to Domitian, who sent them a hundred horse soldiers, the smallness of which number was deemed an affront, and induced them to form a confederacy with the Jaziges, which threatened Dacia and Pannonia. Domitian was defeated, but Trajan proved more successful; but afterwards war broke out more fiercely under Antoninus Philosophus. The barbarians disquieted the empire on two sides without cessation. On one side small but numerous hordes of the Goths arrived in Dacia to establish themselves by force of arms; but these were removed by having a still better country pointed out to them in a southern direction. But the more terrific hostilities were those carried on by the Marcomanni, who had combined with the Hermunduri and the Quadi. Marcus Aurelius contended with them during his whole life; and Commodus purchased a peace with them in 180 A. D. At the same time the Catti laid waste Rhætia and Gaul, and the Cherusci drove the Longobards back on the Elbe, and advanced themselves under the name of Franks. About the year 220 A. D. new tribes of Germans assailed the falling empire. The Visigoths, the Gepides, and Herulians, attacked the Romans in Dacia; whilst about the same time a new race called the Alemanni, a mixed tribe, of Sclavonic origin, made their appearance in Southern Germany, in opposition to whom was constructed the celebrated *Vallum Romanorum*, the traces of which are still visible from Jaxthausen to Ohringen. The power of Rome gradually sunk, partly from the constant and increasing hostilities of the Germans and other barbarous tribes, and partly from internal dissensions. As that empire was weakened, the Franks advanced to Spain, and under Probus conquered also the Batavian peninsula. Thus the Franks and Alemanns remained the most powerful of the German nation. The former of these lost the Batavian territory to the Saxons, and the latter were humbled before the Romans in the last victory obtained by that mighty people. At the beginning of the fifth century the barbarians assailed the empire on every side. The Vandals, Suevi, and Alani became masters of Gaul and Spain. They were followed by the successful Burgundians and the Western Goths; to the Burgundians succeeded the Franks, to the Western Goths succeeded the Eastern Goths, and to them the Lombards. Then began that stream of emigration which poured from the north to the south, and, as a conquering power, became the founders of the subsequent European kingdoms. A new change was given to the face of Europe by those vast emigrations of people, mostly Germans, though some came from countries farther eastward than Germany, which gradually overspread and subdued the west, introduced new forms of society, and framed languages, which, with but little variation, have continued till the present time. The new states, formed out of what had previously been portions of the Roman empire, though often at war with each other, and differing in smaller matters, chiefly arising from difference of soil and climate, were united in one similar system of policy and domestic government, and had those common habits strengthened by the providential introduction of the Christian religion, to which, though varying in some points of faith, they all in process of time professed adherence. We have here space only for a slight sketch of the history of those emigrations the beneficial effects of which we now enjoy, and to which, during a period of more than a thousand years, Europe has been indebted for the great advancement in the arts and the policy of civilization which has raised it above the other portions of the habitable globe.

These emigrations, which thus revolutionized Europe, began from the Frozen Ocean, extended themselves to the Atlantic Sea, and stretched over a portion of Northern Africa. They continued from the year 375, when the Huns first broke into Europe, till 568, when the Lombards had completed their conquest of the Roman empire. The causes of these excursions of whole tribes were various, arising in some cases from excessive population, in others from the pressure of more remote tribes, and in all from the charms of the beautiful and well-cultivated provinces which the Romans had gradually added to their dominions. At a more early period single tribes in small parties had changed their domicils, and thereby prepared the way for the greater emigrations. The constant conquests of the too extended empire began in the middle of the third century to make it totter under its own weight. Some powerful emperors, indeed, especially Constantine and Theodosius, suspended its fall; but others, under the pressure of circumstances, and from short-sighted policy, had taken parties of the barbarians into their pay, and, as a reward for their military services, had granted them lands to establish themselves on, on the frontiers of the empire. In this way settlements were granted to the Franks in Belgian Gaul, and to the Alani, the Vandals, and the Goths, in Dacia, Pannonia, and Thrace.

Many individuals of skill and courage were appointed to offices of high power and trust, and two of them, Ruffin and Stilicho, to the command of armies. The consequence of this was, that as they improved in education, they became fully acquainted with the weakness of the Roman government, and accustomed themselves to consider it as a prey, on which in due time they might seize.

The first movement towards the emigrations was given from the farthest part of Northern Asia, where a wild and warlike tribe, probably of Mongul or Kalmuck origin, were settled on the confines of China. These, expelled from their own settlements about the end of the first century, extended themselves towards the west, and drove the Alani, a tribe from Caucasus, out of Asiatic Sarmatia, and also dislodged the Western Goths, who were settled in ancient Dacia, and in the district between the Dniester, the Danube, and the Vistula. A portion of the Alani, after long wanderings, arrived on the Danube in what is now Hungary; connected themselves there with the Vandals, an original north German colony, who had been planted there about one hundred years, and, together, pressed forward into Germany, where they further strengthened themselves by a union with the Suevi, another German tribe which had been settled on the Upper Danube. These three populations, thus united, pressed forward to the Rhine, passed that river into Gaul, captured Mayence, Strasburg, and other flourishing cities, and devastated the whole country.

After these united people had in a few years spread desolation over a great part of Gaul, they pressed on towards the Pyrenees, and entered Spain. They subdued nearly the whole of that country about the year 411, divided it by lot amongst themselves, and left a very small portion of it only in the possession of the Roman garrisons. They however retained their former discipline and courage, and formed an alliance with some of the Western Goths who had penetrated into Spain, and attacked the conquerors. The Alani, who had founded a kingdom in Lusitania, now Portugal, were completely overcome in 418; and the remnant of them, after their defeat, received protection from the Vandals; and hence from that time their name is no more to be found. They carried on the war with the Romans, and thereby gained the ascendency over them, when, in 427, they formed the resolution to pass over into Africa. The kingdom founded there by Genseric, after maintaining itself a hundred and five years, was at last subdued by Belisarius, the general of the Greek emperor Justinian. The Suevi, who after the departure of the Vandals remained in Spain, extended and maintained their power till they were defeated and scattered by the Western Goths in 584. The Huns, with whom these movements had originated, established themselves in 377 in Pannonia, whence, conducted by their king Attila, they made a wasting campaign in Gaul; but that leader having met with a signal defeat in 451, turned towards Italy, and could scarcely be induced to spare Rome itself and to quit Italy. After his death in 453 the kingdom of the Huns disappeared, its inhabitants having been scattered and lost among the tribes of the Goths and Gepides.

The most dangerous enemies of the Romans were the Goths, to whom reference has before been made. They were a tribe of Germans originally established in East Prussia, on the shores of the Baltic, but had extended themselves through Poland, to the Black Sea, and had spread themselves over the Roman provinces on the Danube. In the third century, Rome found it necessary, or at least convenient, to allow of their establishment in Dacia. This powerful nation, the first amongst the Germans who embraced the Christian religion, was divided into two branches. The Eastern Goths were established on the river Don and the Black Sea, and the Western Goths between the Dniester, the Danube, and the Vistula. As they were assailed by the advancing Huns, and compelled to abandon their settlements about the year 375, the Romans conceded to them other settlements in the interior of their empire. The Western Goths, under their king Alaric, attacked the Romans in Italy in 403, several times assailed Rome itself, and conquered and plundered it in 410. His successor Ataulf led his followers into Gaul in 411, and from thence into Spain, where was erected the largest Gothic kingdom, which from 624 comprehended the whole of the Peninsula, with a part of France and some portions of Africa, and was only terminated in 711, by the victory of the invading Moors at the battle of Xeres.

The Eastern Goths had been settled by the Romans in the country of Mœsia, now known by the names of Bulgaria and of Servia. Odoacer, the chief of two German tribes, the Heruli and the Rugieri, who had served under the Roman standards, became the master of Rome and of all Italy. But he was subdued by Theodoric king of the Western Goths, who thus succeeded to supreme power in Italy in the year 493.

Though Theodoric was one of the greatest characters of his age, the kingdom he founded proved but of short duration. The Emperor Justinian, after his successes in Africa, attacked the power of the Goths, and by his generals, first Belisarius and afterwards Narses, once more, in 554, restored Italy to the dominion of the Greek empire. The Gothic sovereigns then disappeared, and in a few years no trace of them remained except their name, which has been applied to a peculiar style of architecture.

A few years after the fall of the Gothic kingdom, the greater part of Italy fell under the power of the Longobards or Lombards. According to some accounts, they were a tribe from Scandinavia, but according to others, a branch of the great German family of the Suevi, who in earlier times had inhabited those parts on the Elbe which are now known as Luneburg, and who had, after various excursions, been settled in Pannonia about 527. They advanced from thence, in 568, towards Italy, and under their king Alboin made a conquest of nearly the whole peninsula; a feat which was easily effected, owing to its desolate and depopulated condition. The chief opposition they encountered was from the city of Pavia, which, after a siege of three years, was captured in 572, and made the capital of the kingdom. Lombardy flourished during two centuries, till it fell under the power of the Emperor Charlemagne in the year 774.[1]

The history of Germany between the years 560 and 670 is wholly destitute of the materials necessary to frame a consecutive narrative. The only writer of the period was Gregory bishop of Tours, and his attention was wholly engrossed by the events of the Frank kingdom which had sprung up in Gaul, and had begun to decline, the manners, laws, and customs of which he has faithfully represented. The only part of his voluminous work which relates to Germany, is an account of an alliance formed between the Bavarians and Longobards, which offended the Franks, and proved the cause of hostile movements, which, however, were speedily and pacifically terminated in 589. From the death of Dagobert in 632, the dominions of the Frankish kings of the Merovingian race were gradually diminished. One portion after another fell into the hands of great lay or ecclesiastical feudatories; but these circumstances seem to have had little effect on the German tribes. They scarcely interfered in the Frankish contests; and though not without internal controversies and contentions, these were of local and temporary importance only, and seldom produced extensive or calamitous convulsions. Preparations for defence against the Franks were carried on; some fortresses were constructed, and military discipline was maintained. But the most distinguished feature of the century, was the spread of the Christian faith. A saint from Ireland, with his assistants, laboured amongst the German tribes with great diligence and success. The cross of Christ had been planted among them, and publicly acknowledged as their standard; but the remains of heathenism, with its superstitions, were cherished by the great mass of the rude people, and the sacred rites of the Druids were performed in their hallowed groves.

Columban indeed found almost everywhere Christian priests, but their knowledge was slight, many of their ceremonies were idolatrous, their faith was wavering, and, what to the Irish saint was most annoying, their dependence on the see of Rome slightly if at all acknowledged.

The success of the Irish missionaries is much lauded by the monkish writers of the ages that followed their exertions; and whatever effect they may have produced upon the manners and morals of the Germans, it must be acknowledged that they were successful in bringing that people into that close connection with the great head of the Christian church, which became, in a succession of centuries, under the guidance of Providence, one of the means of their advancement in civilization.

During the same period was laid the foundation of those small sovereign states which successively grew up in Germany under ecclesiastical and lay chiefs, who bore the titles of archbishops, bishops, abbots, princes, dukes, counts, margraves, landgraves, and barons. These, in process of time, had the indirect choice of the emperor, who assumed the title of Chief of the Holy Roman Empire, and was elected to that dignity by princes called electors, who were independent, though nominally the household officers of the reigning emperor. The emperor Charlemagne was the real founder of the holy Roman empire, although that name was not given to it until a later period. He was of the race of the Frankish kings, the son of Pepin and the grandson of Charles Martel, and, jointly with his brother Carloman, ascended the throne of Gaul in 768. He was one of those extraordinary characters calculated to change the face of the civilized world. The history of his actions, during a long and glorious reign of forty-seven years, would relate his transactions in France, Spain, Italy, and Germany, but must here be restricted to those which relate to the last of those countries. (See article FRANCE.) The death of Carloman in 771 gave him the sole command of France, and his authority extended over Italy and a portion of Germany. He wished to obtain more power in that direction, and resolved to attack the Saxons, and made religion one of the pretexts for his attempt. The Saxons were a pagan people settled in Holstein and Westphalia, between the Weser and the Elbe, and, like all people in a barbarous state, thought themselves warranted by this independence in making incursions on their neighbours. They were frequently defeated, and made treaties of peace, which they soon broke, and thus continued until they were completely subdued in 803, when Charlemagne settled some of them in Flanders, and others in Switzerland, whilst the country was occupied by a Vandal tribe from Mecklenburg.

This long resistance of so weak a power was owing to the enlistments of the troops of Charlemagne being but for one year, and to the other wars in which he was engaged with the Lombards, the Danes, and the Saracens, as well as with some of the feudatories in his patrimonial dominions. He had long nourished the desire to become emperor of the West, and had negotiated a treaty of marriage with Irene, empress of Constantinople, which would have led to a general union of all Christendom under one head, but which was frustrated by the death of that princess. He was, however, in the year 800, crowned in Rome, by Pope Leo III. and acknowledged as emperor of the West in all the extensive dominions he had obtained. He reigned as emperor fourteen years, and died in 814, at Aachen or Aix-la-Chapelle in Germany, which had been early selected as his favourite residence.

The German empire may be dated from the treaty of Verdun in 843, by which the Frankish kingdom was divided. Lorraine was added to it in 924. Otto the Great brought the kingdom of Italy in 961, and the imperial dominions in that country in 962, into close connection with the empire of Germany, which then for the first time received the appellation of the Holy Roman Empire. But the Italian states were rather feudatories than subjects of that empire, and this slight bond was in a few years dissolved. Bohemia was a part of the empire under Otto, and continued to be so considered until a later period. For a short time the kings of Denmark owned allegiance on account of Jutland, and the king of Poland on account of Silesia, a state of things which continued till 1355. Hungary was also a part of the empire from 1045 till the reign of Henry IV. Prussia likewise, the possession of the Teutonic order, stood in the same relation to the empire from 1230 to 1525, and Livonia from 1205 to 1556.

---

[1] See Luden's *Geschichte des Deutschen Volkes*, 2 und 3 Theil; also Sartorius *De occupatione et divisione agrorum Romanorum per barbaros Germanicæ stirpis*, &c. 1812.

The Emperor Conrad II., in 1033, united a part of the kingdom of Lower Burgundy with the empire, which thus comprehended Franche-Comté, Dauphiné, the Lyonnois, West Switzerland, Provence, and Savoy. These portions were, however, one after another separated from it; and in 1648, when Switzerland and the United Netherlands were declared independent, none of them remained to the empire but Savoy, Mompelgard, and the bishopric of Basel. The principles which regulated the intercourse of the emperor with the several princes, and of those princes with each other, were grounded, not, as in other states, on charters granted by the chief, but on resolutions adopted at various times amongst the several states in general assemblies. The most memorable of these resolutions were, 1*st*, that of internal peace in 1495; 2*dly*, the Golden Bull, so called from having a seal of gold appended to it. This was agreed to under the Emperor Charles IV. in 1356, and confirmed at two subsequent diets or assemblies, which were held at Nuremburg and Metz. The chief object of it was to secure to the several states the right of independent voting in the election of an emperor. 3*dly*, The treaty of Passau in 1552, or rather that concluded in consequence of it at Augsburg in 1555. This treaty established religious peace, and conferred on the several sovereigns who had embraced the Lutheran religion the free exercise of it in their dominions; and to the subjects the right to change their religion, and to leave the dominions without permission from the princes. 4*thly*, The treaty of Westphalia, concluded in 1648, which extended freedom of religion to those who had embraced the reformed or Calvinistic religion, as well as to the Lutherans.

Germany was divided, in 1500, under the Emperor Maximilian I. into six circles, viz. Franconia, Bavaria, Suabia, Upper Rhine, Westphalia, and Saxony. These were increased in 1512 to ten, by adding to them the circles of Austria and Burgundy, and forming two circles out of that of Saxony, and two out of that of the Rhine. But Lausatia, Silesia, Bohemia, Moravia, and other countries, though encompassed by the empire, were nevertheless not included in it. Each of these circles had at its head an ecclesiastical and a lay prince, who assembled the states of the circle, communicated between the emperor and them, and called their attention to the civil or military affairs of the body. Besides these, each circle had a military chief, generally denominated the field-marshal, who commanded the forces, and had the care of providing subsistence, arms, and other stores. In the assembly of the states a majority decided every question; but the decision required to be conformable to the general laws of the empire.

After the reformation of religion at the treaty of Westphalia, the circles were divided into Catholic, Protestant, and mixed. The circles of Austria, Bavaria, and Burgundy belonged to the first; to the second appertained Saxony; and to the third the remainder.

The imperial dignity was retained by the family of Charlemagne till the year 888. After that time it was elective, although for a long period there was a general adherence to the family which had been once chosen. At the commencement, the emperor was elected by the whole of the princes, whether lay or ecclesiastical; but during an interregnum, which lasted from 1197 to 1272, the highest or arch-princes, called *kurfursten*, assumed the exclusive right of electing, and by a subsequent union amongst themselves, at the election of Charles IV. in 1356, secured the power they claimed. Frankfort was the place of election to which the Archbishop of Mentz summoned the princes or their ambassadors who were allowed to vote; but none of them was to be attended by more than two hundred followers, of whom only fifty were permitted to be armed. All strangers, even sovereigns, and the ambassadors of foreign potentates, were commanded to leave the city on the day of election. After the choice had been concluded, the person chosen, or his representative for him, was required to take the prescribed oaths to maintain the golden bull and the several capitulations. He was then led into St Bartholomew's Church, and declared emperor. The early emperors were crowned by the pope or his delegates, and several of them made toilsome marches to Rome, chiefly for that purpose. Till they received that coronation they were only styled kings; and the popes carried their arrogance so far as to claim the right, not merely of confirming and crowning, but even of electing and deposing the emperors. In 1338, however, the electors asserted their right to elect the emperor independently of the pope, and this became a law of the empire.

It became usual, during the lifetime of an emperor, to choose a successor to the imperial dignity; and the person so chosen was designated king of the Romans. This institution first arose in 1220, when Henry VII., a son of the Emperor Frederick II., was elected. He was bound to take oaths similar to those enjoined upon the emperor; but during his lifetime he was forbidden to mingle in the public business of the empire. In case of the death, of the minority, or of a protracted absence of the emperor, the golden bull had provided that the Prince of Saxony should exercise vicariate power in Saxony and Westphalia, and the Prince of Alsace similar power in Franconia, Suabia, and the Rhenish circles. They could call assemblies, collect and control the finances, and administer justice; but they had no power to grant imperial dignities or feudal estates. In neither of the circles of Austria or Bavaria was any provision made for the exercise of this vicariate power.

The states of the empire, or general assembly, consisted of the clergy and laity, who held their property direct from the empire. The first comprehended the archbishops, bishops, prelates, abbots, abbesses, and the masters of the Teutonic and St John's orders; the second included arch-princes, dukes-princes, landgraves, margraves, burgraves, graffs or counts, and the free imperial cities. After the peace of Westphalia, the states were divided into the Catholic and the Protestant portions, who on many subjects deliberated and resolved separately. Whilst the inferior princes exercised the executive and legal authority within their own states, those greater affairs which related to the empire in general, and to the respective connection of one sovereignty with another, were brought under the notice of the general assembly, in which the emperor presided either personally or by his commissary, who was always a prince of the empire, and who was attended by an assessor. The assembly was divided into three benches or colleges, in which every thing was decided by a majority of voices; but at a subsequent sitting they were united, and then the majority of the three benches determined the final resolution. Many subjects were intrusted to the examination of imperial deputations or committees. The power of making war or concluding peace belonged to the assembly, but was sometimes intrusted solely to the emperor, though only in pressing emergencies. The emperor had originally the power of nominating to the ecclesiastical dignities; but the popes gradually so intruded their authority, as to reduce the monarch's power to almost a shadow. After the peace of Westphalia, the empire was divided between the three religions. In the Catholic states, the pope and the bishops had usurped the judicial power, and administered it according to the canon law. In the Protestant parts, all the juridical power of the church was abolished, and the affairs of religion were left to the management of consistories chosen from among the subjects, in most cases on the nomination of the princes.

The power of coining money appertained originally to the emperor, but was gradually obtained by several of the chiefs of the respective states; but the fineness and the weight of the coin were directed by the authority of the emperor and the general assembly. The tolls on certain rivers and roads, the regulation of the great fairs of Frankfort, Brunswick, and Leipsic, and the conveyance of letters by post, as well as providing post-horses, were the regalia of the emperor; and the latter were granted hereditarily to the Prince of Taxis, whose successors, even to the present day, have some power and some profit connected with them. The degrees in the universities were conferred in the name of the emperor; and, through a prince named by him, called the Pfalzgrave, the doctors, licentiates, advocates, solicitors, notaries, and other legal officers, were admitted to practise their professions in the courts of law.

The finances of Germany, viewed as one empire, were under the direction of the general assembly. The contributions were called Roman months, each of which amounted to a force of 20,000 infantry and 4000 cavalry; and the number of these months which were granted to the emperor was adapted to the occasion that required them. These were divided among the several states, and called their contingents. They were, however, in process of time, frequently converted into payments in money, at stipulated rates. In later times each Roman month was estimated at 128,000 florins, or about L.12,000 sterling. This tax was paid either at Augsburg, Frankfort, Nuremburg, or at Leipsic, and the collectors of it were called Pfenning-meister.

Many of the individual princes were under greater or less restraint in the exercise of power, from the rights of their state assemblies; and when there was a collision between them, an appeal was made to the imperial tribunals. To those courts the princes were answerable for the debts they incurred, and by them their dominions were on some occasions put in a state of sequestration; but in other of the principalities there were no assemblies of the states, and consequently less limitation of powers, though in them the sovereign could be brought under the authority of the imperial chamber, and obliged to fulfil his engagements.

This sketch of the ancient constitution of the German empire is interesting, from the length of time which it lasted, and from having, during ten centuries, with all its complexity and impediments, preserved, among the many independent states of which it was composed, a feeling of nationality, which is still cherished by all who are descended from the rude and ancient tribes of German origin. This constitution gave to Germany but little other unity, and less power, and rendered the greatest of the European kingdoms the weakest of them all. It kept them, however, from suffering the misery of a conquered and an oppressed people, and has led them to a degree of intellectual culture, in which they have been equalled by few, and exceeded by no other nation. Perhaps the distribution of the territory in such small sovereignties was one of the most effectual means of advancing and securing that reformation of religion, which all Protestants regard as one of the greatest blessings to the whole human race.

The history of Germany in modern times is so much connected with that of the rest of Europe, especially during the wars of the last and the present centuries, that a narration of it would only be a repetition of what is to be found in this work under the heads of EUROPE, FRANCE, and especially BRITAIN; and to them the reader is referred.

The peace of Presburg in December 1805 first gave occasion for the dissolution of the ancient constitution of Germany. By that treaty the Dukes of Bavaria and Wurtemberg were raised to the rank of kings, and the Prince of Baden to that of an independent sovereign. Soon afterwards (28th May 1806) the arch-chancellor of the empire declared to the assembled diet, that, though contrary to law, he had nominated Cardinal Fesch, the uncle of Bonaparte, as his coadjutor and successor; and on the 12th of July the new kings of Bavaria and Wurtemberg, and sixteen other princes, formally announced to the Emperor Francis II. their separation from the empire, and invited the other princes to join them in a new alliance. The Emperor Francis on the 6th of August issued a declaration of his withdrawing from the head of the empire, abandoning the title of Emperor of Germany, and assuming that of Emperor of Austria.

In the room of this dissolved constitution, of nearly a thousand years' continuance, the several states which had been accomplices in its destruction, with some others added to them, formed what was called the Confederation of the Rhine, which, by February 1808, had received the adhesion of most of the princes, and placed Bonaparte at its head, under the title of protector. Two years afterwards, the protector, by his sole decree, united the rivers Scheldt, Meuse, Rhine, Ems, Weser, and the mouths of the Elbe, to France, and robbed of their dominions several of the smaller princes, whom he had contracted to defend. With these augmentations he continued his aggressions till the dispersion of his army in Russia.

As the events which produced the deliverance of Germany from the yoke of France belong to the history of that country as much as to this, our notices of it here must be brief. After the destruction of that vast army which penetrated into Russia, almost all the states of the north of Germany, with Prussia at their head, declared war against France. An army was quickly collected from the French conscription, and, with a wonderful celerity, Bonaparte, at its head, was enabled to penetrate into Saxony, to threaten Prussia, and exhibit a force which he supposed would overawe Austria. The battles of Lutzen and Dresden, in 1813, produced an armistice, during the continuance of which negotiations for peace between Russia and Prussia on one side, and France on the other, were carried on under the mediation of the Emperor of Austria. But as peace could not be concluded, Austria was induced to join the allies against France. During these periods a spirit had risen in Germany which animated all classes of its inhabitants, so that those powers which still clung to the interests of France could place no reliance on the support of their subjects. Bonaparte, overpowered by numbers, with an army of raw troops from his own dominions, and with troops of doubtful fidelity from the dominions of his allies, was surrounded, and, after being compelled to retreat from Dresden, fought the important battle of Leipsic against the armies of Russia, Austria, Prussia, and Sweden. The issue of that battle was not considered as doubtful even from its commencement; but, during the contest, the Saxon division of the army marched from their station in the French line, and took up their position with the Prussians. The result of the battle was a hurried retreat from Leipsic to the frontier of France, which was then the river Rhine. On the retreat to the Rhine, the shattered remains of the French army were intercepted by the forces of Bavaria. A battle was fought at Hanau, about twelve miles from Frankfort, which, though gained by the French, tended only to hasten their flight, and led to the loss of much that remained of their stores, arms, and ammunition.

By the end of the year 1813, the French were totally expelled from every part of Germany, and the occupation of Paris by the allies, early in 1814, led to general tranquillity. The Congress of Vienna soon afterwards met, and never was a body of plenipotentiaries plunged into such a labyrinth of difficulties. The great extent of country which had been delivered, and was without any government; the number of claims urged either from previous possession, or from active service in effecting the deliverance; were such as to perplex with difficulties which appeared to be nearly insuperable, and, in whatever way they were terminated, must necessarily have left great dissatisfaction. They were, however, so settled as to leave Germany in the state described in the preceding pages; and whether they could have been adjusted with more regard to the principles of equity is not for us to decide.

The return of Bonaparte from Elba produced most gigantic efforts upon the part of all those smaller sovereigns who had been reinstated in their dominions by his downfall. The number of troops actually mustered and prepared to march when the battle of Waterloo took place and suspended them, amounted to more than 1,200,000 men. They were not indeed all armed, but many more men could have been raised if arms for them could have been procured. These efforts, added to the costly exertions made in the war of the deliverance, have encumbered with debts almost every state, as is noticed in the detailed account of them. These debts, however, have not been solely created by the events in question. The ephemeral kingdom of Westphalia, formed for Jerome Bonaparte, extended over Hanover, Brunswick, and Cassel, as well as the circle from which it was denominated. During his government, all the different portions of his kingdom had incurred vast debts in executing his projects. These debts were owing to individuals or corporate bodies within the dominions attached by the congress to their new sovereigns; and the princes, for the sake of the people, were compelled to assume the debts, and provide means for their liquidation, and the payment in the mean time of the interest. Thus the ungrateful task of providing for the expenditure attending the subjection of their states, as well as for their liberation, became one of the first duties on their resumption of power. This odious consequence of former circumstances has been industriously improved by the enemies of tranquillity, and has created considerable discontent.

These feelings of discontent were chiefly confined to writers in periodical papers of the smaller kind, and to associations amongst the young men in those universities in which the discipline was the most relaxed. The demonstrations of this dissatisfied state of the public mind were few, and scarcely noticed except in narrow circles. The murder of Kotzebue by Sandt, and a similar attempt on the life of Ibell, the minister of Nassau, were tokens of great excitement amongst a few fanatics; but the judicial inquiries which followed these transactions seemed to the governments to prove that the mischievous views of insurrection or assassination were confined to a very narrow circle. There was no interruption to the full exercise of the powers of the law, nor any necessity for increasing the military establishments. The Revolution in Paris in 1830 produced, however, considerable excitement in several parts of Germany, particularly in Hanover and in Saxony, and also in Brunswick, though in the latter country it was more owing to the personal character and conduct of the sovereign, which led to his deposition and to the investing of the power in the hands of his brother. In Hanover, the suspension of the university of Göttingen, and the mild but firm measures of the government, soon led to tranquillity; and in Saxony, though some mischief was effected, it was but of short duration, and the kingdom soon returned to that tranquil state which was habitual to the greater part of its inhabitants.

So matters continued till 1848, when the spirit of the French Revolution of that year soon spread over Germany, and awakened the slumbering consciousness of the German people. The effects were seen in various political agitations and commotions, and in the important concessions made by the terrified princes to the demands of their subjects. On the 2d of March the subject of a general representation of the states of Germany, was discussed in the assembly of the states of Baden, and on the 5th of that month, fifty-one German notables met at Heidelberg, passed various resolutions, appointed a committee of seven to prepare the plan of a new German parliament, and called a preliminary meeting, or *Vor-parlament*, to meet at Frankfort on the 30th. This vor-parliament met accordingly, and determined the mode of election for the great national assembly, which was appointed to meet at Frankfort on the 18th of May. When the assembly met, they received a message from the federal diet, expressing the desire of the latter to act in friendly unison and co-operation with the representatives of the nation. The assembly's chief occupation for several weeks was to determine the nature and limits of the authority that it was deemed necessary to lodge in some sort of central executive government, and the result of their deliberations was the appointment of the archduke John of Austria to the provisional office of regent, vicar, or administrator (*Reichsverweser*) to administer the central government till the election of an emperor; and, so completely were the princes humbled, that this appointment was immediately confirmed by the diet, as so instructed by their respective governments. The archduke accepted of the office of vicar, and was formally installed at Frankfort 12th July. At the end of June the committee to whom had been intrusted the task of preparing the draft of a constitution for United Germany, presented their report to the assembly, and the following were its principal provisions. Germany was to form an empire, comprising not only all the states of the confederation, but also the extra-federal provinces of Schleswig, Posen, East and West Prussias, and Austria; and the existing sovereignties were to be limited and subordinated down to the point at which their action might be found compatible with the perfection of imperial unity. The head of the empire was to be a *kaiser* or emperor, whose office was to be hereditary and his person inviolable, but whose powers were to be controlled by a diet of two chambers. The upper chamber of the diet was to be constituted by the reigning subject sovereigns or their deputies, and a deputy from each of the four free cities, with a complement of as many imperial councillors, with certain qualifications, as should raise the number of the members to 200. The latter were to be appointed by the sovereigns or diets from the citizens of any German state, to serve for twelve years, one-third going out every four years by rotation. The lower chamber was to consist of representatives elected by the people in fixed proportions according to population, but by methods to be determined by the governments of the respective states. The members were to be elected for six years, but one-third was to retire every two years. The diet was to hold its sittings, and the emperor to reside, at Frankfort. The emperor's dignity was to be maintained by a civil list voted by the diet. He was to exercise the executive power in all the business of the empire; to nominate and appoint the officers of the state, of the army and navy, and of the staff of the national guard. He was to have a voice in proposing measures to the diet, and the right of affirming their acts. His ministers were to be responsible, and no edict was to have legal force without the signature of one of them. In the emperor and parliament together was to be vested the national representation of Germany with respect to foreign states, the disposal of the army, the right of conducting negotiations and concluding treaties, making peace or declaring war. Provision was also made for the establishment of an imperial court of justice, to have the cognisance of all disputes between the citizens of different states; between the German states and princes; and between princes and their diets; and of all imperial fiscal matters. Free municipal institutions were to be guaranteed; a national guard was to be instituted; there was to be unrestricted freedom of public meetings; and absolute freedom of religion, science, and the press.

Such were the outlines of this memorable constitution. The members of the assembly, however, being men better acquainted with theoretical speculation than with practical business, wasted their time in idle discussions, and the only one of their acts worth further notice was their offering the imperial crown to the king of Prussia, which his majesty felt himself constrained to decline. In May 1849 the assembly split into two parties, one of which transferred its sittings to Gotha, and the other to Stuttgard, and so the bubble burst. The vicar resigned his office in December; the princes have recovered their sovereignties, and the *bund* has been renewed.

Situation and boundaries. Germany may be considered in two points of view, either politically, as the country included within the limits of the Germanic confederation; or ethnologically, as the country inhabited by the people who speak the various branches and dialects of the Deutsch or German language. In the latter respect, the Deutsch or German nations are found to extend in a compact mass along the shores of the German Ocean and the Baltic or East Sea, from a point between Calais and Gravelines, near the Straits of Dover to the Gulf of Riga, and from that long line of boundary southwards, with dimensions continually narrowing to the Alps and the Adriatic Sea. Politically considered, Germany is situate between 45. and 54. 50. N. Lat. and 5. 43. and 20. 50. E. Long., bounded N. by the German Ocean, Denmark, and the Baltic Sea; E. by West Prussia, Posen, Poland, Galicia, Hungary, and Croatia; S. by the Gulf of Venice, Italy, and Switzerland; W. by France, Belgium, and Holland. Its whole extent, including rivers and lakes, is about 246,770 square English miles, which is about the 16th part of Europe, the 215th part of the whole dry land, and the 800th part of the whole surface of the globe.

Face of the country. The southern and the central parts of Germany are occupied by numerous ranges of hills and mountains, sometimes separated only by narrow valleys, and elsewhere forming large elevated plains or table-lands, while the northern portion of the country sinks into a wide sandy moorish plain, but little raised above the level of the sea. The Tyrol and the south-eastern provinces of Austria are occupied by branches of the Alps, which present long narrow valleys, dismal precipices, cataracts, and glaciers; and the northern border of this alpine region may be defined by the towns of Bregenz, Southofen, Fuessen, Traunstein, Salzburg, Gmunden, Steier, St Polten, and Baden. Immediately to the northward lies the valley of the Danube, which stretches almost across the breadth of Germany, declining from an elevation of about 2200 feet, near the source of the river, to about 350, on the borders of Hungary. In passing through Bavaria the valley expands into a plain of considerable extent, which, at Ratisbon on its eastern border, has an elevation of about 1000 feet, and gradually rises as it approaches the mountains that surround it. Further north the middle region of Germany is occupied by various ranges of hills, terminating northwards in a line drawn through the towns of Aachen, Duren, Krefeld, Dortmund, Soest, Paderborn, Bielefeld, Teklenburg, Bentheim, Furstenau, Rehburg, Hanover, Braunschweig, Magdeburg, Dessau, Halle, Weissenfels, Wurzen, Meissen, Bautzen, Goerlitz, Liegnitz, Breslau, Ramslau, and Rosenberg. These hills form a series of elevated valleys and table lands, the most remarkable of which is the valley of Bohemia, which has all the appearance of having been a lake before it was drained by the bursting of its mountain barriers. This region is much diversified by picturesque scenery, and abounds in verdant and well-wooded valleys, watered by clear streams. The banks of the Meyn, the Fulda, and the Moselle, are remarkable for their varied scenery, and the valley of the Rhine unites the grandeur of a fine landscape with the appearance of a highly fertile country. To the northward again of the hilly region, the country sinks into plains, which fall very gradually from an elevation of about 300 feet at the foot of the hills to the level of the sea. These plains extend through Lower Silesia, Lusatia, Brandenburg, Pomerania, Mecklenburg, Holstein, Hanover, and the lower part of Westphalia. To the west of the Elbe the flat country is almost entirely destitute of trees, and presents only a succession of level tracts, covered with heath and juniper, and of moors consisting chiefly of deep beds of turf intersected by rivers which flow in depressions from 100 to 200 feet below the general level of the plains. To the east of the Elbe the country is more sandy, but the sandy tracts are covered with pines, and interspersed with fertile spaces of sometimes considerable extent. The beds of the rivers also are generally wider and less deep than in the western part of the plain. Through the northern part of this plain a higher tract may be traced from west to east, from Oldeslo in Holstein to Schwedt on the Oder, about 70 miles from the sea. Eastward of the Oder it continues for some distance due east, then gradually approaches the sea, terminating on the banks of the Niemen near Grodno. It seems to have formed at one time the shore of the sea, and it is on its northern sides that are found those numerous erratic blocks or boulders that have attracted so much of the attention of geologists. Though it does not rise into hills, it forms the watershed between a number of small streams that run direct to the Baltic, and others that run southward to the Elbe, the Oder, and the Vistula. To the alpine region belong the territories of Liechtenstein, Tyrol, Southern Bavaria, Styria, Salzburg, Carinthia, and Illyria; to the middle region, Baden, Wurtemberg, Hohenzollern, the greater part of Bavaria, the northern portions of Austria, including Bohemia and Moravia, Hessen, Nassau, Luxemburg, Schwartzburg, Reuss, Saxony, and Anhalt; to the low country, Hanover, Oldenburg, Braunschweig, Lippe, Holstein, Mecklenburg, and nearly the whole of Prussia.

Mountains and hills. The Rhætian Alps extending eastward from Switzerland, occupy the provinces of Vorarlberg and Tyrol, where they are divided into two branches by the valley of the Inn the northern branch being called the Algauer Alps, the southern the Tyrolese Alps, through which lies the Brenner Pass. with a summit elevation of 4700 Paris feet above the level of the sea. In the same chain is the highest mountain of Germany, the Orteler-spitz, the elevation of which is estimated by various authorities at between 11,800 and 14,004 Paris feet. Further east, the Noric and Carnic Alps, with their various branches, occupy the greater part of the Austrian territory south of the Danube.

Westward of the Rhine the Vosges mountains extend into the lower palatinate of Bavaria, under the names of the Wasgau mountains and the Hardtwald, the highest of which, the Donnersberg (Fr. *Mont Tonnere*), rises to 2223 feet. The Hochwald and the Hundsruck (dog's back) fill up the rest of the country between the Rhine and the Moselle. To the north of the latter river the country is occupied by the Eifel mountains and branches of the Ardennes, whose range eastward is cut through by the valley of the Rhine. In the N.E. angle formed by the Rhine, in its course from the Lake of Constance to Mentz, and to the N.W. of the Upper Danube, the country is traversed by the various diverging ranges of the Schwartzwald or Black Forest, in Swabia, the Rauhe Alp, the Odenwald, and the Steigerwald, which are terminated northwards by the valley of the Meyn. North of that river, between the Rhine, the Saale, and the Elbe, are the Taunus, the Westerwald, the Ohreberg in Nassau, Hesse, and Rhenish Prussia; the Rodhaar and Eggsgebirge, in Westphalia and Waldeck; the Osning or Teutoburgerwald, in Lippe, Westphalia, and Hanover; the Hohe Rhön and the Spessart, in Bavaria and Electoral Hesse; the Vogelgebirge in Upper Hesse; the Frankenwald, Thuringerwald, and the Hartz, in Bavaria, the Saxon duchies, and Hanover. East of the Meyn and the Saale on the Fichtelgebirge, in the upper palatinate of Bavaria; the Boehmerwald on the south-west, the Erzgebirge on the north-west, the Riesengebirge or Sudetic Mountains, and the Geisenkergebirge, on the east and north-east, and the Zdarsky-Hory, on the south-east of Bohemia. The Erzgebirge are connected with the Fichtelgebirge by the Egergebirge, whose highest points rise only to 2381 and 2335 feet.

None of these mountains attain an elevation comparable to that of the Alps; and the central knot, the Fichtelgebirge, which send their rivers to the German Ocean, and the Baltic and Black Seas, are less a connected range of mountains than an elevated plateau, with a mean elevation of little more than 2000 feet. Their highest point, the Schneeberg, is estimated by different authors between 2599 and 3303 feet.

The principal points of elevation in or among the other ranges are these:—

Geology. The nucleus of the Alps consists of granite. Along the southern slopes of the Rhætian Alps, and in the valley of the Adige (Etsch), the peaks are composed of primary rocks, and rugged masses of dolomite or magnesian limestone look at a distance like buildings in ruins. This formation overlies porphyries, which seem to have undergone, through the action of great heat, a modification that appears even in limestone, having changed its primitive compact into a granulated texture, and destroyed the organized bodies that it contained. At the base of the Styrian Alps, freestone, clay, and shell-marl, accompanied with large deposits of fossil vegetation, are found in the valley of the Muhr. These mountains contain no thermal water, but a great number of chalybeate springs. The Alps of Salzburg are composed of granite and other primitive rocks, and their summits are lost in the clouds, though their elevation appears less than that of the limestone mountains below them, an optical illusion occasioned by the abrupt slopes of the latter. To the west of the lower part of the Ens there are fine marbles and rock salt; to the east, mines of lead, silver, iron, and coal. To the north of the Danube, in the valley of the river March, the low plains are covered with alluvium and detrital matter. On the adjoining slopes of the Gesenke, Karpathian, and Sudetic mountains, there are isolated basins of the coal formation, composed of freestone, schistose clay, clay-ironstone, porphyries, metalliferous limestone, containing lead, iron, and zinc, rocks composed of ancient shells, clay, gypsum, and beds of rock salt. The adjoining summits consist of granite; but schistose and micaceous rocks appear in the lower parts. In Silesia, the alluvial plains abound with bluish clay.

The constitution of the Bohemian mountains is essentially different in several respects. The Boehmerwald consists of small-grained granite, micaceous rocks, slate-schist, and syenite. These rocks present very rugged tops, with pyramidal and needle-shaped peaks, separated by deep ravines. Forests occupy their upper parts, while their bases are covered with pools and marshes. The summits and rounded flanks of the Riesengebirge indicate the former presence of volcanic fires; they contain freestone and basalt, surrounded with limestone full of fossil shells. The southern slopes of the Erzgebirge show also many traces of volcanic agency. Their porphyries have undergone some violent upheavings; the celebrated mineral waters of Carlsbad and Töplitz spring from among them, and the ferruginous waters of Bochin and Eger, and several others less celebrated, rise from ground that bears the marks of igneous origin. Near Eger is the Rammerberg, a conical hill covered with lava and scoriæ. The substructure of the Erzgebirge is granitic, and its mineral wealth, particularly on the Saxon side, is of such importance as to have given the chain the name it bears, which means metalliferous mountains. The eastern part, however, of the Erzgebirge, towards the Elbe, becomes a sandstone range, which bears the name of the Saxon Switzerland, and is much celebrated for its grotesque rocks, romantic valleys, and sublime and picturesque views. Towards the centre of Bohemia, near the banks of the Moldau, the primitive micaceous rocks are covered with alluvium, in which are found fossil wood and iron ore. "In the country round Prague there is a most complete and symmetrical exposure of the whole silurian system, whether as respects the clear order of the strata, or the vast abundance of organic remains." In the mountains of Moravia, particularly towards the north, the freestone is so easily decomposed as to exhibit everywhere at a distance the forms of extensive ruins.

The course of the Danube divides Bavaria into two great geological districts. On the south, from the Lake of Constance to the mouth of the Inn, extend vast tracts of the same epoch as the formations of the Paris basin, reposing upon the older rocks that underlie the granite of the Alps. To the north of the river there is a large development of oolitic rocks, chiefly of the later, middle, and newer periods, amongst which are the remarkable and valuable lithographic limestones of Solnhofen, rich in fossils of various kinds. The alluvial and transported soil of this region contains the bones of extinct species of animals. In the valley of the Regen are found the bones of tapirs and rhinoceroses; in the valley of the Meyn the bones of gigantic elephants; and the caverns of the limestone rocks of the Steigerwald contain immense masses of the bones of lions, hyænas, and various ruminant animals scattered in the alluvial clay. Deposits of the same kind abound in the valley of the Neckar. The calcareous schists of the valley of the Altmuhl contain the remains of crocodiles. The banks of the Regnitz and the Meyn consist of primitive limestone and other quartz deposits. The nucleus of the Schwartzwald seems to consist of granite, but in some places the granitic rocks support secondary limestone. The spaces which extend northward are composed of old sandstone. The slopes that overlook the Rhine are formed of soil posterior to the chalk.

---

[1] "Winderlichs Deutschland." Leipsic, 1852.

To the north of the Meyn the hills are composed of primitive limestone, flanked with sandstone. To the east and west they contain volcanic deposits, which form on the one side the chains of the Vogelsberg and the Westerwald, and on the other, to the west of the Rhine, the basaltic group of the Eifel. Among these oceanic and volcanic products granitic summits and table lands occasionally appear; but to the north of the Thuringerwald granite becomes less and less frequent, till there is no further trace of it. At the mouth of the Aller the old limestone terminates; and to the north and the west all the plains that fall to the North Sea, as far east as the Elbe, are covered with immense beds of sedimentary deposits, or with beds of sand lying upon chalk, limestone, sandstone, and gypsum, which mix at last along the shores of the Baltic, with the sandy and marshy soil of Pomerania. This great plain has every appearance of having been, at no very distant epoch, covered by the sea; in many places its surface still consists of bare sand, but in the Isle of Rugen, and several places in Pomerania, Hanover, Luneburg, and Holstein, there are to be found isolated masses of rock belonging to the chalk or muschelkalk formations.

In the S.W. and N.W. of Germany the new red sandstone formation has been more fully developed than in England or France. It has been called by German writers *Trias*, or the triple-group, because it is separable into three distinct formations called the *Keuper*, the *Muschelkalk*, and the *Bunter-sandstein*. This last consists, as the name implies, of various coloured sandstones, dolomites, and red clays, with some lias, especially in the Hartz, and of calcareous pisolite, or roestone, the whole sometimes attaining a thickness of more than a thousand feet. In Wurtemberg, the keuper, and in Baden, the muschelkalk, attain the same thickness.

According to Sir R. I. Murchison, rocks which have been, or may be classified as silurian, devonian, carboniferous, and permian, occupy detached districts in the S.E. of Prussia, Saxony, and the smaller states westward, and spread over large tracts in the northern territories of Austria, particularly in Bohemia and Moravia. Palæozoic rocks abound in Thuringia, Franconia, Saxony, and the adjacent principalities, the older sedimentary formations occupying a considerable region on the north-western flank of that devious chain of granitic gneissose, and other crystalline rocks that, ranging from N.E. to S.W., divides Saxony from Austria, and trends into the Fichtelgebirge of Bavaria. From that chain these deposits descend into, and spread over, a broad and comparatively low undulating tract, which, in its central part, is cut transversely by the river Saal, as it flows from Hof on the S.E. to Saalfeld on the N.W. On their N.W. boundaries these rocks rise again into the lofty eminences of the Thuringerwald, the whole succession having a dominant strike from the S.W. to N.E. In this way the newer strata may be said to occupy a broad trough ranging lengthwise from Renneburg and Gera on the N.E. by Schleitz, Planen, and Hof, to Upper Franconia on the S.W., whilst the older rocks of the series, rising up on both sides, are often found in a highly metamorphic state, but chiefly on the S.E. flank of the depression. The lower silurian rocks of the Thuringerwald and of the Saalfeld tract, are penetrated at intervals by porphyries and greenstones, and irregularly overlapped towards the S.E. flanks by masses of devonian age.

In advancing westward from central Germany to the Hartz and Rhenish Prussia, nearly all traces of the silurian rocks are lost, whilst devonian and carboniferous deposits become vastly more expanded. The grauwacke of the Hartz is now ascertained to be no older than the devonian era. The Brocken itself is composed of a comparatively modern granite, which has become decomposed into chaotic piles called *Felsen-meer*.

The convoluted and broken rocks that present such an antique slaty aspect, and, crowned with castles, form the chief features of the gorges of the Rhine and the Moselle, and all the territory on the right bank of the Rhine, from the Taunus, S.E., to the coal-fields east of Dusseldorf on the N.W., including the duchy of Nassau, and having its northern frontier in Westphalia, bounded on the E. by the secondary rocks of Hessia, which range southwards by Marburg and Giesen to Frankfort, formerly considered to be a tract of undivided grauwacke, is now found to consist of the devonian and lower carboniferous systems. On the left bank of the Rhine the same succession occurs between the lower devonian rocks of the Hundsruck on the S.E. to the coal-tracts of Aachen and Belgium on the N.W. It is only by deflecting westward into the mountainous region of the Ardennes that the slaty rocks, rising from beneath all the other deposits, are met with. The upward succession, from the devonian to the carboniferous, is clear on both banks of the Rhine.—(*Murchison's Siluria.*)

The coal measures are widely distributed in many parts of Germany, as Bohemia, Saxony, Silesia, Rhenish Bavaria, and Rhenish Prussia, from the last of which Holland is supplied with coals.

No part of Europe yields a greater variety or abundance of mineral productions, and in no part of the world are the mines worked with so much skill or so much economy. Precious stones are discovered in many parts; rock-crystal, amethysts, topazes, are found in Bavaria; calcedony, agate, petchstein, and porcelain-jasper, in Bohemia; barytes in many parts; marbles, gypsum, and alabaster, in Bohemia; alum, near Töplitz; rock-salt and Glauber salts in various parts; and abundance of the earths calculated for making earthenware, from the coarsest description to the finest porcelain. Fossil coal is found in many districts, and much of it is consumed; but the cheapness of wood, and the prejudices of the people against the use of it in their houses, have operated to prevent the mines from being completely explored or worked to anything approaching the extent of which they are capable. Gold is procured, though in very small quantities, by washing, in Salzburg, in Bohemia, in the Rammelsberg, and in Silesia. Silver and cinnabar are raised from the mines of the Erzgebirge in Saxony. Iron, copper, tin, lead, calamine, bismuth, cobalt, nickel, titanium, arsenic, and almost every other mineral, is more or less raised from the mines. The abundance of mineral substances everywhere scattered, and which it would be difficult to enumerate, has promoted the study of mineralogy, and given birth to the school of Freyburg, whence the pupils of Werner carried the science to every part of the world.

Mineral springs.

The great abundance of mineral springs, hot, cold, bitter, acid, salt, is a peculiar characteristic of Germany. The warm waters of Aix-la-Chapelle, Pyrmont, Carlsbad, Töplitz, Baden-Baden, Bruckenau, Kissingen, and Wiesbaden, attract every year crowds of visitors. Those of Ischel, Baden near Vienna, and many more, though less resorted to, are nowise inferior. The acidulated springs of Selters, Driburg, and Rohitschs, the bitter waters of Seidschutz, Seidlitz, and other places, and the long series of salt springs that follow the base of the northern Alps, are sufficient proofs that Germany abounds with mineral veins or deposits of the most various kinds. The country is, moreover, generally well supplied with good and wholesome water for the ordinary purposes of life. The only exceptions consist of some marshy tracts in Westphalia, and of some of the colder valleys of Salzburg.

Soil.

The soil is generally productive. The plains in the north have indeed much arid sandy land; but nature has provided some rich and fruitful soils along the borders of the rivers, where the most abundant harvests are gathered. The south has also on its mountains much barren or slightly productive land; but the beautiful valleys and plains among the hills rival in fertility the best alluvial lands on the banks of the northern rivers. In general the soil in the north is heavy, and in the south light; the former most adapted for corn, and the latter for vines. The best soil is in the middle, between the mountains and the sandy plains. In Bohemia, Silesia, Franconia, Saxony, and on the Rhine, the proportion of good soil is much greater than in the north or the south.

Rivers.

Germany has seven large rivers which pass through it to the sea, and in their course receive about 500 smaller streams, about sixty of which are navigable, either naturally or by means of artificial improvement. These are the Danube, Rhine, Weser, Elbe, Oder, Etsch or Adige, and Ems, which will be found described under their own names.

Lakes.

The chief of the German lakes is the *Boden See*, or Lake of Constance, on the borders of Switzerland. (See CONSTANCE.) To the eastward, among the valleys of the Alps, are several lakes of inconsiderable dimensions, as the Walchen, Kochel, Ammer, Wurm or Starenberger, Tegern, Schleier, Chiern, Grundel, Hallstadter, Traun or Gmunden See, Mond, and Kammer or Alter, lakes.

Along the southern shores of the Baltic or East Sea there is a number of lakes, which form the western portion of an innumerable series, extending through Prussia into Russia and Finland, and occupying comparatively higher ground than the adjoining plains and river channels. Some of these are of considerable extent, as the lake of Schwerin in Mecklenburg and the Spirding See in East Prussia, the latter, however, beyond the political limits of Germany. At the eastern base of the Hartz are the salt and the sweet lakes (*Salzige* and *Süsse Seen*), and to the north of Minden, to the east of the Weser, is a considerable sheet of water called the *Steinhuder Meer;* and to the west of the Weser is a smaller lake called the *Dummer See.*

Climate.

The climate of Germany is very uniform in respect of the degrees of cold or heat experienced in its different regions; for though there is a difference of 9° of latitude between its southern and northern borders, that difference is compensated by the different elevations of the country, the northern part being lowland on the sea, while the midland and southern regions rise to a considerable elevation. This is indicated by the following table of places from north to south.

Places.	Latitudes.	Elevation above the sea in feet.	(Fahrenheit.) Mean temperature of the Climate.		
			Year.	Winter.	Sum.
Stralsund……………	54°19′	51	47°	30°	63°
Berlin ………………	52°30′	140	48°	31°	64°
Gotha ………………	50°57′	1010	46°	29°	60°
Baireuth ……………	49°57′	1119	46°	29°	61°
Ratisbon……………	49° 1′	1260	48°	31°	64°
Munich………………	48°10′	1733	48°	34°	65°
Innsbruck ……………	47°16′	1905	50°	29°	64°

The mean temperature of the coldest month varies from 29° at Munich to 26° at Stralsund; and of the warmest month, from 67° at Innsbruck to 62° at Gotha.

The climate, however, of some parts of Germany is milder than the table would indicate; for a great part of the north-western provinces is open to the influence of the sea, and experiences the benefits of the same western breezes that soften the climates of Britain and Norway. The valley of the Rhine, likewise, being deeply sunk between ranges of mountains, enjoys the finest climate, having the highest annual temperature, a mild winter, and not too hot a summer. A similar climate is enjoyed in the south-eastern part of Germany, the lowlands of Austria, where the mean temperature of the year is 51° at Vienna; of the winter, 33°; of the summer, 69°; of the coldest month, 30°; and of the warmest month, 71°

In Germany the prevalent winds are westerly, or a little to the south of west. Blowing from warmer climates and from the sea, they carry much vapour with them, which, coming in contact with the cold air of the Alps, produces a great deal of rain, particularly in the basin of the Danube. The number of rainy days in each year is about 150, but the greater number of them happens in summer, and the smaller in autumn. From the coast of the North Sea to the plain of Bavaria, the number of foggy days is about 40; but at the foot of the Alps the number increases to 133 or 135. Storms of thunder and of hail are not frequent; they happen oftenest in Lower Silesia, and least frequently in Lower Austria. The quantity of rain that falls yearly on the plains is, in the basin of the Rhine, 25 inches (Paris); of the Weser, 25; of the Elbe and the Oder, 22; and of the Danube, 30.

Except the Alps, none of the German mountains rise to the snow-line. In the southern Tyrol that line is found at an elevation of 8760 feet; in the Alps of Salzburg and Styria, at 8505.

From what has been said respecting the face of the country, and its diversities of elevation, it will readily be understood that no general accounts of the climate will be properly or strictly applicable to every particular region. The whole country may be divided into three zones. The first of these comprehends the northern plains, the climate of which is not cold, but humid and variable. They are exposed to every wind, and to the fogs and storms of two seas. The north-western plains are subject to frequent rains and devastating hurricanes from the North Sea; but the influence of the Baltic on the north-eastern plains is much less, and their climate though colder is less moist and less variable. The second zone comprehends the middle portion of Germany, including Moravia, Bohemia, Saxony, Franconia, Swabia, Hessia, and the country on the Rhine. The mountains of this region form in some degree a barrier against the direct effects of the maritime climate of the lowland. The sky is not so obscured by mists, and the regularity of the seasons is not so much disturbed by winds and storms; but the general elevation of this country renders the climate colder than it is in other countries in the same latitude but nearer the level of the sea. This region is, however, the most agreeable in Germany, and may be divided into three parts: the first comprising Hesse and Saxony, where the grape yields only an acid and imperfect wine, but the peach and the apricot flourish. In the second, comprising Bohemia, Moravia, and part of Franconia, from the height of the mountains the winter's snow is of longer continuance, but the effect of the summer's heat is more sudden and powerful, so that early and abundant harvests depend in a great measure on favourable exposures. In the third, which comprises the countries on the Meyn, the Neckar, and the Rhine, the grape is of better quality, woods of chestnut and almond trees grow, and the summers are warmer and less variable than in the northern provinces of France. The climate, indeed, of these countries is finer than any other in Germany, and is the most salubrious and most agreeable of any in Europe. The third general zone is that of the Alps, whose elevated heights and rapid declivities connect very different climates. Thus the culture of the vine ceases in Bavaria and Upper

Austria, but is resumed with fresh vigour in the neighbourhood of Vienna. In the valleys of Styria and Carniola fields of maize or vineyards are in close contiguity to the glaciers and perennial snows of the Tyrol and Salzburg. In general, the climate of Germany is very healthy. In the south, however, under the influence of the Alps, the air is raw and cold, whilst in the plains and open valleys a climate equal to that of the finest parts of Italy is enjoyed. The northern provinces are colder, damper, and more ungenial, and, near the stagnant lakes that abound in the Baltic provinces, unwholesome. The weather besides undergoes extreme variations, and frost is frequently felt at a late period of the year. It is also often very severe through the winter, and even the great rivers Rhine and Danube are frequently frozen over from November to March.

Vegetable productions.

Germany is suitable for the cultivation of all the kinds of useful plants that belong to the temperate zones; and, owing to the equality of the climate, they are spread over all the country. The highlands of the middle region as well as the northern lowlands grow the different species of cereals; and in the eastern part of the latter region there are tracts of land which will bear comparison with those that are called the granary of Europe. Wheat, rye, barley, and oats are the cereals most generally cultivated; but in some districts to these are added spelt, buckwheat, millet, emmer (*Triticum dicoccum*), einkorn (*Triticum monococcum*), and maize. The potato is largely cultivated, not merely for food, but for the purpose of distillation into brandy. Beans, pease, vetches, and lentils are also produced abundantly. The common beet (*Beta vulgaris*) is largely cultivated in some districts for the production of sugar. Flax and hemp are cultivated, though not to so great an extent as formerly, for manufacturing into linen and canvas, and the expression of oil. In many districts tobacco is the most productive and most profitable object of culture. To these are to be added rapeseed and poppies, and above all cabbages, of which the Germans make a favourite mess called *Sauer-kraut.*

The fruits of temperate climates are largely produced; apples, pears, cherries, and plums are everywhere common. The more delicate fruits, as apricots and peaches, only grow in the warmer districts on the Rhine and the Danube, where likewise are to be found the true chestnut, the common almond, and the fig-tree growing in the open air. The olive-tree is only to be found on the Italian side of the Alps. Vines are grown to a large extent in the west and south, particularly along the Middle Rhine and the Lower Danube. On the Upper Danube, as far down as Austria, no vines thrive; and though vines are grown in the valley of the Saale, on the Weser, and in Silesia, they are in small quantity, and of inferior quality. On the contrary, the lower slopes of the hills along the Rhine from Basel to Coblentz, in Baden, the Palatinate, and Hesse, and above all in Nassau, are literally covered with vines. There are produced the celebrated Andesheimer, Hochheimer, and Johannisberger. The wines of the lower Meyn, particularly those of Würzburg, are of the best kinds; those of the upper Meyn and the valley of the Neckar are rather inferior. The Moselle wines are lighter and more acid than those of the Rhine.

The forests, as well in the plains as in the mountains, produce an abundance of juicy berries of the most various kinds, including strawberries, bilberries, raspberries, and cranberries. The heaths of the north-western plains afford abundant food for bees, which produce large quantities of honey and wax.

The woods are extensive, especially among the hills, where the finest forest-trees of the temperate zone grow to perfection; and on this account it is that so many of the mountain-ranges have the word *wald* attached to their names, as the Schwartzwald, the Böhmerwald, the Thuringerwald, &c. The elevated plateaux are less wooded than the hills; but the eastern region of the northern lowlands abounds with extensive woods. A narrow strip along the shores of the Baltic is covered with oaks and beeches; further inland coniferous trees are the most prevalent, particularly the Scotch fir (Kiefer). Birches are also widespread. Woods on the mountains consist chiefly of firs, pines, and larches, but contain also silver-leaved firs, beeches, and oaks. Chestnuts appear on the terraces of the Rhine valley, and in Swabia and Franconia. Quite woodless is the whole north-west of Germany, where the people find compensation for the want of wood in their boundless fields of turf or peat.

Animals.

Wild animals of numerous kinds abound all over Germany, to the great injury of agriculture; among these may be mentioned particularly the roe, stag, hare, and boar. The fallow deer and the wild rabbit are more rare. Of other wild animals, the Alps produce wolves, bears, and lynxes. The wolves are likewise a scourge of the Scheifergebirge, on the west of the Lower Rhine, to which they find their way from the French territory. The chamois and marmot are numerous in the Alps; the wild goat, or ibex, is seldom met with. Foxes, martens, weasels, badgers, and otters abound everywhere; the hamster particularly at the foot of the Hartz.

Of domesticated animals, horses, oxen, sheep, and swine are the principal objects of attention in Germany. They are bred everywhere, as well in the plateaux as in the lowlands, but more successfully in the latter. The coastlands of the North and the East seas are celebrated for the excellence of their cattle. Saxony, Silesia, Bohemia, and Moravia feed the finest sheep; Westphalia and the districts bordering on the lowlands furnish excellent swine. The ass is found in the hill-countries only, and the mule among the Alps. The hilly regions are also favourable for the breeding of goats. The finest breed of German horses is to be found in Mecklenburg and north Hanover, mixed indeed, it is admitted, with English blood, but not improved. The pure Mecklenburg horse is particularly excellent, the Holstein horse is larger and heavier, and often purchased for the Mecklenburger, but is not so enduring. The Hessian horse is large and strong, of little beauty, but spirited, and a good worker. Horses are mostly brought from Westphalia, Friesland, and north Holland. Various other breeds might be named; but, generally speaking, those of North Germany are better than those of the south.

The feathered tribes are everywhere abundant in the fields, woods, and marshes. Partridges, snipes, thrushes, quails, wild geese, bustards, grouse, blackcocks, woodcocks, wild ducks, widgeons, and teal abound everywhere. The Leipzig larks are known all over Germany; thrushes, sparrows, bullfinches, and serinfinches are plentiful, the last especially in the Hartzwald. Bohemia is celebrated for its pheasants, bustards, and mountain-cocks. Geese and ducks are found mostly in the flat districts, where the great abundance of standing water affords ample scope for their increase. The lammergeir and the golden eagle are found only, with the chamois, among the highest Alps. Tame geese are bred in large flocks, particularly in Pomerania. The length of time during which the migratory birds remain in Germany differs considerably with the different species. The stork remains about 170 days; the house-swallow 160; the snow-goose 260; the snipe 220. In Northern Germany these birds arrive from twenty to thirty days later than in the south.

The waters of Germany abound with fish; but the genera and species are few. Carp and the salmon tribes are the most abundant; after them rank the pike, the eel, the shad, the loach, the perch, the lamprey, and many others.

Besides frogs, Germany has few varieties of amphibia. Of serpents there are only two kinds, but both poisonous. In Southern Germany the edible frog (*Rana esculenta*) and the *Helix pomatia* are used as food. The most remarkable animal of Germany is the olm (*Proteus anguinus*), which is found in the lake of Zirknitz, the cave of Adelsberg, and the lake of Sittich.

The rearing of bees is chiefly attended to in the heaths of Hanover, where they abound. The cultivation of the silkworm has been attempted, but has either entirely failed, or had at best very indifferent success; the black mulberry, which grows in Germany, being less suited to them than the white. Of late an attempt has been made to extend the cultivation of silkworms in Lusatia and the Mark of Brandenburg, but it seems not yet to have become an object of general attention.

Inhabitants.

Germany is inhabited by people of two distinct families, Deutsch and Slavs. The former are the more numerous, and exclusively occupy the northern, western, and southern provinces; the latter prevail in the east, where, besides forming the bulk of the population of Bohemia and Moravia, they have likewise colonized in the alpine valleys of Styria and Illyria, on the northern slope of the plateau of Upper Silesia, on the plateau of Lusatia, and on the coasts of Pomerania. In the latter province they are called Kassubes; in Lusatia, Wends; in Bohemia, Czechs; in Moravia, Slowaks, Hannaks, Chrowats, &c. The Slavic population bears the proportion to the Deutsch of about 2 to 13. But, besides these principal stocks, there are also groups of people of other families,—Italians, in the valleys on the south side of the crest of the Alps, in the Tyrol, Friuli, and Istria; French, in a small district of the Lower Rhine, to the west of that river, and in several parts of the northern lowlands, in small colonies, where, however, they have acquired the German manners and customs, language, and way of thinking. Greeks and Armenians are to be found in the Austrian provinces; Jews are scattered over all Germany, and gypsies wander about as nomades or vagabonds. The total number of all races was estimated, in 1854, at 43,286,116, being an increase of only 13,121,716 since 1816, or less than 1 per cent. per annum. The increase, however, in North Germany has been in a ratio double of that of the south, which seems to have nearly reached the maximum of its capabilities of supporting population, and it is from that region principally that during this period several millions of people have emigrated to America and elsewhere abroad.

The Roman writers described the Germans as large and powerful men, with blue eyes and yellow hair. These characteristics are still preserved among the people of the highlands of Middle Germany and the adjoining borders of the northern lowlands. In general the Northern Germans are taller and more slender than those of the south; and, instead of the yellow hair and blue or light gray eyes of the former, the latter have dark gray or brown eyes and brown hair. The inhabitants of the Alps, even the women, are distinguished for their large bones and great bodily strength. In the flat land the forms are not so angular as in the south; but the northerns are not on that account inferior in bodily strength.

The German is earnest, quiet, and somewhat listless; he is considered, however, industrious and persevering in everything he undertakes, honest and frank in expression, simple in his manners. "To be always true and honest" is his motto, and his courage is equal to any emergency. Gifted with a deeply penetrating spirit of observation, and naturally inventive, the exact sciences have been always his favourite object of study, while at the same time he has not neglected the fine arts. The Germans have been the authors of many useful inventions, among which, those of gunpowder and printing have been attended with the most important results.

The German loves his country, but for a long time it has been more the love of home than true patriotism that has been most obvious in the character of the German people. The splitting of Germany into so many states, and the difference of interests thence necessarily arising, increased by difference of political and commercial institutions, have essentially contributed to lessen their general patriotism, though in the minds of many enthusiasts, notwithstanding the failure of the great experiment of 1848, the union of the whole German race into one great nation is contemplated as not only desirable, but as even still within the limits of probability.

Languages.

The German and the Slavonic languages are of course the prevalent ones; but in southern Tyrol and the Adriatic coast-land Italian is spoken, and in the small district round Malmedy in the Lower Rhine French is most general.

The German language is divided into two great branches. the High (Hoch) Deutsch and the Low (Platt) Deutsch; the former being the language of books and the educated classes, while the latter is spoken by the lower classes. The Low Deutsch is divided into many dialects, which, according to the situations of the places where they are spoken, may be called Upper Dutch and Lower Dutch (*ober-deutsche und nieder-deutsche*). The ober-deutsche dialects are spoken in the alpine and middle highland regions of Germany by a greater number of people than the nieder-deutsche. Among these dialects may be noticed the following:—

The *Alemannic*, the language of the German Swiss, which has spread itself within the political limits of Germany, into the north-western region of the Alps, the Black Forest, and the valley of the Rhine, as far down as Baden-Baden. Rough guttural tones are its characteristics.

The *Swabian* dialect prevails between the Black Forest and the Lech, and from the Alps to Kocher, consequently in the greater part of the kingdom of Würtemburg and as far as Augsburg. Its characteristics are nasal sounds, and a peculiar but pleasing ringing soft sing-song utterance.

The *Bavarian* dialect, which is broader and more nasal than the Swabian, and slurs over a great many sounds, is spoken in the plateau of Bavaria, and the adjoining region of the Alps, as far as Austria and Carinthia.

The *Frankish* dialects are very manifold. In place of the broad and strong tones of the Bavarian and Swabian, they have more flexibility and sharpness. They are distinguished into East Frankish and West Frankish: the former prevailing in Bohemia, the Voigtland, and the western portion of the Erzgebirge; the latter in Hesse, as far as the Taunus, and across the Rhine, in this middle part of its course. Both are subdivided into a variety of minor dialects.

The *Upper Saxon* dialect which forms the transition from the *ober-* to the *nieder-*deutsch, is spoken in Thuringia, the whole of Saxony (except the Upper Erzgebirge), Lusatia, and Silesia, with differences of tone and expression in the different districts.

The *Nieder-Deutsch* dialects are spoken by the people of the whole of the northern plains, from the hill country to the sea, and from the eastern borders of Germany to the western. They are the proper *platt-deutsche*, in contradistinction to the *ober-deutsche*, out of which the *hoch-deutsche*, or written language, has been framed. Two principal dialects may be distinguished in this nieder-deutsche, viz., the *Lower Saxon* and the *Westphalian*, the latter of which approaches, in some of its branches, to the hardness of the ober-deutsche, while the former exhibits great softness, flexibility, and euphony, but at the same time a want of power. The Lower Saxon branch extends from the east side of the Weser eastward throughout the plain of Germany, and is divided into the Holstein, Hamburg, Mecklenburg, Pomeranian, Brandenburg-Markish, and Luneburg varieties, the last of which is spoken through Brunswick and Hanover east of the Weser. The Westphalian branch prevails from the Weser westward to the Rhine, not only in the plains but also in the adjacent hill country. Its varieties are the Munster, the Osnaburg, and the Sauerland dialects. The Flemish and Dutch dialects are spoken in a small corner of Germany, where the Rhine passes into its delta.

The mixture of Westfrankish, Westphalian, and Dutch has produced a particular dialect called the *Lower Rhenish*, which is spoken on the Lower Rhine, particularly to the west of the river.

The *Frisian* language, which differs considerably from the Deutsch dialects, is spoken on the shores of the North Sea, between the Ems and the Elbe, not however always in its original purity, but much intermixed with the Westphalian and Lower Saxon dialects, which are its immediate neighbours.

The Germans have spread themselves and their language in numerous colonies beyond the proper bounds of their fatherland, not only in Europe but also in America. Since the twelfth century they have occupied the shores of the Baltic provinces of both Prussia and Russia, imposing their language as well as manners and customs upon those regions. Numerous German colonies are also to be found on the banks of the Volga, the shores of the Black Sea, and beyond the Caucasus. German miners inhabit the Urals; and it was Germans that in the tenth century carried the first elements of civilization to the Magyars, by settling in Transylvania, where their descendants still form an industrious community. Germans have crossed the Atlantic in swarms; there are said to be now upwards of five millions of them settled in the United States, and emigration is still continuing on a large scale.

Of the *Slavonic* languages, the Polish is spoken in Upper Silesia, and the Czech in Bohemia and Moravia, in various dialects. The dialect spoken in Prague and its vicinity is the finest and purest, and has now become the language of writing and books. Other dialects of the Slavic tongues are spoken in Carniola, Carinthia, and Styria, and the eastern regions of the alpine valleys, and in Lusatia.

Ranks and classes.

Noble, burgher, and peasant are the three ranks or classes that form the population of Germany. The nobility are divided into the higher and the lower; the burghers, according to their occupations, into many branches; the peasantry into still more, which, in the several states and their constituent parts, exhibit many differences, arising from the political and civil arrangements of the particular districts.

The German civil law, in its present state, secures to every German the privilege of changing his residence from one German state to another, of becoming its subject, and even of entering into its civil or military service, unless his obligation to the military service of his native state stands in the way. He has likewise the privilege of acquiring and possessing landed property beyond the limits of the state where he lives, without being subjected to more burdens and taxes on that account. He is also free of any transit dues on his property passing into another state, unless there be particular treaties on this subject between the one state and the other.

To the high nobility belong all those princely and *gräflich* (of the rank of count or earl) families, which, before the establishment of the existing political constitution, were immediate feudatories or princes of the empire, in the enjoyment of territorial possessions, of which they were sovereigns. The heads of these families form now the first rank in the state to which they belong; and they and their families are the most privileged class, particularly in respect of taxation. In respect of their persons, families, and possessions, they still retain most of the old rights and privileges attached to their estates not inconsistent with the sovereign power and the higher rights of the state governments. Among these may be mentioned the unlimited right of living in any German state, or in any foreign state at peace with Germany; of making obligatory engagements respecting their estates and family relations, freedom from military service, the exercise of civil and criminal jurisdiction on their estates in the first instance, and, when their territory is large, in the second instance also, jurisdiction in the forests, and in matters of local police, and connected with the churches and schools and other institutions, but always according to law. Many of the same sort of privileges were also allowed to the other nobles of the empire, who are not of this first and most highly privileged class. But of the more invidious of these privileges, especially that of exemption from military service and taxation, the *old* nobles, as they are called, were deprived in 1848.

Religions.

Christianity was introduced into Germany in the seventh century, and Mentz became the ecclesiastical metropolis of the empire. The Reformation, in the sixteenth century, divided the Germans into three denominations, the Catholic, the Lutheran, and the Reformed; but in recent times the two latter are scarcely to be discriminated, and in most of the states they have become united under the name of the Evangelical Church. The difference of religions, however, occasions no difference in the enjoyment of civil and political rights. The Catholics are the most numerous in the south of Germany, the Protestants in the north. They stand to each other in the proportion of about 22 Catholics to 15 Protestants. In south-eastern Germany there are a few thousand members of the Greek Church; and scattered over all the country about 300,000 Jews. The spiritual affairs of the Roman Catholic Church are administered by nine archbishops and their thirty-one suffragan bishops, namely:

Archbishoprics.	Bishoprics.
Vienna	St Poelten, Graetz, Gurk, Leoben.
Salzburg	Linz, Brixen, Trent.
Görz	Laibach, St Andree-lavant, Gradiska, Trieste, Citta-nova.
Prague	Leitmeritz, Budweis, König-grætz.
Olmütz	Brunn, Breslau.
Freising	Passau, Augsburg, Regensburg.
Bamberg	Eichstadt, Würzburg, Speier.
Freiburg	Mentz, Fulda, Rottenburg, Limburg.
Cologne	Treves, Munster, Paderborn, Hildesheim.

The archbishops and bishops are the representatives of the pope in all spiritual affairs and matters of conscience; but they are not allowed to publish any papal bull without the express permission of the state governments. Occasional outbreaks, however, still serve to show that the spirit of the long-during contest between church and state is only slumbering, and not extinct; and the supremacy and other inadmissible claims of the church are still asserted with as much zeal, if not with the same success, as in the middle ages. Mentz and Treves, formerly the sees of archbishops who were prince-electors of the empire, have been degraded into suffragan bishoprics.

The Evangelical Church acknowledges the headship of the state, and submits to the rule of the spiritual officers and boards appointed by government. These consist of a minister of church affairs, consistories, and of general superintendents, who, in the Prussian states, generally bear the title of bishops. There is a bishop of the Greek Church in Trieste; and the spiritual concerns of the Jews are superintended by land-rabbis.

Industry.

In the intelligent practice of agriculture some of the Germans are not behind the most advanced of the other countries of Europe. Mecklenburg, in particular, and Holstein are distinguished for their excellent husbandry; and in Hanover, Brunswick, Bohemia, Saxony, and some parts of Prussia and Austria, it is scarcely inferior. Generally speaking, agriculture is the principal occupation of the Germans, particularly in Bavaria, Würtemberg, Baden, Hesse, Nassau, Hanover, Brunswick, Oldenburg, Prussia, Anhalt, Holstein, and Mecklenburg; while in the Saxon duchies, Schwartzburg, and Reuss, some districts of Prussia, Bohemia, and the kingdom of Saxony, manufactures employ at least an equal, and in some cases even a greater, number of the people. The greatest contrast in respect of agriculture is to be seen in Mecklenburg and Würtemberg. In the former farming is conducted on a large scale; in the latter, as well as in other provinces, the land is divided into small parcels, cultivated by small proprietors or tenants, who follow ancestral usages, and are unprovided with means to make any improvements, by draining or otherwise. In the former the *Schlagwirthschaft* prevails, according to which one immense field is covered with wheat, while another is covered with oats, a third with clover, a fourth is being ploughed and harrowed, and a fifth is feeding herds of cattle, the common size of farms being so much as 500,000 square *ruthe*, or almost 2000 acres; in the latter, everything is grown chequerwise, in small patches, more like gardening than farming, the usual size of Würtemberg farms being only from 5 to 20 square *ruthe*, or from $\frac{1}{40}$th to $\frac{1}{10}$th of an acre.

There are three systems of husbandry at present practised in Germany. In the first, called the three-field husbandry, while one field is sown with winter corn, and another with summer corn, a third lies fallow; but sometimes, instead of a fallow the third field is sown with green crops, pease, potatoes, &c. In the second system, called the four-field husbandry, the principle is that the same field shall not be occupied two years together with corn, without at least one fallow intervening; as, for example, one year, rye; second, clover; third, oats or barley; fourth, potatoes; fifth, again winter corn. This is also called the rotation system (*Fruchtwechselwirthschaft*). The third system, called the *Schlag* or *Koppelwirthschaft*, practised in Holstein and Mecklenburg, divides a farm into a number of large parcels of equal size (*stucke*, *koppeln*, or *schläge*), which, after several years' continuous bearing of grain or other produce, are allowed for several years more (3 to 7) to lie fallow, or in grass for summer pasture. For these two countries this system is found very suitable, for the population is there comparatively thin.

In the different provinces of Germany different kinds of corn obtain the preference and are most cultivated, as in the following list, where the different articles follow each other in the order in which they are named.

Bavaria,—Rye, oats, barley, spelt, wheat.

Würtemberg and Baden,—Spelt, oats, barley, rye, wheat, maize.

Hesse,—Rye, barley, oats, wheat, spelt, maize.

Mecklenburg,—Wheat, barley, rye, oats.

Brunswick,—Barley, rye, wheat, oats.

In Germany generally, and in Mecklenburg in particular, the production of corn is greater than the consumption. Assuming the productiveness of the kingdom of Saxony as a standard, Germany could maintain about 54,000,000 of inhabitants, or 12,000,000 more than at present. The cultivation of the potato is now largely extended, particularly in Prussia. In the north-east of Germany buckwheat is also cultivated; but the cultivation of oil plants, pease, beans, turnips, and other roots, flax, hemp, and hops, is not large enough to dispense with the importation of these articles. About three-fourths of the Germans are employed in agriculture; and many parts of the country are crowded with small proprietors or tenants, who necessarily live in a state lower than that of hired labourers. Of the great bulk of the people the food is of the poorest kind—rye-bread or potatoes; and it is chiefly owing to this general misery that Germany can export corn in most years. In bad seasons the distress is sometimes dreadful; the agricultural population having no means of procuring foreign supplies,—nothing to give in exchange for bread.

Naturally, in accordance with climate and other physical circumstances, the production of wine and fruits (*Obst-und Weinbau*) is greater in the south and west than in the north and east. The districts on the Rhine, the Lower Maine, and the Neckar are the best; but, even in the south of Germany, there are districts, as in Old Bavaria, between the Inn and the Lech, that are less productive of fruit than even Mecklenburg and Brandenburg. In both quantity and quality, however, the south excels the north, where the best kinds of fruit only ripen with difficulty. The principal places for the production of wine have been already noticed. The quantity is estimated at about 3,000,000 of *eimers*, worth about 18,000,000 of *thalers* = about L.3,000,000 sterling yearly.

The cultivation of forest trees is now more scientifically practised in Germany than in any other country, and the care of the government is now directed to the restoration of the forests, which, till recently, were completely neglected and left exposed to every kind of destructive agency. In all the states likewise, institutions for the promotion of agriculture, in all its branches, have been or are being formed.

The relative proportions of ground occupied in agricultural and other natural productions in the different states is shown in the following table.

State.	Agriculture.	Wine.	Gardening.	Meadows.	Pastures.	Wood and Forests.	Waste.
Austria	34·0	1·2	1·7	5·1	15·5	26·0	15·5
Prussia	48·0	0·5	1·0	6 5	11·0	24·0	9·0
Bavaria	41·0	0·4	1·0	14·0	5·0	30·6	7·0
Würtemberg	39·0	1·2	3·0	12·8	5·2	30·8	8·0
Baden	35·0	1·6	2·6	9·7	6·4	32·0	11·7
Hesse	50·0	1·2	0·2	11·0	1·2	33·6	3·0
Mecklenburg.	75·0	...	0·2	9·0	2·8	8·0	6·0
Brunswick	35·0	...	2·0	6·0	3·0	32·0	2·0
Nassau	39·0	2·0	1·4	9·0	5·0	40·0	2·6
Saxony	70					26·0	4·0
Hanover	40					15·0	45·0

The following table shows the absolute quantities (in English acres) of the ground so occupied.

State.	Agriculture.	Meadows.	Garden-land.	Wine-land.	Woods and Forests.
Austria	15,322,812	5,217,162	362,110	415,732	15,850,837
Prussia	18,867,581	3,074,151	493,958	38,421	8,866,652
Bavaria	8,326,641	2,589,024	213,859	79,487	5,622,170
Würtemberg	2,045,859	686,369	94,628	64,347	1,493,862
Baden	1,444,628	391,129	34,696	53,307	1,227,641
Elect. Hesse	876,228	256,757	447,906	788	948,153
G. D. Hesse	976,561	266,851	365,895	23,341	685,107
Nassau	433,396	121,123	4,415	9,462	493,327
Saxony	1,838,939	412,578	104,090	4,415	1,131,121
Weimar	494,944	81,380	18,294	473	225,214
Coburg Gotha.	278,837	34,696	7,570	...	140,049
Altenburg	212,597	23,972	10,724	...	66,239
Meiningen	249,187	43,528	13,247	...	226,476
Hanover	2,752,413	1,606,154	168,438	...	1,302,082
Brunswick	340,030	74,440	15,771	...	299,655
Oldenburg	464,939	155,190	27,126	...	232,099
Mecklenburg Schwerin	2,242,261	287,038	40,374	... ...	372,834
Meck. Strelitz	425,826	43,528	7,570	...	135,633
Luxemburg	281,360	61,823	10,093	1,766	199,294
Limburg	152,666	164,022	8,201	...	32,804
Holstein	1,463,793	316,688	25,234	...	167,807
Lauenburg	173,484	29,650	4,418	...	29,650
Other States	1,186,636	237,201	35,327	1,198	592,727
Totals	60,851,618	16,174,454	2,513,944	692,737	40,341,433

Great attention has been paid for the last 30 or 40 years to the breeding and rearing of all sorts of useful animals, and every encouragement and facility have been given by the governments to the improvement of the breeds. The following table, from Winderlich's Deutschland, shows the number of the principal kinds of stock in the German states, in or about 1848.

States.	Horses.	Cattle.	Sheep.	Swine.
Austria.........	572,800	3,981,200	4,774,300	1,205,200
Prussia.........	909,700	3,543,400	11,356,400	1,271,000
Other states...	1,242,500	8,450,400	9,032,300	3,044,800
Totals..........	2,726,000	15,975,000	25,163,000	5,601,000

Metals and minerals.

The whole Austrian territory produces yearly about 7000 marks of gold, whereof five-sixths in Hungary and Transylvania; silver, 180,000 marks, whereof three-fifths in Hungary and Transylvania; copper, 15,000 centners, whereof four-fifths in Hungary and Transylvania; iron, 2,000,000 centners, whereof only one-seventh in Hungary and Transylvania; quicksilver, 6000 centners; lead, 110,000; cinnabar, 1000; zinc, 12,000; tin, 950; coal, 7,500,000; salt, 5,500,000; cobalt and nickel, 20,000; arsenic, 1800; sulphur, 18,000; alum and vitriol, 160,000; graphite, 35,000; and about as much sulphuric acid. Of the German provinces, Bohemia produces silver, tin, iron, vitriol, and coal, the last equal to three-fifths of the produce of the whole empire; Austria and Styria produce half of the whole quantity of iron; Illyria, the quicksilver and most of the lead; and Galicia most of the salt.

Prussia:—No gold; 23,000 marks silver; 40,000 centners of lead; 36,000 of copper; 230,000 of zinc; 7000 of smalt; 3360 of arsenic; 35,000 of vitriol; 4,500,000 of iron; 46,000,000 of stone-coal; 11,000,000 of brown-coal; 1,750,000 of salt; and stone-quarries to the value of 1,500,000 thalers, = L.240,000. Silesia produces zinc, iron, coal, arsenic, vitriol, and sulphur; Saxony, silver, copper, iron, &c.; the Rhine provinces, iron and coal; Westphalia, coal, and some metal and salt. Nearly 3,000,000 tons of coal are extracted yearly from the coal-field on the banks of the Ruhr; and 4 miles above Bonn are the large brown-coal mines and alum works of Friesdorf.

The produce of the other states amounts to about 60 marks of gold, and 125,350 marks of silver; 1,200,000 centners of iron; and the various other articles above mentioned in comparatively small quantities.

Manufactures.

In many branches of manufacturing industry the Germans have reached a high degree of excellence. German linen is known to the whole world; and the linens of Bielefield and Silesia in particular are equally valued in America as in Europe. Of late years, however, the introduction of cotton, and the high prices obtained for corn, have tended greatly to lessen the cultivation of flax, which was formerly a principal staple of agricultural industry, and the linen manufacture has suffered in consequence. With the improvement of the breeds of sheep within the last half century, the woollen manufacture has made great progress, the German cloth being now not merely equal but even superior in quality to the cloths of England and Belgium. The chief seats of the cloth manufacture are in Brandenburg, Saxony, Bohemia, Moravia, and the Prussian Rhenish provinces, from which it is exported to all parts of the world. The cotton manufacture has been established and is rapidly extending in Saxony, Austria, and along the Rhine; the silk manufacture is carried on successfully in Vienna, Roveredo, Gorz, Berlin, Elberfeld, Erefeld, and other places. Works in metal, especially iron and steel, are produced in great perfection, and large quantities in Styria, Austria, Rhenish Prussia, Westphalia, and the district of the Hartz; brass work, in Rhenish Prussia, Bavaria, and Brandenburg; gold and silver work in Augsburg, Vienna, and Berlin. Pottery and glass-making have reached a high degree of perfection; the porcelain of Vienna, Berlin, and Meissen is much in request, on account not only of the fineness of its material, but also for the tasteful elegance of its forms and ornaments. Bohemian glass is to be met with in all parts of the world. The manufacture of leather is particularly extensive in Rhenish Prussia; of soap, tallow wares, and wax, in many places. Paper-making is carried on to a great extent, and of late has been very much improved in quality. Sugar-refining is carried on in Hamburg, Berlin, Potsdam, and other places; brewing of beer, to a great extent in Bavaria; and ardent spirits (Branntwein), to a still greater extent in the north. Ship-building and the connected trades are of little importance; but German industry is much distinguished in the making of mathematical, physical, surgical, and musical instruments; the chief seats of these branches of trade being Munich, Vienna, Berlin, and Cassel. German clocks and wooden articles, manufactured in the Tyrol and other mountain provinces, are exported to all parts of the world.

The great progress which the Germans have made in manufacturing industry since 1815, is chiefly the result of extraordinary exertions on the part of the German governments. In every district industrial schools have been established or extended; and in all the chief towns there are schools and institutions for instruction in the higher branches of art, where pupils are trained in both theory and practice, at the expense of the government. Numerous societies also have been formed for the promotion of art and industry.

Commerce.

The commerce of Germany has always been extensive; but the abolition of the innumerable state custom houses and tolls, and the long-continued peace, have given an immense impulse to its activity. Germany exports corn and timber to England and the Netherlands; linen to Spain, Portugal, Poland, Russia, America, and Africa; woollen cloth to Western Asia, and even to China; iron wares to every part of Europe; and lead to France. The exportation of fat cattle to England is also becoming a great trade. The other principal articles of export are horses, glass wares of all kinds, cobalt, galmei (siliceo-carbonate of zinc), potash, porcelain, hides and skins, honey, wax, lime, gypsum, copper, horns, bones, rags, millstones, turnip seed, swine's bristles, vitriol, tin, and spirits. The chief articles of import are sugar, coffee, tea, cacao, rice, vanilla, rum, and other colonial produce, spices, drugs, dried fish, cheese, tobacco, olive-oil, and southern fruits, French, Spanish, and Portuguese wines and liqueurs, cotton, raw silk, cotton and silk stuffs, leather, train oil, and many smaller articles. The intercourse within Germany is much facilitated by excellent carriage roads; and all the chief towns are now connected by railways. The principal rivers are also made available for the transport of bulky commodities, and were connected by several canals, before the introduction of the far superior method of locomotion by railways.

The principal seats of the inland trade are Vienna, Prague, Reichenberg, Brunn, Olmütz, Troppau, Linz, Steyer, Salzburg, Grätz, Botzen, Roveredo, and others, in the Austrian provinces; Berlin, Breslau, Cologne, Magdeburg, Frankfort-on-the-Oder, Naumburg, Posen, Traustadt, Aachen, Coblentz, Elberfeld, Erfurt, Munster, Minden, and others, in the Prussian territory; Leipzig, in Saxony; Munich, Augsburg, and Nurnberg, in Bavaria; Frankfort-on-the-Maine, Cassel, Brunswick, Hanover, Mentz, &c. But of all these places four hold the first rank; Vienna for the south-east; Augsburg, for the south-west; Frankfort-on-the-Maine for the northwest; and Leipzig for the north-east. Large fairs are held twice or thrice a year in Leipzig, the two Frankforts, Brunswick, and other places; but it is only in those named that these fairs are of much importance. Those of Leipzig are celebrated for the sale and exchange of books. Great wool-markets are likewise held in Berlin, Breslau, Dresden, Magdeburg, Prague, Stettin, &c.

The principal commercial seaports are Hamburg, Bremen, and Embden on the North Sea; Lübeck, Rostock, Stettin, Dantzig, Königsberg, and Memel on the East Sea; and Trieste on the Adriatic. Hamburg is one of the principal commercial towns of Europe, and with its neighbours Altona (in Holstein), Bremen, and Embden and the Baltic ports, connects Germany with the countries of the north and west, and with America, India, &c. Trieste forms the communication with the south of Europe and the Levant.

Commerce was not a little impeded by the different money systems of different parts of Germany; but, on the other hand, it was much facilitated by the establishment of banks and exchanges in the principal towns. Of late years also the postal system has been very greatly improved, but the German governments have not yet seen their way to the adoption of the British penny postage. They cannot indeed expect, in the circumstances of their country, that enormous increase of the number of letters that would compensate the diminution of rates.

The internal trade of Germany has been greatly facilitated by the formation of the customs unions and commercial treaties, of which an account has already been given in the article EUROPE.

The following table shows the proportions of revenue drawn by the different states.

An Account showing the proportion of the Revenues of the German Customs Union raised in the different States respectively, in the year 1851, *and the distribution thereof according to Population. Compiled from the official "Centralblatt der Abgaben," &c., Berlin,* 1852. *By J. G. Flügel, United States Consul, Leipsig.*

STATES.	Population.	Amount of common gross receipts.	Import duties. Amount of common nett receipts for distribution.	Amount payable to each State according to its population.	Export and transit duties payable to each State, according to its population.	Import, export, and transit duties payable to each State, according to its population.	Balance due to or from the common fund which each State has had	
							To pay.	To receive.

Mental cultivation, and moral condition.

In respect of mental cultivation the German nation stands in a high rank; and according to Professor Berghaus it may be said without vanity, that Germany stands on the highest step of the ladder of civilization. In no country of Europe, he continues, are education and true enlightenment so generally spread over all classes of society, from the richest to the poorest, as in his fatherland. This result has been brought about only in recent times, and it is ascribed to the unceasing exertions of the state governments to free their people from the darkness of ignorance and superstition. There is not a village in Germany that has not its school to spread intelligence among its people; but the present or probable effects of this universal teaching upon the moral condition of the country form still a grave subject of discussion among German philosophers. In a moral point of view there are great differences among the Germans, and it is admitted that there are among them some extremely lamentable moral (or *im*moral) phenomena highly deserving of general attention, with a view to amendment. In this respect it may be said generally that the Northern Germans are more moral than those of the south, though, whether that is to be ascribed to the prevalence of Protestantism in the former, and of Popery in the latter, is a question we will not presume to determine.

For the purposes of education there are, especially in Protestant Germany, numerous schools or institutions for elementary instruction in all the towns, for both the higher and the working classes. For the higher civic professions and employments there are *real* professional and commercial schools, seminaries for the training of schoolmasters, gymnasiums and lyceums for the higher branches of education, and for the highest of all there are twenty-three universities, to which may be added the German University of Königsberg, in East Prussia, making in all twenty-four. The institutions preparatory for the universities are the gymnasia, in which the educational course consists chiefly of classical studies, that is to say, Greek and Latin, with French, mathematics, and a considerable portion of the natural sciences. The basis of their constitution lies in remote times, and there have been but few and slight alterations in their plans of study since the beginning of the present century. Owing, however, to the smallness of the emoluments, and the consequent low estimation in which the office of teacher is held, there is not a sufficient number of qualified competitors to supply the vacancies that occur. The government has been obliged in consequence to raise their emoluments, and thereby obviate this increasing evil. A more recent class of institutions are the *real-schulen* (or high town schools), in which Latin is the only ancient language taught, the other branches being modern languages, especially French and English, mathematics and natural philosophy. These schools have for a long time enjoyed much approval as preparatory institutions for many departments of civil life. Industrial schools are of still more recent origin. They have been established by government in the larger towns of every province; the one half of the expense of maintaining them being defrayed by the government, and the other half by the municipality. Their purpose is purely industrial; drawing, mechanics, mathematics, physics, and chemistry, are the subjects taught; languages are excluded.

The following tables contain the names of the twenty-four universities; the dates of their respective foundations; the number of professors and other teachers; the number of students that attended them during the winter session of 1853-4, and the numbers that attended each branch:—

Names.	Dates of foundation.	Number of Professors and Teachers.	Number of Students.
Berlin	1810	173	2,204
Bonn	1818	87	888
Breslau	1702 1810	96	789
Erlangen	1743	48	479

Würzburg	1403	47	706
Totals		1697	17,636

The teachers consisted of the following classes, viz., 1. Ordinary professors; 2. Extraordinary professors; 3. Honorary professors; 4. Private teachers or tutors; 5. Language and exercise-masters. The students consisted of—

1.	Students of Protestant theology	1692
2.	... Roman Catholic theology	1606
3.	... law, statecraft, and forestry	6394
4.	... medicine, surgery, and pharmacy	3644
5.	... philosophy and philology	2592
6.	... not matriculated	1708

In the matter of education Prussia is the ruler and guide, and whatever is established or pursued in that kingdom comes sooner or later into operation in other states. Since the beginning of the present century education has occupied the attention and received a new impulse at the hands of the other governments; but it is only since 1848 that the school organization of Prussia has been transplanted into the Austrian territory, where, however, it still continues to experience the opposition of the nobles and clergy. The ignorance which formerly prevailed among the lower classes has almost entirely vanished in Northern Germany at least, and there is no class in which scholarly culture and scientific attainments may not be expected. The constant care, however, and determination of the government to make all partakers of a certain amount of education has made it seem necessary to constrain all parents by fines or other punishments to send their children to school. Peculiar attention is at present being paid to educational institutions, and the governments are seeking to reform them so as to prevent the recurrence or continuance of those evils that are believed to have flowed from them, and to have occasioned, in a great degree, if not entirely, the popular outburst in 1848.

Mental cultivation and the general diffusion of knowledge are largely promoted by means of numerous public libraries established in the capitals, the university towns, and other places. The most celebrated public libraries are those of Vienna, Berlin, Göttingen, Munich, Dresden, Hamburg, Wolfenbuttel, Stuttgart, Frankfort-on-the-Maine, and Weimar. Besides the public ones there are throughout Germany many private libraries of extraordinary richness in literary treasures of all kinds. There are also numerous societies and unions, among which the most distinguished are the academies of sciences at Berlin and Munich, and the society of sciences at Göttingen, which are state institutions. With scientific collections of all kinds every place is richly provided, either at the public expense or by the favour of private persons. The observatories of Altona, Berlin, Breslau, Göttingen, Mannheim, Munich, Prague, Seeberg near Gotha, Vienna, and Königsberg in Prussia, are distinguished for the promotion of astronomy and other branches of physical science. The taste for astronomy is very great in Germany, as is evidenced by the existence of many private observatories, among which those of Olbers at Bremen, and of Beer near Berlin, are the most celebrated. In this department Germany can boast of the names of Copernicus, Kepler, Herschel, Olbers, Bessel, and many others.

Fine arts.

The fine arts likewise are carefully fostered. There are academies at Berlin, Dusseldorf, Munich, and Vienna, whose object it is to spread a taste for painting, sculpture, architecture, and music, and to improve the technics of art. The taste for art has struck deep root among all the educated Germans, particularly in the north, and is directed and represented by three schools, those of Berlin, Dusseldorf, and Munich, which have produced some of the finest proofs of German genius. Besides the academies, there are numerous art-museums and collections of pictures and antiquities, particularly in Berlin, Cassel, Dresden, Munich, and Vienna. In sculpture German genius has of late years greatly excelled, as in the works of Dannecker, Schwanthaler, and Kiss; and architecture has received the greatest encouragement in the erection of both public and private buildings of great magnificence, of which the late king of Bavaria showed the most munificent example in the embellishment of his capital Munich, and the erection of the German Valhalla, near Ratisbon, though the attempt to adapt the Grecian temple style, without regard to climate and other circumstances, to modern buildings, intended for very different purposes, has failed as completely there as it has everywhere else.

Book trade.

The activity of the German mind on the wide fields of art and science has, through the effect of general intercourse and exchange of ideas, produced a liveliness of which the Germans believe there is no parallel to be found in any other country of Europe. The German book trade, in respect of the position it has gradually acquired since the Reformation, must be considered as a prime mover in the mental culture of Germany; while, in a material point of view, it has acquired an extent and importance elsewhere unknown. Thousands of people find in it employment and maintenance, as printers, typefounders, machine-makers, paper-makers, and bookbinders; and the productions of the press are spread over all Germany with the most marvellous rapidity. Leipzig is the central point of this important branch of industry. The general taste for the beautiful has had its effect on the art of printing, in requiring the use of fine, close, white paper, clear type, and elegant binding, instead of the gray-brown blotting paper, and worn out and broken type, that were formerly used. The periodical press is very active; but political discussion is not free. On political subjects freedom of speech does not suit the German governments, and offences of this kind are very severely punished, as happened in 1854 with Gervinus in Baden. On religion, however, and philosophy, the utmost freedom of publication is allowed; and the effect has been almost to root out ancestral faith and dogmatic theology from the minds of most educated people, though, of late years, an evangelical reaction seems to have made, or to be making, considerable progress. The publication of Kalendars, which have been of late years vastly improved, is of much importance in the instruction of the people. Almost every town in Germany has its own daily newspaper, and of these five have acquired a European reputation, if not for the excellence, at least for the importance of their contents. These are the Austrian *Observer* and the Prussian *State Gazette*, the organs of their respective governments; the Hamburg *Correspondent*, and the Augsburg and Leipzig *General Gazettes.* Of the number of weekly newspapers and popular instructive publications, their name, says Dr Berghaus, is legion. The higher branches of learning and of art are equally well attended to by their respective journalists.

No field of knowledge has been left uncultivated by the Germans; but much of the best talent of the country has been wasted in the attempted cultivation of the barrenest of all fields, that of speculative philosophy, or, if it be not a contradiction in terms to call it so, the science of the unknowable. In this science the most eminent professors have been Fichte, Schelling, and Hegel, whose doctrines, promulgated during the first thirty years of the present century, almost entirely superseded those of the soberminded Kant, and prevailed to a wide extent; for in Germany, as elsewhere, says Schlosser, whenever a new direction is taken in philosophy or theology, a new head of a sect appears, or a new school is formed, a multitude of followers at once adopt, and devote themselves to, the new prophets with blind zeal and madness. The doctrines of these philosophers have, in succession, superseded each other, only to be superseded themselves in turn by some new phase of Idealism, or systematized play of words. The Hegelians have split into sects, or factions, and Kant is again in the ascendant. The Germans, however, seem to be awakening from their dreams, and to be now directing their attention more and more to the cultivation of the concrete, the positive, and the practical, instead of the abstract, the speculative, and the mystical, which have occupied so long the attention of their fathers. Speculative philosophy is said indeed to be almost already dead. There is not one celebrated professor to represent it in any German university. The governments dislike and discourage it; and the lectures of its remaining adherents are delivered in empty halls. Notwithstanding, however, this unfortunate predilection of the German mind for the speculative and the useless, Germany can boast of many names that have acquired pre-eminent distinction in the cultivation of physical science, and in philology, now no longer confined to Greek and Latin, but become of paramount importance in enabling us to trace the affinities of nations, and the early history of the earth's inhabitants. In this latter department the names of Adelung, Klaproth, Grotefend, William Von Humboldt, Bopp, Grimm, Lassen, and Lepsius, have become familiar even in Britain.

In theology, which, as treated by the Germans, must be considered as a branch of speculative philosophy, and not the least barren portion of it, they have been pre-eminently busy, the country swarming with theologians, and biblical critics and commentators, who have carried the Protestant principle of private judgment to its natural but very utmost extreme. In the art of explaining away the obvious meaning of the Bible they have never been excelled. Their theology, indeed, and criticism have degenerated into neology and rationalism, and even into a wide-spread pantheism, which seems to be the inevitable result of Hegel's principles carried out to their legitimate consequences. Supernaturalism, however, still asserts its right to hold the mind in bondage, and a strong evangelical party have roused themselves to oppose the prevalent scepticism and infidelity, with what success remains to be seen. Roman Catholic theology likewise still clings to the authority of the fathers and the decrees and canons of the church.

In the cultivation of their native tongue, the Germans long remained behind other nations. The language of books dates from the Reformation, but it has been only since the middle of the eighteenth century that it has been strenuously and systematically cultivated. This cultivation began with Gellert (1715-1759), Lessing (1729-81), Klopstock (1724-1803), and Wieland (1733-1813). Since their time the language has been cultivated to the utmost; and the rich fancy of the Germans has expressed itself in lyric poetry, ballads, idylls, fables, and epics. Lessing was the founder of dramatic poetry and true representation, which have been cultivated to excess. Novels, tales, and romances have given employment to thousands of persons, and pastime to millions of readers, but not always to the moral improvement of the nation. The multitude of writers in the department of belles-lettres defies enumeration.

Other German prose writers have been neither fewer nor less able than the poets and romancers, but their names have not had the good fortune to be so far renowned as those of Goethe, Schiller, Lessing, Richter, Tieck, and others. In history and geography many excellent works have been produced. In classical and biblical literature many Germans have acquired distinguished reputation as critics and editors. Many others have exhibited the most indefatigable zeal in ransacking all the treasures of ancient and modern learning; collecting materials for new judgments on every point of history, philosophy, science and art; and throwing, perhaps, as much doubt as light on many established opinions, venerable for their antiquity.

Political state.

As settled by the treaty of Vienna in 1815, Germany was divided into forty sovereign states, or portions of states; but the number is now reduced to thirty-five, as stated in the following table:—

Table of the Thirty-Five Sovereign States.

NAMES.	Area in square English miles.	Population in 1852.	Title of Sovereign.
Austrian provinces	75,979	12,919,300	Kaiser.
Prussian provinces	71,987	12,937,228	King.

Frankfort	91	73,150	...
Totals,	246,740	43,286,116	

The Saxon princedom of Gotha became extinct in 1826 by the decease of the last grand-duke, and his territories were divided by compact among his collateral relatives, the princes of Coburg, Meiningen, and Hildburghausen, the last of whom ceded Hildburghausen to Meiningen, and assumed instead the additional title of Altenburg, from the chief town of that portion of the Gotha territory that fell to his share. The prince of Coburg-Saalfeld likewise ceded Saalfield to Meiningen, and received Gotha in its stead. In 1846, the lordship of Kniphausen was absorbed in Oldenburg; in 1847, Anhalt-Cöthen became annexed to Anhalt-Dessau; and in 1849, the two princes of Hohenzollern abdicated the government of their states in favour of their kinsman, the king of Prussia.

Confederation.

These states exhibit every form of government from absolute autocracy to democracy; but even in those that are constitutional the authority of the sovereign is but feebly limited by his states. They are all united into a *bund* or confederation, the object of which is the maintenance of the external and internal security of Germany, and the independence and inviolability of the several states. The confederation is represented by the diet which is composed of the plenipotentiaries of all the states, and is the constitutional organ of its will and action; but the diet has no power of self-action, the plenipotentiaries that compose it acting only according to the special instructions of their respective sovereigns; and there is no central executive government to carry its resolutions into effect. In fact it has been found that there is no power of ensuring the combined action of the members for any object or purpose whatever, either civil or military; though, having many interests in common, and the territories of the smaller states, in multifarious parcels, being so intermingled[1] that with most of them separate action would be impossible, they naturally follow the same course of policy, modified by the influence of the powerful neighbours at whose mercy they would seem to lie.

The management of the ordinary business of the bund is entrusted to an ordinary and permanent diet, at which the plenipotentiary of Austria presides; but there are only 17 votes to be divided among the 35 states, Austria, Prussia, and the larger states having one each, and only six being allotted to the smaller states and cities. When fundamental laws are to be made or changed, when measures are to be taken that relate to the federal act itself, when changes of organic institutions or other arrangements of general interest are to be adopted, when war or peace is to be made, or when a new member is to be admitted, the diet becomes a general assembly, a *plenum*, in which 70 votes were originally distributed among the members in classes, Austria, Prussia, Bavaria, Saxony, Hanover, and Würtemberg, having each four; five others having each three; three having each two; and the smaller states each one vote.

The diet holds its sittings at Frankfort-on-the-Maine, and has ostensibly at its disposal, in terms of the federal act, a numerous army, of whose constitution and efficiency we have already given an account in the article Europe.

GERMEN, or Germ, in *Botany*, the name formerly used for the ovary or seed-bud.

GERMINATION. See Botany, v., pp. 162–7.

GERONA, anciently Gerunda, a city of Spain, was well fortified till the French invasion of the Peninsula in 1808. It is the capital of the modern province of the same name—one of the four into which Cataluña has recently been divided. It stands on a declivity, and at the foot of a steep hill surmounted by the fortress of Monjuí, near the junction of the Ter and the Oña, 54 miles N.E. of Barcelona. The name of Gerona, is thought by many to be a compound of the Celtic *ger*, "near," and *ond*, "confluence." The form of Gerona is nearly triangular; and it is defended by the Monjuí, which is a square fort 720 feet on each side, with bastions and outworks of various kinds. The city wall is now in a very dilapidated state. Gerona boasts that it is the city in which St Paul and St James first rested when they came to Spain. During the time of the Moors it generally took part with them, though not unfrequently it changed sides. Its Emir Soleyman was in alliance with Pepin so early as 759 A.D. It was taken by Charlemagne in 785; but the Moors regained and sacked it in 795. Soon after, it was recovered by its counts, and then passing to Aragon, it gave the title of prince to the king's eldest son. The most remarkable and interesting relic of the Moorish period is an elegant bath in the Capuchin Convent: it is a light pavilion rising from an octangular stylobate. The modern town contains three *plazas*. The part of the city situated on the left bank of the Oña is called the Mercadal, and is very ancient, but now much dilapidated—the results of the French siege and bombardment. The bishop's see was founded so early as 786 A.D. by Charlemagne; and the ancient cathedral was pulled down and rebuilt in 1316. The approach to this cathedral is very handsome and imposing. There is a superb flight of 86 steps, raised by Bishop Zuazo in 1607, leading to the façade, which rises in tiers, order above order, and terminates with an oval rose-window. The upper story of the hexagonal belfry tower commands a fine panoramic view. In the cathedral are the tombs of Ramon Berenguer II., and his wife Ermesendis, who died in 1058 A.D. In the archives in the cloister are some early MSS. and a copy of the Bible written in 1374 by Bernardin Mutina for Charles V. of France, but ascribed here to Charlemagne.

Gerona has been several times blockaded. In the war of the succession, Philip V. came against it with 19,000 troops, and abolished its university and its liberties. Again, in June 1808 with 300 men of the Ulster regiment under O'Daly, Gerona beat off Duhesme with 6000 men. Once more, in May 1809, it was besieged by the French with 35,000 troops under Verdier, Augereau, and St Cyr, who bombarded the city; and though the resistance was dogged and desperate, at last famine and disease effected what force of arms could not accomplish, compelling the governor Alvarez to capitulate on 12th December 1809. In this siege the French spent 20,000 bombs, 60,000 balls, and lost 15,000 men. The manufactures are coarse woollen and cotton goods, hosiery, paper, and soap. The trade of the city is, however, very insignificant. Every one here seems to live alone, giving the place a very melancholy look. It has no theatre, no public amusements, no common rendezvous. The population amounts to about 8000, of whom one-fourth are priests, monks, nuns, and students. (*Memorias*, por J. A. Nieto y Samaniego, Tarragona, 1810; *Resumen de las Grandezas*, por Juan Gasper Roig y Yalpi, fol. Barcelona, 1678; Ford's *Handbook of Spain*).

GERONTES, in *Grecian Antiquity*, the members of the γερουσία, or council of elders in the states of Doric origin generally; in a more limited sense applied to the senators of Sparta. The constitution of the Gerusia was essentially aristocratic. It corresponded to the βουλή or democratic assembly of the Ionic states of Greece. No one was elected into it who was not sixty years of age. The conditions were also of a very exclusive nature. In theory, the office was held to be the reward of virtue, and none were admitted to it but persons of known character and distinguished position. The Gerusia comprised in all thirty members, returned by the thirty "obæ," or "phratriæ," into which the three tribes that constituted every Doric state were subdivided. The method of their election was peculiar. The candidates presented themselves in succession before their constituents, who received them with applause proportioned in intensity according to their respective merits. Persons were stationed in an adjoining room to note the applause without knowing by which of the candidates it was elicited. The candidate most applauded was declared successful. An election was a matter of great importance, and the result was always watched with great anxiety. The powers of a councillor were great. His term of office was for life, and his authority was irresponsible.

---

[1] For example, the grand-duchy of Saxe-Weimar-Eisenach consists of at least 10 parcels perfectly separated from each other by the territories of other states, Hamburg and Lubeck each of 7 or 8. In short, the 35 states are divided, within Germany, into more than 150 separate parcels of territory, all inextricably mixed together.

It is not easy to define with exact precision the extent of the functions of these councillors. They were partly legislative, partly executive, and partly judicial. As a criminal court they could punish without appeal by death and civil degradation. They appear to have also taken a general care of the lives and morals of the citizens, and made provision against the dangers of wealth and luxury by maintaining the ancient strictness of discipline and austerity of manners.

GERRHA, near the modern El-Katif, one of the chief cities of Arabia, stood on the N.E. coast of Arabia Felix, and became a great emporium for the trade of India and Arabia. The site is about 25 English miles from the shore of the Sinus Gerrhaicus, now Elwah Bay, on the W. side of the Persian Gulf, 240 miles from the mouth of the Tigris. The inhabitants were considered originally to have been Chaldeans who had been expelled from Babylon. Niebuhr considers it the modern Koneit. There was a small place of the same name on the N.E. frontier of Egypt, about 8 miles from Pelusium.

GERS, a department of France, so called from the river of that name by which it is intersected. It is composed of parts of the old provinces of Gascony and Guienne; and is bounded N. by the department of Lot-et-Garonne, E. by Tarn-et-Garonne and Haute-Garonne, S. by Hautes-Pyrénées and Basses-Pyrénées, and W. by Landes. It lies between 43. 17. and 44. 5. N. Lat., and between 1. 10. E., and 0. 18. W. Long., being about 72 miles in length from E. to W., and 53 in breadth from N. to S., and having an area of 2425 square miles. This department is hilly, particularly in the south, where it is mostly covered with ramifications of the Pyrénées. Some of those in the north attain a height of nearly 1200 feet above the level of the sea, but they rapidly decrease in height towards the south. The principal of them run from N. to S., and are separated from each other by longitudinal valleys, each having its own peculiar stream. Thirty-eight water-courses mark out as many valleys of great beauty and fertility, opening in width from a few yards in the southern to three or four miles in the northern extremities. The greater part of this department belongs to the basin of the Garonne, while a small portion in the W. is drained by the Adour. The chief affluents of the former are the Save, Gimone, Arratz, Gers, and Baïse; and those of the latter, the Arros, Midou, and Douze, the last two uniting and taking the name of Midouse previous to joining the Adour. None of these rivers is navigable within the department. The climate is temperate and salubrious, but very changeable. The coldest month is January, but from October to May, rain, frost, and snow are not unfrequent. In May and June the weather is warmer, and during July and August is very hot. Of this department rather more than $\frac{1}{2}$ is arable, about $\frac{1}{7}$th in vineyards, $\frac{1}{10}$th in natural pasture, $\frac{1}{10}$th in woods and forests, $\frac{1}{17}$th in heath and moorland, and $\frac{1}{32}$d in rivers, ponds, and canals. The soil is not of great fertility, but is tolerably well cultivated, and the grain produced is more than sufficient for home consumption. Wheat, maize, oats, and rye, are the principal grain crops. The quantity of wine annually produced is about 24,000,000 gallons, of which about one-third is used for home consumption, and the remainder is chiefly manufactured into brandy known by the name of Armagnac. Horned cattle, sheep, mules, swine, game, and poultry, particularly ducks and geese, are abundant. The minerals and manufactures of this department are unimportant. It is divided into five arrondissements as follows:

	Cantons.	Communes.	Pop. 1851.
Auch	6	85	61,925
Lectoure	5	72	51,125
Mirande	8	152	83,113
Condom	6	87	69,901
Lombez	4	71	41,415
	29	467	307,479

GERSON, Jean Charlier de, chancellor of the University of Paris, surnamed the Most Christian Doctor, was born in 1363 near Reims, in Champagne, in the village of Gerson, from which he took his name. He was educated at the college of Navarre in Paris, and there distinguished himself so highly that he was chosen to succeed the famous Pierre d'Ailly as chancellor of the university, and canon of Notre Dame. These appointments Gerson owed to the influence of his friend the Duke of Burgundy. When that nobleman, however, tarnished his good name by the murder of the Duke of Orléans, none denounced his conduct more severely than Gerson who owed him so much; and the duke's partizans, enraged at what they considered his ingratitude, broke into his house and pillaged it, and would have slain himself, had he not fled for refuge to the vaults of Notre Dame. Undaunted by these demonstrations, Gerson, as soon as he resumed his functions, attacked before the church and the university of Paris the doctrine of Jean Petit, a hireling apologist of the murder of Orléans as a legitimate act, on the ground that the murdered man was a tyrant; and that tyrannicide was not only lawful but praiseworthy. In the schism which long divided the church, Gerson was often employed on missions to the popes at Rome and Avignon; and by his treatise *De Unitate Ecclesiastica* contributed to bring about the result afterwards attained by the Council of Pisa, when the rival popes Gregory XII. and Benedict XIII. were both deposed in favour of Alexander V. At this time, also, Gerson wrote his famous essay *De Auferibilitate Papæ*, in which he advocated, not as has been sometimes thought the suppression of the papal office, but the right of the church to depose any particular pope, when the interests of peace and unity require it. At the Council of Constance he appeared as ambassador of Charles VI., and exercised immense influence, especially in effecting the deposition of Pope John XXIII. who had succeeded Alexander V. The object of all his writings and speeches at this time was to vindicate the power of the church over its temporal head as well as its members; to prove the necessity of councils, general as well as special, and their right to meet without the papal consent, if that be needlessly withheld; to extirpate simony, at this time very common, &c. He was also successful in establishing the supremacy of the church in matters of doctrine and discipline as the basis of the decrees of the council. On the same occasion he distinguished himself in the discussions with John Huss; and though the spirit of the age was still too strong upon him for him to use his influence in preventing the martyrdom of that theologian and his party, yet many acts of his life show his religious zeal to have been wonderfully free from bigotry or superstition. In his essay *Contra Sectam Flagellantium*, he denounced the abuses of these fanatics and their leader, whom he endeavoured to reclaim by friendly remonstrance. Again, in his work *De Probatione Spirituum*, he laid down rules for distinguishing false revelations from true. He applied these rules in the case of St Bridget, whose revelations were then making a great noise in the world. Gerson proved these pretended prophecies to be false, but the influence of the famous Cardinal Torquemada saved their author from the consequences of her imposture. Instead of returning home from Constance, Gerson, well assured that the powerful faction of the Duke of Burgundy were plotting his destruction, fled for refuge into Germany. Disguised as a pilgrim, he sought the mountains of Bavaria, where, in imitation of Boethius, he wrote his *De Consolatione Theologiæ*, partly in prose and partly in verse. From Bavaria he passed into Austria, where the duke offered him an asylum. At the abbey of Mölek where he resided were found after his death many copies of his works, especially that on the Consolation of Theology. Appended to one of these was found for the first time a MS. of the *Imitation of Jesus Christ*, which circumstance gave rise to the idea that Gerson was the author of that famous work. Many competent authorities still incline to support the claims advanced in favour of the learned Frenchman. After a residence of several years in Germany, Gerson returned to France, and fixed his residence at the convent of the Celestins at Lyons, of which his brother was prior. Here he employed the remainder of his days in teaching and catechising the little children whom he daily collected in the church of St Paul, and from whom he exacted no other fee than that they should repeat on his behalf the simple prayer, "Seigneur, ayez pitié de votre pauvre serviteur Gerson." In the midst of these humble functions Gerson died, 12th July 1429, at the age of sixty-six. (*Biog. Univ.; L'Enfant's Hist. of the Council of Constance*, &c. &c.)

GERUND (*gerundium*, from *gerere, to bear*), in *Latin Grammar*, a verbal noun of the neuter gender, in form nothing else than the four oblique cases singular of the neuter of the gerundive or participle of necessity. It governs the case of its verb, and in signification supplies the place of a declinable infinitive active. See Zumpt's *Lat. Gram.* § 655, &c.

GERUSIA, in *Antiquity*, the assembly of elders at Sparta. The term was also applied to like councils in other Dorian states. See GERONTES.

GERVAISE, or GERVASE, of Tilbury, an historian of the thirteenth century, was a native of Tilbury in Essex, and nephew of Henry II. The exact date of his birth has not been ascertained. Having visited part of Europe, he arrived about 1208 at the court of Otho IV., emperor of Germany, who received him with the greatest distinction, and appointed him marshal of the kingdom of Arles. Gervase died about 1218. His principal works are—*Otia Imperiali*, libri tres, a work which is also known under the titles *Mappa sive Descriptio Mundi*, and *De Mirabilibus Orbis ; Illustrationes Galfridi Monemuthensis*, libri iv. ; *Historia Terræ Sanctæ ; De Origine Burgundiorum ; Facetiarum liber*, dedicated to Henry II. of England ; *Tricolumnium Angliæ* ; and, *Metrica Descriptio Balneorum Puteolanorum*. The compilation of the Exchequer book, entitled *Liber Niger Scaccarii*, was ascribed, though on insufficient evidence, to Gervase. Bale and Pitts differ considerably in their accounts of Gervase's works, the greater part of which still remain in manuscript, and are but little known.

GESENIUS, FRIEDRICH HEINRICH WILHELM, a distinguished German orientalist and biblical critic, was born in 1786 at Nordhausen, in Hanover. He was educated at the gymnasium of that town, and afterwards at the universities of Helmstadt and Göttingen. In 1806 he became *magister legens*, and *repetent* in the latter university, where he continued for three years. His studies had early been turned to the oriental languages ; and the need which he soon perceived of a better mode of treating both the grammar and lexicography of the Hebrew, led him to devote himself exclusively to the elucidation of the Old Testament. This determination he formed during his residence at Göttingen, where he already made preparations for his Hebrew lexicon. In 1809 he was appointed professor of ancient literature at Heiligenstadt, whence in the following year he was transferred to Halle. After holding a subordinate office there for a year, he was chosen in 1811 ordinary professor of theology. Many offers were subsequently made to him of high preferment elsewhere, but he clung to Halle during the remainder of his life, and never left it except for an occasional literary journey to England or France or some part of Germany. It was at Halle that he died, Oct. 23, 1842.

The great literary objects to which the life of Gesenius was devoted were first the lexicography and then the grammar of the Hebrew tongue. At the early age of twenty-six he had completed his dictionary of the Old Testament, a work exhibiting a depth of research, a command of materials, and a sagacity in using them, that immediately placed its author in the first rank of modern philologists. Gesenius himself in after life came to regard this as a juvenile effort, and disavowed many of the views and results embodied in it. The lexicon was followed in 1813 by a grammar, which in its successive editions has continued to be the current and almost the only grammar of the Hebrew tongue in common use in the schools of Germany. In 1815 he conceived the idea of a thesaurus of the Hebrew language. This work he was unable to execute on the scale which he had originally proposed, and it finally took the form of a manual or lexicon for schools. In that same year appeared his *History of the Hebrew Language*, which, however, has been long since superseded by his own researches, as well as those of other scholars. Gesenius' next work was published under the title of *Lehrgebaüde*, a systematic work on Hebrew grammar, a vast and valuable storehouse of the *facts* of Hebrew, but defective in so far as it enters little into the *philosophy* of the language. During these and the succeeding years Gesenius was amassing materials for his *Thesaurus*, of which the first fasciculus appeared in 1827. Various causes prevented him from bringing out the parts regularly, and death surprised him before he had quite completed the whole work. The only other important work of Gesenius which remains to be mentioned is his *Commentary on Isaiah*, on which he has brought to bear all his learning and ingenuity. His opinions as to the origin, history, and prophetical character of this book are strongly tinged with those rationalistic views with which he had allowed himself to become imbued in early life. The services which Gesenius rendered to literature by his writings were not his only or indeed his greatest ones. To him alone is due the revival of Hebrew learning in Germany, where it had almost fallen into abeyance since the time of the Buxtorfs. When he opened his course at Halle, he had only ten students ; for some years before his death their numbers had increased to 500 annually. As a lecturer he was natural and animated, and always perfectly clear and intelligible. In respect of these latter qualities, indeed, his mind seemed as if cast in an English rather than a German mould. (Robinson's *Bibliotheca Sacra ; Encycl. of Religious Knowledge ; Encycl. des Gens du Monde*, &c.)

GESNER, CONRAD, a celebrated naturalist, surnamed the Pliny of Germany, and, for his time, a prodigy of application, knowledge, and sagacity, was born at Zurich on the 26th March 1516. He was the son of Vasa Gesner, a furrier, and Barbara Frick, persons who, besides being poor, had several other children, so that he would not have been able to continue his studies had it not been for the assistance of his maternal uncle John Frick, a minister, who formed his taste for literature, and gave him his first ideas of botany. But this uncle having died, and his father having been killed in 1531 at the battle of Albis, where the celebrated reformer Zwinglius also perished, young Gesner found himself obliged to seek his fortune in a foreign country. He accordingly went to Strasburg, where, by means of a salary, he for some time seconded the labours of Capiton; then, having obtained some assistance from the canons of Zurich, he repaired to Bourges, and there commenced the study of medicine. At the age of eighteen, having occasion to visit Paris, he indulged without guide and without restraint his passion for all kinds of study, being assisted in his poverty by John Steiger, a young Bernese of patrician family, with whom he was connected by the ties of friendship. From Paris he returned a second time to Strasburg, whence, in 1536, he was recalled to Zurich to occupy in the college of that place the petty employment of regent. But the magistrates having soon perceived that he was formed for less obscure and more important labours, made him in 1537 a new grant to enable him to continue his medical studies at Bâle; and it was in this city that he began to labour for the public by superintending an edition of the Greek Dictionary of Favorinus. The following year the senate of Berne having founded an academy at Lausanne, Gesner was appointed to that institution, and taught Greek there for three years. He then passed a year at Montpellier, where he became intimately connected with the celebrated physician Laurent Joubert, and the great naturalist Rondelet. At length, in 1541, he was received as doctor in medicine at Bâle, where he completed some extracts from the Greek and Arabian authors on botany and medicine, which were published the same year at Zurich, and the succeeding one at Lyons. Soon afterwards he published a Catalogue of Plants in four languages, in which he gave proofs of very extensive knowledge in botany, and indicated several vegetables which were then new. Some journeys in the Alps of Switzerland and Savoy enabled him to discover other plants which were also new, and led him in 1542 to write a little book on milk, accompanied by a letter on the beauty of the mountain scenery. The same year he translated from the Greek a Treatise on Syllogisms, and other philosophical works; which were followed in 1543 by the Maxims of Stobæus, and in 1544 by the Allegories of Heraclides of Pontus, the Discourse of Dion Chrysostom on Homer, and a "purified" edition of Martial. In 1545 he made a journey to Venice and to Augsburg, where he formed an acquaintance with several men of merit, and had an opportunity of consulting many rare works and valuable manuscripts. It was then that he began to bring out his famous *Bibliothèque Universelle*, the first great bibliographical work which the moderns had produced. The titles of all the works then known in Hebrew, in Greek, and in Latin, whether extant or lost, and often a summary of their contents, with a judgment of their merits, and some specimens of their style, formed the substance of this collection. The first volume, published at Zurich in 1545, is classed in the alphabetical order of the names of the authors; the second, which is arranged in the order of the materials, and divided into nineteen books, appeared at the same place in 1548, under the title of *Pandects;* the twenty-first book, devoted to theology, was published the following year; but the twentieth, which was to treat of works on medicine, has not been printed, because the author did not conceive it so complete as it ought to be, or as the subject required. The Library of Gesner has been abridged by Lycosthenes, and completed by Simler and by Fries, Zurich, 1583, in folio. During the same time he occupied himself with editions or translations of different small Greek treatises; in particular, he published a corrected edition of Hermolaus Barbaro, a critical Preface on the works of Galen, another on the History of Plants by Tragus, a Treatise on the Mineral Waters of Switzerland and Germany, and a Description of Mont Pilat near Lucerne. But amidst these diversified labours he lost no opportunity of collecting and arranging materials for a great work on Natural History, of which he had conceived the plan from his earliest youth. Numerous friends whom his merit had procured him over almost all Europe, sent him figures and notices of the productions of their various climates, and sometimes the natural objects themselves, which he caused to be painted and engraved. As often as he had leisure, he also travelled in Switzerland and in Germany. He had long desired to visit the coasts of the North Sea, but the religious war which broke out in 1551 constrained him to return home without having accomplished the object of his wishes. Gesner has written on the three kingdoms of nature, but his History of Animals is the most considerable of his works on natural history, and that which will ensure him the most enduring reputation. It is divided into five books, which are commonly bound in three volumes folio. The first book, printed originally at Zurich in 1551, treats of viviparous quadrupeds; the second, printed in 1554, of oviparous quadrupeds; the third, printed in 1555, of birds; the fourth, printed in 1556, of fishes and other aquatic animals; and the fifth, a posthumous publication, which appeared at Zurich in 1587, of serpents. There was to have been a sixth book on insects, but it is doubtful whether Gesner had commenced preparing it, and all that remains consists of some inedited figures of butterflies. Besides these first editions of the different parts of the History of Animals, there appeared several others, some of which, considerably amplified, were printed during the author's lifetime, or after his death, in Latin, German, and French, and also various abridgments under the titles of *Icones Animalium*, *Icones Avium*, *Nomenclator Aquatilium*, &c. In this great work the author arranges animals in the alphabetical order of their Latin names, and gives details respecting each, divided into eight heads, viz., its denominations in the different languages, ancient and modern; its description, internal as well as external, and the countries it inhabits; the duration of its life and of its growth, with the epoch of its fecundation and birth, and the number produced at a birth; the maladies to which it is subject; its peculiar habits and instincts; its utility; the aliments on which it subsists; the remedies which it supplies; and, lastly, the images which it furnishes to poetry and eloquence, as well as the epithets which have been applied to it. This work may be considered as the basis of all modern zoology. Copied almost literally by Aldrovand, and abridged by Johnston, it has served as the foundation of works much more recent; and more than one celebrated author has borrowed from it, without acknowledgment, nearly all his erudition. Another important service rendered by Gesner to zoology consists in his edition of a complete translation of the works of Ælian, which he published in 1556, immediately after his volume on fishes. His new notes on the text, which had long occupied his attention, appeared for the first time in the edition published by A. Gronovius, London, 1744, two vols. folio, as those on the *Historiæ Diversæ* did in the edition of Leyden, 1731, 4to. His *Enchiridion Historiæ Plantarum*, printed at Paris in 1541, is not deserving of much attention; it is a youthful performance of Gesner, and is merely a compilation. His real botanical works, after having passed in manuscript into different libraries, were, about the middle of the last century, acquired by Trew, a botanist of Nuremberg, and published by Schmiedal, physician to the margrave of Anspach, Nuremberg, 1754 and 1770. They consist of Commentaries on the fifth book of Valerius Cordus, Fragments of a History of Plants, commenced according to the plan of Gesner, by his pupil, Wolf, and a great number of figures which he had designed, with the relative notes and descriptions. The little treatise of Gesner on the figures of fossils, stones, and gems, Zurich, 1565, 8vo, attracted attention to the subject of petrifactions and crystals; and we find from his letters, that he had made experiments on several minerals, and was not ignorant of the electrical qualities of certain precious stones. Lastly, in his *Mithridates de differentiis Linguarum*, Gesner, not confining himself to the comparison of different languages, threw out several very ingenious ideas respecting language generally, which have since been more fully developed. His own acquisitions as a linguist were in fact very considerable. He possessed a knowledge of the three learned languages, had some knowledge of Arabic, understood French, Italian, and Flemish, and had laboured much to improve the German language. So many useful works having secured to Gesner merited consideration, the magistrates of Zurich, in the year 1555, created him public professor of natural history. But he did not long enjoy this mark of esteem. A pestilential malady, which had commenced at Bâle in the spring of 1564, and extended itself to Zurich, where it re-appeared the following year with great fury, at length smote Gesner. During these two years he had bestowed great care on the persons who were affected with this disease, and had even written a dissertation on the best method of treating it; but a bubo having showed itself under his right armpit, although it occasioned him but little pain, he considered himself as doomed to fall a victim to the prevailing malady; and, accordingly, having caused himself to be carried into his cabinet, that he might put his works in order, he died there, while thus occupied, on the 13th of December 1565, aged only forty-nine years and some months. He bequeathed his library and his manuscripts to Gaspar Wolf, his pupil, whom he charged to publish all that could be extracted from his papers calculated to advance any branch of the natural sciences. (*Eloges de M. de Thou; Mémoires de Nicéron; Biographie Universelle.*) (J. B—E.)

GESSNER, Solomon, a Swiss painter and miscellaneous writer of considerable note, was born at Zurich in 1730. His early life gave no indication of the talents which afterwards made him famous. A residence in a romantic part of his native country awakened in him a love of poetry; and a volume of *Idyllen*, which both had and deserved success, encouraged him to fresh literary effort. His next attempt, the *Death of Abel*, was still happier and more successful than his Idylls. The story is based upon the narrative in the book of Genesis, and reflects the spirit of the Bible with wonderful closeness. The principal charm of the work, however, lies in its touchingly simple and pathetic descriptions of patriarchal manners. Some of the female characters are portrayed with beautiful truth and delicacy. The male characters, however, are deficient in force and individuality; and the descriptions of nature, though often very fine, are too numerous, and bear too great a likeness to each other. His pathetic scenes are sometimes spun out to a tiresome length, and the speeches of his *dramatis personæ* are often too detailed and languid to please any but a German reader. Gessner's other poem of the *First Navigator* is characterized by the same excellences and defects. All these pieces were speedily translated into the principal modern tongues, and their author became an especial favourite in France. Though often invited to exchange Switzerland for that country he steadily refused, and spent the remainder of his life in the energetic and successful pursuit of his business as a bookseller. His leisure hours were devoted to his favourite arts of painting and engraving, in both of which he attained very considerable eminence; and his house was the rendezvous of the leading artists and literary men of his native town. After his death, which happened in 1788, his fellow-citizens erected a handsome monument with a bust in his honour in one of the finest promenades in Zurich, at the confluence of the Lint and Limmat. There have been numerous editions of Gessner's works both in French and German.

GETÆ. See Dacia.

GETHSEMANE (seemingly from two Hebrew words denoting an *oil-press*), the name of a small field, or garden, just out of Jerusalem, over the brook Kidron, at the foot of the Mount of Olives. That which is now pointed out as the garden in which our Lord underwent his agony, occupies part of a level space between the brook and the foot of the Mount, and corresponds well enough in situation and distance with all the conditions which the narrative requires. It is about fifty paces square, and is enclosed by a wall of no great height, formed of rough loose stones. Eight very ancient olive-trees now occupy this enclosure, some of which are of very large size, and all exhibit symptoms of decay clearly denoting their great age. The garden belongs to one of the monastic establishments, and much care has been taken to preserve the old trees from destruction. Dr Robinson admits the probability that this is the site which Eusebius and Jerome had in view; and, as no other site is suggested as preferable, we may be content to receive the traditional indication.

GEX, a town of France, capital of a cognominal arrondissement, department of Ain, on the road from Paris to Geneva, 10 miles N.N.W. of the latter. It has an active trade in cheese, corn, wine, and charcoal, and contains 2710 inhabitants.

GEYSER (*i.e.*, *raging* or *roaring*), the name given to certain boiling springs in Iceland. These are particularly described under Iceland, and Physical Geography.

GHADAMES. See Gadames.

GHARA, in Hindustan, a river formed by the united streams of the Beas and Sutlej from their confluence at Endreesa to the confluence of the Chenaub, in Lat. 29. 18., Long. 71. 6. The length of course between these points is about 300 miles. See Sutlej. (E. T.)

GHAUTS. The term Ghaut signifies properly a pass through the mountains, or a place where boats land. But it has been applied to designate the mountainous chains which run in a direction nearly north and south through southern India. These are divided into the Eastern and Western Ghauts. The eastern ridge commences in the south at a point within about 20 miles of Cape Comorin, where it appears to issue from the termination of the Western range. From the point of convergence the Eastern Ghauts take a northerly direction, and may be characterized rather as detached groups and clusters of hills than as a regular range until they reach the latitude of 11. 40., when they assume the character of a continuous chain. The ridge then skirts the coast of Coromandel in a north-westerly direction to the vicinity of the city of Madras. At Naggery, in Lat. 13. 20., it forms a junction with the chain which crosses the peninsula in a south-westerly direction to the Neilgherries, where, according to some authorities, the point of junction between the two great ranges of Coromandel and Malabar should be regarded as taking place, instead of at Comorin as before stated. The course of the Eastern Ghauts north of the point of junction with the transverse range, is continued in a northerly direction, and terminates in the vicinity of Balasore, where they unite with the Vindhya mountains, and thus constitute one side of the triangle on which rests the table-land of the Deccan. In regularity and grandeur the Eastern Ghauts bear no comparison with those of Western India; their average elevation does not exceed 1500 feet. The intermediate table-land has consequently a gradual slope to the eastward, as indicated by the drainage of the country in that direction. All the principal rivers—the Godavery, Cauvery, Kistna, and Pennaur, though deriving their sources from the base of the Western Ghauts, find their way into the Bay of Bengal through fissures in the Eastern Ghauts. According to Captain Newbold, the mean elevation of the table-land around Bangalore and Nundidroog above the sea is 3000 feet; northerly, towards Hyderabad, it sinks to 1800 feet; and a little south of Bangalore it falls by rather abrupt steps 1400 feet to the level of the plains of Salem; whence to Cape Comorin the mean height of the country is about 400 feet. The average height of the low country between the Ghauts and the sea, on both the coasts of Coromandel and Malabar, may be roughly estimated at 200 feet, rising at the base of the mountains to 800 feet. On the Coromandel side the slope to the sea is gentle, exhibiting the alluvial deposits borne down from the higher portions of the table-land. Granite, gneiss, and mica slate, overlaid by clay slate and hornblende, constitute the geological strata of these mountains.

Ghauts, *Western*. This great chain of mountains runs along the peninsula of Hindustan, from Cape Comorin to the Taptee or Surat river, at the distance of not more than 60 or 70 miles, and in some places not above 40 from the western shore of the Indian peninsula, namely, the coasts of Malabar, Canara, &c.; and they are frequently visible from the sea, to which at one point they approach within six miles. By this peculiar configuration of the country all the great rivers of the peninsula of India run down the eastern slope of these mountains into the Bay of Bengal, there not being sufficient space for the collection of any great body of water on the western declivity, which is of greater elevation, and more abrupt in its ascent. These hills extend about 800 miles in length, forming a continuous line, with the exception of a break in the ridge about 16 miles wide, where the river Paniany takes its course from the Coimbetore country to the sea; and here it is well known that ships which navigate the Malabar coast during the N.E. monsoons commonly experience a stronger gale in the neighbourhood of Paniany than elsewhere—a circumstance which Major Rennell ascribes to this opening in the Ghaut Mountains. The range has an average height of 4000 feet above the level of the sea; but this degree of elevation is considerably exceeded at particular points, Bonasson peak being 7000 feet above the sea-level, and that of Dodabet in the Neilgherries having an elevation of 8700. At the extreme south near Cape Comorin, and at the point of convergence with the range from the opposite coast, the Western Ghauts terminate abruptly in a peak about 2000 feet above the sea. The average height of the low country between the Western Ghauts and the sea may be roughly estimated at 200 feet, rising to 800 at the base of the mountains. This tract, which is called the Coast of Malabar, is marked by a succession of irregular hilly spurs, from the Ghauts descending to the sea in abrupt cliffs. The altitude of this mountain chain is sufficient to intercept the great body of the clouds which are alternately impelled across the continent of India by the S.W. and N.E. monsoons; and accordingly these winds occasion a rainy season on one side of the mountains only, so that while the periodical rains are deluging the country on one side, the weather is serene and dry on the other. But it is only a particular tract of country that is sheltered from rain by the ridge of the Ghauts; for the clouds do pass over, but at too great a height and too much attenuated to be condensed into rain. At a greater distance, however, they collect into masses, and occasion a rainy reason in the countries farther to leeward. Thus, at Nagpoor, in the centre of the Deccan, the seasons differ but little from their usual course in Bengal and on the western side of India. They have a rainy season occasioned by the S.W. monsoon, though it is not so violent as in Bengal. At the mouth of the Godavery, and in the neighbourhood, the S.W. monsoon occasions a rainy season, when the Godavery is swollen and overflows; and this country is about the same distance to leeward of the Ghauts as Nagpoor. Major Rennel suggests that the clouds which occasion the rainy season at the mouth of the Godavery may come from Cape Comorin, though from the prevalence of westerly winds this appears doubtful. But it is certain that the clouds which bring rain at Nagpoor must pass over the Ghauts. Madras lies in the sheltered tract, though at least 300 miles to leeward of the Ghauts. The country near the mouth of the Godavery is about 200 miles further. It would be curious, if we had facts for such a speculation, to trace the limits between wet and dry, and thus to ascertain the influence which this elevated and extensive mountain chain exercises on the climate of the Indian peninsula; but without fuller and more minute information we can scarcely enter into such an inquiry.

The Western Ghauts, about the fifteenth degree of north latitude, although they are steep and stony, are by no means rugged or broken with rocks. On the contrary, in the Province of Canara the stones are buried in a rich mould, and in many places are not visible until they are dug up. Thus, instead of the naked, sun-burnt, rocky peaks, so common in the eastern chain, these mountains are clothed with stately forests. Dr Buchanan mentions that he had nowhere seen finer trees, nor any bamboos that could be compared to those he saw there. These bamboos compose a large part of the forest; they grow in detached clumps, with open spaces between, and equal in height the most stately palms, which are also found in great abundance. There is no underwood nor creepers to interrupt the traveller who may choose to wander in any direction through these woods. But there are numerous tigers, which, besides the unhealthiness of the climate, renders any long stay there uncomfortable. About midway up the mountain the teak becomes common; but it is very inferior in size to other trees. Roads have been formed through these mountains with great labour, out of a bed of loose rock. These roads are ploughed up by torrents during the rainy season, which wash away their softer parts, and leave single rocks of four or five feet diameter standing in the centre. The difficulty formerly experienced in penetrating these mountain passes was very great. In 1791, when the Bombay army was advancing to the Mysore through the Poodicherrim pass, it required two days to draw up twenty light field-pieces two miles, and three weeks to bring up the other artillery to the top of the Ghauts. (E. T.)

GHAZEEPORE, a town of Hindustan, and the capital of the district of the same name, situated within the jurisdiction of the lieutenant-governor of the north-western provinces. The town is built on the left bank of the Ganges, which is here crossed by ferry, and, according to Bishop Heber, is as wide as the Hooghly in the vicinity of Calcutta. At the eastern extremity of the town is the palace of Meer Cossim Ali, the Nawaub of Bengal, who rendered himself infamous by the massacre of his British prisoners The building is at present a custom-house, its numerous apartments being converted into store-rooms and habitations for the guards and officials. At the west end of the town are the military cantonments; and in their vicinity is the cenotaph monument to Lord Cornwallis, who died here in 1805. A government stud is maintained close to the town, and the races annually held here are reckoned among the best in India. According to the census of 1853, the population of the town amounts to 38,573.

The district, of which this town is the chief place, embraces an area of 2181 square miles. It is one of the most fertile districts in India, remarkably well supplied with water, being bounded and traversed by several noble rivers, among which are the Ganges, Goggra, Karamnassa, and Tons. Besides grain of all kinds, it produces cotton and sugar, as well as opium and very fine indigo; and it has long been celebrated for its attar of roses and rose water. The entire population is returned at 1,596,324, of whom 1,438,085 are Hindus and 158,239 Mohammedans. Ghazeepore, with other territory, was ceded to the East India Company in 1775 by the Vizier of Oude. The town of Ghazeepore is in Lat. 25. 32., Long. 83. 39. (E. T.)

GHEE, a kind of butter much used by the natives of India. It is prepared by boiling fresh-drawn milk (generally that of buffaloes) in earthen pots for an hour or more, and adding, after it has cooled, a little curdled milk called *tyre*, in order to promote its coagulation. When this process is completed, the curdled mass is churned for half an hour, some hot water is added, and the operation of churning continued for half an hour longer, when the butter forms. Its tendency to become rancid may be obviated by boiling it until all the water that may be mixed with it is evaporated, and then adding some tyre and salt, or betel leaf, and excluding it from the air in closed jars. In this way it may be preserved for many months. Ghee is an article of considerable commercial importance in many parts of India, though from its strong smell and flavour it is considered unpalatable by Europeans.

GHEEL, a town of Belgium, province of Antwerp, 26 miles E.S.E. of the town of that name. Lunatics and idiots are sent from all parts of Belgium to Gheel, where they are boarded with the inhabitants, and employed in manual occupations chiefly agricultural. In 1851 they amounted to 931. Pop. about 7000.

Name, features, and aspect.

GHENT (in Latin *Ganda*, French *Gand*, Flemish *Gend*, German *Gent*), a city of Belgium, standing on the rivers Scheldt and Lys, whose numerous branches traversing the town form canals in all directions, and so intersect each other as to partition the town into twenty-six islands, which are connected by forty-two large and forty-six small bridges. The number of fine promenades forms another striking and pleasing feature of Ghent. Of these the most remarkable is the Coupure, formed by rows of trees extending along the Bruges Canal. In general the town is well built, and occupies a larger area than most European towns in proportion to the number of houses and the population. The general aspect of the city, without being highly picturesque, is very agreeable. When Charles V. was recommended by the cruel Alva to raze it to the ground on account of its rebellion, which had given him so much trouble, he is said to have taken him to the top of the Beffroi (Belfry Tower), and showing him the vast city spreading out beneath, asked, " How many skins of Spanish leather (Alva was a Spaniard) would it take to make such a glove (*gant*[1]) ?" thus rebuking the duke's atrocious suggestion. And truly interesting is the prospect from this elevation. The walls extend nearly eight miles in circumference, inclosing a large space interspersed with gardens, orchards, and corn-fields, as well as with canals and rivers. The number of the squares and width of the streets permit the eye to range over more than mere roofing and chimneys. Besides the towers and steeples of numerous churches, and the imposing pile of the town-hall close by, in the distance is seen the site and ruined walls of the citadel, erected by Charles V. to overawe the rebellious citizens. Beyond this, if we continue the survey, lies the Great Béguinage, one of the largest nunneries in the world, with its streets and squares; and following the line of ramparts still further to the left near the Coupure promenade, the Maison de Force, a vast building resembling a wheel in its ground plan, with the prison-church steeple rising in the centre. At every turn in Ghent the eye is arrested by the picturesque appearance of the houses and the fantastic variety of gable-ends rising step-like, or ornamented with scrolls and carving. Most of the canals are bordered with magnificent quays, and some of them with beautiful rows of trees. The streets in general are wide and straight, and the greater number of them have been modernised. Almost all the houses are constructed on the Italian model, and are large, with ample portes-cochers, spacious court-yards, lofty stair-cases, tall windows, and frescoes and bas-reliefs occasionally on the exterior. Here and there, on the quays and in the narrower streets, are to be seen the gloomy old residences of " The men of Ghent," with their sharp tilted roofs and mullioned windows sunk deep into the walls. The most remarkable among the numerous squares are the Marché-du-Vendredi, where in early times the counts of Flanders were inaugurated and the trades unions used to assemble, but now the weekly market is held; the Kauter (the Flemish of " field") or Place d'Armes, a large square within the town, planted with trees and surrounded with large buildings, among which are the three clubs—the military, the nobles, and the merchants; the Plaine de St Pierre, especially used for reviews and military exercises; the corn market, near the centre of the town: the Place de Pharailde, near the Marché aux Poissons, where the old turreted gateway called the Oudeburg or 's Gravensteen (" the Count's Stone," *i. e.* castle) still stands hard by; and the Plaine des Recollets, with its numerous elegant mansions and fine hotels. Near the Marché-du-Vendredi is the enormous cannon, eighteen feet long and ten in girth, and nearly three feet wide at the mouth, formed like Mons Meg in Edinburgh Castle, and surnamed *Dulle Griete*, " Mad Margaret."

Dimensions,—squares and public buildings.

Principal public buildings.—The Cathedral of St Bavon (Flem. *Baefs*), an enormous structure, in its exterior rather heavy, but in its internal proportions and decorations one of the most splendid churches in Belgium. It has a large crypt, a beautifully carved pulpit, many interesting monuments and fine paintings, and is surmounted by an elegant tower 272 feet high. It was founded in 944; the choir and crypt were rebuilt in 1228; and the whole was finished in the beginning of the sixteenth century. It was at first dedicated to St John; but in 1540 received the name of St Bavon, when Charles V. caused to be removed to it the collegiate chapter of the abbey of St Bavon; and in 1560 the church was constituted a cathedral. The choir and transepts are lined with black marble, and the balustrades are of white or variegated marble, in the Grecian style; but these, though elegant, are very unfit for a Gothic church. The gates of the chapels are of brass, and every vacant space is ornamented with a painting or a statue. The arms of the knights of the Golden Fleece are affixed over the choir at a considerable elevation. The last chapter of this order was held here by Philip II. of Spain in 1559. The high altar is adorned with a statue of St Bavon in his ducal dress, and in front of it are four tall copper candlesticks which belonged to Charles I., and still bear the royal arms of England. The twenty-four chapels of this cathedral contain pictures of the highest excellence. The most ancient church in the city is that of St Nicholas, but it is now much altered by conflagrations and repairs. Other churches worthy of mention are St Michael's, an elegant light structure on the bank of the Lys, in the centre of the city; the parish church of St James, and many others, some of which are very ancient, and mostly all contain pictures and sculptures of great excellence. The only Protestant place of worship is the English church, on the Braband Dam. The university of Ghent is an elegant modern edifice, with a noble Corinthian portico after the model of the Pantheon at Rome, and founded by William I., king of Holland, in 1826. The museum of natural history is extensive, but it has no collections of any remarkable excellence. The library contains upwards of 60,000 volumes, and the number of students averages 350. Not far from the Beffroi stands the Hôtel-de-Ville, with two façades in totally different styles of architecture, having been built at intervals between 1480 and 1620, according to several different plans. The Beffroi or Belfry Tower, which originally served as a watch-tower, and contained the tocsin-bell, is one of the most ancient buildings in the town, and dates from A.D. 1182. To be allowed to erect a belfry was one of the earliest privileges obtained by the citizens of Ghent, hence they long regarded this tower as a monument of their power and wealth. The gilt dragon-weathercock on the top of it was a trophy brought from Bruges in 1382, on the conquest of that town by the men of Ghent under Philip van Artevelde.

---

[1] Combien il fallait de peaux d'Espagne pour faire un *gant* de cette grandeur ?

Manufacture and trade.

The cotton manufacture is extensively carried on in Ghent, employing about L.1,800,000 of capital, engaging upwards of 20,000 persons, and annually producing about 1,000,000 pieces of plain and printed calicoes. Sugar-refining is also extensively carried on. The other important manufactures are common and table linens, flannels, serges, woollen cloths, silks, ribbons, lace, thread, hosiery, wax-cloth, oil, chemicals, armour, mathematical, physical, and surgical instruments, hardware, bronze and crystal, carriages, paper, tobacco, blue, starch, delft, &c. The important branches of trade are in corn, oil, seeds, Flemish linens, and wine. About 20,000 pieces of linen are exposed for sale every Friday, and the annual fairs are very numerously frequented, besides the horse fairs held in Mid-Lent and on 23d July. The great general fair is held in August. The governor of the province resides in Ghent, which is also the seat of a tribunal of first resort, as well as of a court of appeal, which has jurisdiction over all the province of Flanders. Ghent also gives title to a bishop, and is the headquarters of the first of the four divisions of the army of Belgium.

Government.

The Casino, whose destination is social, literary, and scientific, is a handsome building standing near the Coupure. The new theatre, in the corner of the Place d'Armes, is a fine erection, containing magnificent concert and ball rooms, and cost the town L.1,000,000. Besides these public buildings may be named, as worthy of notice, the Palais de Justice and the post-office. The modern citadel is situated on Mont Blandin, at the end of the elevated ground on which the western part of the city stands. It commands the course of the Scheldt and the Lys, and is one of the chain of fortresses defending the Belgian frontier. Ghent communicates with the sea by the Ternuzen Canal, a grand canal which enters the Scheldt at Terneuse. This confers on the city all the advantages of a seaport; vessels drawing seventeen feet water can unload in the basin under its walls; and at Sas van Gend, fifteen miles north of the city, there are sluices by means of which the whole country could be laid under water. The railways from Ostend to Liége and Brussels, and from Amiens to Amsterdam through Antwerp, pass through Ghent.

History.

The origin of Ghent is uncertain. Tradition ascribes it to the Vandals, who, in their irruption into Belgium, built a fort, named from them Vanda, afterwards changed into Ganda, whence Gandavum Castrum, which seems to be borne out by the existence of a fort on the left bank of the Scheldt, within Ghent, still bearing the name of Vandelaers Kasteel (Vandal's Castle). In the seventh century it is first mentioned as a town, but seems not to have acquired much importance till the twelfth, when its fortifications were completed, and it occupied only the space between the Scheldt and the Lys. At the end of the thirteenth century, however, it had become nearly as large as at present, so large indeed as in some measure to justify the pun of Charles V.—*Je mettrais Paris dans mon Gand* (gant). About 630 A.D., Dagobert sent St Amand to Ghent to convert its inhabitants from paganism. This saint founded two monasteries in honour of St Peter—one on St Peter's Mount, and the other near the Antwerp Gate. In process of time the second of these monasteries became richly endowed by some of the wealthier converts, among whom was one St Bavon, whose name became attached to this part of the city as well as to the abbey, of which some parts of the ruins may still be seen. Baldwin Ironarm, first Count of Flanders, built a fortress at Ghent, which was called 's Gravensteen (Count's Castle); and he as well as his successors encouraged persons skilled in manufactures, especially of linen and woollen. The Flemish nobles, about the end of the twelfth century, sold their possessions to their vassals in order to have the means of equipping themselves for the crusades. By this means the vassals became enfranchised; and the inhabitants of the Flemish towns, at the same time, having already become wealthy by their extending trade and improving manufactures, were enabled to purchase important commercial and political privileges, which were the foundation of the wonderful prosperity and liberty enjoyed by these communities during the middle ages. It was under these favourable circumstances that the "Men of Ghent" established their form of municipal government. They adopted a public seal, established a court of justice, elected sheriffs, joined the association of the Hanse Towns, and obtained the free navigation of the Rhine from the emperor Frederick I. In 1180 Ghent obtained a charter from Count Baldwin of Hainault, with great privileges, and became the capital of Flanders. Under these favourable circumstances so rapidly did Ghent increase in wealth and population, that by the end of the thirteenth century it surpassed the capital of France. At the commencement of the fifteenth century, in time of war, Ghent furnished 20,000 armed men, and had upwards of 40,000 engaged in the woollen manufactures alone. And many were the proofs furnished by the artizans and manufacturers of Ghent that these peaceful occupations in nowise diminished their valour. With increasing wealth and free institutions they waxed turbulent, and being led on by Jacques van Artevelde and his son Phillip (1332–1382), they raised frequent insurrections against the counts of Flanders, and during the succeeding century against the dukes of Burgundy. To this unfortunate spirit of turbulence and dissension, however, not only the city of Ghent but other large Flemish towns must trace their subsequent decline. Charles V. was born here in 1500, and eighteen years afterwards succeeded to the most extensive monarchy that had existed in Europe since the time of Charlemagne. The site of the palace in which he was born is now occupied by the Cour des Princes, a recently formed street. During his reign the city had a population of 175,000, inhabiting 35,000 houses. In 1557 Maria the sister of Charles V., who then governed the Netherlands, demanded from Flanders an extraordinary subsidy of 1,200,000 gold florins, of which Ghent was to raise one-third; but the inhabitants having already been heavily taxed in order to aid the emperor in his war with France, refused to comply with this new demand, and attempted resistance, but were immediately reduced to submission. The sad consequence of this ineffectual attempt on the part of the citizens was that Charles V. deprived them of all their valuable privileges, besides confiscating the property of many of the leaders in the revolt, and condemning others to death. Not only so, but above all this the citizens had to pay for the erection of a citadel to keep them in bondage. On the formation of the confederation for the expulsion of the Spaniards from the Netherlands, a congress was convened in Ghent; and the document known as "the Pacification of Ghent" was publicly signed by the confederates met in the Town-Hall, Nov. 8, 1576. Three days after, the Spanish garrison in the citadel capitulated to the citizens. Though this citadel was afterwards nearly destroyed (1584), yet parts of it may still be seen near the railway station towards the east of the city. But again, unfortunately, did Ghent submit to the Spanish dominion by signing the capitulation of Sept. 17, 1584. On this disastrous occasion one-third of the inhabitants left the town, and the citadel was rebuilt. The Belgian provinces in 1598 were severed from the dominion of Spain in favour of Isabella, daughter of Phillip II., wife of Albert, son of the emperor of Germany. After a siege of six days, Louis XIV., in 1678, took Ghent. Under the French, as well as afterwards during the campaigns of the Duke of Marlborough and the commotions of the French Revolution, it suffered much; but the advantages of its position, as well as the intelligence and industry of its citizens, seem to render it superior to all calamities. From 1792 till the overthrow of the power of Napoleon, Ghent was the capital of the department of the Scheldt. In 1814 Flanders became part of the kingdom of the Netherlands; and the same year the treaty of peace was signed here between Great Britain and the United States of North America, which put an end to the revolutionary war. In 1815, on the return of Napoleon from Elba, Louis XVIII. took refuge in Ghent; and in the revolution of 1830, this city with the rest of Flanders was comprised in the new kingdom of Belgium. The city seems now as prosperous as ever, and is increasing in population as well as in all the elements of wealth and power.

Ghent stands in Lat. 51. 3. 12. N., and Long. 3. 43. 51. E., at the intersection of the railways connecting Lille with Antwerp, and Ostend with Malines, from which towns it is respectively distant 42, 32, 38, and 33 miles. The population in 1851 was 106,704.

GHERIAH, a fortress of Hindustan, in the south of India, on a rocky promontory in the southern Concan, about one mile long, and a quarter of a mile broad. It is joined to the main land by a narrow neck of land; and lies about a mile from the entrance of a capacious harbour, formed by the mouth of a river which descends from the Western Ghauts. It was taken possession of by the Mahrattas in the seventeenth century; and in 1707 Conajee Angria had established an independent sovereignty here, and possessed a numerous piratical fleet. The depredations of these pirates drew on them the vengeance of the British; and in 1756 Angria's fleet was destroyed by Admiral Watson and Colonel Clive. Gheriah having surrendered, it was given up to the Peishwa under the treaty concluded in the same year with the Mahrattas; and upon the overthrow of that potentate in 1818 the place escheated to the British with the rest of his dominions. Distant south from Bombay 170 miles. Lat. 16. 32., Long. 73. 22. (E.T.)

GHIBELIN, the name of a celebrated faction in Italy, which was opposed to that of the Guelphs. Their origin is involved in some obscurity; but according to the generality of authors they arose about the year 1240, upon the excommunication of the emperor Frederick II. by pope Gregory IX. The Ghibelins were in favour of the emperor, while the Guelphs adhered to the pope. Authors are at variance respecting the precise date and cause of their origin. Maimbourg says that they arose in consequence of a quarrel between two ancient and illustrious houses on the confines of Germany—that of the Henris of Gibeling, and that of the Guelphs of Adorf. However this may be, their feuds long distracted Italy, so that the history of that country for the space of several centuries is little more than a detail of their mutual violence and slaughter. For further particulars see Italy, and Guelphs.

GHIBERTI, Lorenzo, an Italian sculptor, whose life marks an era in the history of modern art. He was a native of Florence, but it is not known in what year he was born. Vasari assigns his birth to the year 1380; but some original documents brought to light by Baldinucci place it two years earlier. While still very young, Ghiberti was taught drawing and the arts of modelling and casting metals by his step-father Bartoluccio, a goldsmith. The goldsmiths of Florence were at this time highly celebrated. He is believed to have afterwards received lessons in painting from Starnina, which he turned to account by painting a fresco in the Malatesta palace at Rimini, when compelled to leave Florence by the plague which devastated that city at the end of the fourteenth century. His success in this effort tempted him into the study of the pictorial art, when a circumstance occurred which gave him the opportunity of proving himself the first sculptor of his own day, and one of the most remarkable of all times. The Society of Merchants of Florence opened a competition for a pair of bronze doors for the Baptistery of St John's, to rival those erected about half a century before by the famous Andrea Pisano. Artists from all parts of Italy entered the lists, and seven were finally chosen to make trial of their skill, among whom were Brunelleschi, Donatello, and Ghiberti. Each of these artists was allowed a large fee and his expenses for an entire year, at the end of which period he was to present a panel of gilt bronze representing in bas-relief the sacrifice of Isaac. On the trial day the judges and competitors were unanimous in awarding the palm to Ghiberti, who, when he began his work, was invited by his employers to spare neither time nor expense in turning out a work worthy of his own genius and of the state. The gates, when finished, contained twenty panels, each with a relief representing some Scripture subject, and were pronounced by Michael Angelo as worthy to be the gates of Paradise. Some of the best of modern critics have denied that these gates are in all respects superior to those of Andrea Pisano, admitting indeed that they display greater invention and a higher skill, but pronouncing them inferior on the score of simplicity and correctness. Another objection is that the designs have been conceived rather in the spirit of painting than of sculpture, and that the artist's endeavour to represent perspective by various degrees of relief is wrong, in so far as the outermost figures cast shadows on those immediately behind them, though these inner figures are intended to be a considerable distance from the former. These defects, however, detract but little from the intrinsic merit of Ghiberti's masterpieces. These doors were set up in 1424; and four years later he received a commission to execute two others in a still richer style. This second engagement occupied eighteen or twenty years. It was not till 1446 that he completed his task. Some of Ghiberti's other bronzes are worthy of special notice, such as his statues of Saints John, Matthew, and Stephen in the church of Or-San-Michele at Florence, and the shrine of St Zenobius in the cathedral of that city. Ghiberti practised successfully some of the other branches of art, particularly that of painting on glass. Some of the finest windows in the cathedral and other churches of his native city were his handiwork. The exact date of Ghiberti's death is unknown. His will bears the date of 1455, and as he was at that time seventy-seven years of age, it is not likely that he long survived.

GHILAN, a province of Persia, lying along the S.W. shore of the Caspian Sea. It is bounded on the N.E. by the Caspian, S.E. by the province of Mazaunderan, S. by Irak-Ajemi, W. by Azerbijan, and N. by the Russian district of Talish. It is about 120 miles in length by 50 in breadth, being between 36. 25. and 37. 45. N. Lat., and between 48. 35. and 50. 47. E. Long: area, estimated at 5000 square miles. This is one of the most beautiful of the Persian provinces, being covered with lofty mountains and magnificent forests, forming a striking contrast to the parched plains of the rest of Persia. In many places, however, it is swampy and unhealthy. It is hemmed in on the S. and W. by the Elburz range of mountains, which rises to the height of from 6000 to 9000 feet, and can be crossed only by extremely steep and difficult passes. The interior and much of the coast line are intersected by morasses and thickly covered with forests of oak, boxwood, mulberry, and walnut trees. The only river of importance is the Kezil-Oozen, which descends from the Elburz mountains with the rapidity of a torrent, and flows with a meandering course through Ghilan to the Caspian. The soil is fertile, yielding abundantly rice, wheat, hemp, hops, and many kinds of fruit, as lemons, oranges, peaches, grapes, and pomegranates. Silk, however, is the most celebrated of the productions of this province, and constitutes the principal employment of the inhabitants. It is annually exported in great quantities to Irak, Fars, Kerman, and Russia. Ghilan was ceded by Persia to Russia in 1724, taken by Catherine in 1780, and restored to Persia in 1797.

GHIRLANDAIO. See Corradi, and Painting.

GHIZNI, an ancient and celebrated town and fortress of Afghanistan, on the western extremity of a range of hills running east and west, and rising a moderate height above the plain. As the plain itself lies very high, the site has an elevation of 7726 feet above the sea. The shape of the whole inclosed fortress is nearly an irregular square, and the total circuit is about a mile and a quarter. The face of the rock on which the walls are built is about 35 feet high and scarped nearly perpendicularly: the walls are about the same height, so that the parapet is 70 feet above the ditch. This wall is flanked by numerous towers, and surrounded by a *fausse-braye*. A wet ditch runs along the bottom of the steep on which the wall is built, and obtains a supply of water from the river of Ghizni, which flows round the western angle and is crossed by two bridges. The citadel in the north of the town is an irregular square, with a magazine in the west quarter, and a granary in the east. Three miles to the N.E. of Ghizni are the ruins of the old city, destroyed in the middle of the twelfth century by the prince of Ghoor. Amidst the destruction which overtook nearly all besides, the conqueror spared the tomb of the renowned Mahmood of Ghizni, the ruler of Persia, Turkestan, Afghanistan, and a considerable part of India. The tomb is a rude structure, consisting of an oblong chamber 36 feet long and 18 wide, with a mud cupola. The grave-stone is of marble, covered with inscriptions, and is highly polished—the result of being handled by numerous visitors during several centuries. The interior is hung with ostrich eggs, peacock feathers, and other trumpery. The apartment in which repose the relics of the mighty victor was, previously to the British invasion, closed by the gates which it is believed he triumphantly removed from the temple of Somnath in Guzerat. These gates, to which an undue importance has been attributed by Christian, Hindoo, and Mussulman, are of sandal wood, 18 feet high, each 5 feet broad and 3 inches thick, very beautifully carved in tasteful arabesques. As Mahmood is said to have removed these gates in 1024, they must, in this view, be above 800 years old, yet they are still in perfect preservation. In 1842, when the British under General Nott dismantled Ghizni, they carried off these gates with the view of restoring them to their original place in the temple at Pattan in Guzerat. Probably the earliest authentic notice which history affords of Ghizni is of the date 976, when it was made the seat of government by Abustakeen, an adventurer of Bokhara. He was, after a short interval, succeeded by Subuctageen, the father of the renowned Mahmood the destroyer. Few pursued the career of conquest with more perseverance or success than Mahmood, whose empire extended from the Tigris to the Ganges, and from the Indian Ocean to the Oxus. It fell to pieces on his death; and in 1151 his capital Ghizni was stormed by Allahudeen, Prince of Ghoor, who massacred the inhabitants on the spot, with the exception of those of rank, whom he conveyed to Ghoor, and there butchered, using their blood to moisten the mortar with which he constructed his fortifications. From that period Ghizni ceased to be independent; and at the time of the British invasion it was held by a garrison of 3000 men, under the command of Mahomed Hyder Khan, son of Dost Mahomed Khan. On the 23d of July 1839 it was stormed by the British army, amounting to 4863 men, commanded by Sir John Keane: 514 of the garrison were killed, 1500 prisoners taken, with a loss on the part of the captors of only 17 killed. In place of the tedious process of breaching, for which the assailants were but ill prepared, Captain Thomson, of the Bengal Engineers, undertook to blow in one of the gates with gunpowder. An opening was thus made for the entrance of the storming party, who after a severe struggle within the town succeeded in planting the British colours on the citadel. In 1842 Ghizni was surrendered by the British garrison to the Afghans; and shortly after, in the same year, it was retaken by the army under General Nott, by whom it was dismantled and immediately evacuated. Lat. 33. 34., Long. 68. 18. (E. T.)

GHOOR, Ghore, or Ghour, a large district of Afghanistan, situated between the 35th and 37th degrees of N. Lat., and the 67th and 69th degrees of E. Long. This was formerly one of the Persian governments; but in the 12th century its chiefs became independent, overturned the Ghiznian empire, and carried their arms as far as Benares. One of their slaves, named Cuttub, founded the Mohammedan kingdom of Delhi about 1206. This country was overrun in the 13th and 14th centuries by the armies of Genghis Khan and Tamerlane, and it is now in possession of the Usbec Tartars. The Ghory tribe, being of pastoral habits, have emigrated to the vicinity of Peshawur, and are now subdivided into three tribes. Its chief towns are Ghoor and Firoy Koh. Ghoor is the name of the capital, and was once the residence of a long line of sovereigns. It was taken by the king of Kharezm, and was subsequently sacked by the armies of Genghis and Tamerlane, from which it has never recovered, and is now scarcely known. Long. 67. 48. E., Lat. 35. 45. N.

GHOST. See Apparitions.

GIANNONE (in Latin Jannonius), Pietro, a celebrated Neapolitan writer and historian, was born at Ischitella, a small town in the province of Capitanata. Having acquired the elements of a liberal education under the paternal roof, he was sent by his father, at the age of eighteen, to Naples, there to complete his studies, and particularly to study jurisprudence. Being placed under the immediate tuition of the learned Dominico Aulisio, he applied himself with great ardour to the study of jurisprudence on philosophical principles, and soon gave proofs of his capacity for investigating and illustrating the sources of that science by several learned dissertations *De Originibus Juris*. His inquiries, however, having disclosed to him much respecting the origin and mutations of laws, and the vicissitudes of nations, which had escaped the penetration of ordinary jurisconsults, he conceived the design, with the approbation of Argento, of writing a civil history of the kingdom of Naples, comprehending an account of the origin and progress of its laws and government, and an exposition of the causes which led to the gradual abolition of ancient customs and institutions. But this work, interrupted from time to time by the affairs of the bar, was not completed until after the lapse of twenty years, and only appeared in 1723, under the title of *Istoria Civile del Regno di Napoli*, in four volumes 4to. Giannone took as his guide Angelo di Costanzo, whose history of Naples, which was then accounted the best, he almost entirely transfused into his work; but his distinguishing merit consists in the valuable expositions he has given relative to the ecclesiastical and civil constitution, and to the laws and customs of the kingdom. Although the style is neither correct nor elegant, the philosophical spirit, the erudition, and the profound research, which this history exhibits, secured it a high reputation. The freedom with which he treated ecclesiastics generally, and the boldness with which he discussed several topics relating to the origin of the papal power, raised a storm against him, which neither the authority of the viceroy, Cardinal Althann, nor the credit of the municipality of Naples, of which he had been elected advocate, could allay, or even mitigate. "I know not, indeed," said Argento, when speaking to him on this subject, "whether I should congratulate you or condole with you; for I very much fear lest the crown of laurel which now encircles your brows should become a crown of thorns." Having been several times insulted by the populace, and at length excommunicated by the archiepiscopal court, Giannone, seeing his work placed in the *index expurgatorius*, left Naples on the 29th of April 1723, and went to seek an asylum at Vienna. The Emperor Charles VI. regarded him at first with an unfavourable eye; but the protection of such men as Prince Eugene, the Chancellor Zinzendorf, the celebrated Count de Bonneval, and the Chevalier Garelli, first physician to the emperor, procured him a pension of a hundred florins on the secretaryship of Sicily. During his stay at Vienna, where he enjoyed the favour of the great and of men of letters, he laboured at a work entitled *Il Triregno, ossia del regno del Cielo, della Terra, e del Papa*, which occupied him nearly twelve years, and to which he only put the last touches at Geneva. This work, in which man is successively represented in the state of nature, under the law of grace, and under the temporal dominion of the popes, comprehends ten epochs, the first three of which extend to the ninth century; but the remainder has not been completed. Don Carlos having ascended the throne of Naples and of Sicily in 1734, Giannone lost his pension and all his hopes. Being constrained to quit Vienna, he retired to Venice, where he was received with every mark of distinction. He refused the appointment of counsellor of the republic, and the chair of Roman law in the university of Padua, ingenuously confessing that he was not in a condition to explain the laws in the Latin language, according to the usage of the schools. But the repose which he hoped to enjoy at Venice was not of long duration. Denounced as unfavourable to the pretensions of the republic over the Adriatic, he endeavoured to avert the storm by publishing a *Lettera intorno al dominio del mare Adriatico ed ai trattati seguiti in Venezia tra Papa Alessandro III. e l'Imperador Federigo Barbarossa*; but as the state inquisitors had taken umbrage at the prolonged visits paid by him to the ambassadors of France and Spain, his removal was decided on, and, in the night of the 23d September 1735, sbirri seized and conducted him in a small boat to the frontiers of the territory of Ferrara. The apprehension of still greater misfortunes now induced him to change his name to that of Antonio Rinaldo, under which be sojourned at Modena, Milan, and Turin, and arrived with his son at Geneva on the 5th of December. His reputation, which had preceded him in different cities, procured him in the last-mentioned place the most satisfactory reception on the part of Dr Turretin, the minister Vernet, and the bookseller Bousquet, who furnished him with the means of living at his ease. In 1736 he was preparing to print a volume of supplement to his history, when, having been conducted by a perfidious friend to pass Easter in a catholic village belonging to the king of Sardinia, he was arrested by order of that sovereign, and his manuscripts were seized and sent to Rome. He was himself conducted to the castle of Miolan, and thence to the fort of Ceva. Afterwards, his Sardinian majesty ordered him to be transferred to the citadel of Turin, where he passed twelve consecutive years in trouble and agitation. It was in this fortress that, giving ear to the persuasions of Father Prever of the Oratory, Giannone retracted, on the 4th April 1738, the maxims in his history which had been condemned. But this submission did not procure him his liberty; for he died in prison on the 7th of March 1758, aged seventy-two years. In 1760 his posthumous works were published at Lausanne, in one volume 4to, under the title of *Opere Postume in difesa della sua Storia civile del regno di Napoli, con la di lui professione di fede.* The History of Giannone was translated into French by Louis Bochat of Lausanne; and among the re-impressions of the work may be distinguished that which appeared with illustrations by the Abbé Cestari. It has been highly commended by Gibbon in his *Extraits de mon Journal* (Miscellaneous Works, vol. v., p. 413, 8vo ed.). "The candour, penetration, and freedom of this excellent lawyer," says he, "will ever ensure to this work the esteem of all wise men. But," he adds, "churchmen are not always of the number." In the number of the refutations which have appeared, it is only necessary to mention the *Riflessioni morali e teologiche sopra l'Istoria civile del regno di Napoli*, by Eusebio Filopatro (Father Sanfelice, a Jesuit), in two volumes 4to, an extract of which may be seen in the *Mémoires de Trevoux* for January 1730. (Fabroni, *Vitæ Italorum*, vol. xiii. v. *Petrus Jannonius—Biog. Univ.*) (J. B—E.)

GIANT, a person of extraordinary stature. The word is derived from *gigas*, the Latinized form of the Greek γίγας, which is probably made up of γινέσθαι and γῆ = γηγενής, thus signifying "the earth-born," in allusion to classical fable.

In the Old Testament the appellation of giant is bestowed upon various races of men; but it is generally supposed to have reference to violence and strength rather than to actual stature. It nevertheless seems evident that the Anakim and some other tribes denominated giants were also remarkable for their comparative stature, in the same way probably that particular races at the present day are distinguished from others by their superior strength and proportions. Of the existence of individual giants of great size, the particulars related of Og and Goliath leave no room for doubt; but such instances may properly be regarded as extraordinary deviations from the standard proportions, of which there have occurred examples more or less remarkable in all ages, even down to our own times. It is a current opinion in ancient authors generally that the primitive races of men greatly surpassed others in stature; and at an early period, under favourable circumstances, individuals and even tribes may have attained an unusual stature. It would seem that the possibility of a race of giants, comparatively speaking, cannot well be denied, since there is a known tendency in the human frame to perpetuate peculiarities which have been once evolved. The inhabitants of Potsdam, for example, who are descended to a great extent from the famous regiment of tall grenadiers which Frederick of Prussia took so much pains to bring together, are still remarkable, it appears, for exceeding the average height. But apart from such considerations, many things concur to show that the average size of the human race never differed materially from what it is at present. We have evidence of this in the remains of human beings found in tombs; and the mummies of Egypt attest that the people of that country two or three thousand years ago were not superior in size to its present inhabitants. To the same effect may be adduced the size of ancient armour, architectural dimensions, and the measures of length derived from the human form which have been transmitted to us from antiquity. Such ancient writers as are free from the influence of fable are found to give a concurrent testimony.

That great diversity as to height and size prevails in the human family is well known. The inhabitants of northern latitudes are below the ordinary standard, many of them scarcely exceeding four feet; while in temperate climates the height of the human race ranges from four feet and a half to six feet; and instances are not wanting of individuals who have measured eight or even nine feet. (See Prichard's *History of Mankind*, and Lawrence's *Lectures on Man.*)

Giant's Causeway.

Some writers, among whom is Maclaurin, have attempted to demonstrate mathematically the impossibility of the existence of giants exceeding certain dimensions, dependent on the limits of the strength of materials; but it is evident that arguments of this kind are not necessarily conclusive, because a great increase of stature might be attended with a proportional increase of strength in the constituent parts of the body. But again, the difference that does exist in this respect in the bones and other parts of animals, though considerable, is not found to be so great as to favour the supposition of the possibility of excessive deviation from the ordinary standard. Strabo makes mention of the skeleton of a giant sixty cubits in height, and Pliny tells us of another of forty-six cubits. The progress of comparative anatomy has done much to dispel the errors that have been propagated on the subject of giants; and there is now little danger of the bones of fossil elephants, whales, and other large animals being mistaken, as they so frequently have been, for those of human beings. It is a curious fact that Buffon, in his great work, has figured and described the bones of an elephant as human remains. In not a few instances have the dimensions of supposed giants been calculated from a single bone or a few teeth; and on such data the imagination would find little difficulty in rearing a superstructure sufficiently astounding. Kircher (*de Mundo Subterraneo*, viii. 4) exposes an instance of this kind with regard to the body of the giant so minutely described by Boccaccio as found in the fourteenth century in a cave near Trapani in Sicily. It was reported to be 200 cubits in length, and a single tooth was said to weigh 100 ounces; but when Kircher visited the place he was shown no other remains than the teeth, which probably were those of a mastodon. This author has given a comparative scale of five reputed giants, in which Goliath (whose height has been variously estimated from about 8 feet to 11) scarcely overtops the ankle of the giant of Trapani.

GIANT'S CAUSEWAY, a vast collection of columnar basalt in the county of Antrim, on the northern coast of Ireland. It is divided into the Little, the Middle, and the Large or Grand Causeways, divided from each other by whin-dykes, composed of amorphous basalt. The Grand Causeway consists of a most regular arrangement of innumerable polygonal columns of basalt, almost all of a hexagonal figure; one, however, has been found with only three sides, and several with nine. Though the polygons are somewhat irregular, the faces of the adjacent pillars are equal, and fit so compactly, that although perfectly distinct from top to bottom, no space is unoccupied, and water will lodge in the cavities until it evaporates, without any portion sinking between the columns. Each pillar is perfect in itself, consisting of articulations, the internodes of which vary from a few inches to some feet; sometimes the concavity, sometimes the convexity is uppermost, in some instances both ends are concave, in others both convex, but the joints of the separate portions of the columns are always accurately adjusted to each other. The diameter of the pillars is as various as their length and figure, but the general measurement is from 15 to 20 inches. The columns are of an unequal height and breadth; some of the highest, visible above the surface of the strand, and at the foot of the impending angular precipice, are about 20 feet. How deep they are fixed in the strand has not been discovered. This grand arrangement extends nearly 200 yards, visible at low water, but how far beyond is uncertain. The breadth of the principal causeway, which runs out in one continued range of columns, is in general from 20 to 30 feet; at one or two places it may for a few yards be nearly 40. In this account are not included the broken and scattered pieces of the same kind of construction which are detached from the sides of the Grand Causeway, as they do not appear to have ever been contiguous to the principal arrangement, though they have frequently been taken into account when estimating the width. The highest part of the causeway is the narrowest. The columns of this narrow part incline from the perpendicular a little to the westward, and form a slope on their tops, by which an ascent is made at the foot of the cliff, from the head of one column to the next above, *gradatim*, to the top of the great causeway, which, at the distance of half a dozen yards from the cliff, obtains a perpendicular position, and, lowering in its general height, widens to between 20 and 30 feet, and for nearly 100 yards is always above water. The tops of the columns for this length being nearly of an equal height, they form a grand and singular parade, rather inclining to the water's edge, but easily walked on. Below high-water mark the platform lowers considerably, and becomes more uneven, so that a firm footing can only be maintained with difficulty. At the distance of about 150 yards from the cliff it turns a little to the eastward for 20 or 30 yards, and then sinks into the sea. The Little Causeway is first approached from the sea, next comes the Middle Causeway, which is commonly called the Honeycomb by the local guides; but the chief object of attraction is the Grand Causeway, which is formed of the upper surface of the first or lowest range of columnar basalt laid bare. The ends of the pillars may be distinctly traced both on the east and west sides of the causeway resting on the ochre bed, upon a concave depression of which the whole causeway probably stands, so that in the centre only are the columns perpendicular to the horizon, those at the extremities leaning over towards the middle. The causeway, properly so called, consists of three piers or moles jutting out into the sea, the greater being visible to the extent of 300 yards at low water, the other two not more than half that distance.

The cliffs connected with the causeway, especially in the bay to the eastward, exhibit in many places the same kind of columns, shaped and jointed in all respects like those of the Grand Causeway. Some of them are seen near the top of the cliffs, which in general, in those bays to the east and west of the causeway, range from 140 to 390 feet in height; others again are observed about midway, and at different elevations from the strand. A very considerable exposure of them is seen in the very bottom of the bay to the eastward, about 100 roods from the causeway, where the earth has evidently fallen away from them upon the strand, and exhibits a most curious arrangement of many of these polygonal columns in a perpendicular position, supporting in appearance a cliff of different strata of earth, clay, rock, &c. to the height of about 130 feet or more above. Some of these columns are between 30 and 40 feet high, from the top to the sloping bank below them; and, being longest in the middle of the arrangement, and shortening on either hand, they have obtained the appellation of *organs*, from a rude likeness in this particular to the exterior or frontal tubes of that instrument. The most remarkable of these cliffs is the Pleaskin, the summit of which is covered with a thin grassy sod, under which lies the natural basaltic rock, having generally a hard surface, somewhat cracked and shivered. At the depth of 10 or 12 feet from the summit this rock begins to assume a columnar shape, and forms a range of massy pillars of basalt, which stand perpendicular to the horizon, presenting in the sharp face of the promontory the appearance of a magnificent gallery or colonnade, upwards of 60 feet in height. This colonnade is supported on a solid base of coarse black amygdaloid, nearly 60 feet thick, with many of the cavities empty; but though comparatively irregular, it may be plainly observed to affect a peculiar figure, tending in many places to run into regular forms, resembling the shooting of salts and many other substances during a hasty crystallization. Under this great bed of stone stands a second range of pillars between 40 and 50 feet in height, less gross and more sharply defined than those of the upper story; many of them, on a close view, emulating even the neatness of the columns in the Giant's Causeway. This lower range is borne on a layer of red ochre, which serves as a relief to show it to great advantage. These two admirable natural galleries, together with the adjacent mass of irregular rock, form a perpendicular height of 170 feet; from the base of which the promontory, covered over with rock and grass, slopes down to the sea for the space of 200 feet more, making in all a mass of nearly 400 feet in height, which, in beauty and variety of colouring, in elegance and novelty of arrangement, and in the extraordinary magnitude of its objects, cannot readily be rivalled by anything of the kind at present known.

In association with the scenery and natural curiosities of the Giant's Causeway, are the ruins of the castles of Dunseverick and Dunluce, situated high above the sea on insulated crags; the swinging bridge of Carrick-a-Rede, over a chasm of 80 feet deep, and connecting a rock, which is used as a salmon-fishing station, with the mainland. Fairhead, about 550 feet in height, is the highest promontory on this coast; it is composed of columnar greenstone, and some of the pillars exceed 200 feet in height, forming the finest object on the whole line of coast.

To the geologist, the mineralogist, or the observer of nature in her more singular and fantastic moods, the Giant's Causeway and its neighbourhood is of surpassing interest; but as remarked by Inglis, "The traveller who visits the Giant's Causeway, expecting to find nature in her most majestic form, and associating, as I did, with the name, something very sublime, will certainly be disappointed; but if he goes to see something very curious—something calculated to excite wonder and admiration, he will undoubtedly leave the Causeway fully satisfied."—Hamilton's *Letters from the Coast of Antrim;* Dubourdiew's *Statistical Survey of Antrim;* Dr Richardson's *Letter in the Transactions of the Royal Irish Academy*, &c. &c. (II. S—R.)

GIAOUR, a Turkish word signifying *dog*, used by the Turks to designate any unbeliever in Mohammedanism, but more particularly a Christian. Though originally an epithet of contempt, it is now often applied without any intentional insult.

GIAVENO, a town of Italy, kingdom of Sardinia and province of Susa, on a hill near the Sangone, 16 miles W.S.W. of Turin. It has manufactures of linen, cotton, and silk goods; several tanneries and iron forges; and some trade. Pop. (of commune) 8866.

GIBBET (Fr. *gibet;* Arabic, *gibel*, a mount or eminence), a gallows, or a machine in form of a gallows, on which notorious criminals are hung in chains, as spectacles *in terrorem*.

GIBBON, EDWARD, one of the most celebrated historians of any age or country, was also his *own* historian. He has left us one of the most piquant autobiographies ever written. In the following sketch the chief incidents of his life will be condensed from that authentic source: for more than *facts*, even for the *setting* of these, it would be unwise to trust to any man's autobiography—though Gibbon's is as frank as most. There are points on which vanity will say too much, and perhaps others on which modesty will say too little.

Gibbon was descended, he tells us, from a Kentish family, ancient, though not illustrious. His grandfather was a man of ability, an enterprising merchant of London; one of the commissioners of customs in the latter years of Queen Anne; and, in the judgment of Lord Bolingbroke, as deeply versed in the "finance and commerce of England" as any man of his time. He was not always wise, however, either for himself or his country; for he became deeply involved in the South Sea scheme, and lost the ample wealth he had amassed, at the explosion of that tremendous bubble (1720). As a director of the company, he was suspected of fraudulent complicity, was taken into custody, and heavily fined; but L.10,000 were allowed him out of the wreck of his L.60,000, and with this his skill and enterprise soon constructed a second fortune.[1] He died at Putney in 1736, leaving the bulk of his property to his two daughters—nearly disinheriting his only son, the father of the historian, for having married against his wishes. This son (by name Edward) was educated at Westminster and Cambridge, but never took a degree; travelled; became member of parliament, first for Petersfield, then for Southampton; joined the party against Sir Robert Walpole, and (as his son confesses, not much to his father's honour) was animated in so doing by "private revenge" against the supposed "oppressor" of his family in the South Sea affair. If so, revenge, as usual, was blind; for Walpole sought rather to moderate than to inflame public feeling against the projectors.

His celebrated son was born at Putney, Surrey, 27th of April 1737. His mother was the daughter of a London merchant. Gibbon was the eldest of a family of six sons and a daughter, yet was the only one who survived childhood; and his own life in youth hung by so mere a thread as to be a thousand times despaired of. His mother, between domestic cares and constant infirmities (which, however, did not prevent an occasional plunge into fashionable dissipation in compliance with her husband's wishes), did but little for him. His *true* mother, if the expression may be permitted, was his maiden aunt—Catherine Porten by name—who tenderly nursed his infancy, and, whenever his feeble health allowed, took care that his mind should not be neglected. "Many anxious and solitary days," says Gibbon, "did she consume with patient trial of every mode of relief and amusement. Many wakeful nights did she sit by my bedside in trembling expectation that each hour would be my last."[2] At seven he was committed for eighteen months to the care of a private tutor, John Kirkby by name, and the author, among other things, of a "philosophical fiction" entitled the *Life of Automathes*. The illustrious pupil speaks gratefully of his tutor, and doubtless truly, so far as he could trust the impressions of his childhood. Of the "philosophical fiction" he says, "The author is not entitled to the merit of invention, since he has blended the English story of *Robinson Crusoe* with the Arabian romance of *Hai Ebn Yokhdan*, which he might have read in the Latin version of Pococke. In the *Automathes* I cannot praise either the depth of thought or elegance of style; but the book is not devoid of entertainment or instruction."[3]

At nine (1746), during a "lucid interval of health," he was sent to a school at Kingston-on-Thames; but the usual breaks of sickness intervened, and his progress, by his own confession, was slow and unsatisfactory. "My timid reserve was astonished by the crowd and tumult of the school; the want of strength and activity disqualified me for the sports of the play-field. . . . . . . By the common methods of discipline, at the expense of many tears and some blood, I purchased the knowledge of the Latin syntax; and not long since I was possessed of the dirty volumes of *Phædrus* and *Cornelius Nepos* which I painfully construed and darkly understood."[4]

In 1747 his mother died, and he was taken home. After a short time his father removed from Putney to the "rustic solitude" of Buriton, and young Gibbon accompanied him. There probably his health was benefited, and his mind certainly received its first decided stimulus. In these early years, under the care of his devoted aunt, he first acquired, he tells us, that passionate love of reading "which he would not exchange for all the treasures of India." He read at will; and there are minds to which it is the best possible schooling. To be turned loose to graze in the free mountain pasture, to "browse" at pleasure—as Charles Lamb expresses it—in a library of wholesome literature, tends more than anything else, if not to discipline, to stimulate their powers; and often not only tinctures, but determines their whole future. It was so with Gibbon. After detailing the circumstances which "unlocked" for him the door of his grandfather's "tolerable library," he says, "I turned over many English pages of poetry and romance, of history and travels. Where a title attracted my eye, without fear or awe I snatched the volume from the shelf."[1] In 1749, in his twelfth year, he was sent to Westminster, still residing, however, with his aunt, who, unwilling to live a life of dependence, had opened a boarding-house for Westminster School. "In the space of two years (1749–50), interrupted by danger and debility, I painfully climbed into the third form; and my riper age was left to acquire the beauties of the Latin and the rudiments of the Greek tongue."[2] The continual attacks of sickness which had retarded his progress induced his aunt, by medical advice, to take him to Bath; but the mineral waters had no effect. He then resided for a time in the house of a physician at Winchester; the physician did as little as the mineral waters; and, after a further trial of Bath, he once more returned to Putney, and made a last futile attempt to study at Westminster. Finally, it was resolved that he would never be able to encounter the discipline of a school; and casual instructors, at various times and places, were provided for him. The snatches of his youth that could be given to mental effort were doubtless pretty well filled up by himself, and, for the reasons already assigned, perhaps not unpropitiously, in relation to the peculiar character of his intellect and the requirements of his subsequent career.

---

[1] No less than three of the family intermarried with the Actons of Shropshire. "I am thus connected," says Gibbon, "by a triple alliance with that ancient and loyal family of Shropshire baronets. It consisted about that time of seven brothers, all of gigantic stature; one of whom, a pigmy of six feet two inches, confessed himself the last and least of the seven; adding, in the true spirit of party, that such men were not born since the Revolution."—*Memoirs*, vol. i., p. 10.

[2] *Ib.*, p. 19.

[3] *Ib.*, p. 21, 22.

[4] *Ib.*, p. 22.

Towards his sixteenth year he tells us that all his infirmities suddenly vanished. "Nature," as he frigidly expresses it, "displayed in my favour her mysterious energies." His education was now resumed under the roof of Francis, the translator of Horace; of whose negligence as a tutor the historian speaks most strongly. "The translator of Horace," says he, "might have taught me to relish the Latin poets had not my friends discovered in a few weeks that he preferred the pleasures of London to the instruction of his pupils."[3]

Gibbon was then sent to *finish* his education (before it had been properly *begun*) at Oxford, where he matriculated as gentleman commoner of Magdalen College, April 1752. His description of his intellectual condition at that time is curious enough:—"I arrived there with a stock of erudition which might have puzzled a doctor, and a degree of ignorance of which a schoolboy might have been ashamed." It was natural. He had read extensively, though at random; and, his memory being tenacious, he had amassed much knowledge, though of a very miscellaneous character. It seems, however, that during the three previous years his youthful mind had received a determinate direction, either from its own secret tendencies, or from the class of works on which he accidentally lighted, or more probably from both causes. His taste was already fixed where it never afterwards wavered—on *history*.

His list of the books which, during the previous three years of self-prompted and wandering study, he had more or less devoured, is amazingly miscellaneous; but we have no space to give it. The reader may find it in the *Memoirs*. Many of them, both for their extent and dryness, would have been repulsive enough to most lads of his age. Most of the classical historians accessible in translations, not forgetting a "ragged *Procopius*" which chanced to fall in his way, and "many crude lumps," as he oddly expresses it, of the most voluminous modern historians, as Davila, Rapin, Father Paul, Machiavel, were hastily gulped—giving in those days, doubtless, but little trouble in the digestion. "I devoured them," he says, "like so many novels; and I swallowed with the same voracious appetite the descriptions of India and China, of Mexico and Peru."[4] At the same period his fancy kindled with the first glimpses into oriental history, the wild "barbaric" charm of which he never ceased to feel. India, China, Arabia, and especially the career of Mohammed, successively attracted his attention. Ockley's book on the Saracens "first opened his eyes" to this last subject; and with his characteristic ardour of literary research, he forthwith plunged into the French of D'Herbelot, and the Latin of Pococke's version of *Abulfaragius*—sometimes "guessing," and sometimes understanding—now swimming, now wading up to his chin, and now plunging out of his depth altogether. His first introduction to the historic scenes which afterwards formed the passion of his life took place at the same period. In 1751 he notes his "discovery" of a "common book"—Echard's *Roman History*.[5] "To me," he says, "the reigns of the successors of Constantine were absolutely new; and I was immersed in the passage of the Goths over the Danube, when the summons of the dinner bell reluctantly dragged me from my intellectual feast."

He seems even then to have adopted the plan of study he followed in after-life and recommended in his *Essai sur l'Etude*; that is, of letting his subject rather than his author determine his course; of suspending the perusal of a book to reflect, and to compare the statements with those of other authors; so that he often read portions of fifty volumes while mastering one. Where the mind has vigour and perseverance to adopt this course, it is, without doubt, the most profitable of all modes of reading. A man rarely forgets what he has taken so much trouble to acquire. The chase itself, too, and the variety of forms in which knowledge is presented, afford a thousand links by which association aids memory.

But Gibbon's huge wallet of scraps stood him in little stead at the trim banquets to which he was invited at Oxford; and the wandering habits by which he had filled it absolutely unfitted him to be a guest. He was not well grounded in any of the elementary branches which are essential to university studies, and to all success in their prosecution. It was natural, therefore, that he should dislike the university, and as natural that the university should dislike him. Many of his complaints of the *system* were certainly just; but it may be doubted whether *any* university system would have been profitable to him, considering his antecedents. He complains of his tutors, too, and in one case with abundant reason; but, by his own confession, they had equal reason to complain of him, for he indulged in gay society, and kept late hours. His observations, however, on the defects of our university system in general, are acute and well worth pondering, however little relevant to his own case. Many of these defects, in the case of our own universities, have been removed since his time, and some very recently. He remained at Magdalen about fourteen months. "To the University of Oxford," he says, "I acknowledge no obligation; and she will as cheerfully renounce me for a son as I am willing to disclaim her for a mother. I spent fourteen months at Magdalen College;

[5] *Ib.*, p. 30.

they proved the fourteen months the most idle and unprofitable of my whole life."[1]

But little as he did as a student, he already meditated authorship. In the first long *vacation*—"during which," he says, (whimsically enough,) "his taste for books began to *revive*"—he resolved to write a treatise on *The Age of Sesostris*;[2] in which (and it was characteristic) his chief object was to investigate the probable epoch of that semi-mythical monarch's reign. "Unprovided with original learning, unformed in the habits of thinking, unskilled in the arts of composition, I resolved to write a book." He long afterwards (Nov. 1772), but wisely, no doubt, "committed the sheets to the flames."

Literary ambition almost uniformly displays its early energy in some such crude project, and Gibbon was no exception to the rule.

This period of his life was also signalized by another premature attempt to solve difficulties beyond the age of sixteen. He read Middleton's *Free Inquiry*; and this, strange to say, *repelled* him from Protestantism, and gave him a bias towards Rome; he read Bossuet's *Variations of Protestantism*, and *Exposition of Catholic Doctrine*, and these completed his conversion; "and surely," he adds, "I fell by a noble hand." In this notable victory, however, of the Bishop of Meaux over a youth of sixteen, there is nothing wonderful; nor was Bossuet the only champion of Rome who helped to lay him low, for he attributes not a little to the perusal of the works of Parsons, the Jesuit. But the inexperience, perhaps waywardness, of youth, and impatience to have doubts hushed and quelled, if not removed, had probably more to do with this transient conquest than all the above controvertists put together.

No sooner converted, than he confessed. He certainly practised none of the *reserve* of the Jesuit to whom he had been so much indebted. On June 8th, 1753, he records that he "privately abjured the heresies" of his childhood before a Catholic priest in London, and announced the same to his father in a somewhat grandiloquent effusion which his spiritual adviser much approved, and in which it is probable he had some share. "Gibbon," says Lord Sheffield, "described the letter to his father, announcing his conversion, as written with all the pomp, the dignity, and self-satisfaction of a martyr."[3]

His father heard with indignant surprise of this act of juvenile apostacy; and indiscreetly giving vent to his wrath, the authorities at Oxford dismissed the neophyte. It is curious to read Gibbon's rather complacent estimate in after-life of this "sacrifice of self-interest to conscience." It is expressed in terms which might almost tempt one to think that he scarcely contemplated his subsequent changes with equal satisfaction. Yet he also seems to have felt that the infirmities of reason which this escapade implied needed some apology, and that the applause of conscience hardly compensated for the reflections on his logic. He therefore justifies his apostacy by the parallel vacillations of Chillingworth and Bayle. "He could not blush," he says, "that his *tender* mind was entangled in the sophistry which had seduced the acute and manly understandings of a Chillingworth or a Bayle;"[4] of whom he takes care to inform us that the latter was *twenty-two*, and the former of the "ripe age" of twenty-eight years, when caught in the meshes of Romanism.

In short, he attaches rather too much importance to the fluctuations of sixteen. As a fact in the history of his own mind, however, it is of interest; in any other light, of no importance whatever. "To my present feelings," he tells us in his *Memoirs*, "it seems *incredible* that I should ever believe that I believed in transubstantiation;" that is, if he were interpreted rigorously, "he could not *believe* that he could ever *believe* that he *believed* in transubstantiation." If that were his meaning, he had certainly cured himself of all superfluous facility of belief.

It was now high time that his education, so nearly finished in name, should be begun in earnest. But as one chief object of his father was to secure in the course of it his reconversion to Protestantism, he was consigned (1753) to the care of a Calvinist minister at Lausanne—a M. Pavilliard, of whom Gibbon speaks in strong terms of affection and esteem, and who appears to have deserved them. There was one slight obstacle, to be sure, to the intercourse of tutor and pupil; M. Pavilliard appears to have known little of English, and young Gibbon knew nothing of French. But this difficulty was soon removed by the pupil's diligence; the very exigencies of his situation were of service to him, and he studied the language with such success, that at the close of his five years' exile he declares that he "spontaneously thought" in French rather than in English, and that it had become more familiar to "ear, pen, and tongue." It is well known that in after years he had doubts whether he should not compose his great work in French; and it is certain that his familiarity with that language, in spite of considerable efforts to counteract its effects, tinged his style to the last.

Under the judicious regulations of his new tutor a systematic course of study was marked out, and was most ardently prosecuted; the pupil's progress was proportionably rapid. With the systematic study of the Latin and Greek classics he conjoined that of French literature, which he read largely though somewhat indiscriminately.

Nor was the object his father primarily had at heart less effectually attained.

To his large reading of the classics he added a diligent study of logic in the prolix system of Crousaz, and further invigorated his reasoning powers, as well as enlarged his knowledge of metaphysics and jurisprudence, by the perusal of Locke, Grotius, and Montesquieu. He also read about this time Pascal's *Provincial Letters*, and at sixty he declares he had reperused them almost every year with new pleasure. It is one of the "three books" which, by his own confession, probably contributed, in a "special sense, to form the historian of the *Roman Empire*." From Pascal, he flatters himself, he "learned to manage the weapon of grave and temperate irony, even on subjects of ecclesiastical solemnity:" a grand mistake as regards both the adroitness with which he used and the subjects on which he employed the weapon. There is as much difference between the light grace of Pascal's irony and the heavy, laboured movement of Gibbon's, as between an Arab courser and a Flanders war-horse.—He also studied mathematics to some extent, though purely in compliance with his father's wishes. He advanced as far as the conic sections in the treatise of L'Hôpital. He assures us that his tutor did not complain of any inaptitude on the pupil's part, and that the pupil was as happily unconscious of any on his own; but here he broke off. He adds, what is not quite clear from one who so frankly acknowledges his limited acquaintance with the science, that he had reason to congratulate himself that he knew no more. "As soon," he says, "as I understood the principles, I relinquished for ever the pursuit of the mathematics; nor can I lament that I desisted before my mind was hardened by the habit of rigid demonstration, so destructive of the finer feelings of moral evidence, which must, however, determine the actions and opinions of our lives."[5]

There is no doubt that the sort of evidence with which the future historian was called to deal has to do with probabilities and not "rigid demonstration;" but whether he would not have sometimes computed its elements with more impartiality and precision if he had had a little further training in the exact sciences, may be a question.

Under the new influences which were brought to bear on him, he resumed in less than a twelvemonth his Protestantism. "He is willing," he says, to allow M. Pavilliard a "handsome share in his reconversion," though he stoutly avows that it was principally due "to his own solitary reflections." He particularly congratulated himself on having discovered a "philosophical argument" against "transubstantiation." It was, "that the text of Scripture which seems to inculcate the real presence is attested only by a *single* sense—our sight; while the real presence itself is disproved by *three* of our senses—the sight, the touch, and the taste."[1] It is possible that the unconscious influence of the threats of disinheritance, and the exchange of his "handsome apartments at Magdalen" for the meanness and discomforts of his Swiss home, may have been quite as efficacious as this curious enthymeme. Thus was he converted to Romanism in his sixteenth year, and recanted his recantation in his seventeenth. The changes were doubtless important to him, and it was natural that he should give them some prominence in his "autobiography;" but relatively to the great questions they involve, the oscillations of such a youthful mind, however intelligent, are of as little moment as the transfer of a cypher from one side of an equation to the other.

Two circumstances specially signalized his residence at Lausanne—he saw Voltaire, and he fell in love. "*Virgilium vidi tantum*," says he; but his admiration of Voltaire's writings was great, and exerted a rather equivocal influence on his poetic tastes. It led to an excessive estimate of the French drama, and abated, he scruples not to declare, his "idolatry for the gigantic genius of Shakspeare." Voltaire's writings also probably gave him a false bias in matters of infinitely more importance than those of literature.

His love affair—his first and only one—was transient enough. The young lady, in the bloom of sixteen, the daughter of a Swiss pastor, was Mademoiselle Curchod, afterwards the wife of the celebrated M. Necker. She was, as Gibbon declares (and we know it on better testimony than a lover's eyes), beautiful, intelligent, and accomplished. Her charms, however, do not seem to have made any indelible impression on our young student, whose sensibility, to say the truth, was never very profound. On his father's expressing his disapprobation, he surrendered the object of his affection with as little resistance as he had surrendered his Romanism. "I sighed," he says, "as a lover, but obeyed as a son." It would be invidious to institute comparisons as to the merit of "faithful love" and filial devotion; but, if the one be unrewarded by fortune, and the other stimulated by menaces, it is a difficult choice, no doubt, for any but a hero; and Gibbon neither then nor afterwards was a hero. "Without my father's consent," he plaintively says, "I was destitute and helpless."

Unwearied application to study was the best "*remedium amoris*," if indeed he stood in need of any remedy. In any case, his diligence was most commendable, and no one can read the account of the three last years he spent at Lausanne, and especially the all but incredible toils of the last eight months, without perceiving that the foundations of that vast erudition which the *Decline and Fall* demanded, were effectually laid; or hesitate to give our student a worthy place with the Scaligers, Huets, and Leibnitzes, of the preceding century. Though there may be a little unconscious exaggeration in his statement of the achievements of these miraculous eight months, we are tempted to give it in a note for the encouragement or despair of other youthful students.[2]

In 1758 he returned to England, and was kindly received at home. But he found a stepmother there; and this apparition on his father's hearth at first rather appalled him. The cordial and gentle manners of Mrs Gibbon, however, and her unremitted study of his happiness, won him from his first prejudices, and gave her a permanent place both in his esteem and affection. He seems to have been much indulged, and led a very pleasant life of it; he pleased himself in moderate excursions, frequented the theatre, mingled, though not very often, in society; was sometimes a little extravagant, and sometimes a little dissipated, but never lost the benefits of his Lausanne exile; and with the exception of a few transient youthful irregularities, settled into a sober, discreet, calculating epicurean philosopher, who sought the *summum bonum* of man in temperate, regulated, and elevated pleasure. The two years after his return to England he spent principally at his father's country seat at Buriton, in Hampshire, only nine months being given to the metropolis. He has left an amusing account of his employments in the country, where his love of study was at once inflamed by a library rich enough to make him contrast its treasures with the poverty of Lausanne, and checked by the necessary interruptions of his otherwise happy domestic life. After breakfast "he was expected," he says, "to spend an hour with Mrs Gibbon—read the paper to his father in the afternoon—was often called down to entertain idle visitors—and, worst of all, was periodically compelled to return the visits of their more distant neighbours." He says he dreaded the "recurrence of the full moon," which was the period generally selected for the more convenient accomplishment of such formidable excursions.

His father's library, though large in comparison with that he commanded at Lausanne, contained, he says, "much trash," which he gradually weeded out, and transformed it at length into that "numerous and select" library which was "the foundation of his works, and the best comfort of his life both at home and abroad." No sooner had he returned home than he began the work of accumulation, and records that, on the receipt of his first quarter's allowance, a large share was appropriated to his literary wants. "He could never forget," he declares, "the joy with which he exchanged a bank note of twenty pounds for the twenty volumes of the *Memoirs of the Academy of Inscriptions*." It may not be unprofitable here to remark that the principles on which he selected his admirable library are worthy of every student's attention. "I am not conscious," says he, "of having ever bought a book from a motive of ostentation; every volume before it was deposited on the shelf was either read or sufficiently examined." The account he gives of his *mode* of study is also deeply instructive, but there is not space for it here.

In London he seems to have seen but little select society—partly because his father's habits opened to him but little that he cared for—partly from his own reserve and timidity, increased by his foreign education. This had made English habits unfamiliar and the very language in some degree strange. And thus it was that he draws that interesting picture of the literary recluse among the crowds of London: "While coaches were rattling through Bond Street, I have passed many a solitary evening in my lodging with my books. My studies were sometimes interrupted with a sigh, which I breathed towards *Lausanne;* and on the approach of spring I withdrew without reluctance from the noisy and extensive scene of crowds without company, and dissipation without pleasure."[1] He became acquainted, however, with Mallet—by courtesy called the "poet"—and through him gained access to Lady Hervey's circle, where a congenial admiration, not to say affectation, of French manners and literature, made him a welcome guest. In one respect Mallet gave him good counsel. He advised him to addict himself to an assiduous study of the more idiomatic English writers—Swift and Addison, for example—with a view to unlearn his foreign idiom, and recover his half-forgotten vernacular;—a task, which he never perfectly accomplished. Much as he admired these writers, Hume and Robertson were still greater favourites, as well from their subject as for their style. Of his admiration of Hume's style—of its nameless grace of simple elegance—he has left us a strong expression, when he tells us that it often compelled him to close the historian's volumes with a feeling of despair.

---

[1] *Memoirs*, vol. i., p. 58.

[2] He says in his *Journal*, December 4, 1755,—"In finishing this year, I must remark how favourable it was to my studies. In the space of eight months, from the beginning of April, I learned the principles of drawing; made myself complete master of the French and Latin languages, with which I was very superficially acquainted before, and wrote and translated a great deal in both; read Cicero's Epistles *Ad Familiares*, his *Brutus*, all his Orations, his Dialogues *De Amicitiâ* and *De Senectute*; Terence, twice; and Pliny's Epistles. In French, Giannone's *History of Naples*, and l'Abbé Bannier's *Mytholoyy*, and M. De Bochat's *Mémoires sur la Suisse*, and wrote a very ample relation of my tour. I likewise began to study Greek, and went through the grammar. I began to make very large collections of what I read. But what I esteem most of all, from the perusal and meditation of De Crousaz's *Logic*, I not only understood the principles of that science, but formed my mind to a habit of thinking and reasoning I had no idea of before."—*Memoirs*, p. 61.

In 1761 Gibbon, after many delays, and with many flutterings of hope and fear, gave to the world, in French, his maiden publication, composed two years before. It was partly in compliance with his father's wishes, who thought that the proof of some literary talent might introduce him favourably to public notice, and "secure the recommendation of his friends." But in yielding to paternal authority, Gibbon frankly owns that he complied, "like a pious son,—with the wish of his own heart."

The subject of the *Essai sur l'Etude de la Littérature* was suggested, its author says, by a refinement of vanity—"the desire of justifying and praising the object of a favourite pursuit." Partly owing to its being written in French, partly to its character, the essay excited more attention abroad than at home. Gibbon has criticised it with the utmost frankness, not to say severity; but after every abatement, it is unquestionably a surprising effort for a mind so young, and contains many thoughts which would not have disgraced a thinker or a scholar of much maturer age. The account of its first reception and subsequent history in England, deserves to be cited as amongst the curiosities of literature. "In England," he says, "it was received with cold indifference, little read, and speedily forgotten: A small impression was slowly dispersed; the bookseller murmured, and the author (had his feelings been more exquisite) might have wept over the blunders and baldness of the English translation. The publication of my history *fifteen years afterwards* revived the memory of my first performance, and the essay was eagerly sought in the shops. But I refused the permission which Becket solicited of reprinting it: the public curiosity was imperfectly satisfied by a pirated copy of the booksellers of Dublin; and when a copy of the original edition has been discovered in a sale, the primitive value of half-a-crown has risen to the fanciful price of a guinea or thirty shillings."[2]

Just before the publication of the essay, Gibbon entered a new, and, one might suppose, a very uncongenial scene of life. He became a captain in the Hampshire militia; and for more than two years led a life of march and countermarch in the southern counties of England. Hampshire, Kent, Wiltshire, and Devonshire, formed the successive theatres of what he calls his "bloodless and inglorious campaigns." He, nevertheless, justly describes it as a life of "military servitude," as the term of service was prolonged far beyond the period he had contemplated, and the mode of life utterly alien from all his pursuits as a scholar and a student. "In the act," says he, "of offering our names and receiving our commissions, as major and captain in the Hampshire regiment (June 12th, 1759), we had not supposed that we should be dragged away, my father from his farm, myself from my books, and condemned during two years and a half (May 10, 1760 to December 23, 1762), to a wandering life of military servitude."[3] He has left us an amusing account of the busy idleness in which his time was spent; but, considering the circumstances, so adverse to study, one is rather surprised that our military student should have done so much, than that he did so little;[4] and never probably before were so many hours of literary study spent in a tent. In estimating the comparative advantages and disadvantages of this wearisome period of his life, he has summed up with the sagacity of a man of the world, and the impartiality of a philosopher. Irksome as were his employments, grievous as was the waste of time, uncongenial as were his companions, solid benefits were to be set off against these things; his health became robust, his knowledge of the world was enlarged, he wore off some of his foreign idiom, got rid of much of his reserve; he adds,—and perhaps in his estimate it was the benefit to be most prized of all,—"the discipline and evolutions of a modern battalion gave me a clearer notion of the phalanx and the legion, and the captain of the Hampshire grenadiers (the reader may smile) has not been useless to the historian of the Roman Empire." In 1762, while the new militia was forming, he "enjoyed two or three months of literary repose," and flew to his books with an appetite sharpened by his long fast. In pursuing a plan of study at this period, he hesitated between the prosecution of mathematics and Greek; it was but for a moment. As might be anticipated, Homer carried the day against Newton and Leibnitz.

Nothing can better illustrate the intensity of Gibbon's literary ambition—his only strong passion—than the number of literary projects with which his mind was teeming even in camp. He enumerates amongst others a history of the expedition of Charles VIII. of France; the crusade of Richard the Lion-hearted; the wars of the barons; and lives of the Black Prince, Sir Phillip Sydney, Sir Walter Raleigh, and Montrose. These are only a portion of the subjects he revolved with the same view. They show by their number how strong was the impulse to literature, and by their character, how determined the bent of his mind in the direction of history.

The militia was disbanded in 1763, and he joyfully shook off his bonds; but his literary projects were still to be postponed. Following his own wishes, though with his father's consent, he had projected a continental tour as the completion "of an English gentleman's education." This had been interrupted by the episode of the militia. He now resumed his purpose and left England in 1763. Two years were "loosely defined as the term of his absence," which he exceeded by half a year—returning June 1765. He first visited Paris, where he saw a good deal of D'Alembert, Diderot, Barthelemy, Raynal, Helvetius, Baron d'Holbach, and others of the same set; and was often a welcome guest in the saloons of Mesdames Geoffrin and Du Deffand.[1] Voltaire was at Geneva, Rousseau at Montmorency, and Buffon he neglected to visit; but the above names are enough to justify the suspicion that the hostility he afterwards evinced towards Christianity may in part be attributed to the influence of such society. How well he liked Paris is evident from his own statement: "Fourteen weeks insensibly stole away; but had I been rich and independent, I should have prolonged and perhaps have fixed my residence at Paris."[2]

---

[1] *Memoirs*, vol. i., p. 81.

[2] *Ib.*, p. 90.

[3] *Ib.*, p. 95.

[4] The notes of his *Journal* at this period are worth reading, as curiously illustrative of his indomitable literary industry. "My example," he says, "might prove that in the life most averse to study some hours may be stolen, some minutes may be snatched. Amidst the tumult of Winchester camp I sometimes thought and read in my tent; in the more settled quarters of the Devizes, Blandford, and Southampton, I always secured a separate lodging, and the necessary books."—*Ib.*, p. 104.

From France he proceeded to Switzerland, and revisited his friends at Lausanne; thence to Italy in 1764. The account of his feelings on approaching Rome—how like in intensity to those of Luther on a similar occasion, and yet of how different a character!—is deeply interesting. His emotions, he says, were not "enthusiastic," and yet became, he confesses, almost "uncontrollable." While here, his long yearning for some great theme worthy of his historic genius was gratified. The first conception of the *Decline and Fall* arose as he lingered one evening amidst the vestiges of ancient glory; but his precise words cannot be omitted in any sketch of Gibbon, however brief:—"It was at Rome," says he, "on the 15th of October, 1764, as I sat musing amidst the ruins of the Capitol, while the barefooted friars were singing vespers in the temple of Jupiter, that the idea of writing the decline and fall of the city first started to my mind." M. Suard fancifully attributes to the combination of circumstances under which the conception of the work arose, some of that inveterate hatred of Christianity which pervades it. "Struck with a first impression," he says, "Gibbon, in writing the *Decline and Fall of the Empire*, saw in Christianity only an institution which had placed vespers, bare-footed friars, and processions, in the room of the magnificent ceremonies of Jupiter, and the triumphs of the Capitol."

Others attributed it in part to the *conservative* quality of his politics, which led him to regard Christianity as a "daring innovation." It seems probable that his tendencies and habits of mind, which were eminently favourable to scepticism, and the society in which he had early moved (and especially of late in the saloons of Paris), had much more to do with the result than either of these causes.

About five years after his return home his father died (1770). This is the period of his life which he says he passed with the least enjoyment, and remembered with the least satisfaction. He attended "every spring the meetings of the militia at Southampton,—and rose successively to the rank of major and lieutenant-colonel;" but was each year "more disgusted with the inn, the wine, the company, and the tiresome repetition of annual attendance and daily exercise." From his own account, however, it appears that other and deeper causes produced his *ennui*. Sincerely attached to his home, he yet felt the anomaly of his position. At thirty, still a dependent, without a settled occupation, without a definite social *status*, he often regretted that he had not embraced some profession: "From the emoluments of a profession," he says, "I might have derived an ample fortune, or a competent income, instead of being stinted to the same narrow allowance, to be increased only by an event which I sincerely deprecate."[3] Doubtless the secret fire of a consuming, but as yet ungratified, literary ambition also troubled his repose.

He still "contemplated at awful distance" *The Decline and Fall*: and, meantime, revolved other subjects. Hesitating between the revolutions of Florence and Switzerland, he consulted M. Deyverdun, a young Swiss with whom he had become intimate during his first residence at Lausanne, and decided in favour of the land which was his "friend's by birth" and "his own by adoption." He executed the first book in French; it was read as an anonymous production before a literary society of foreigners in London, and condemned. Gibbon sat and listened to their strictures. It never got beyond that rehearsal; and though Hume encouraged him to proceed, Gibbon declared the sentence just, and declined.

In 1767, he joined with M. Deyverdun in starting the *Mémoires Littéraires de la Grande Bretagne*. But its circulation was limited, and only two volumes had appeared when Deyverdun went abroad. The materials already collected for a third volume were suppressed. It may be interesting to the reader to know that in the first volume is a review by Gibbon of Lord Lyttleton's *History of Henry II.*

The next appearance of the historian made a deeper impression. It was the first distinct print of the lion's foot. "*Ex ungue leonem*" might have been justly said, for he attacked, and attacked successfully, the redoubtable Warburton. Of the many paradoxes in the *Divine Legation*, none is more extravagant than the theory that Virgil in the sixth book of his Æneid intended to *allegorize*, in the visit of his hero and the sybil to the shades, the initiation of Æneas, as a lawgiver, into the Eleusinian mysteries. This theory Gibbon completely exploded in his *Critical Observations* (1770); no very difficult task, indeed, but achieved in a style, and with a profusion of learning, which showed that its author was capable of far greater things. Warburton never replied, and few will believe that he would not, if he had not thought silence more discreet. Gibbon, however, regrets that the style of his pamphlet was too acrimonious; and this regret, considering his antagonist's slight claims to forbearance, is creditable to him. "I cannot forgive myself the contemptuous treatment of a man who, with all his faults, was entitled to my esteem."[4]

At length, after fifteen years from the date of his maiden *Essai*, and five from his father's death—an event which left him the free use of his time—appeared the *first* volume of the history which has immortalized his name. His preparations for this great work were vast. The classics, "as low as Tacitus, Pliny the Younger, and Juvenal," had been long familiar. He now "plunged into the ocean of the Augustan history," and "with pen almost always in hand," pored over all the remains, Greek and Latin, between Trajan and the last of the western Cæsars. "The subsidiary rays of medals and inscriptions, of geography and chronology, were thrown on their proper objects; and I applied the collections of Tillemont, whose inimitable accuracy almost assumes the character of genius, to fix and arrange within my reach the loose and scattered atoms of historical information."[4] The Theodosian Code, with Godefroy's Commentary; the Christian Apologists, with the testimonies of Lardner; *The Annals and Antiquities* of Muratori, collated with "the parallel or transverse lines" of Sigonius and Maffei, Pagi and Baronius, were all critically studied. Such was a portion of the formidable apparatus employed by this great historical genius. His maxim as a student had always been *multum legere potius quam multa*. The reader will probably think, even from this imperfect enumeration of his studies, that he read both *multum* and *multa*; but the general accuracy of his investigations was commensurate with their variety. It appears from his own confession that he long brooded over the chaos of materials before light dawned upon it. At the commencement, he says, "all was dark and doubtful;" the limits, divisions, even the *title* of his work were undetermined; the first chapter was composed three times, and the second and third twice, before he was satisfied with his efforts. But this prolonged meditation on his design and its execution was well repaid by the result; so methodical did his ideas become, and so readily did his materials shape themselves, that (with the above exceptions) the original MS. of the entire six quartos was sent *uncopied* to the printers. He also says that not a sheet had been seen by any other eyes than those of author and printer. This last statement must be taken with a small deduction; or rather we must suppose that a few chapters had been submitted, if not to the "eyes," to the "ears" of others; for he elsewhere tells us that he was "soon disgusted with the *modest* practice of reading the manuscript to his friends."

---

[1] This lady, though blind—"l'aveugle clairvoyante," as Voltaire happily calls her—recognised with exquisite tact the self-betraying solicitude of Gibbon to catch the exact tone of French manners and society. She thus speaks in a letter to Walpole, "He sets too much value on our talents for society (*nos agréments*), shows too much desire of acquiring them; it is constantly on the tip of my tongue to say to him, 'Do not put yourself to so much trouble; you deserve the honour of being a Frenchman.'"

[2] *Memoirs*, p. 117.

[3] *Ib.*, p. 132.

[4] *Ib.*, p. 139.

[5] *Ib.*, p. 140.

Such, however, were his preliminary difficulties, that he confesses he was often "tempted to cast away the labour of seven years." He persevered, and in February 1776 the first volume was published. The success was instant, and, for a quarto, probably unprecedented. The entire impression was exhausted in a few days. The author might almost have said, as Lord Byron after the publication of *Childe Harold*, that "he awoke one morning and found himself famous." In addition to public applause, he was gratified by the more select praises of Robertson and Hume, and declares that the complimentary letter of the last "overpaid the labours of ten years." Hume applauds, as may be supposed, the "prudent temperament" of the historian in the treatment of the delicate subjects of the "celebrated chapters." Nevertheless, he predicted "clamour;" and formed a much more correct notion of the effects on the public mind than Gibbon had done. He admits the nation's reverence for Christianity, though he calls it "superstition;" Gibbon believed, or affected to believe, that England sympathized with the indifferentism of France.

Two years before the publication of this first volume (1774) Gibbon was elected member of parliament for Liskeard. His political duties did not suspend his prosecution of his history, except on one occasion, and for a little while. In the year 1779 he undertook a task on behalf of the ministry, which, if well performed, was, it must be confessed, well rewarded. The French government had issued a manifesto preparatory to a declaration of war, and Gibbon was solicited by Chancellor Thurlow, and Lord Weymouth, Secretary of State, to answer it. This produced his able *Mémoire Justificatif*, composed in French, and delivered to the courts of Europe. He was rewarded with a seat at the Board of Trade and Plantations,—little more than a sinecure in itself, but with a very substantial salary of nearly L.800 per annum. His acceptance displeased his political associates, and he was accused of "deserting a party in which," he declares, "he had never enlisted." A note of Fox, however, on the margin of a copy of Gibbon's history, records a very distinct remembrance of the historian's previous vituperation of the ministry; and this could not but make his political services look venal. He is *said* to have said that "there would be no hope for England except by taking off the heads of six of the cabinet, and exposing them as an example in parliament." Yet in a fortnight he accepted place. Lord Sheffield says his friend never intended the words to be taken *literally!* No doubt, but it sufficiently shows what he thought of the *deserts* of the ministry he yet consented to serve. But who can read the life and works of Gibbon and imagine him a martyr, whether for love, politics, or religion?

At the general election in 1780, he lost his seat for Liskeard, but was subsequently elected for Lymington. The ministry of Lord North, however, was tottering, and soon after fell; the Board of Trade was abolished, and Gibbon's salary vanished with it;—no trifle, for his expenditure had been for three years on a scale somewhat disproportionate to his private fortune. He did not like to depend on statesmen's promises, which are proverbially uncertain of fulfilment; he as little liked to retrench; and he was wearied of parliament, where he had never given any but silent votes. Urged by such considerations, he once more turned his eyes to the scene of his early exile, where he might live on his decent patrimony in a style which was impossible in England, and pursue unembarrassed his literary studies. He therefore resolved to fix himself at Lausanne.

A word only is necessary on his parliamentary career. Neither nature nor acquired habits qualified him to be an orator; his late entrance on public life, his natural timidity, his feeble voice, his limited command of idiomatic English, and even, as he candidly confesses, his literary fame, were all obstacles to success. "After a fleeting, illusive hope, prudence condemned me to acquiesce in the humble station of a mute. . . . I was not armed by nature and education with the intrepid energy of mind and voice—'Vincentem strepitus et natum rebus agendis.' Timidity was justified by pride, and even the success of my pen discouraged the trial of my voice." His repugnance to public life is strongly expressed in a letter to his father of a very early date. He prays that the money which a seat in parliament would cost may be expended in a mode more agreeable to him. Gibbon was eight-and-thirty when he entered parliament; and the obstacles which even at an earlier period he would have had to encounter were hardly likely to be vanquished then.

Nor had he much political sagacity. He was better skilled in investigating the past than in divining the future. While Burke and Fox, and so many great statesmen, proclaimed the consequences of the collision with America, Gibbon saw nothing but colonies in rebellion, and a paternal government justly incensed. His silent votes were all given on that hypothesis. In a similar manner, while he abhorred the French revolution, he seemed to have had no apprehension, like Chesterfield, Burke, or even Horace Walpole, of its approach, or that it had had anything to do with the philosophic coteries in which he had taken such delight.

In 1781 he published two more quartos of his history. They excited less controversy, and were therefore less talked about. This seems to have extorted from him a half murmur "about prejudice and neglect." The fact is, there was less room for discussion and complaint; the volumes, however, were read with silent avidity, and deserved it. Though less exciting than the first, they were written with a deeper judgment, and were more free from the taint of infidelity.

Having sold all his property except his library—to him equally a necessary and a luxury—Gibbon repaired to Lausanne in Sept. 1783, and took up his abode with his early friend Deyverdun, now a resident there. Perfectly free from every engagement but those which his own tastes imposed, easy in his circumstances, commanding just as much society, and that as select, as he pleased, with the noblest scenery spread out at his feet, no situation can be imagined more favourable for the prosecution of his literary enterprise;—a hermit in his study as long as he chose, and the most delightful recreation always ready for him at the threshold. "In London," says he, "I was lost in the crowd; I ranked with the first families in Lausanne, and my style of prudent expense enabled me to maintain a fair balance of reciprocal civilities. . . . Instead of a small house between a street and a stable-yard, I began to occupy a spacious and convenient mansion, connected on the north side with the city, and open on the south to a beautiful and boundless horizon. A garden of four acres had been laid out by the taste of M. Deyverdun; from the garden a rich scenery of meadows and vineyards descends to the Leman Lake, and the prospect far beyond the lake is crowned by the stupendous mountains of Savoy."[1] In this enviable retreat, it is no wonder that a year should have been suffered to roll round before he vigorously resumed his great work,—and with many men it would never have been resumed in such a paradise. We may remark *en passant* that the retreat was often enlivened, or invaded, by friendly tourists from England, whose "frequent incursions" into Switzerland our recluse seems half to lament as an evil. What would he have said fifty years later? Among others, Mr Fox gave him two "welcome days of free and private society" in 1788. Differing as they did in politics, Gibbon's testimony to the genius and character of the great statesman is highly honourable to both: "Perhaps no human being," he says, "was ever more perfectly exempt from the taint of malevolence, vanity, or falsehood."

When once fairly reseated at his task he proceeded in this delightful retreat leisurely, yet rapidly, to its completion. The fourth, fifth, and sixth volumes were all in manuscript before he thought of printing. On the 27th of June 1787, he was "free"—if freedom can be predicated of that condition, so profoundly natural, which Gibbon has as naturally delineated. "I have presumed," says he, "to mark the moment of conception: I shall now commemorate the hour of my final deliverance. It was on the day, or rather night, of the 27th of June 1787, between the hours of eleven and twelve, that I wrote the last lines of the last page in a summer house in my garden. After laying down my pen, I took several turns in a *berceau* or covered walk of acacias, which commands a prospect of the country, the lake, and the mountains. The air was temperate, the sky was serene, the silver orb of the moon was reflected from the waters, and all nature was silent. I will not dissemble the first emotions of joy on the recovery of my freedom, and, perhaps, the establishment of my fame. But my pride was soon humbled, and a sober melancholy was spread over my mind by the idea that I had taken an everlasting leave of an old and agreeable companion; and that whatsoever might be the future date of my history, the life of the historian must be short and precarious."[2] Sad that the *Consolations of Philosophy* should have offered nothing better than this!

Taking the manuscript of the last three volumes with him, Gibbon, after an absence of four years, once more visited London. The arrangements for publishing volumes so heralded by their predecessors, were soon effected, and the printing proceeded apace; but after it was completed, a little trait of characteristic egotism for a while delayed the publication. The great event was to synchronize with the author's fifty-first birthday, and the *two* great events were celebrated by Mr Cadell, the publisher, by a third great event—no less than a literary dinner in the author's honour;—where, says Gibbon, "I seemed to blush while they read an elegant compliment from Mr Hayley." Assuredly it ought to have been no *seeming* blush with which the historian listened to the fulsome hyperboles of the verses with which this *mediocre* Pindar regaled him; and if he did not blush for himself, he ought to have done so for the Muse.

The last volumes of the work were eagerly read, but much criticised; and while the same religious objections were taken, and justly, the author was found more fault with for the indecency of his notes. Gibbon professes that he never could understand this charge; and it is very likely (though very lamentable) that he spoke the simple truth. In his defence, he says he had wrapped up the offensive matter in the learned languages; but then, to how many thousands of those who read his book were those languages familiar! The question is as to the *necessity* of such citations and comments as those in which he has indulged, and few will contend for it, in the majority of cases, to any legitimate purpose of history. He also says that he had been equally free, though less censured, in the earlier volumes. This would be nothing to the purpose even if true; but it is hardly true; for it would be easy to point out in the later volumes more than one instance in which Gibbon has gone completely out of his way to introduce impurities which none but a mind too accustomed to revolve such ideas would wish to suggest to the minds of others; and *one* instance, at least, in which he has chosen to improvise a ludicrous *varia lectio* of a passage for the very purpose of conveying a most gross obscenity. As a writer in the *Quarterly Review* has very justly remarked, "the critical scrupulosity with which he investigates the most nauseous details, sifting them with the pertinacity and relish of a duck filtering the filthiest mud for its meal," "his sly inuendos, his luxurious amplifications," disclose a gross and prurient mind. Many other men, equally sceptical, would have shrunk from this kind of pollution; he plunges into the filth with all the *gout* and relish of a congenial sensuality.

He returned to Switzerland in July 1788; but the death of his friend Deyverdun, and the *ennui* resulting from the loss of his great occupation, which had been as a daily companion for so many years, had divested his retreat of its chief charms; while the premonitory mutterings of the great thunderstorm of the French revolution, which reverberated in hollow echoes even through the quiet valleys of Switzerland, further troubled his repose. At length public events, seconded by motives of friendship, drove the historian to his island home. He arrived in England 1793. He appears to have amused himself during the latter part of his stay at Lausanne with his *Memoirs*, which, with his correspondence and miscellaneous pieces, it was reserved for his friend Lord Sheffield to give to the public.

His life was now drawing to a close. He had fondly anticipated, from the "laws of probability, so true in general," but, alas! "so fallacious in particular," fifteen years of life. They proved in his case to be "fallacious in particular," for he survived for scarcely a fourth of the hoped-for period. He died January 16th, 1794, about nine months after his return to England. Singularly enough, he had been for years afflicted by the disease which at last proved fatal, but had been insensible to its importance, and had declined, from false delicacy, to seek medical aid. It was an element of the "probabilities" which he had not calculated.

Just before his death he was in full possession of his senses, and is said to have died with much composure; but he was evidently unconscious of the stealthy step of the Destroyer till the curtain was suddenly drawn, and the blow struck.

The character of Gibbon presents much that is personally and socially estimable. Of a frigid temperament,—he had not in his composition one particle of the qualities which constitute moral greatness in any one of its many forms; but it would be unjust to deny that he was amiable and good tempered, and capable of feeling and inspiring a firm, though not very enthusiastic, friendship. It must be added that his friendships were such as did not involve any severe strain on patience, self-denial, or generosity, or on his characteristic equanimity. That equanimity, it must be allowed, was very little tried in any way; he practised his philosophy cheaply. Born to competency, and at length possessed of fortune—always fully sensible of the advantages which fortune brings in her train—

---

[2] *Ib.*, p. 170.

provided with pleasures and occupations he intensely loved —successful in the great object of his literary ambition, which was his only strong passion, and the gratification of which, as his *Memoirs* show, afforded him intense delight—he seems, if we but suppose this world to be *all*, to have whiled away his time here as pleasantly as any wise epicurean could, and to have computed the sum of his enjoyments at the close with a sufficiently complacent, but not erroneous, arithmetic.[1] "M. d'Alembert relates," says he, "that as he was walking in the gardens of *Sans Souci* with the King of Prussia, Frederick said to him, 'Do you see that old woman, a poor weeder, asleep on that sunny bank? She is probably a more happy being than either of us.' The king and the philosopher may speak for themselves; for my part I do not envy the old woman."[2]

But with good nature and social amenity the praise of his personal character almost ends. No traits, so far as we can find, of self-denial, generosity, magnanimity, nobility of mind, mark his history. M. Vaillant even charges him with "*insensibility* to all lofty and generous *sentiments*." This is too strong; at least, if the *expression* of "lofty" sentiments (a cheap way, it must be admitted, of manifesting the more arduous virtues) may be taken as a key to character where we cannot appeal to the better test of action. Of such *sentiments* of sympathy with magnanimous virtue, there is no lack in his *Decline and Fall*,—if we except two subjects. "His reflections," says Porson, "are just and profound; he pleads eloquently for the rights of mankind and the duty of toleration, nor does his *humanity ever slumber*—unless when women are ravished, and Christians persecuted." The exceptions, it must be confessed, cut deep, and may remind us a little of the indignant virtue of the Irishwoman who challenged her accusers to say, *barring* theft, lust, and drunkenness, what they could have to allege against her. Vanity he had in abundance, as appears in his *Memoirs;* indeed, without it, would any man ever write his autobiography? Yet it is accompanied in Gibbon with much candour. Less indulgence can be given to the contemptuous arrogance with which he treats opponents.

His conversation though, as might be expected, full of information, seems to have been, if not tinged with pedantry, yet too formal. He talked much as he wrote, and this prevented his attaining the ease and grace of the best colloquial style. "His conversation," says M. Suard, "never carried one away. Its fault was an artificiality which never permitted him to say anything unless well,"—that is, well in his estimate; and so, in books, and notes, and conversation, his diction was apt to be *recherché*, and his sentences a mosaic.

Gibbon's genius was singularly adapted to the task he undertook. He ironically observes, in his *Memoirs*, that since "philosophy has exploded all innate ideas and natural propensities," fortuitous causes in early life must be alleged to account for the invincible bent of his mind to *history*. But he distinctly intimates his convictions to the contrary in another part of his *Memoirs:* "After his oracle Dr Johnson, my friend Sir Joshua Reynolds denies all original genius, any natural propensity of the mind to one art or science rather than another. Without engaging in a metaphysical or rather verbal dispute, *I know* by experience that from my early youth I aspired to the character of an historian."[3] No just philosophy is likely to explode "innate" aptitudes or fundamental peculiarities of mind, whether generic or individual; and to these, at least as strongly as to education or accident, must we attribute each special bias of genius. Not that these last have little to do with the character of intellect, which is finally the result of two *variables*—certain original tendencies of mind, and the discipline to which the mind has been subjected. It is a departure perhaps from ordinary language to speak of some one distinct endowment of mind, or *congeries* of endowments, and call it an *historic* genius, in the same way we speak of a philosophical or poetical genius; but if the phrase be ever allowable, it is assuredly in the case of Gibbon. It may be more proper to say, however, that he had in large measure all those separate endowments which, in conjunction, best fit a man for this department of composition; some of them hardly compatible at all, and scarcely ever seen united. In him all were possessed in a harmony and perfection seldom equalled, perhaps never surpassed; a most retentive memory, the most active powers of acquisition, indomitable industry; a mind capable equally of ascending to the most comprehensive, and of descending to the most minute surveys; of appreciating the beautiful and sublime in classic literature, and yet of delighting in the verbal criticisms, the tedious collations, and dry antiquarian research by which the text is established or illustrated; of celebrating the more imposing events of history with congenial pomp of description, and of investigating with the dullest plodder's patience and perseverance the origin of nations, the emigrations of obscure tribes, and the repulsive yet instructive problems which ethnology presents. Accordingly, the widest deductions of historic philosophy alternate in his pages with attempts to fix the true reading of an obscure passage or a minute point of chronology or geography. It may even be said that in these last investigations he took almost as much delight as in depicting the grander scenes of history, and surrendered himself as absolutely for the time to the migrations of the Goths and Scythians as to the campaigns of Belisarius or the conquests of the Saracens. It must be added that never has any historian evinced greater logical sagacity in making comparatively obscure details yield important inferences, or held with a firmer hand the balance in the case of conflicting probabilities; none who has exhibited sounder judgment or self-control (always excepting Christianity) in cases where it is so easy for learned enthusiasm to run into fanciful hypotheses. To these qualities must be added a singular skill in marshalling for effect the diversified and multifarious matters of his history, and often much richness of imagination and great graphic art in investing their more picturesque features with the brilliant tints and colours, the due light and shade, which belong to historic painting.

Of the many high qualities which characterize his history, perhaps none is more marked than the manner in which he has managed to manœuvre, so to speak, the vast array of facts which crowd its pages. It is the amplest historic canvas ever spread, the largest historic painting ever executed, by a single hand. The history of Rome is, for the many centuries which Gibbon treats, the history of the world; and it is astonishing that he should have been able to work with so much ease such vast and incongruous materials into so much unity of design; that he should have been able (so to speak) to exhibit the many-coloured nations of all varieties of costume, habits, languages, and religions in one tolerably consistent *tableau*. This history is a sort of moving panorama of the nations; and as tribe after tribe, nation after nation, Celt, Goth, Saracen, and Sarmatian, appear on the scene from the obscurity of their original seats, they blend with grace in the picturesque narrative. His history is like the Indus or the Mississippi, swelling and still swelling by a thousand tributary floods, which augment its volume, and tinge its waters, but without destroying the identity or the pervading character of the stream.

The style of Gibbon has great merits, mixed with some not trivial defects. The "luminous Gibbon" was a phrase of Sheridan in his speech on Hastings' trial, with which

---

[2] *Ib.*, p. 183.

[3] *Ib.*, p. 106.

Gibbon was much delighted; but which the malicious wit afterwards playfully denied, and said he must have meant the "*vo*luminous Gibbon." Yet the epithet may well stand. The diction is precise, energetic, massive; splendid, where the pictorial demands of the narrative require it, as that of Livy; and sometimes, where profound reflections are to be concisely expressed, as sententious and graphic as that of Tacitus. Less can be said for the *sources* of his diction; it is not sufficiently idiomatic English, and bears everywhere the traces of his early addictedness to French. The Gallicisms are in many places amusingly perverse. Thus, for example, his constant use of "prevents" in the old sense of "anticipate," sometimes leads to ludicrous apparent contradiction, as when he tells us that "The prefect had signalized his fidelity to Maximin by the alacrity with which he had obeyed, and even *prevented*, the cruel mandates of the tyrant;" or, again, that "the fortunate soil assisted and even prevented the hand of cultivation."

The *structure* of his style is open to still greater objections than his *diction*. Harmonious as it often is, it is too frequently set and formal; deficient in flexibility. It is apt to pall on the ear by the too frequent recurrence of the same cadence at equal intervals, and the too unsparing use of antithesis. It is not veined marble, but an exquisite tesselation; not the fluent naturally-winding stream, but a stately *aqueduct*, faced with stone, adorned with wooded embankments, or flowing over noble arches, but an aqueduct still. It is a just criticism of Sir James Mackintosh that probably no writer ever derived less benefit from his *professed* models. Pascal, Voltaire, Hume, were his delight, and he acknowledges (as so unsuccessful a pupil well might) that he often closed the pages of the last with a feeling of despair. Addison and Swift he read for the very purpose of improving his acquaintance with idiomatic English, yet, as the above critic remarks, "with so little success, that in the very act of characterizing these writers, he has deviated not a little from that beautiful simplicity which is their peculiar distinction."

The irony of Gibbon, on which he evidently plumed himself, is in him no pleasant feature, not merely because in *history* it can seldom be in place if much indulged, but because it is especially distasteful to the great majority of his readers when applied to those deeply serious themes on which he usually exercises it. He flattered himself, as already seen, that Pascal's *Provincial Letters* had taught him to use this weapon gracefully; as little, it may be retorted, as Addison and Swift had taught him the use of idiomatic English. The difference between an innocent smile and a sardonic grin is scarcely greater than that between the irony of Pascal and the irony of Gibbon; the one speaks with a sweet *riant* air, as with the consciousness that what is ridiculed *is* ridiculous; the other with a cautious, stealthy, Guy Faux look, as if conscious of a sinister purpose. Gibbon's irony almost always wears a sneer, and seldom provokes the smile of the reader, even where the subject does not repel it. Not only so; it is so elaborate as to lose much of its grace even where innocent; in other cases it is often *so* masked as to leave the reader (Pascal is never thus chargeable) in doubt whether the author meant what he seemed to mean, or whether he is not meditating, by the very form of expression, a pusillanimous escape from the inferences that may be legitimately founded on it.

We have expressed ungrudging admiration of the great merits of this astonishing work. It has, nevertheless, one pervading blemish, of which we shall speak with similar impartiality. That blemish is, of course, the treatment of Christianity.

If the Christian public had given itself time to reflect, it would have been seen that Gibbon's attack really afforded little cause for alarm. The purpose of the assassin-like stroke from behind the curtain of his irony is plain enough; but it is really a *brutum fulmen*. Gibbon himself has provided for his own defeat by his very mode of conducting the assault. If he meant, as he seemed to *insinuate* rather than *affirm* (or, to speak more accurately, insinuated while in words he expressly affirmed the contrary), that his "five secondary causes" gave a probable *natural* solution of the *origin* and early triumphs of Christianity,—then the whole thing was a ludicrous instance of ὕστερον πρότερον, or, as our proverb has it, of "the cart before the horse." The story begins all too late; the "causes" require as much to be accounted for as the "effects;" or rather, they are among the very *effects* to be accounted for. According to this mode of explaining the *origin* of Christianity, causes are assigned which implied not only its existence, but its activity; in other words, the hypothesis assigns Christianity *itself* as a cause of *itself*, and its success as a ground of its success. Thus, for example, if he is to be supposed (as he evidently wishes the reader to infer) to be accounting for the purely human origin and triumphs of Christianity,—the most potent secondary causes he assigns are the zeal, morality, virtue, unity,[1] and so forth, of the Christian church; meanwhile, the very thing that demands explanation is just the sudden apparition in the world of this singular phenomenon, the Christian church, with this bright retinue of virtues; how it was that a system from which the Jews have recoiled more than any other nation for the last eighteen hundred years should have sprung up in their bosom, in spite of all their national antipathies; how it was that a system which was scarcely less odious from its origin, its character, its doctrines (in a word, everything), to all other nations, should nevertheless have found its proselytes so rapidly in every part of the Roman empire; and in a few centuries, not only gained a sphere for the exercise of that marvellous "virtue" and "zeal" which *it* indeed might cause, but which could hardly cause *it*, but dethroned all the deities of Olympus, and became the established religion of the empire! *That* was the problem; and Gibbon takes it up long after Christianity had made good its footing, and assigns, if he means what he seems to mean, causes for its origin and success which already presuppose both origin and success! It is as though a man were seeking the source of the Nile, and ascending no higher than the cataracts, avows that he finds its fountain there. Such is the value of Gibbon's hypothesis, *supposing* he intended his secondary causes to *account* for the origin and triumphs of Christianity; but, as before said, he made a provision for his retreat, by nominally granting the "truth of the doctrine and the providence of God" to be *the* great cause of the success of Christianity. Seriously, one would imagine, (if we did not know his manner), that he meant all this; for in his *Vindication*, in reply to Davis, where he takes occasion briefly to mention Watson's *Letters*, and to excuse himself from reply, he appeals to this very concession as a reason for silence! He says,—"The remarks of Dr Watson consist more properly of general argumentation than of particular criticism. He fairly owns that I have expressly allowed the full and irresistible weight of the *first* great cause of the success of Christianity; and he is too candid to deny that the five *secondary* causes, which I had attempted to explain, operated with *some* degree of active energy towards the accomplishment of that great event. The only question which remains between us relates to the *degree* of the weight and effect of those secondary causes; and as I am persuaded that our philosophy is not of the dogmatic kind, we should soon acknowledge that this precise degree cannot be ascertained by reasoning, nor perhaps be expressed by words."[1] This language, on the supposition that Gibbon was still really *ironizing*, greatly aggravates the disingenuousness of the "celebrated chapters." But either he meant what he said, or he did not; if he did, it of course formally surrenders the argument which infidelity has founded on the supposed sufficiency of his "secondary" causes; if he did *not* mean it, he of course evades the very question which his antagonist (and every other discreet antagonist) would contest with him, by ironically affecting agreement.

---

[1] As to his *third* secondary cause, "miracles," the same may be said as of his ironically conceded primary cause. He either meant that miracles had been performed, or not; if he did, he of course concedes the main point; if he did not, then he is giving a *nothing* (by a new name) to account for the success of Christianity. If it be said that what he *meant* was the *pretension* to miracles, though miracles there were none, it is very likely; but then it is easy to reply that though such pretensions have been often of service when a religion has *already become accredited*, there is no example (unless he choose to *beg the question* by assuming it of the Jewish and Christian religions) of a religion successfully *founding itself* on such hazardous assumptions, while there are many examples of failure in such attempts; that is, Gibbon's cause, as usual, comes too late.

It may be further remarked, not only that the *Christian* feels that the "secondary causes" of Gibbon do not touch the principal problem,—but that infidelity has confessed, in the most significant way, a similar mistrust, by laboriously constructing other, and often reciprocally destructive hypotheses, to account for the intractable phenomena. That of Strauss is one, which, unlike that of Gibbon, professes to track the origin of Christianity to its cradle; but faithfully represents that of Gibbon and many more, in one respect, that it is ephemeral. It is even now fast losing its transient *prestige*. These shining exhalations from the bog of scepticism glimmer, flicker, and vanish. Fortuitous myth, deliberate fiction, deep fraud practising on simplicity, deep fanaticism practising on itself,—have all under various modifications been resorted to, as the contradictory bases of infidel theories, and have been successively abandoned. The problem of the origin of *such* a system as Christianity under *such* circumstances, and with *such* results, within a given century, still presents the ancient difficulty. Meanwhile, it may now be safely asserted, that the chief hypotheses have been exhausted; and we have reason to infer, therefore, that the vast majority who examine Christianity will be, as they have hitherto been, of Butler's opinion, that nothing but the truth of the gospel will *harmonize the facts*.

But still further; it is a special weakness in Gibbon's theory that so far from his "secondary causes" being sufficient to account for the origin, they do not even account for the *progress* of the gospel; they are, when closely investigated, quite as often opposed to that progress; sometimes must have been far greater hindrances than helps. Nothing can be more infelicitous than some of his suppositions. For example, he imagines that the "intolerant zeal" of Christianity—which expressed the most open and derisive contempt of all the gods, consecrated by the classic mythologies—was a mysterious advantage to it! That the austere virtue—with which, be it recollected, it not only recoiled from the too welcome laxity of a jovial heathenism, but enlarged the circle of moral duties by adding the demands of the most diffusive and refined *spiritual* purity—would somehow attract votaries! That its visions of immortality—of a heaven so unalluring—of a hell so terrible—would be of magnetic force! Surely these are problematic *auxiliaries.* Similarly, some of the facts he assumes are purely imaginary; he attributes the zeal of proselytism manifested by the Christians to a Jewish origin, forgetting that the *zeal* of the Jews was just of the opposite kind; that Judaism was as exclusive as Christianity is catholic. There may be, no doubt, zeal for freedom and zeal for slavery; but because each is *zeal*, it would be odd to derive one from the other. Another cause to which he attributes much, was, alas! too often non-existent, and its effects were at least neutralized by opposite causes. It is the *unity* of the early church; its close compacted organization! Surely a singular topic of compliment, and even at a very early period a doubtful source of strength. The divisions, jealousies, and quarrels of Christians, were from the very first their weakness and their shame; and must have been at least as influential to retard, as ever their union was to advance, the progress of the gospel.

In conclusion, Christians may take some encouragement from Gibbon's failure. If ever man could hope to be the historic champion of infidelity with success, it was he. His work has such prodigious merits in nearly everything but its treatment of Christianity, as to have procured it almost universal perusal; it has now been published for the greater part of a century; and what, relatively to Christianity, have been its effects? Quite inappreciable. His management of this high argument is generally considered as the great blot of the work; as a sufficient, or even plausible account of the *origin* and early *triumphs* of Christianity, it is for the most part abandoned by infidels themselves.

The New Testament, somehow, still manages to impress the bulk of mankind who examine it, with an indelible conviction that it is the fruit of neither imposture, fiction, nor fanaticism, and that the *facts* connected with the propagation of the religion it embodies are historic verities. Since men have persisted in this belief, in spite of the efforts of such men as Bolingbroke, Voltaire, Hume, and Gibbon, to disabuse them, it is not probable that the enterprise in which such champions have failed will be successfully achieved by other hands. Hence it may be inferred, that *if* Christianity be false, it will, nevertheless, *not* be exploded.

The manner in which Gibbon prosecutes his object affords, no doubt, great facilities for exciting *prejudices* against Christianity, and ample scope for his cherished sneer. Christianity does not enter on the scene till it had degenerated in some degree from its primitive purity, and had contracted many pollutions. The foibles and follies of its adherents, of course, afford a very easy triumph to the satirist.

The Christian religion, once originated, and having achieved an initial success, was left to struggle with all the corrupting influences of the world, and, as might be expected, did not come off uninjured. Brought into contagious contact with false philosophies and degrading superstitions, and gathering converts from those who were but partially reclaimed from either, no wonder that its purity was blemished. But all this, which is favourable to Gibbon's satire, is anything but favourable to his argument: for the characteristics of Christianity to which, one moment, he would fain assign such wonderful efficacy, are anon exhibited in a very different light; are alternately, as the exigencies of his argument or the gratification of his malignity may dictate, the objects of respect or contempt. Thus the zeal and the purity of manners which are now so potent a cause of success, are now transformed, the one into bigotry and fanaticism, the other into austerity and grimace. But *velis et remis;* if Christianity may but be discredited, the historian seems but little troubled by his own inconsistencies. Thus, to give other instances of this blind animosity: sometimes the Christians are, nearly all, poverty-stricken wretches, the very dregs of society; presently, they have plenty of riches among them, and the mere prodigality of their benevolence is no inconsiderable bait for proselytism: at one time the early Christians, for a certain purpose, are too obscure to attract the attention of the Roman great; then, for another purpose, it is suddenly *remarkable* that illustrious men like Tacitus and Seneca could have been so insensible to its existence, or have regarded it with such apathy!

The historian, in short, has greatly diminished the pernicious effect of his attack, by the *animus* he everywhere be-trays. It is that of inveterate prejudice, of resolute hostility. On this one topic he is never moved to generous or noble emotion. The excellence of the Christian ethics, indeed, is coldly conceded; but even Gibbon could hardly deny that.

---

[1] *Miscellaneous Works*, vol. iii., p. 362. The italics are the author's own.

The sixteenth chapter is in some respects worse than the fifteenth; for in his anxiety to depreciate the numbers and heroism of the Christian martyrs, he forgets what is due to his professed maxims of toleration, and becomes, if not the apologist, the palliator of the most odious persecution. But his conduct here has been rebuked by one whose eminently calm and judicial spirit, and exemption from all suspicion of religious fanaticism, render his testimony particularly impressive. "The sixteenth chapter," says Sir James Mackintosh, "I cannot help considering as a very ingenious and specious, but very disgraceful extenuation of the cruelties perpetrated by the Roman magistrates against the Christians. It is written in the most contemptibly factious spirit of prejudice against the sufferers. . . . . Dr Robertson has been the subject of much blame for his zeal or supposed lenity towards the Spanish murderers and tyrants in America. That the sixteenth chapter of Mr Gibbon did not excite the same or greater disapprobation, is a proof of the unphilosophical and indeed fanatical animosity against Christianity which was so prevalent during the latter part of the seventeenth century."[1] It is also well observed by M. Guizot, that there is scarcely anything in his history that does not move Gibbon more than Christianity and its fortunes. The achievements of a vigorous barbarism—the sanguinary conquests, even the odious cruelties of a Bajazet or a Tamerlane—are described with more animation than the moral conquests of Christianity. One would have imagined that at least the prodigious influence of Christianity, true or false, on the world's history and its civilization would have been a tempting theme for the philosophical historian's speculation. Yet, as the above writer has observed, it is a topic almost unappreciated by him. A single sentence from M. Guizot's article in the *Biographie Universelle* well expresses the above traits. "Après s'être efforcé de rebaisser le courage héroïque des martyrs Chrétiens, il prend plaisir à célébrer les féroces exploits de Tamerlan et des Tartares: la grandeur matérielle, si on peut le dire, le frappe beaucoup plus que la grandeur morale; et les élans d'une vertu sublime ne pénètrent point jusqu' à son ame, tandis que les écarts d'une force barbare séduissent son imagination et égarent son jugement."

It is difficult, as several critics have remarked, to account for Gibbon's extreme injustice to Christianity. Some have fancied, and himself in his later days would fain countenance the fancy, that it was partly due to his "conservative politics;" because he regarded Christianity as he would a "modern innovation," and yearned, with desperate fidelity to antiquity, over the old heathenism it supplanted; because he felt much as he did at seeing the throne of France menaced by revolutionary fury! A remarkable passage to this effect occurs in one of his latest letters to Lord Sheffield, dated 1790. He says, "Burke's book is a most admirable medicine against the French disease, which has made too much progress even in this happy country. I admire his eloquence, I approve his politics, I adore his chivalry, and I can forgive even his superstition. The primitive church, which I have treated with some freedom, was itself at that time an innovation, and I was attached to the old Pagan establishment."[2] To most this has appeared an *after thought*, and justly. For was ever any argument more suicidal? When *he* wrote, Christianity, right or wrong, *was in possession;* and to attempt to destroy it was to do that very work of destruction which he professed to deprecate; yet he had the effrontery to say in his *Memoir*, on the breaking out of the French revolution,—"I have sometimes thought of writing a dialogue of the dead, in which Lucian, Erasmus, and Voltaire, should mutually acknowledge the danger of exposing an old superstition to the contempt of the blind and fanatic multitude."[3] Assuredly he should have made himself a *fourth* interlocutor in the dialogue, and confessed that *he* was the greatest culprit, in this kind, of his whole generation. Christianity, which, even if according to him a "superstition," could plead the hoary prescription of nearly two thousand years, he did his best to undermine, because so many centuries ago it had dethroned poor Jupiter! On the same principles, had he lived in the age of Augustus, he ought to have exemplified his zeal against innovation by being jealous of the upstart of Olympus, pleaded for the restoration of Saturn, or even gone back to the more "primitive tradition" of "Chaos and Old Night!"

It would have been well if the contemporaries of Gibbon had adopted that moderate estimate of his attack on Christianity which experience has now justified us in forming. As it was, the public took fright, and numberless hasty replies were published,—some of them insolent and abusive, most of them very inadequate in point of learning and logic, and none of them, if we except those of Watson and Lord Hailes, of much value. That of Watson alone touched the real points of the controversy, and showed that Gibbon's sophistry left the great problem as it was. It is a pity that Gibbon, instead of replying, evaded it by that disingenuous feint of agreement on the main point at issue, to which reference has been already made.

The only adversary whom he honoured with distinct refutation was Davis, whose unworthy attempt to depreciate the great historian's learning, and captious, cavilling, acrimonious charges of petty inaccuracies and discreditable falsification, gave Gibbon an easy triumph. It was, as he said, "a sufficient humiliation" to vanquish such an adversary. At the same time it must be confessed, that he selected his adversary discreetly.

The charges of inaccuracy against Gibbon in the citation of his authorities have often been repeated, but they are not, except to a very limited extent, substantiated in the estimate of the most recent and competent of his editors. In his treatment of Christianity, his inveterate and resolute prejudices may account for his partial evidence and perverted logic without accusing him, as Davis did, of ignorance, which *cannot* be suspected, or of deliberate *suppressio veri*, which one *would* not suspect.

It is impossible to enumerate here the various editions of Gibbon's works, or to enter into the voluminous literature they have evoked. It may be well to mention, however, the beautiful edition of the *Decline and Fall* recently put forth in eight volumes 8vo, under the editorship of Dr W. Smith, and which embodies the notes of Professor Milman and M. Guizot.

He who would obtain a full insight into the character and genius of Gibbon, would do well to consult not only the *Memoir*, but the Letters and Journals; his life was emphatically that of a student and scholar, and these remains as vividly illustrate it as the *Memoir* itself. (H. R.)

GIBBONS, Grinling, a celebrated English woodcarver, was born at London in the latter half of the 17th century. His parents have been generally represented as Dutch by descent. He early displayed great cleverness and ingenuity in his art, on the strength of which he was recommended by Evelyn to Charles II., who commissioned him to execute the ornamental carving for the chapel at Windsor. The subjects which Gibbons selected are taken chiefly from the Bible, and consist of doves, pelicans, palm-trees, and other emblematic devices. He also executed the foliage and festoons in the choir of St Paul's, the baptismal fonts in St James's, and an immense quantity of ornamental work at Burleigh, Chatsworth, and other aristocratic mansions. The finest of all his productions in this style, however, is believed to be the ceiling which he devised for a room at Petworth. He sometimes wasted his ingenuity on trifling subjects. He is said, for instance, to have carved feathers and pens that were mistaken for real ones; and many of his flowers used to move on their stems like their natural prototypes when shaken by a breeze. Some of Gibbons' works, such as his statue of Charles II. at the Bank, and of James II. at Whitehall, sufficiently prove that had he chosen to cultivate the more difficult walks of art he might have attained a high rank among the sculptors of England. Even as it is, he has been called by some critics the English Cellini, and the title is perhaps not wholly undeserved.

GIBBOUS, protuberant, swelling, of a convex form. It is particularly applied to the moon, when more than half full or illumined.

GIBEON, an ancient city of Palestine, frequently mentioned in the Old Testament, though not occurring in the New. It is identified with El-Jib, which is a moderately sized village, seated on the summit of a hill, five miles north by west from Jerusalem. The houses stand very irregularly and unevenly, sometimes almost above one another. They seem to be chiefly rooms in old massive ruins, which have fallen down in every direction. One large building still remains, probably a former castle or tower of strength. Towards the east the ridge of the hill sinks a little, and here, a few roods from the village, just below the top of the ridge towards the north, is a fine fountain of water. It is in a cave, excavated in and under the high rock, so as to form a large subterranean reservoir. Not far below it, among olive trees, are the remains of an open reservoir, about 120 feet in length by 100 in breadth. It was doubtless designed to receive the superfluous waters of the cavern, and there can be little question but that this was "the Pool of Gibeon" mentioned in 2 Sam. ii. 13; and, in the whole, we find the "Great waters that are in Gibeon" of Jer. xli. 12.

GIBRALEON, anciently *Ossonoba*, a secular town of Spain, in the modern province of Huelva, in Andalucia, on the left bank of the Odiel, here navigable, and 7 miles from the town Huelva. It is rather well built, and contains two churches, a town-house, a public school, a nunnery, and the buildings of two monasteries; and it has also the remains of two forts. Gibraleon has an annual fair, and carries on some trade in fruit, wool, corn, and wine. Pop. (1855) about 4000.

GIBRALTAR, a British town and fortress in Andalucia, the most southerly province of Spain. It stands on the extremity of a small peninsula, washed on the east side by the Mediterranean, and on the west by the Bay of Gibraltar. This peninsula is connected with the mainland by a low sandy isthmus called the "Neutral Ground," which reaches from the rock of Gibraltar northwards to the ancient Spanish lines, a distance of a mile and a half; its breadth is about three-fourths of a mile.

Gibraltar was known to the ancient Phœnicians by the name of Alube, which was corrupted by the Greeks into Calpe. Over against it, on the African shore, stood Abyla (called by the English Apes' Hill); and these two mountains formed the renowned Pillars of Hercules, and for many centuries the extreme limits of maritime enterprise among the seafaring men of the ancient world. Its importance in a strategic point of view was first discovered by the Saracens, who, when they crossed over from Africa into Spain in 711, built a fortress on it, in order to keep up their communication with the other side. From the name of their leader, *Tarik*, or *Tarif*, they called the rock *Gebel Tarik*, the hill of Tarik, whence the modern name of the mountain is said to be derived. An ancient tower, the sole relic of the castle built by the Berber chief, is still standing. The rock remained in possession of the Arabs till the year 1309, when it was retaken by Guzman the Good, who commanded the Spanish armies for Ferdinand IV., the king of Castile and Leon. In 1333, however, the Moors once more made themselves masters of it, through the treachery of the Christian governor, and retained it till 1462, when they were driven out of it by Henry IV., king of Castile. It was finally incorporated with the Spanish crown in 1502. The arms of the town were from this time forth a castle with a key hanging from its gate, typifying its command over the straits. Great efforts were made by the Spaniards to strengthen the natural defences of the place, and they succeeded so well that throughout Europe Gibraltar was regarded as impregnable. In 1704, however, it was taken by a combined English and Dutch fleet under Sir George Rooke and the Prince of Hesse Darmstadt. The Spaniards made desperate efforts to recover it, but their attempts were invariably defeated, sometimes with immense loss. The peace of Utrecht in 1713 confirmed the possession of it to the English. In 1720 the Spaniards determined once more to take it if possible by a *coup-de-main;* but their intention became known to the garrison, and the plan was abandoned for a time. Seven years after this a much more formidable attack was organized. The Spaniards had made vast preparations, and surprised the garrison before reinforcements could be sent for from England. The result of the siege was still doubtful, when the news of a general pacification brought it to a close. But the most memorable siege of Gibraltar, indeed one of the most memorable of all sieges, was that which it sustained from the combined land and sea forces of France and Spain during the years 1779–1783. The grand attack on the place was made on the 13th September 1782, and all the resources of power and science were exhausted by the assailants in the fruitless attempt. On the side of the sea they brought to bear against the fortress forty-six sail of the line, and a countless fleet of gun and mortar boats. But their chief hope lay in their floating batteries. These celebrated engines of destruction had been planned by D'Arçon, an eminent French engineer, and built at the cost of half a million sterling. They were so constructed as to be impenetrable by the red-hot shot which they foresaw the garrison would employ; and such hopes were entertained of their efficiency that they were styled *invincible.* The Count d'Artois (afterwards Charles X.) hastened from Paris to witness the capture of the place. He arrived in time to see the total destruction of the floating batteries, and a considerable portion of the combined fleet, by the English fire. In writing home on the subject he found it convenient to hide his chagrin under a wretched joke: "La batterie la plus effective," said he, "était ma batterie de cuisine." Despite this disaster, however, the siege continued till brought to a close by the general pacification, February 2d, 1783. The history of this famous siege is fully detailed in the work of Captain Drinkwater, who himself took part in the defence, and in the *Life* of its gallant defender Sir Gilbert Elliott, afterwards Lord Heathfield, whose military skill and moral courage place him among the best soldiers and noblest men whom Europe produced during the eighteenth century. In nothing did his true nobility of character show itself more clearly than when it became his duty to animate his little garrison, whose spirits often flagged under the combined influences of disease and impending famine. When victory at length crowned his arms, the small remnant of 400 men that were saved from the wreck of the hostile fleets owed their lives to his humanity. His conduct at the opening of the siege, when called upon by the

Spanish commander to deliver up the keys of the fort, is a worthy parallel to that of Leonidas at Thermopylæ, when ordered by the Persian king to lay down his arms. This scene has supplied to Reynolds the subject of one of the noblest portraits ever put on canvas. Since this memorable siege everything that the science of the engineer could do has been done to render Gibraltar, humanly speaking, impregnable. The east and north sides are naturally so steep as to be wholly inaccessible. At the north-west corner, where "the Lines" intervene, a narrow gorge, leading down to the neutral ground, is flanked by the most formidable batteries. Europa Point, the southern extremity of the rock, is almost equally precipitous; but to make assurance doubly sure, powerful batteries have been erected there also. The top of the Point is now surmounted by a fine lighthouse. In the neighbourhood are the "Flats," an open sandy space where the soldiers of the fort are drilled and exercised. On the western side the hill slopes down gradually to the sea. On this slope stands the town of Gibraltar, flanked by the old and new moles. It was almost entirely destroyed during the great siege, but has been rebuilt on an enlarged and improved plan. The houses are, for the most part, tolerably well built, but the curious intermixture of English and Spanish architecture, and the large number of mean public houses painted in flaring white, are not calculated to impress the visitor very favourably. The town is connected with the isthmus by a narrow causeway, on the defence of which science has exhausted its resources. The most remarkable of the defences commanding this part of the town are the "galleries," two excavations cut out of the solid rock with great difficulty, and at an immense expense. Their aggregate length is between two and three miles, and their breadth is sufficient to let a carriage pass. At intervals of 12 yards port-holes have been cut out in the face of the rock commanding the neutral ground and the bay, and so contrived that the gunners in the galleries are quite safe from the shot of any possible assailants. These galleries are so scarped as to be inaccessible, and their safety is further secured by the batteries that bristle on every height above. The rock of Gibraltar itself is composed chiefly of gray primary marble, lying in strata which vary in thickness from 20 to 40 feet. As seen from the sea it presents a bare and uninteresting aspect, as if wholly devoid of trees, plants, or verdure of any kind. It possesses, however, some wooded and grassy little glens, shaded from the scorching heat in the nooks of the mountains. In the crevices of the rock itself are found the asparagus, the caper plant, the palmita, and various sorts of succulent herbs, such as the aloe, and some species of cactus. Kelaart in his *Flora Calpensis* describes upwards of 400 flowering plants and ferns as indigenous to Gibraltar, and about fifty as introduced. The rock shelters rabbits, partridges, pigeons, and woodcocks, which are never shot at; and is remarkable as the only spot in Europe where the ape is found wild. The species is the Barbary ape, of a dark fawn colour. They inhabit the high ground on the east of the rock, and never approach the dwellings of men unless driven into the low ground by the cold winds from the N.E. They then do a little damage to the orchards; but they have always enjoyed perfect impunity for these occasional depredations; and it is as grave an offence to kill one of them as it was in Egypt in ancient times to destroy an ibis, or as it is now in Holland to injure a stork. The rock is honey-combed in many places with caverns, some of them of great size. The largest of all is that of St Michael on the S.W. side, the entrance of which is about 1000 feet above the sea-level. On entering, one sees a spacious but gloomy hall hung round with massive stalactites, from which the visitor descends through a succession of caves of the same sort to a depth of about 500 feet below the entrance. The foulness of the atmosphere has hitherto prevented any one from penetrating further; but at this depth it is said that the waves of the sea may sometimes be heard roaring through the caverns below. Among the rocks, chiefly in the fissures filled with calc-sinter, are to be found many interesting fossils, among others the bones of various animals, intermixed with helices and fragments of spar.

The climate of Gibraltar is temperate, and, on the whole, healthful, the only exception being in the case of children cutting their first teeth. To them it seems to be peculiarly fatal. In summer the African heat is tempered by a refreshing sea-breeze, which blows from about 10 A.M., and ceases before sunset. During the other seasons, however, fogs and mists are common. The easterly winds, or levanters, sweeping the Mediterranean, bring with them the unhealthy season, which lasts from July till November. During the prevalence of these winds, wounds are said to become aggravated, acute diseases arise, and many convalescents relapse and perish. The west winds on the other hand are clear and refreshing, and blow directly on the town. The rains set in with great violence in the end of September, and continue to fall at intervals, though much more lightly, till May. The drought which then follows is very intense. The heavy dews and thick fogs of autumn are as disagreeable as they are insalubrious. Much discussion exists as to the nature and origin of the Gibraltar fever, which scourges the rock periodically at intervals of about twelve years. It is believed to arise from the filthy habits of some of the alien residents, and to be fostered by the defective sewerage. Probably also the structure of the English parts of the town is calculated to make the infection spread. These houses, which are built on the English model, and furnished in the English style with carpets, curtains, and other appliances which prevent the free circulation of air, are singularly ill adapted either for the hot or the cold weather of Gibraltar, and the fever is consequently peculiarly fatal to British subjects. The means that have been taken to diminish the amount of disease by enforcing a strict quarantine on foreign ships visiting the port do not seem to have contributed materially to that end. There is a magnificent tank for supplying the navy. It generally contains from 9000 to 11,000 tons of good water, which is that which falls on the mountain in the rainy season. The houses are so constructed that all the rain which falls on their roofs is led into under-ground tanks. There are no springs on the rock itself, and those on the neutral ground yield but a scanty supply of bad water. Provisions are supplied cheaply and abundantly from Africa. The soldiers of the garrison used formerly to be fed on salt meats sent out from England. This diet was found to be productive of very fatal dysenteries and inflammations; but since 1840, when a different dietary was introduced, the amount of sickness and mortality among the troops has greatly diminished.

Gibraltar contains a motley population of from 15,000 to 20,000 (exclusive of the troops in garrison), chiefly English, Jews, Spaniards, and Moors. Stringent measures are adopted by government to prevent any increase in the number of permanent residents. No person is allowed to remain on the rock who cannot find some one to stand security for his good behaviour. *Permis de séjour* are issued by the police magistrate for ten, fifteen, or twenty days, at the end of which period they require to be renewed. The officers of the garrison have the privilege of introducing a stranger for a month.

Justice is administered at Gibraltar according to the law of England, which is not found to meet thoroughly the emergencies that are constantly occurring among a population so heterogeneous as inhabits the rock. The judge-advocate settles disputes that arise between debtor and creditor; but appeal is open from his decision to that of the governor, whose verdict is final in all cases where the value of the contested property is below L.300. If it exceed that amount the parties may appeal to the privy-council in England.

The utmost tolerance exists in Gibraltar in all matters pertaining to religion. Nearly every known form of worship is celebrated; but that which reckons by far the greatest number of adherents is the Roman Catholic. Next in number are the Jews, who have four synagogues; and after them the Protestants, chiefly members of the Church of England. The least numerous are the Mohammedans. Two bishops representing the Romish and English Churches reside permanently at Gibraltar. There are three excellent libraries on the rock, the oldest and best of which is that which owes its origin to Colonel Drinkwater, the historian of the siege. It numbers about 20,000 volumes.

Gibraltar is a free port; and though its trade and commerce have of late years declined considerably, they are still extensive and important. It is the great resort of the *contrabandistas* or smugglers, who purchase nearly all the goods that find their way into the south of Spain. The smuggling of tobacco, which is manufactured in large quantities at Gibraltar, is a source of constant fretting and ill-will between the governments of Spain and this country. The quantity of this commodity that finds its way into Spain without paying duty is between six and eight millions of pounds annually, employing in its manufacture about 2000 hands. The loss and affront endured by the Spanish crown through the continuance of this trade, are all the more keenly felt, as tobacco is a monopoly of the government, and a considerable source of its income. Inquiry, however, has shown that the success of the smugglers is chiefly due to the incapacity or dishonesty of the Spanish officials, whose duty it is to put an end to their trade. The only chance that these personages have of making fortunes is to accept the presents which procure their connivance. In 1852 the declared value of British and Irish produce and manufactures exported from the United Kingdom to Gibraltar was L.510,889.

Gibraltar was long an ill-managed and most expensive colony. It has now been thoroughly reformed, and not only defrays its own expenses, but even pays over a small surplusage to the home government. The total amount of the revenue is a little above L.30,000; the expenditure is rather under that sum. The sources of income are the customs, port and quarantine dues, land revenue, rents, auction dues, stamps and licences, &c. The outlay is caused by the salaries in the civil, judicial, ecclesiastical, and municipal services, by allowances to some of these departments, and by office contingencies.

GIBRALTAR, *Bay of*, or, as it is sometimes called, ALGECIRAS BAY, is bounded by the rock of Gibraltar on the one side, and the headland of Cabrita on the other. Its greatest length is about eight miles from N. to S., its greatest width about five miles from E. to W., and its circuit nearly forty miles. Its depth in the centre is about 110 fathoms. In spring tides the water rises in the bay about four feet. Algeciras, from whose name the bay is sometimes called, is a fortified Spanish town on the W. side of the bay, over against Gibraltar. Near it is the beautiful little island called Isla Verde, or Green Isle.

GIBRALTAR, *Straits of*, the narrow channel which separates the south of Spain from the north of Africa. The width at the narrowest part, between Cabrita Point and the opposite shore, is thirteen miles. We have an excellent chart of the straits by Don Vincente Tefino de San Miguel, with the additional observations of Captain H. W. Smyth, R.N., from which it appears that there is a continual current flowing from the ocean in the middle of the straits, which has a velocity varying from three to six miles per hour, and is three and a half miles in breadth. There are two lateral currents, which have a mean breadth each of two and a half miles; but they change their direction with the changes of the tide. At the time of ebb these lateral currents have a velocity equal to that of the central one. The depth of the strait in the meridian of Cape St Vincent is 100 fathoms; but in passing upwards the channel regularly and rapidly deepens, until, opposite to Europa Point at Gibraltar, the depth of water is 1000 fathoms. It is remarkable, that though the oceanic current at the straits, and that of the Bosporus at the Dardanelles, continually pour their waters into the Mediterranean, its level is not raised. But Dr Halley long ago showed the evaporation from its surface was fully equal to maintain it at the same level, notwithstanding those additions, and that of the rivers it received. The current is sufficiently strong to be dangerous to vessels sailing into the Atlantic, and can only be overcome by a brisk wind from the Levant.

GIBSON, EDMUND, D.D., author of the *Codex Juris Ecclesiastici Anglicani*, was born at Bampton in Westmoreland in 1669. His parents were persons of humble fortune, but sensible enough to give their son the best education within their reach. After distinguishing himself at the local schools, young Gibson was sent to Oxford, where he made himself known by publishing at the early age of twenty-two a Latin translation of the *Saxon Chronicle*, with notes, indexes, &c. This work is held in high esteem among historians, as it throws light on many points of early English history on which the Latin chronicles are silent. Gibson's version of the work was welcomed by the antiquarians of England, many of whom volunteered their aid for the edition of Camden's *Britannia*, on which it soon became known that he was engaged. This latter work appeared in 1695, and was republished in 1722. Its editor's next production was also antiquarian in its nature, being an edition of some historical remains left by Sir Henry Spelman, and published by Gibson under the title of *Reliquiæ Spelmannianæ*. In virtue of these and other works Gibson attracted the notice of Tenison, archbishop of Canterbury, who made him his private chaplain, and afterwards rector of Lambeth and archdeacon of Surrey. In the discussions which subsequently arose relative to the convocation of the clergy, Gibson took a very active part, and warmly upheld in a series of pamphlets the rights of the archbishop as president of that assembly. This controversy suggested to him the idea of those researches which resulted in his *Codex Juris Ecclesiastici Anglicani*, a work which discusses more learnedly and comprehensively than any other the legal rights and duties of the English clergy, and the constitution, canons, and articles of the English Church. In 1715 Gibson was presented to the see of Lincoln, whence he was translated five years after to that of London. Here he exercised an immense influence in the affairs of the church, over whose integrity he watched with the most jealous care. Sir Robert Walpole used to consult him on all church matters, and allowed his power to become so great that Sir Robert was once reproached for tolerating a pope in England. "And a very good pope he is," was the minister's reply. Gibson's overscrupulous regard for the clerical prerogative finally lost him Walpole's favour; and his fearless denunciation of the licentious masquerades, then highly popular at court, brought him into disgrace with the king.

In his church politics Gibson was a thorough conservative, yet he respected the various forms of dissent, and checked all attempts to prevent them from worshipping in the manner and on the principles which they preferred. In practical life his generosity and charity are well attested by numerous and striking examples. He died in 1748, having reached his eightieth year. The only work of Gibson which need be particularized here, in addition to those already mentioned, is his *Pastoral Letters*, intended as a reply to Collins and other assailants of Christianity.

GIDEON (*destroyer*), surnamed JERUBBAAL or JERUBBESHETH, fifth judge in Israel, and the first whose history is circumstantially narrated. He was the son of Joash, of the tribe of Manasseh, and resided at Ophrah in Gilead beyond the Jordan.

The Midianites, in conjunction with the Amalekites and other nomade tribes, invaded the country every year, at the season of produce, in great numbers, with their flocks and herds. They plundered and trampled down the fields, the vineyards, and the gardens; they seized the cattle, and plundered man and house, rioting in the country, after the manner which the Bedouin Arabs practise at this day. After Israel had been humbled by seven years of this treatment, the Lord raised up a deliverer in the person of Gideon.

Gideon having delivered Israel from the most afflictive tyranny to which they had been subject since they quitted Egypt, the grateful people, and particularly the northern tribes, made him an offer of the crown for himself and his sons. But the hero was too well acquainted with his true position, and with the principles of the theocratical government, to accept this unguarded offer.

The remainder of Gideon's life was peaceable. He had seventy sons by many wives, and died at an advanced age, after he had "ruled Israel" (principally the northern tribes and those beyond the river) for forty years—1249 to 1209 B.C. He is mentioned in the discourse of Samuel (1 Sam. xii. 11), and his name occurs in Heb. xi. 32, among those of the heroes of the faith.

GIEN, a town of France, capital of a cognominal arrondissement in the department of Loiret, on the right bank of the Loire, here crossed by a handsome stone bridge, thirty-seven miles E.S.E. of Orléans. It has manufactures of serge, leather, and earthenware, and some trade in corn and wine. Pop. (1851) 6036.

GIESSEN, a town of Germany, capital of the province of Upper Hesse, in the grand duchy of Hesse, at the confluence of the Wieseck with the Lahn, and on the railway from Frankfort to Cassel, thirty-three miles N.N.W. of the former city. The fortifications which formerly surrounded Giessen have been destroyed, and their site converted into promenades. The town itself is old and generally ill built, but contains some good edifices, as the castle, now the seat of the provincial government, the university buildings, arsenal, town-hall, and the new town church. The university was founded in 1607, and has a library of 40,000 volumes, a botanic garden, observatory, museum of natural history, &c. Its school of organic chemistry has become famous under Professor Liebig, and is frequented by students from all parts of Europe. Pop. 9049.

GIFFORD, WILLIAM, a distinguished critic, satirist, and dramatic annotator, was born at Ashburton, in Devonshire, in April 1757. Although his immediate ancestors had at one time possessed considerable property in their native county, and been there accounted gentlemen, yet a series of indiscretions had deprived them of the greater part of their substance. The elder Gifford, whose roving propensities had driven him to sea, and also led him "to wander in some vagabond society," as his son informs us, established himself after his marriage as a plumber and glazier at South Molton. But his habits were unsettled and desultory; he went again to sea, and once more returned without having acquired any wisdom from his misfortunes; and he died at last, "of a decayed and ruined constitution, before he was forty." When this event happened, his son William had not completed his thirteenth year. He had been sent to school to read, write, and cipher; but, according to his own account of himself, he there made "a most wretched progress." In less than twelve months after the death of his father, his mother followed her husband to the grave; and after various vicissitudes young Gifford was sent on board a coasting vessel, by the person under whose guardianship he had been placed. This individual, who was his godfather, and into whose hands the effects of Gifford's parents had fallen, recalled him from his nautical pursuits, principally, it would appear, on account of the outcry which the people of Ashburton raised against him for the manner in which he had treated his young charge. Gifford was now sent to school, where he made great progress, especially in arithmetic; but from this he was in a short time withdrawn, and apprenticed to a shoemaker. He was now in his fifteenth year, and he was articled to serve until he was twenty-one. But he thoroughly hated his new craft, and whenever leisure afforded him opportunities, he prosecuted his favourite study of mathematics. He also began to write verses, though not at this period for amusement, but only when he wanted money for his mathematical pursuits. But his devotedness to his studies seems to have rendered him indifferent to the concerns of his master, whose indignation was accordingly roused. He desired young Gifford to give up his books and papers; and this being refused, he proceeded to the garret of the delinquent, which he thoroughly sacked. Being now deprived of his sole means of improvement, almost of enjoyment, Gifford began to display a degree of sullenness, reserve, and discontent, which made him an object of dislike to his fellow-workmen. However, he had the good fortune to attract the notice of Mr Cookesley, a surgeon, who interested himself deeply in behalf of Gifford, and set on foot a subscription to purchase his freedom from the latter part of his indentures, and to pay for his education; a scheme which completely succeeded.

After having passed two years at school, Gifford was pronounced fit for the university; and by the active benevolence of Mr Cookesley, was enabled to proceed to Oxford, where he was appointed Bible reader in Exeter College. Whilst at this place, he undertook a translation of Juvenal. A subscription for publishing it was set on foot; but during the progress of this undertaking his benefactor died; a circumstance which ultimately, and perhaps fortunately, prevented him from publishing a translation of the great Roman satirist, at least for a time. By an accidental occurrence, however, he became known to Lord Grosvenor, who invited him to his house. He accordingly quitted Oxford, and took up his residence with that nobleman, under whose hospitable roof he prosecuted the translation of Juvenal, until called upon to accompany the son of his patron to the Continent. With this young nobleman he spent, in two successive tours, many years, "of which," he says in his autobiography, "the remembrance will always be dear." Although Gifford was principally engaged upon his translation of Juvenal, its publication was preceded by several other productions, by which at the time he obtained great popularity. The first was the *Baviad*, a paraphrase on the first satire of Persius. This production appeared in 1794, and was levelled at a class of poetasters who deluged the daily prints of the time with their maudlin and inflated effusions. The satire had the effect of completely extinguishing this tuneless tribe. Gifford's next production, which appeared the following year, was entitled the *Mæviad;* an imitation of Horace, and directed against the corruptions of the drama. This work was only partially successful, for the malady which it was intended to cure had its seat in public manners rather than in the affectation of individuals. In 1800 he published his *Epistle to Peter Pindar*, an attack which brought him little else but disquietude; the laughter of the one satirist being quite as formidable as the gall of the other. Soon after this Gifford became acquainted with Mr Canning, who had resolved to establish a weekly paper for the purpose of exposing the political agitators of the time. This print was called the *Anti-Jacobin*, and Gifford became its editor. The ministerial connection thus formed was of some use to him, as by it he obtained the paymastership of the band of gentlemen pensioners; and at a subsequent period he was made a double commissioner of the lottery. In 1802 appeared his English version of Juvenal, a work which may be said to have engrossed the greater part of his life. It was ushered into the world with every possible advantage, headed by a dedication to Earl Grosvenor, and with the translator's autobiography prefixed to it. The translation is able and spirited, although it is occasionally diffuse and inharmonious, and not unfrequently coarse in its diction. In 1805 Gifford published an edition of the Plays of Massinger in four volumes; and in 1816 the Works of Ben Jonson, in nine volumes. In his annotations upon both these dramatic poets he displays great acuteness and industry; but in exposing the blunders of previous commentators he shows not a little of his characteristic acrimony. In 1821 he published a version of Persius; and since his death his editions of the dramatic works of Ford and Shirley have been given to the world, accompanied with able and acute notes.

It was, however, as editor of the *Quarterly Review* that Gifford became most generally known. The success of the *Edinburgh Review*, in advocating liberal principles in politics, suggested to the opposite party the idea of a counterpoise in the shape of the journal above named, which was accordingly carried into effect in 1809, and Gifford entrusted with its management. The scheme completely succeeded; and this success was in no small measure due to the skill and ability with which Gifford fulfilled his duties as editor. No man possessed a finer tact in discerning the weak and bad points of an author, when his object was to turn him into ridicule; none could hold them up to laughter with more felicitous acrimony. From the time of his taking the charge of the *Quarterly Review* until his death, few circumstances of any moment occurred in the life of Gifford, except the publication of the works already mentioned. He continued the editorship until about two years before his death, which took place on the 31st of December 1826.

From the prominent position which Gifford occupied in the literary world, his character has been the subject of severe animadversion by one party, and of exaggerated eulogy by another. Of his great talents there can be no doubt. His sagacity and quickness of apprehension were striking, and the rapidity with which he acquired knowledge is proved by his having prepared himself for the university after being only two years at school. His wit was distinguished for caustic severity rather than for brilliancy, and he dealt more in invective than in polished repartee. As a poet he cannot be said to rank very high; but that he had a keen perception of the beauties of poetry, and could point them out with great felicity, when political feelings did not intervene to pervert his judgment, is proved by his many admirable criticisms, and by the confidence which Lord Byron and others reposed in his opinions. In private life Gifford was modest and unassuming; and amongst the numerous parties, poetical, political, or religious who occasionally suffered by his castigations, none of them ever ventured to recriminate by attacking the moral character of the editor of the *Quarterly Review*. The memoir of himself, which he prefixed to his version of Juvenal, is an interesting and instructive autobiography. It is written with ability and manly feeling, as well as with unaffected modesty and apparent candour. (J. F. S.)

GIFT, in *English Law*, in its general sense, is a conveyance that passes either lands or goods. But when restricted to things immovable, it is applicable only to lands and tenements given in tail.

New Year's Gifts. The custom of giving presents on the first day of the year is very ancient, the origin of it among the Romans being referred to Tatius king of the Sabines, who reigned at Rome conjointly with Romulus, and who, having considered as a good omen a present of some sprigs of vervain gathered in a wood consecrated to Strenia, the goddess of strength, which he received on the first day of the new year, authorized this custom afterwards, and gave to these presents the name of *strenæ*. But however this may be, the Romans on New Year's Day gave one another presents of sweetmeats, and of copper coins stamped with the double head of Janus, to whom this day was specially dedicated. Clients, that is to say, those who were under the protection of the great, carried presents of this kind to their patrons, adding to them a small piece of silver. Under Augustus, the senate, the equestrians, and the people presented such gifts to the emperor, and in his absence deposited them in the Capitol. Of the succeeding emperors, some adopted this custom, others did not; but it always continued among the people. The early Christians condemned it as a relic of paganism, and a species of superstition; but when it began to have no other object than that of being a mark of regard and esteem, the church ceased to disapprove of it.

GIGG, or JIG (Ital. *giga*), a lively dance-tune in $\frac{6}{8}$ time, of two sections, each composed of eight measures.

GIGLIO, the ancient *Igilium*, an island of the Mediterranean, lying off the coast of Tuscany, and comprised in the Tuscan province of Siena. It is about six miles in length by four in breadth, and is mountainous. Its chief products are timber, wine, marble, and fish. Pop. about 1600, chiefly inhabiting the small town of the same name.

GIGUELA, a river of Spain, in New Castile. It rises on the western slope of the Sierra de Cuenca, flows circuitously S.S.W., and after a course of nearly 100 miles, joins the right bank of the Guadiana, 36 miles N.E. of Ciudad-Real. Its chief affluents are the Cencara on the left, and the Rianzares on the right.

GIJON, a seaport-town of Spain, province of Oviedo in Asturias, on the Bay of Biscay, and 20 miles from Oviedo. The town is built on a slope, of which the upper part is occupied by the old town, partly surrounded by ancient walls; the more modern portion extends to the beach, and both are defended by a fortress and several batteries. In general the houses are good and commodious; the streets are wide, paved, and clean. There are in the town a parish church, many chapels, several primary schools, nautical school; a town-house, a prison, hospital, economic society, custom-house, triumphal arch; a glass and bottle manufactory, and a cigar manufactory employing 1400 hands. Besides, there is some coasting trade in coals, paving-stones, grain, cider, and colonial produce. Fishing and fish-curing are carried on to a considerable extent. The harbour is safe, with good anchorage, though rather difficult of access. The number of vessels visiting the port yearly is about 1000, aggregating 60,000 tons burthen. The coal existing in the vicinity is not wrought. Pop. nearly 7000.

GIL, SAN, or ST GILES, a town of New Granada, province of Scorro, 64 miles S.W. of Pamplona, on an affluent of the Suarrez, here crossed by a stone bridge. San Gil was founded in 1690, and has manufactures of cotton fabrics and tobacco, with an extensive trade in agricultural produce. It contains several schools and a college. Pop. nearly 7000.

GIL VICENTE, the Portuguese Plautus, was born about the year 1482. It is known that he belonged to a family of rank, and that he studied law at the university of Lisbon, in compliance with the wish of his family; but his legal studies he soon relinquished, and devoted himself entirely to the dramatic art. We know not whether he was pensioned as a writer to the court; but he was most indefatigable in furnishing the royal family, as well as the public, with dramatic entertainments suited to the taste of the age. He constantly resided at court, where his poetic talents were held in permanent requisition for the celebration of spiritual as well as temporal festivals; and no dramatic writer in Europe was more admired and esteemed than Gil Vicente.

The success of Juan de la Encina, who had recently produced before distinguished audiences in Spain a style of pastoral dialogue till then altogether unknown in the peninsula, excited Gil Vicente to his first attempts in the dramatic art.[1]

In the reign of Emmanuel the Great, his first productions were performed with approbation at court; but additional lustre was added to his fame in the reign of John III., who did not scruple in his youth to perform characters in the dramas of his favourite author. Not only was Vicente a great dramatic writer, but he seems also to have possessed all the requisite qualifications for a theatrical manager. He was himself an actor, and the tutor of the most brilliant actress of his age—his own daughter Paula, maid of honour to the Infanta Maria, a poetess, an amateur performer on several instruments, and celebrated for every accomplishment except beauty.

Gil Vicente's diction, as well as his poetic style, belongs to the fifteenth century; and to the latest period of his life he continued faithful to the old national manner. In the conflict with the new style introduced by Saa de Miranda's school, Gil Vicente appeared as the representative of the yet enduring national taste, which even at court preserved an authority equal to that of the party whose adherents were most honourably distinguished.

At the command of the king, Gil Vicente was engaged during his declining years in the collection of his works for publication. But he did not live to complete the task. Barbosa states that he died before the year 1557 at Evora, where he was in attendance upon the court. This was the year in which John III. died. Hence we may conclude that Barbosa's date is a misprint for 1537. For when Gil Vicente wrote from Santarem to the king, in 1531, he thought himself at death's door (*mui visinho da morte*), and the *Garden of Errors*, his last composition, bears the date 1536. It is not then unreasonable to suppose that he died in 1537, not 1557. Besides, this is much strengthened when we find that Barros in his *Dialogue*, a pamphlet which forms part of a miscellaneous volume, printed in 1539–40, seems to speak of him as of one already dead. He was buried in the cloisters of St Francis, and an epitaph written by himself was engraven on his tomb, but without a date. Whatever may have been the date of his death, however, we know for certain that the license for the first impression of his collected writings was granted by Queen Catharine, as regent for her grandson Sebastian, to the poet's daughter Paula so late as Sept. 3, 1561, and that they were first published in 1562 by his son Luiz, and dedicated to king Sebastian, who was then only eight years old, and though so young, took particular pleasure in the works of Gil Vicente—"He read them and delighted to see them performed."

The dramatic pieces of Gil Vicente which have been preserved are 42 in number. In the first volume of the *Obras de Gil Vicente* (published by J. V. Barreto Feio e Jose Gomez Monteiro, Hamburgo, 1834) are contained twelve "Devotional Autos," called *Obras de Devoção*. The second volume contains four comedies, and ten tragi-comedies; the third, twelve farces, besides a few miscellaneous addenda in prose and verse. This classification to modern taste seems capricious; for, more than one of the *Autos* might with equal propriety be placed among the farces, so much more does the humour appear than the devotion. But however questionable, or even indefensible, may be the taste of dramatizing sacred subjects, it is not our business here to discuss the morals of ancient moralities, or the religion of miracle-plays. We take Gil Vicente's as we find them, and as they were exhibited in the sixteenth century to a splendid court—one of the most orthodox in Europe, in a country whose pride it was to be the "most faithful" champion of Christianity, and even in the presence of that zealot boy-king who was nurtured up to be the very "knight-errant of the Faith," and who was so early to perish, with all his chivalry, on the battle-field of Alkázer-Kebír.

About one-fourth of these plays are in the Spanish language, about one-half of them in the Portuguese, and the remainder in Portuguese and Spanish intermixed.[2] The first three religious "autos" already noticed are in Spanish. In the *Auto da Fe*—a title suggestive of the horrors of the Inquisition, but literally meaning "an act of faith," for the Inquisition, so long before established in Spain and France, was not yet admitted into Portugal[3]—the awkward swains who receive instructions in the rudiments of the creed, and are most obtuse learners, express their admiration and perplexity in low Spanish; while the Faith alone, their teacher, speaks good Portuguese—a capital stroke of patriotism in the author. Though this piece, as well as some others, has no date attached, it may be supplied from the *Auto* itself; for one of the peasants asks how many years ago the Messiah was born, and Faith answers, "fifteen hundred and ten years."

The best critical account of Gil Vicente and his works yet published is that contained in the *Quarterly Review*, vol. lxxix., pp. 168—202; and the best edition of his works is that already mentioned—*Obras de Gil Vicente*, Hamburgo, 1834. A copy of the 1562 edition of Gil Vicente's plays is still preserved in the university library of Göttingen. It is entitled: *Compliaçam de todalas obras de Gil Vicente, &c.—Empremiose em a muy nobre e sempre leal cidade de Lisboa*, anno 1562, in folio. In p. 87 of Dieze's Velasquez, the complete title may be found. In this edition the text of the dramas is printed in Gothic characters; but the introduction which precedes each piece is printed in modern Roman type, and is written chiefly in the Portuguese language. A reprint in 4to appeared also at Lisbon in 1586, but much disfigured by the Inquisition. These are among the rarest and most curious books in modern literature. The Hamburg edition of 1834 is in 3 vols. 8vo, and particularly valuable as being chiefly according to the Göttingen folio. Consult also *Crónica de Don Manoel*, parte i., cap. 62, from which it appears that the first secular dramatic exhibition in Portugal took place June 8, 1502. (A. F. F.)

GILA, a river of New Mexico, United States of North America. It is supposed to rise about N. Lat. 33., W. Long. 109.; and after a course, first southerly and then westerly, it falls into the Colorado in N. Lat. 32. 44., W. Long. 114. 30.

GILBERT, or GILBERD, WILLIAM, an eminent physician and experimental philosopher, was born at Colchester in 1540, and became famous in consequence of his discovery of several of the properties of the loadstone. He was a strenuous advocate for the inductive mode in philosophical matters, and was the first who proposed the theory of the great central magnet in the earth, afterwards applied by Halley to the explanation of the variation and dipping of the needle in the mariner's compass. Gilbert died in 1603.

---

[1] Garcia de Resende, who was brought up at the court of King Emmanuel, seems decisive on this point. In his *Miscellanea*, a most curious poem illustrative of customs and occurrences of which he had been witness, he says, speaking of the pomps and pleasures of his master's court,—

E vimos singularmente
Fazer representaçoens,
D'estilo mui novas invençoens,
E feitas por Gil Vicente.
Elle foi que inventon
Isto cá, e o uson
Com mais graça e mais doutrina;
Posto que Joam del Encina
O Pastoril começou.

i.e., "We also saw singularly curious representations, in style right eloquent, and quite new inventions, by Gil Vicente. He it was that introduced the dramatic pastoral here, using it with more grace and more skill than Juan de la Encina, who, however, commenced it."

[2] To write in Spanish was a fashion of the time easily accounted for; hence it is not surprising that Gil Vicente should have often adopted it when writing for the court. Two of the three wives of Emmanuel the Great were princesses of Castile, and the third was sister of the Emperor Charles V. The wife of John III. was also a Castilian.

[3] The Bull for the establishment of the Inquisition in Portugal was sent to John III. by Pope Clement VII., and is dated "*Anno Incarnationis Dominicæ* 1531."

Gilbert, *Sir Humphrey*, a celebrated English navigator of the sixteenth century, was born in 1539 in the county of Devon. By his mother's side, he was half-brother to Sir Walter Raleigh, who resembled him in many points of his character, and whose early life was chiefly guided and influenced by his example. He was educated first at Eton and afterwards at Oxford, and, embracing the military career, was sent to Ireland, where he contributed so powerfully to put down the rebellion raging there that in 1570 he was made a knight, and rewarded with the government of Munster. The idea of a north-west passage to Cathay and the Indies at this time occupied the thoughts of men, and in 1576 Gilbert published a treatise to prove the possibility of it. A perusal of this book induced Frobisher to set out on his first voyage to solve the mystery of the frozen north. In 1578 Gilbert was furnished with letters patent by the queen to take possession of the N.E. coast of America, and establish factories there. He was singularly unfortunate in his first setting out, having hardly set sail when a storm obliged him to return with the loss of one of his ships. In 1583, however, he again set out, and on the 5th August landed at St John's Bay, of which he took possession in the name of the English queen. On his way his fleet was assailed by a terrific storm, and the little vessel on board of which he was sailing went down, with all on board. Gilbert was one of those high-souled and adventurous men of whom the Elizabethan era was so prolific. There was almost no region of human thought or experience through which they did not pass. They were "soldiers, scholars, Christians, discoverers, and 'planters' of foreign lands, geographers, alchemists, miners, Platonic philosophers; many-sided and high-minded men, not without fantastic enthusiasm," an enthusiasm which led them on to enterprises that posterity, though reaping the benefit of them, has too often affected to pity as Quixotic, or sneer at as downright ridiculous. Tardy justice is now being done to these heroic souls, and there is even a prospect that Sir Humphrey Gilbert will at length find that recognition which has been denied him since his death. (Haklnyt's *Collection*, *Biog. Univ.; North British Review*, No. 45; *Edin. Review*, vol. lxxi., &c.)

GILBERTINES, a religious order founded by Gilbert lord of Sempringham, in the county of Lincoln, about A.D. 1148. The monks observed the rule of St Augustin, and were accounted canons; the nuns observed that of St Benedict. The founder erected a kind of double monastery, in which the monks were separated from the nuns by a very high wall. St Gilbert founded thirteen monasteries, viz. four for men, and nine for men and women conjointly. At the dissolution there were about 25 houses of this order in England and Wales.

GILD, or Guild. See Guild.

GILDAS, surnamed the "Wise," and also "Badonius," from the battle of Badon (Bath), which happened soon after his birth, said by some to have taken place 493 A.D., and by others in 511. He was the son of the British prince Caw who emigrated to North Wales in order to avoid submission to the Anglo-Saxons; was a pupil of Iltutus, abbot of Morgan, and became a monk of Bangor. After visiting Ireland, France, and Italy, he returned to his native country, where he became eminent as a preacher. In his journeys he visited the monastery of Llancarvan, then recently founded by a nobleman of South Wales, whose example Gildas urged others to imitate. He is supposed to have died at Bangor about 590 A.D., though some date his death 20 years earlier. He is the most ancient historian of Britain; but his only complete work now extant is *Epistola de Excidio Britanniæ et Castigatione Ordinis Ecclesiastici*, in which he graphically depicts and mourns over the total ruin of his country, as well as the revolting profligacy of manners then prevailing. This work was first published by Polydore Virgil in 1525; but the best edition is that of Gale, in the first volume of his *Historiæ Britannicæ, Saxonicæ, etc., Scriptores quindecim*, London, 1691, folio. Gildas also wrote several letters and pieces, of which only extracts remain. An excellent edition of his *Excidio Britanniæ* has been published under the care of the English Historical Society, by Jos. Stevenson, London, 1838, 8vo, and it has been translated into English by J. A. Giles, LL.D., London, 1841, 8vo. It had previously been translated by T. Habington, and published in London so early as 1638.

GILDING, the art of spreading or covering gold, either in leaf or in liquid, over the surface of a body for the purpose of ornament. The art of gilding was not unknown among the ancients. According to Herodotus, the Egyptians were accustomed to gild wood and metals; and gilding by means of gold plates is frequently mentioned in the books of the Old Testament. Pliny informs us that the first gilding seen at Rome was after the destruction of Carthage, under the censorship of Lucius Mummius, when the Romans began to gild the ceilings of their temples and palaces; the Capitol being the first place on which this enrichment was bestowed. But he adds, that luxury advanced on them so rapidly, that in a little time you might see all, even private and poor persons, gild the walls, vaults, and other parts of their dwellings.

We need not doubt that they had the same method as ourselves of beating gold, and reducing it into leaves; though it should seem that they did not carry it to the same extent, if it be true, as Pliny relates, that they only made 750 leaves of four fingers square out of an ounce. Indeed he adds that they could make more; that the thickest were called *bracteæ Prænestinæ*, by reason of a statue of the goddess Fortune at Præneste gilt with such leaves; and that the thinner sort were called *bracteæ questoriæ*.[1]

The modern gilders also make use of gold leaves of different thickness; but there are some so thin as not to exceed $\frac{1}{250,000}$th of an inch in thickness. The thicker sorts are used for gilding on iron and other metals, and the thinnest on wood. But we have many advantages over the ancients in the manner of using or applying the gold. The secret of water gilding, discovered of late ages, furnishes us with means of gilding works capable of enduring all the injuries of time and weather, which to the ancients was impracticable. They had no method of laying on the gold on bodies so as to endure the fire; their method was to attach it by means of the albumen of eggs or size; but as this will not resist the action of moisture, they could only gild in such places as were sheltered.

The Greeks called the composition on which they applied their gilding on wood *leucophæum* or *leucophorum;* which is described as a sort of glutinous compound earth, serving in all probability to make the gold stick and bear polishing. But antiquaries and naturalists are not agreed as to the particulars of this earth, its colour, and ingredients.

The lustre and beauty of gold have led to several inquiries and discoveries concerning the different methods of applying it to different substances. Hence the art of gilding is varied, and involves several distinct processes.

Gilding is chiefly of two kinds, entirely distinct from each other, according as the material to be gilded is wood or metal. Gilding on wood is also of two kinds, known as *burnish-gilding* and *oil-gilding*. In burnish-gilding the following are the processes for a plain picture-frame. The gilder procures from the joiner a bevelled moulding twelve feet in length. He prepares this for gilding by a number of coats of priming; the first coat consisting of hot size and whiting, and called *thin white*. This is prepared by melting the size in an earthen pipkin, stirring in the size in a fine powder in small portions at a time. When the first coat is dry the surface is examined, and holes and irregularities are filled up with a putty formed of whiting and size. Four or five successive layers of *thick white* are then laid on. This is prepared in a manner similar to the thin white, only of greater consistence, and time is allowed for the work to dry between every two coats. To prevent the fine work of the moulding from being filled up, opening tools such as crooks, chisels, gouges, &c., are used while the thick white is wet, and in some cases two thick whites are laid on, one almost directly after the other, and are worked into the shape of the mouldings by means of hard stones of the required shape, which are used in conjunction with the opening tools. The whiting may now be from $\frac{1}{16}$th to $\frac{1}{12}$th of an inch in thickness, the edges are trimmed even, and the surface is smoothed with pumice-stone of the required form, the work being slightly wetted to promote the smoothing effect. The final polish is given with glass paper. Gold size is now put on in from four to eight coats, with dryings between. The size consists of pipe-clay, red chalk, black lead, suet, and bullock's blood; a portion of this is melted with thin clear size, and is laid on slightly warm with a brush.

---

[1] See Beckmann, *History of Inventions*, the Chapter on Gilding.

The tools used by the gilder consist of the *cushion*, the *knife*, and the *tip*. The cushion is a flat board eight inches by six, covered with layers of woollen cloth or flannel, over which is strained a piece of leather. Along one of the short sides, and reaching half round each of the long sides, is a rim or border of parchment three inches high, which serves to prevent the gold-leaf from being blown about. The knife used for cutting gold-leaf has a straight smooth edge, ending in a well-defined point. The tip used for laying on the gold is a row of camel's hairs fastened between cards, and projecting from one inch to two inches and a half. The gold-leaf is supplied to the gilder in books, each containing 25 leaves. The gilder supports the cushion on his left hand by means of a leathern loop, and with the tip, the knife, and a camel's-hair pencil between the fingers of his left hand, he opens the book of leaf-gold with his right, and blows a number of leaves sufficient for his work upon the cushion; then taking one leaf he spreads it out upon the leather by a few dexterous manipulations with the knife, assisted by the breath. He next cuts it into strips suited to the width of the moulding; then wetting a few inches thereof with the camel's-hair pencil, he applies the tip to a slip of gold, which slightly adheres to the hairs, and enables him to transfer it to the moulding. Should the tip fail to take up the gold, the hairs are rubbed briskly across the face, or against the palm of the hand, and the friction, probably exciting the hairs electrically, enables them to take up the gold. The leaf being laid on, the gilder blows forcibly upon it, and uses a dry camel's-hair pencil to press down such parts as do not adhere. Another portion of the moulding is next wetted, and another piece of gold-leaf is laid on so as slightly to overlap the former. The whole moulding being in this way covered, it is set aside to dry.

The next process is *burnishing*, which is done with pieces of agate set in sticks; and these being rubbed over the surface greatly increase the brilliancy of the gold, an effect which is promoted by the yielding foundation of gold-size and whitening. The parts which are to be in *dead* or *matt* gold are left unburnished; a thin clear size is passed over them, and when dry, the gold is wiped with cotton wool, and defective places are restored with pieces of leaf-gold. When dry, the whole is finished by wetting the matt parts with a pencil dipped in clear finishing size. The moulding is now passed to the frame-maker, who cuts it up and forms the pieces into a frame. It is then returned to the gilder, who stops up nail-holes, and paints the sides of the frame yellow.

In oil-gilding the moulding is whitened as in the former case, and is at once made up into a frame. Composition ornaments are then put on, and the gilder now proceeds first by washing the frame to remove oil, &c. He next gives it two or three coatings of thin white, with additional coatings to the parts intended to be burnished. Two or three coats of a moderately strong size called *clear-cole* are laid on, after which the oil gold-size is applied, which consists of a mixture of boiled linseed oil and ochre. After some hours, the gilding is performed as before, except that no water is used, the partially dried oil serving the purpose. For deep ornaments, the gold is pressed in with cotton wool, and has to be repeated to get rid of those irregular fractures called by the gilders "spiders' legs." The work has at first a ragged appearance, but it is now carefully gone over with the brush, smoothed, and any defective part restored. This is called *skewing*, and the superfluous gold removed during the process is known as *skewings*. The parts to be burnished are next worked, and the frame is lastly sized with clear size, and yellowed on the outside.

The method of applying gold to metals is entirely different from the above, and is done in various ways. One of these is by previously forming the gold into a paste or amalgam with mercury, for which purpose the gold must first be reduced to thin plates or grains, which are heated red hot, and thrown into mercury previously heated, till it begins to smoke. Upon stirring the mercury with an iron rod, the gold totally disappears. The proportion of mercury to gold is generally as six or eight to one. When the amalgam is cold it is squeezed through chamois leather for the purpose of separating the superfluous mercury; the gold, with about twice its weight of mercury, remains behind; it is a yellowish silvery mass of the consistence of butter, and with this amalgam the surface of the metal to be gilded is to be covered; then a sufficient heat is to be applied to evaporate the mercury; and, lastly, the gold is to be burnished with a bloodstone.

This method of gilding by amalgamation is chiefly used for gilding copper, or an alloy of copper with a small portion of zinc, which more readily receives the amalgam; and it is also preferable for its colour, which more resembles that of gold than the colour of copper. When the metal to be gilt is wrought or chased, it ought to be covered with quicksilver before the amalgam is applied, that this may be more easily spread; but when the surface of the metal is plain, the amalgam may be applied directly to it. It is to be observed that the use of the bloodstone is now generally abandoned, and a steel burnisher substituted for it. The steel burnisher is case-hardened and then polished; and the clearer the polish is, the brighter will the metal be burnished. The quicksilver or amalgam is made to adhere to the metal by means of a little aquafortis, which is rubbed on the metallic surface at the same time, and by which such surface is cleansed from any rust or tarnish that might prevent the union or adhesion of the metals. The nitrous acid also facilitates the application of the amalgam to the surface by dissolving part of the mercury of the amalgam; and when this solution is applied to the copper, the latter metal, having a stronger affinity for nitrous acid than the mercury has, precipitates the mercury upon its surface, in the same manner as a polished piece of iron precipitates copper upon its surface from a solution of blue vitriol. When the metal to be gilt is thus covered over with a thin precipitated coating of mercury, it readily receives the amalgam. The amalgam being equally spread over the surface of the metal to be gilt, by means of a brush, the mercury is then to be evaporated by a heat just sufficient for that purpose; for if it be too great, part of the gold may also be expelled, and part of it will run together, and leave some of the surface of the metal bare. Whilst the mercury is evaporating, the work should be from time to time taken from the fire, that it may be examined, that the amalgam may be spread more equally by means of a brush, that any defective parts of it may be again covered, and that the heat may not be too suddenly applied to it; and when the mercury has evaporated, which is known by the surface having entirely become of a dull yellow colour, the metal must then undergo other operations, by which the fine gold colour is given to it. First, the gilded surface is rubbed with a scratch brush of brass wire, until its surface be smooth; then it is covered over with a composition called *gilding wax*, and again exposed to the fire until the wax be burnt off. This wax is composed of bees'-wax, mixed with some of the following substances, viz., red ochre, verdigris, copper scales, alum, vitriol, borax; but, according to Dr Lewis, the saline substances alone are sufficient, without any wax. By this operation the colour of the gilding is heightened; and the effect seems to be produced by a perfect dissipation of some mercury remaining after the former operation. The dissipation is well effected by this equable application of heat. The gilt surface is then covered over with a saline composition, consisting of nitre, alum, or other vitriolic salt, ground together, and mixed up into a paste with water or urine. The piece of metal thus covered is exposed to a certain degree of heat, and then quenched in water. By this method its colour is further improved, and brought nearer to that of gold, probably by removing any particles of copper which may happen to lie on the gilded surface. Lastly, some artists think that they give an additional lustre to their gilt work by dipping it in a liquor prepared by boiling some yellow materials, as sulphur, orpiment, or turmeric. The only advantage of this operation is, that a part of the yellow matter, as the sulphur or turmeric, remains in some of the hollows of the carved work, in which the gilding is apt to be more imperfect, and to which it gives a rich and solid appearance.

In the gilding of iron and steel it is difficult to prevent the oxidation of the metal during the volatilization of the mercury; and the temper of the metal in sword-blades, daggers, &c., is liable to be injured in the process. In ornamenting iron and steel, however, a solution of mercury in nitrous acid, called *quicksilver-water*, is used; the acid attacks the iron, and deposits in its place a thin coating of mercury, which unites with the gold amalgam after it is applied. By this method a bright durable gilding cannot be obtained.

By another method a solution of sulphate of copper is applied by a camel's-hair pencil, after which an amalgam of gold is laid on, and the mercury is driven off by heat. It is, however, more usual to burnish down the gold-leaf upon the steel with the assistance of heat.

By another process a solution of gold is made with nitro-muriatic acid; about twice the quantity of ether is then cautiously added in a large vessel; the liquids are agitated and allowed to rest, when the ether will separate and float on the surface of the acid. The whole mixture is then poured into a funnel with a small aperture, and allowed to rest for some time, when the acid is run off and the ether separated. The ether has taken up all the gold from the acid, and may be used for gilding iron or steel, for which purpose the metal is polished with the finest emery and spirits of wine. The ether is then applied with a small brush, and as it evaporates it deposits the gold, which can now be heated and polished. For small delicate figures a pen or a fine brush may be used for laying on the ether.

What is called cold gilding on silver is performed by a solution of gold in aqua-regia, applied by dipping a linen rag into the solution, burning it, and rubbing the black and heavy ashes on the silver with the finger or a piece of leather or cork.

Fine instruments of brass are sometimes gilt in order to preserve their surface, for which purpose a saturated solution of gold is evaporated until crystals begin to form; these are dissolved in water, into which the articles to be gilded are immersed. Washing and burnishing complete the process.

In the drying off or removing the mercury by volatilization the health of the workpeople is seriously injured by the fumes of the mercury; so much so, as formerly to make this the most unhealthy of employments, to say nothing of the loss of mercury. Various contrivances, by Dr Lewis and others, have done much to remedy the evil. In the modern gilding furnace buttons and similar small articles are put into a wire cage within a furnace, constructed so as to preserve and condense the fumes of mercury by carrying them with the draught through a kind of labyrinth containing water, the centre of the labyrinth communicating by an inclined pipe with the chimney, which discharges the smoke almost entirely free from metallic fumes.

The grand improvement which has been made of late years in the art of gilding metals has been the application of galvanism or voltaic electricity, founded on the fact that when a voltaic current is passed through a metallic solution decomposition takes place; the metal in a revived form attaches itself to the negative pole or electrode, while the acid or alkali goes to the positive pole. In the process of electro-gilding a gold solution is formed by dissolving gold in nitro-muriatic acid, which is digested with calcined magnesia, and the gold is precipitated as an oxide; this is boiled in strong nitric acid, washed, and dissolved in cyanide of potassium, which forms cyanide of gold and potassium. This solution is used at a temperature of at least 130° Fahr.

The positive electrode of the battery is of gold, the negative of iron or of copper. The articles to be gilt are cleansed by boiling in an alkaline ley and other solutions, and they are then hung on wires and suspended from the wire which crosses the mouth of the vat or gilding vessel from the negative pole. A small article may be gilt in three or four minutes. In gilding articles of iron, tin, or lead, a thin coating of copper is first deposited upon them, and upon this the gilding is deposited. The gilding solution usually contains from $\frac{1}{2}$ to 1 oz. of gold in the gallon; but for small articles, such as rings, thimbles, &c., a weaker solution is used. The durability of the article depends, of course, on the quantity of gold deposited; but the appearance of gold (or colour, as it is called) may be given by a few grains to a very large surface. A very thin layer of gold upon silver will be of a light colour. For articles not exposed to wear, a mere blush of gold will give them a very ornamental appearance; but for watch-cases, pencil-cases, chains, &c. the coating should be thick. Mr Napier states that an ordinary-sized watch-case should have from 20 grains to 1 pennyweight of gold—a covering that will last 5 or 6 years. Small silver chains should have 12 grains, pencil-cases from 3 to 5 grains, and a thimble from 1 to 2 grains. The springs and works of chronometers are sometimes electro-gilt; and we have known a coat of gold to be deposited on plates intended for etching, instead of the usual varnish, and through this delicate layer the design has been traced and afterwards bitten in.

The beauty and durability of gold, and its unchanging nature, have led to its employment on various domestic articles, such as those of porcelain. For this purpose the gold is dissolved in aqua-regia, and the acid is driven off by heat, or the gold may be precipitated by means of sulphate of iron. In this pulverulent state the gold is mixed with $\frac{1}{12}$th of its weight of oxide of bismuth, together with a small quantity of borax and gum-water. The mixture is applied to the articles with a camel's-hair pencil, and after passing through the fire the gold is of a dingy colour, but the lustre is brought out by burnishing with agate and bloodstone, and is lastly cleaned with vinegar or whitelead.

The art of gilding is of extensive application in ornamenting the covers of books. The parts intended to be gilt are covered with a thin layer of ovalbumen or white of egg called *glaire*, and then with a film of leaf-gold; on pressing upon this a heated brass tool containing the letter or device intended to be impressed, the gold becomes permanently fixed, and the superfluous portion is wiped off with a rag. The whole of the lettering and ornaments on the back and sides of a book-cover are commonly impressed at one operation, in what is called a blocking-press, for which purpose the pattern is cut out in a thick plate or block of brass attached to the upper bed of the press. In this upper bed is a cavity containing a row of gas jets for keeping the block at the proper temperature. The cloth book-cover, previously covered with gold-leaf at the parts intended to be ornamented, is placed within a metal gauge in the lower bed, when by means of a lever the upper bed is brought down, and the heated block is firmly pressed against the cover. In this way a large number of cloth covers are quickly ornamented. In leathern binding, however, the gold-lettering and ornaments are usually applied after the cover is on by the process of gold or hand-tooling.

GILEAD, a group of mountains connected with Lebanon by means of Mount Hermon. It begins not far from the latter, and extends southward to the sources of the brooks Jabbok and Arnon, thus inclosing the whole eastern part of the land beyond the Jordan. This was also the name of a large district beyond the Jordan, continually mentioned in the Scriptures in contradistinction to, or apart from, Bashan; though, to judge from its geographical position (as given in Num. xxxii. 26; Deut. iii. 12), it must have comprised the entire possessions of the two tribes of Gad and Reuben, and even the southern part of Manasseh. The cities Ramoth, Jabosh, and Jazer, are usually designated as lying in Gilead. This region was distinguished for its rich pastures and aromatic simples; from which latter different sorts of balsam were prepared—facts confirmed by modern travellers (Seetzen, Burckhardt, &c.)

GILENA, a small town of Spain, in the province and archbishopric of Sevilla. It is situated in a plain sweeping from the southern flank of the Sierra de Estepa, where a fine fountain of crystalline water rises, and is called the "Eye of Gilena." This excellent spring is so copious that it irrigates the plain, and supplies water-power to several grain mills. Gilena consists of several pretty regular but ill-paved streets, generally lined by low badly-built houses. It has two elementary schools, a parish church, and a courthouse; and it has a small trade in corn and oil. Pop. in 1855, nearly 3000.

GILGIT, a small independent and unexplored territory of Central Asia, on the southern declivity of the Hindu Koosh; having Little Tibet on the E., and Chitral on the W. It consists principally of one large valley, through which flows the river Gilgit, afterwards falling into the Indus in Lat. 35. 28. N., Long. 74. 28. E. There is also a village of the same name on the right bank of the stream in Lat. 35. 35. N., Long. 74. 15. E.

GILL, JOHN, an eminent Baptist minister and Rabbinical scholar, was born at Kettering in 1697. In consequence of the limited means of his parents, he was compelled to educate himself. Nevertheless, he became an eminent scholar in all the branches of knowledge required for the elucidation of Scripture, to which he devoted much of his long and useful life. After receiving baptism according to the usual forms in Nov. 1716, he began to preach, and officiated at Higham Ferrers, as well as occasionally at his native place in Northamptonshire, until the beginning of 1719, when he became pastor of the Baptist congregation at Horselydown in Southwark, where he continued during fifty-one years. In 1728 he published his *Exposition of the Song of Solomon*, in which he strongly contends against Whiston for its authenticity. In the same year he published also *The Prophecies of the Old Testament respecting the Messiah Considered*. This work was intended to refute *Collins' Scheme of Literal Prophecy*. His *Treatise on the Doctrine of the Trinity* was issued in 1731; and in 1735 and following years he published his *Cause of God and Truth*, in 4 vols. 8vo, containing a defence of the Calvinistic against the Arminian views on election, original sin, predestination, &c. But his great work was an *Exposition of the Bible*, in 10 vols. 4to. For this he had formed a large collection of Hebrew and Rabbinical books and MSS., and spent many years in a careful study of them, at the same time reading and collating the *Targums*, the *Mishna*, and the *Book of Zohar*. Of this work, the New Testament appeared first, in 3 vols. folio, 1746–48, in which year he received the degree of D.D. from Marischal College, Aberdeen. The volumes on the Old Testament were published in succeeding years. He published in 1767 a *Dissertation on the Antiquity of the Hebrew Language—Letters, Vowel Points, and Accents;* and in the same year he collated the various passages of the Old Testament quoted in the *Mishna*, in the Jerusalem and Babylonian *Talmuds*, and in the *Rabbath;* besides extracting the variations in them from the modern printed text, which he sent to Dr Kennicot, who very handsomely acknowledged the obligation in his work published in 1767. In 1769 Dr Gill's *Body of Doctrinal Divinity* was published, in 2 vols. 4to; and in 1770 a *Body of Practical Divinity.* The next year, 1771, October 14th, he died at his house in Camberwell.

GILL, a measure of capacity, containing a quarter of an English pint, or 8·665 cubic inches.

GILLIES, JOHN, the historian of ancient Greece, was born in 1747, at Brechin, in Forfarshire. He distinguished himself greatly at the University of Glasgow, and at the age of twenty officiated for a short time as professor of Greek. From a dislike to public teaching, however, he resigned this office and went to London, intending to study science there. On returning from a short scientific tour on the Continent, he accepted an engagement as tutor in the family of Lord Hopetoun, a Scottish nobleman, who rewarded Gillies' services to his sons with a pension for life. He travelled with his pupils for some years on the Continent; and in 1784 returned home to complete his principal work, which he published two years later under the title of *History of Ancient Greece, its Colonies and Conquests*, in 4 vols. 8vo, or 2 vols. 4to. This work was chiefly valuable as giving a fair picture of the various states of Greece, and the progress of each in literature and the arts. The different parts of this picture are well distributed, and presented always in a lucid and sometimes in an interesting form. The learning displayed in the work is considerable, but the author's reflections never rise above mediocrity, and his style, though ambitious, is far from being effective. The book, however, enjoyed a great popularity in its day, and was translated into most of the living tongues of Europe. It was long a favourite text-book for schools, and lingered there after it had ceased to be used elsewhere, but it is now completely superseded. On the death of the illustrious Robertson, Gillies was appointed historiographer royal for Scotland, but he failed to preserve to that office the éclat thrown around it by his predecessor. Of his subsequent works, the best known are his *View of the Reign of Frederick II. of Prussia, with a Parallel between that Prince and Philip II. of Macedon;* and the *Translation of Aristotle's Ethics and Politics;* and afterwards, of his *Rhetoric; History of the World from Alexander to Augustus;* &c. None of these works, however, are likely to preserve his name. In his old age Gillies retired to Clapham in Surrey, where he died in 1836, in the ninetieth year of his age.

GILOLO, or HALMAHERA, one of the Molucca or Spice Islands in the Indian Archipelago, lying principally between

1. S. and 2. N. Lat., and 127. 30. and 128. 30. E. Long. It is of a very irregular form, consisting of a common centre from which four peninsulas extend to the N., N.E., E.S.E., and S., respectively. It has an area of about 6600 square miles, and is for administrative purposes divided into two parts, the greater being under the sultan of Ternate, and having about 19,000 inhabitants; the smaller portion has only about 4000 inhabitants, and is nominally under the sultan of Tidor. Gilolo is of volcanic origin, and is covered with mountains, some of which (particularly in the N. and N.E. peninsula) attain a great height. Some parts of it are densely wooded. Its chief products are sago, cocoa-nuts, spices, fruits, edible birds'-nests, pearls, and gold-dust. Horses, horned cattle, and sheep, are abundant. Trade is carried on chiefly with the Dutch East Indian settlements, whence are imported manufactured goods, opium, china-ware, and iron.

GILPIN, Bernard, rector of Houghton, distinguished for piety and hospitality, was descended from an ancient family in Westmoreland, and born at Kentmire, in 1517. Being bred in the Roman Catholic religion, he for some time defended it against the Reformers, and at Oxford held a disputation with Hooper, afterwards Bishop of Worcester, and a martyr for the Protestant faith; but he was staggered in another disputation with Peter Martyr, and began seriously to examine the contested points by the best authorities. Accordingly, being presented to the vicarage of Norton, in the diocese of Durham, he soon resigned it, and went abroad to consult eminent professors on both sides; and, after three years' absence, returned a little before the death of Queen Mary, satisfied with the general doctrines of the Reformation. He was kindly received by his uncle Dr Tonstall, Bishop of Durham, who soon afterwards gave him the archdeaconry of Durham, to which the rectory of Effington was annexed. When repairing to his parish, though the persecution was then at its height, he boldly preached against the vices, errors, and corruptions of the times, especially among the clergy; on which a charge, consisting of thirteen articles, was drawn up against him, and presented in form to the bishop. But Dr Tonstall found a method of dismissing the cause in such a manner as to protect his nephew without endangering himself, and soon afterwards presented him to the rich living of Houghton-le-Spring. He was a second time accused to the bishop, and again protected; but his enemies, enraged at this second defeat, laid their complaint before Dr Bonner, Bishop of London, who immediately gave orders to apprehend him. Upon this, Gilpin prepared for martyrdom; and having ordered his house-steward to provide him a long garment, that he might make a decent appearance at the stake, he set out for London. Providentially, however, he broke his leg on the journey, which protracted his arrival until the news of the queen's death freed him from all further apprehension. Being immediately set at liberty, he returned to Houghton, where he was received by his parishioners with the most sincere joy.

Upon the deprivation of the Roman Catholic bishops, he was offered the see of Carlisle, which he declined; and confining his attention to his rectory, he discharged all the duties of his office in the most exemplary manner. He employed much of his time in endeavouring to improve the minds of the young of his parish, suffering none to grow up in ignorance of their duty, but pressing it as the wisest part to unite religion with labour, and amidst the cares of this life to have a constant eye upon the next. He attended to everything which might be of service to his parishioners, and was assiduous in preventing lawsuits among them. His hall is said to have been often thronged with people who came to him about their differences. He was not indeed much acquainted with law, but he could decide equitably, and that satisfied them; nor could his sovereign's commission have given his decisions greater weight or authority than his own character secured.

His hospitable manner of living was the admiration of all. He spent in his family every fortnight forty bushels of corn, twenty bushels of malt, and an ox; besides a proportional quantity of other kinds of provisions. Strangers and travellers found a cheerful reception. All were welcome who came; and even their horses had so much care taken off them, that it was humorously said, if a horse were turned loose in any part of the country, it would immediately make its way to the rector of Houghton.

Every Sunday, from Michaelmas till Easter, was a public day with him. During this season he expected to see all his parishioners and their families. For their reception, he had three tables well covered; the first being intended for gentlemen, the second for husbandmen and farmers, and the third for day-labourers. This piece of hospitality he never omitted, even when losses or scarcity made its continuance rather difficult. He considered it was his duty, and that was a decisive motive.

But notwithstanding all his painful industry, and the large scope he had for it in so extensive a parish, Mr Gilpin thought the sphere of his benevolence too confined. It grieved him extremely to see everywhere, in the parishes around him, so great a degree of ignorance and superstition, occasioned by the shameful neglect of the pastoral cure among the clergy. The bad consequences resulting from this induced him to supply, as far as he could, what was wanting in others. For this purpose, he used every year regularly to visit the most neglected parishes in Northumberland, Yorkshire, Cheshire, Westmoreland, and Cumberland; and that his own parish might not in the mean time suffer, he was at the expense of a constant assistant. In each place he stayed two or three days, instructing the people in as plain a way as possible.

The value of Gilpin's rectory was about L.400 a-year; an income at that time very considerable, yet in appearance very disproportionate to the generous things he performed with it; indeed he could not have done these unless his frugality had been equal to his generosity. His friends, therefore, could not but wonder to find him, amidst his many great and continual expenses, entertain the design of building and endowing a grammar-school; a design, however, which his exact economy soon enabled him to accomplish, though the expense of it amounted to upwards of L.500. His school was no sooner opened than it began to flourish; and so great a number of young people flocked to it, that in a little time the town was not able to accommodate them. He put himself, therefore, to the inconvenience of fitting up, for that purpose, a part of his own house, where he seldom had fewer than twenty or thirty children. Some of these were the sons of persons of substance, whom he boarded at small rates; but the greater part were poor children, whom he educated, clothed, and maintained at his own charge. He was at the expense likewise of boarding in the town many other poor children.

He not only placed in his school able masters, whom he procured from Oxford, but he himself likewise constantly inspected it. One method used by him to fill his school was singular. Whenever he met a poor boy upon the road, he would try his capacity by a few questions, and if he found it such as to please him, he would provide for his education. And besides those whom he sent from his own school to the universities, and there wholly maintained, he likewise gave to others, who were in circumstances to do something for themselves, what further assistance they required.

In his walks abroad, he would frequently bring home with him poor people, and send them away clothed as well as fed. But the money best laid out was, in his opinion, that which encouraged industry. It was one of his greatest pleasures to make up the losses of his laborious neighbours, and prevent their sinking under them. If a poor man had lost a beast, he would send him another in its room; or if any farmer had had a bad year, he would make him an abatement in his tithes. Thus, as far as he was able, he took the misfortunes of his parish upon himself; and, like a true shepherd, he exposed himself for his flock.

This benevolent and excellent divine, who merited and obtained the glorious titles of Father of the Poor, and the Apostle of the North, died in 1583, in the sixty-sixth year of his age.

GIMBALS (Lat. *gemellus*, *twin*), the two brass rings or hoops within which a ship's compass is suspended in its box, in order to counteract the effect of the ship's motion and keep the card horizontal. These rings move one within the other, each perpendicularly to its plane, about two axes placed at right angles to each other. By this contrivance the compass, having a free motion in two directions at right angles to each other, maintains a vertical position, and consequently the card is horizontal. Gimbals are also applied to other instruments, such as the portable or mountain barometer, &c.

GIN, a kind of malt spirit flavoured with the essential oil of juniper. The process of making it is described under Distillation, vol., viii. p. 51. The inferior spirit sold as gin is said to be flavoured with turpentine instead of juniper, and rendered biting to the palate by caustic potash.

GIN, in *Mechanics*, a contrivance for raising heavy weights, driving piles, &c., which consists of three spars set up in a pyramidal form, and furnished at top with a tackle which is worked by a windlass beneath. The name *gin* is also applied to a machine with which the fibres of cotton are disentangled, by means of a series of revolving spikes. This operation is termed *ginning*.

GINETA, La, a town of Spain, province of Murcia, thirteen miles N.N.W. of Albacete, in a plain. It contains a parish church, two primary schools, a prison, and a court-house. La Gineta has manufactures of hempen and woollen cloth; and a trade in wine, oil corn, rice, and salt fish. The market is weekly, and the population is nearly 3000.

GINGEE, a town of the Carnatic, in the district of South Arcot, and a celebrated fortress, which stands on a stupendous rock and is impregnable by all the ordinary modes of attack. It is said to have been built or improved on an old foundation of the Chola kings by the son of Vijeya Runga Naik, the governor of Tanjore, in 1442. It was successively strengthened by the Mohammedan kings of Bejapore, who possessed it from 1669 to 1677, and by the Mahrattas, who held it in the year 1698. At this period it was besieged and taken by Zulficar Khan, the imperial general, who appointed Rajpoot governors. They affected independence, and assumed the rank of rajahs. In 1750 it was taken by surprise during a night attack by the French under M. de Bussy; but it surrendered to the British after the capture of Pondicherry in 1761. Like all the other hill forts in India, it is reckoned very unhealthy; and the French are said to have lost about twelve hundred of their number during the ten years they held possession of it. Long. 79. 27. E., Lat. 12. 15. N.

GINGER, the rhizome (underground stem) of *Zingiber officinale*, a plant of the nat. ord. *Zingiberaceæ*, and a native of the East Indies and China, but early carried to the West Indies, where it is much cultivated, particularly in the island of Jamaica. The ginger of commerce is distinguished into two kinds, the white and the black; but the difference depends merely on the method of preparation. The white variety consists of carefully selected rhizomes, which are scraped, scalded in boiling water, and dried in the sun; and the whiteness is frequently aided in this country by bleaching with chloride of lime. The black kind (which is really of a pale brown colour) consists of inferior pieces which have been scalded but not scraped. It should be observed, however, that some East Indian ginger, in its natural state, is as light-coloured as African ginger that has undergone the whitening process: and hence it seems probable that they are the produce of different species.

The young and tender rhizomes preserved in syrup constitute the well-known sweetmeat called *preserved ginger*. Ginger is much employed in medicine as an antispasmodic and carminative. Made into a thin paste with spirit, and spread as a plaster, it is a useful topical remedy in face-ache, earache, &c.; and has this peculiar property, that notwithstanding it excites a considerable sensation of heat, it leaves even the most delicate skin perfectly free from injury or discoloration.

GINGERAH. See Jinjeera.

GINGUENÉ, Pierre Louis, the author of the *Histoire Littéraire d'Italie*, was born in 1748 at Rennes in Bretagne. He was educated at a Jesuit college in his native town, but he owed most of his literary tastes and accomplishments to his father, who early imbued him with a love of music and the languages of England and Italy. His first literary effort, a poetical piece entitled *Confession de Zulme*, brought him into notice among the literary coteries of Paris, from the circumstance that when first published anonymously it shared the fate of Wolfe's Ode on the Burial of Sir John Moore, and was claimed by six or seven different authors. Though the intrinsic value of this piece is not very great, it is still entitled to be called Ginguené's poetical *chef d'œuvre*. The part he took in the strife which then divided the musical world into partizans of Glück or Piccini made him still more widely known; and the reputation he enjoyed as a promising political writer secured employment for him in the public service. He hailed, however, with enthusiasm the first symptoms of the Revolution, and celebrated in an indifferent ode the opening of the States General. A more creditable effort was his *Lettres sur les Confessions de J. J. Rousseau*, in which he defended to the uttermost the life and principles of that richly-endowed but ill-starred genius. Refusing to countenance the excesses of the Revolution, Ginguené became an object of suspicion to the authorities, and was thrown into prison, whence he only escaped with life by the downfall and death of Robespierre. Some time after his liberation he was made director-general of the "Commission Exécutive de l'Instruction Publique," and re-organized the system of public instruction according to the principles and ideas then fashionable in France. When the Institute was established in 1796, Ginguené was elected into it and attached to the academy of moral and political sciences. In 1798 he was sent by the Directory as minister plenipotentiary to the king of Sardinia, whose ruin, begun by force of arms, they had determined to complete, if possible, by treachery and cunning. A worse tool than Ginguené could not have been found for carrying out so base a design. After fulfilling his duties for seven months very little to the satisfaction of his employers, Ginguené resigned office and retired into private life at his country house of St Prix, in the valley of Montmorency. Here he prosecuted his literary toils till the revolution of the 18th Brumaire called him once more into public life. He was made a member of the tribunate which made a show of maintaining a democratic opposition to the arbitrary proceedings of the First Consul. But Napoleon, finding that Ginguené was by no means sufficiently tractable, had him expelled at the first "purge" which he administered to the tribunate, and Ginguené once more joyfully returned to private life and his favourite pursuits. These were now more than ever a necessity of life to him, as his only other source of income was the small endowment attached to his seat in the Institute. Fortunately he was nominated one of the commission charged to continue the literary history of France, brought down by the Benedictines to about the close of the twelfth century. The continuation of this work, which appeared in three volumes in 1814, 1817, and 1820 respectively, is for the most part the work of Ginguené. But the work by which he will be longest remembered is his *Histoire Littéraire d'Italie*, 9 vols. 8vo, 1811–1819. He was still engaged in putting the finishing touches to this great undertaking when he was cut off by a painful disease, Nov. 16th, 1815. The first six volumes of the work appeared before their author's death; the seventh is entirely his except a few pages; and of the eighth and ninth he wrote about a half, the other half being composed by Salfi, and revised by Daunou. The success which this work had in Italy was astonishing. Editions of it appeared in various parts of the peninsula, with notes and comments by the best scholars. Three translations of it also appeared at Milan, Naples, and Venice.

Ginguené was originally led to make Italian literature his especial study by finding how ill that subject was understood, and how little it was appreciated by his countrymen. The better to dispel their prejudices, as well as their ignorance, by enhancing the interest of the work, he classified the various productions of each department of literature under one head and in the order of time, so that we can trace the progress of thought in modern Italy, through its various phases, from its dawn in the twelfth century to its glorious noon in the sixteenth. In its composition, Ginguené was guided for the most part by the great work of the Jesuit Tiraboschi, from which he has borrowed very largely. He avoids, indeed, the prejudices and party views of his model, and has imparted a more lively colouring to the original design; but his own style, though occasionally forcible and eloquent, is often too tame for the subject. He often trespasses also on his reader's patience by his over-minuteness of detail. But these faults are more than atoned for by the fine critical discernment, the impartiality, and the freedom which the work displays. On the score of accuracy, indeed, Ginguené sometimes offends, but seldom in matters of great moment; and his occasional slips are such as are almost inevitable to a foreigner and one who could hardly be said to have even seen the country whose literary history he relates. The Italians felt grateful to Ginguené for having placed their literature in its proper light, and readily forgave the excessive eulogies which he passed on many of their writers, whose very names had been forgotten in their own country.

During the latter years of his life Ginguené wrote extensively for the press, and edited the *Decade Philosophique, Politique et Littéraire*, till it was suppressed by Napoleon in 1807. He also contributed largely to the *Biographie Universelle*, chiefly articles bearing on the literature of Italy. (*Biog. Univers.*; *Eloge de Ginguené, Mémoires de l'Institut*, tom. vii.; *Discours de M. Daunou*, prefixed to the 2d edit. of the *Hist. Litt. d'Italie.*)

GINSENG, the Chinese name for the root of *Panax quinquefolium*, a small plant of the nat. ord. *Araliaceæ*, found in the northern parts of Asia and in America. It has a jointed, fleshy, tapered root, which when dried is of a yellowish-white colour, and has a mucilaginous sweet flavour somewhat resembling liquorice, accompanied with a slight bitterness. It is highly prized by the Chinese as a stimulant and restorative, or rather as a panacea for every ill. American ginseng was formerly exported largely from this country; but now the Americans carry it direct to China, which is its only market.

GINZO DE LIMIA, SANTA MARINA, a town of Spain, province of Orense, in Galicia. It stands on a small stream of the same name about twenty miles S.E. of Orense, and contains a parish church, a primary school, and a town-house. Its chief manufacture is linen of various kinds; and its trade is principally in linens and wool. On account of the numerous antiquities found in its vicinity Ginzo is supposed to occupy the site of an ancient town. Pop. 2000.

GIOJA, FLAVIO, an Italian navigator and mathematician of the fourteenth century. His native place was Pasitano, near Amalfi. He has been frequently asserted to be the inventor of the mariner's compass in consequence of his having properly applied it to navigation; but before his time that valuable instrument was known in Europe. It is most likely that the secret of this use of the magnetic needle was brought to Italy by Marco Polo in the year 1260 A.D., after his visit to the East.

GIORDANO, LUCA, a celebrated Italian artist, called by some writers "The Proteus of Painting," was born at Naples, in the house adjoining that inhabited by his future master the famous Ribera, better known as Spagnoletto. The date of his birth is a moot-point among authorities; some assigning it to the year 1632, others, and among them Velasco, with a greater show of probability, to 1629. After studying under Ribera at Naples, he became the pupil of Pietro da Cortona at Rome, whom he assisted in many of his works. Leaving Rome, he visited the famous schools of Bologna, Florence, and Venice, studied the great masters there, and made many copies of their works. He executed these so well and so quickly, that his sketches came to be in great demand. His father, who was noted for his avarice, turned his son's gifts to good account, and would hardly allow him time to eat his meals in peace, continually crying out, "Luca, fa presto" (make haste, Luke), so that the young Giordano was at last known by no other name among his companions. The rapidity of his execution may be inferred from the following story, which is pretty well authenticated. While engaged one day on a painting of Jesus and his twelve disciples, he was interrupted by his father summoning him to dinner; "Luke, come down immediately, the soup will be cold;" "I shall be there in a moment," answered Luke, "I have only the twelve apostles to do now." It is said that he often used his fingers instead of the brush, and never spent more than half an hour upon a half figure of the size of life. To this astonishing rapidity of hand, however, he joined a fine imagination, teeming with ideas; and his fame at length became so great that it reached the ears of Charles II. of Spain, who invited him to his court, and commissioned him to paint fresco-pieces for the Escorial. After Charles's death, Giordano returned to Naples, where, despite his fame achieved, his wealth, and his advanced age, he continued as busy as he had been in his youth, when he had both his name and his fortune to make. He died at Naples in 1704 or 1705.

As a painter, Giordano has no claim to be ranked among the Raphaels, Titians, or Michael Angelos of his own country. But the versatility of his talents, the fire of his compositions, and his fine powers of colouring, entitle him to respectful mention in the history of art. Even his drawing, which has been severely criticised, is perfectly correct in those pieces on which he chose to bestow time and pains. But the wideness of his aims, and his perpetual haste, prevented him from attaining the first rank in any of the many styles which he affected. His best pieces are his frescoes at the Escorial, at Florence, and at Rome. His grand altar-piece of the Fall of Lucifer and Battle of the Angels in one of the Neapolitan churches, is reckoned his masterpiece. There are some fine cartoons and other pieces of his in the galleries of Dresden and London.—See Lanzi.

GIORGIONE, or GIORGIO BARBARELLI, an eminent painter, born at Castelfranco, near Trevigi, in 1478. He learned the rudiments of his profession from Giovanni Bellini at Venice, and is said to have derived his first notions of the force of well-adapted lights and shadows from the works of Leonardo da Vinci. Giorgione was one of the first of the Venetian school who broke through the timid and constrained style to which the art was confined in the time of Bellini, and introduced a freedom of outline, a boldness of handling, and a new and animated manner of colouring, unknown before. De Piles remarks, "that it is a matter of wonder to consider how, all of a sudden, he soared from the low and dry manner of Bellini's colouring to the supreme height to which he raised that lovely part of painting, by joining extreme force with extreme sweetness." Yet, as Pilkington observes, when we reflect that nature and Da Vinci were his models, and that he had a genius happily qualified to study them judiciously, we may more easily account for that excellence by which he was distinguished. His pictures were much admired by Titian, who copied his style, and improved upon his effects of chiaroscuro. His untimely death prevented his acquiring so extensive a celebrity as Titian did; but, as Phillips observes, "in the race of rivalship between these extraordinary artists, it seems probable, had Giorgione's life been prolonged, he might have surpassed Titian in splendour and vivacity, both of colour and of execution." Several of Giorgione's grand compositions in fresco have perished, and those which remain are so materially injured that little of their original beauty is discernible. His easel pictures were few, and now, on account of their scarcity as well as merit, are exceedingly valuable.

In the department of portrait-painting Giorgione may be ranked with the greatest masters. His figures are justly esteemed for their grace, dignity, expression, and truth of character. His carnations have more the appearance of real flesh than of being a fine imitation of it. The landscapes of this artist are also admirable. Of his oil pictures the principal are—Christ bearing his Cross, in the Church of St Roch at Venice; at Trevigi, St Mark appeasing the Tempest; in the Monte di Pietà, a Dead Christ; and at Milan, the Finding of Moses. Giorgione died of the plague, in the prime of life, in 1511.—See Lanzi, *Stor. Pit.* (A. II.)

GIORNOVICHI, Giovanni Maria, more commonly known under the name of Jarnowick, was, according to his own statement, born at Palermo in Sicily, in the year 1745. He studied the violin under the famous Lolli, and became one of the most popular violinists in Europe. About 1770 he went to Paris, where his elegant performance of his first concerto (in A major) at once rendered him a favourite. His overbearing temper and fondness for gambling led him everywhere into misadventures, and a discreditable affair forced him to leave Paris in 1779. After visiting several continental cities, he reached London in 1792, and was well received; but unluckily for him, Viotti arrived soon after, and took the place due to the latter's great superiority. Giornovichi quitted London in 1796, and went to Hamburg; thence, in 1802, to Berlin, and afterwards to St Petersburg, where he died suddenly while playing at billiards on the 24th November 1804. During his residence in England he was invited to Edinburgh, and performed there at the St Cecilia's Hall concerts. His particular merits as a player were perfect intonation, neat execution of rapid passages, and good taste in embellishment. His tone was pure but feeble, and he was deficient in breadth of style and expression. His compositions are light and pleasing, and consist of fifteen violin concertos; three stringed-quartetts; four sets of duets for two violins; sonatas for violin and bass; several symphonies. (G. F. G.)

GIOTTO, who shares with Cimabue the honour of creating, or at least of restoring, modern art, was born at Vespignano, a little village about 15 miles from Florence. His father's name was Bondone, and his own was a diminutive either of Ambrogiotto, his Christian name, or of Angiolotto, a term of endearment formed from Angiolo or Angelo. The date of his birth is not very accurately determined. Vasari and Baldinucci refer it to the year 1276, which would make Giotto only twenty-two years of age when he executed his famous mosaic of the Miraculous Draught of Fishes in 1296, before which date he had produced some of his most famous works. Other authorities refer it to the year 1270; others, considering that Vasari had made a mistake of a figure, put the real date as 1266, thus making him almost exactly coeval with Dante, his *coetano ed amico suo grandissimo.* He died at Florence, January 8, 1336. The best of his works were executed in fresco in various cities of Italy, especially Florence, Rome, Naples, Padua, and Assisi. Giotto may also be considered the creator of the art of portrait-painting. (For an estimate of his genius, and an account of his principal works, see Painting.)—See Lanzi, *Stor. Pit.*

GIOVENAZZO, the ancient *Natiolum*, a walled seaport-town of Naples, province of Bari, on a high rock projecting into the sea, 10 miles W.N.W. of Bari. It is a miserable looking place, with narrow and filthy streets. It is the seat of an archbishopric, and has a cathedral and several other churches, convents, hospitals, and an asylum for the maintenance and instruction in some useful art of foundlings, mendicants, &c. Pop. 7000.

GIPSIES. See Gypsies.

GIRAFFE. See index to Mammalia.

GIRALDI, Lilio Gregorio (1479–1552), a celebrated classical scholar of Italy, was born at Ferrara. The early part of Giraldi's career is a bright example of severe study successfully carried on amid hardships and privations of every kind. The fall of Constantinople had spread the learning of Greece throughout Europe, and Giraldi applied himself to master that branch of knowledge, then new and strange in the West, under the care of Chalcondylas at Milan. The fruits of his extensive erudition was a vast number of treatises on the literature and antiquities of the ancient world. Through one of these Giraldi's name is still remembered—his *Historia de Diis Gentium.* To him belongs the merit of having first examined the mythology of the ancients, and applied to its elucidation an amount of learning and judgment till that time unknown.

Another distinguished member of this family was Giovanni Battiste Giraldi Cintio, who wrote a large number of *novelli* and miscellaneous pieces, of which the most remarkable was his *Gli Hecatomiti*, or *Hundred Tales.*

GIRALDUS CAMBRENSIS. See Barry, *Girald de.*

GIRDER, in *Architecture*, a main beam for supporting the joists of a floor: so called, probably, because the ends of the joists are inserted into it.

GIRDLE, a band of leather or other material worn around the waist. The girdle was used by the Hebrews, the Greeks, and the Romans, and is still worn in the East. Among the Romans it was used to confine the *tunica;* and so general was the custom, that the want of a girdle was regarded as strongly presumptive of idle and dissolute propensities. It also formed a part of the dress of the Greek and Roman soldier; and we meet with the phrase *cingulum deponere*, to lay aside the girdle as equivalent to quitting the service. It was used as now in the East to carry money in; hence *zonam perdere*, "to loose one's purse."

The phrase *zonam solvere virgineam* was appropriated to the ceremony of unloosing the girdle of the bride on the nuptial night. To Venus was attributed by the poets the possession of a girdle which had the miraculous virtue of inspiring love. See Cestus.

It was an ancient custom in Britain for bankrupts or other insolvent persons to put off and surrender their girdles in open court. The reason of this was, that our ancestors used to carry their purse, keys, and the like, fastened to the girdle; and hence the girdle became a symbol of the condition of the individual. History relates that the widow of Philip I. duke of Burgundy renounced her right of succession by putting off her girdle upon the duke's tomb.

GIRGEH, a town of Upper Egypt, on the Nile. See Egypt, vol. viii., p. 505.

GIRGENTI, a province on the S.W. coast of Sicily, occupying an area of about 1200 square miles. Ramifications of the Neptunian mountains cover most of its surface, rising highest in the north, and rapidly descending towards the southern shore. Among the mountain ridges there are numerous beautiful and very fertile valleys, producing in rich abundance oranges, lemons, corn, wine, and oil. The valleys and uplands afford also excellent pasture, which gives richness to the abundant dairy produce, especially to the cheese, which has long been famous. The principal streams are the Salso, the Belice, and the Platani—the Salso bounding the province on the S.E., the Belice on the N.W., and the Platani traversing it near the centre in a W.S.W. direction. The mineral products found in greatest abundance are salt, sulphur, naphtha, and bitumen, as well as some fine agates. The manufactures and trade of this province are unimportant. It is divided into three administrative districts—Girgenti the capital, Bivona, and Sciacca, which are subdivided into sixteen circondarij. The population is rather more than 250,000.

GIRGENTI, a town on the S.W. coast of Sicily, capital of the province of the same name. It stands near the site of the ancient Agrigentum (which is described under that head), on the slopes of Mount Camicus, in the Val-di-Mazzara, nearly 3 miles from the shore, and 60 S.S.E. of Palermo. The modern town is about one-tenth of the size of the ancient city, and though irregularly built, it presents rather an imposing appearance standing at an elevation of 1100 feet above sea-level. The streets are, however, mean and dirty; and they are so steep, narrow, and wretchedly paved, that they are impassable by wheel-vehicles. It contains a cathedral, 45 churches, 17 convents, one seminary, one orphan hospital, a lyceum, and a monte-di-pietà. The harbour, once capable of admitting large vessels, has now only 12 feet water on the bar. It was formed in 1752 by the erection of a fine mole; and its latitude and longitude are respectively 37. 15. 36. N., and 13. 31. 45. E. The principal objects of commerce are fruit, oil, sulphur, and grain, of which last large quantities are stored in caverns in the rock. Four miles north of Girgenti is the mud volcano called Maccaluba. The present population of the town is nearly 18,000, consisting chiefly of agriculturists and priests.

GIRONDE, a maritime department in the S.W. of France, formed of part of the old province of Guienne; and bounded on the north by the department of Charente-Inférieure, east by those of Dordogne and Lot-et-Garonne, south by that of Landes, and west by the Bay of Biscay. It lies between Lat. 44. 12. and 45. 35. N., and between Long. 0. 18. E. and 1. 16. W., being 106 miles in length from N.W. to S.E., and 80 in breadth from N.E. to S.W. This is the largest of the French departments, having an area of 3761 English square miles. Population (1851) 614,387, as follows:

	Cantons.	Communes.	Pop. in 1851.
Bordeaux	18	153	296,632
Blaye	4	56	59,469
Lesparre	4	30	39,677
Libourne	9	132	111,104
Bazas	7	68	55,112
La Réole	6	105	52,393
	48	544	614,387

Bordeaux, the capital, in 1851 contained 123,935 inhabitants.

With the exception of the eastern portion of the department, where there are some hills, the surface is generally level. The western portion is a vast sandy plain, termed *les Landes.* On the coast are two extensive shore lakes, Carcano and Canau, communicating with each other, and with the bay of Arcachon, near the southern extremity of the department. A range of sandy downs separates these two lakes from the sea. The bay of Arcachon contains numerous islands, and on the land side forms a vast shallow lagoon; a considerable portion of which, however, has lately been drained and converted into arable land. On the south side of the bay stands the port of Teste-de-Buch, which is now connected with Bordeaux by railway. The river or estuary of the Gironde, from which this department takes its name, is formed by the union of the Garonne and Dordogne. It has a N.N.W. direction, is about 45 miles in length, and varies in breadth from 2 to 6 miles. The principal affluent of the Dordogne in this department is the Isle. The feeders of the Garonne are, with the exception of the Dropt, all small. West of the Garonne the only river of importance is the Leyre, which flows into the bay of Arcachon. The climate is humid and temperate, and, except in the Landes, is generally healthy. About one-third of this department consists of heaths and wastes, one-fourth of arable land, one-seventh of vineyards, and one-eighth of woods and forests. Wheat, rye, maize, millet, and hemp, are grown to a considerable extent. The corn produced, however, does not more than half meet the wants of the inhabitants. The culture of the vine is by far the most important branch of industry carried on. The annual produce of wine, principally claret, in this department is about 55,000,000 gallons. The finest clarets are the growths of Lafitte, Latour, Château-Margaux, and Haut Brion. The most valued white wines are Sauterne, Barsac, Preignac, and Vin de Grave. This department also produces excellent fruit. The extensive woods which skirt the sea-coast or pervade the *Landes* consist chiefly of pine, and supply timber for deals and masts, as well as resin, pitch, and turpentine. There are stone quarries and smelting works, but few mines. The manufactures are various, and, with the general trade, are chiefly carried on at Bordeaux.

GIRONDISTS. See FRANCE, vol. x., p. 71, &c.

GIRONS, ST, a town of France, capital of a cognominal arrondissement in the department of Ariège, on the right bank of the Salat, 25 miles west of Foix. It has a communal college, an old Gothic church with a lofty spire, and manufactures of woollens, linens, leather, and paper. Pop. (1851) 3895.

GIRVAN, a market-town and burgh of barony in the county of Ayr, Scotland, on the left bank of the Girvan, near its mouth, 17 miles south by west of Ayr. The river here forms a small harbour, with 9 to 11 feet water. The houses are chiefly buildings of one story, and the inhabitants are mostly weavers for the Paisley and Glasgow manufacturers. A few are employed in fishing. They are generally very poor, and about two-thirds of them are Irish, or of Irish extraction. Market-day, Monday. Pop. (1851) 7319.

GISORS, a town of France, department of Eure, in a pleasant valley on the Epte, 14 miles east of Les Andelys. Of its ancient castle built in the twelfth century, and once one of the principal strongholds in the kingdom, the tower and keep are still standing. Its ancient ramparts have been converted into promenades. It has a curious old church which dates from the thirteenth century, a communal college, tanneries, breweries, cotton-spinning and bleaching establishments. Pop. 3700.

GITTITH, גִתִּית, a word which occurs in the titles of Psalms viii., lxxxi., lxxxiv., and is generally supposed to denote a musical instrument. From the name it has been supposed to be an instrument brought from Gath (גת) by David; and from Isaiah xvi. 10 it has been inferred that it was used especially at the vintage season. If it means a musical instrument, it is remarkable that it does not occur in the list of instruments assigned by David to the temple musicians, nor even in that list which appears in the first two verses of Psalm lxxxi., in the title of which it is found. The supposition of Gesenius that it is a general name for stringed instruments obviates this difficulty. The Septuagint renders the title by ὑπὲρ τῶν ληνῶν, "upon the wine-press;" and Carpzov, Pfeiffer, and others follow this in taking the word to denote "a song composed for the vintage," or for the feast of tabernacles. (Carpzov, *Observ. Philol. super Psalmos Tres* על־הגתית, Helmst. 1758.; Pfeiffer, *Ueber die Musik*, p. 32.)

GIUGLIANO, a town of Naples, 8 miles N.N.W. of the capital of that kingdom. It has a castle, four churches, two of which are collegiate, and a hospital. Pop. 9000.

GIULIANO, SAN, a town of Sicily, on the summit of a mountain of the same name, 5 miles E.N.E. of Trapani. It has numerous churches and convents, a hospital, a *mont-de-piété*, and about 10,000 inhabitants. It occupies the site of the ancient ERYX, which see.

GIULIO-ROMANO, the name by which Giulio-Pippi, or rather De Giannuzzi, is commonly known, was born at Rome in 1492, and at an early age distinguished himself as one of the ablest of the pupils of Raphael, whose successor he may justly be considered. He assisted that great master in the celebrated "Battle of Constantine," and other famous frescoes in the Vatican; and with Pinni he completed the frescoes of the Stanza di Costantino in the Vatican after the death of Raphael in 1523. In the following year he entered the service of the duke Federigo Gonzaga at Mantua, where he succeeded in establishing a considerable school, and conducted the various works which that prince had projected for the embellishment of his capital. His talents as an architect would place him among the most eminent of his age in this profession, were it not that his reputation as a painter has eclipsed these. Giulio Romano died at Mantua, November 1, 1546, at the age of forty-seven, leaving numerous works in fresco, and many fine oil paintings, which fully established his fame as the chief of all Raphael's disciples. He may also fairly be considered the ablest of the Italian ornamental decorators. See PAINTING. (Vasari, *Vite de' Pittori*, &c., Flor. 1846; Gaye, *Carteggio Inedito d' Artisti;* Lanzi, *Storia Pittorica.*)

GIURGEVO, a town and river port of Wallachia, on the left bank of the Danube, opposite Rustchuk, 40 miles S.S.W. of Bucharest. The houses are mean-looking mud edifices, and the streets are narrow and filthy. The cathedral stands on an eminence in the river, and is connected with the town by a bridge. The principal square contains a tall quadrangular tower, surmounted by a bell, which sounds at certain hours. The fortifications which formerly surrounded the town were demolished by the Russians in 1829. Giurgevo is the most important trading port on the Wallachian side of the Danube, and carries on a considerable trade with Austria, Germany, Hungary, &c. Pop. 7000. The Russians were here defeated by the Turks, July 7th, 1854.

GIVET, a fortified town of France, department of Ardennes, situated on both sides of the Meuse, 26 miles N.N.E. of Mezières. On the left bank of the river, at the foot of a mountain, on which stands the citadel called Charlemont, is the quarter Givet St Hilaire, while on the opposite bank is that of Givet Notre-Dame. They are both fortified, and communicate with each other by means of a handsome stone bridge of five arches. The town is generally well built, and has extensive barracks, a military hospital, and public library; also manufactures of white-lead, glue, earthenware, leather, and some trade. Pop. 4000.

GIVORS, a town of France, department of Rhône, 14 miles south of Lyons. Being situated on the Rhone and the Canal of Rive-de-Gier, and near the railway between Lyons and St Étienne, its inhabitants are chiefly boatmen or carriers. It has also several glass and tile works. Pop. 7010.

GLACIER,

A NAME given to masses of ice which descend from snowy mountains into the adjacent valleys, where they attain a level often far below the upper limit of the surrounding vegetation. The following are the synonymes for a glacier in some different languages and dialects. In French, *glacier;* German, *gletscher;* Italian, *ghiacciaja;* Tyrolese, *fern;* in Carinthia, *käss;* in the Vallais, *biegno;* in part of Italy, *vedretto;* in Piedmont, *ruize;* in the Pyrenees, *serneille;* in Norway, *iisbræ* or *iisbrede;* in Lapland, *geikna* or *jegna;* in Iceland, *jökull* or *fall-jökull.*

The characteristic appearance of a glacier can be nowhere better studied than in Switzerland and Savoy. The icy mass of the glacier of Bossons at Chamouni—which descends immediately from the highest part of Mont Blanc, but lies, summer and winter, in the valley at a height of no more than 3500 English feet (the height of perpetual snow being about 9000 feet), where it is embosomed amongst luxuriant wood, and is almost in contact with corn-fields—exhibits a spectacle which none who have once seen it can forget, and which attracts more interest and curiosity the more carefully it is considered. The lower glacier of Grindelwald, descending to 3400 feet, is another familiar example of the same phenomenon. In the Arctic regions true glaciers also exist, which, descending the valleys (often of great width and little inclination), enter the sea, and, breaking off, supply the floating ice-islands or icebergs which frequently drift into comparatively low latitudes. These glaciers do not essentially differ from those of alpine countries.

The diminution of temperature as we ascend the slopes of mountains, as indicated by successive zones of vegetation, and finally by the occurrence of perpetual snow, is stated and explained in other articles (CLIMATE, PHYSICAL GEOGRAPHY, and BOTANY, Part III.), and therefore may be assumed here. Thus in the high mountains of the Andes and Himalaya, between the tropics, the commencement of perpetual snow is found at from 15,000 to 18,000, or even 19,000 feet, according to circumstances; whilst in southern Europe the level is from 8000 to 9000 feet, and in Norway from 5500 to 3000 feet, according to the latitude and the distance from the sea. It was first shown by Baron Humboldt and Von Buch that the limit of perpetual snow depends principally on the temperature of the summer, and not upon that of the whole year.

It has been already explained that an accumulation of snow, even frozen snow, does not constitute properly a glacier. A glacier is a mass of ice, having its origin in the hollows of mountains where perpetual snow accumulates, but which makes its way down towards the lower valleys, where it gradually melts, and it terminates exactly where the melting, due to the contact of the warmer air, earth, and rain of the valley—compensates for the bodily descent of the ice from the snow reservoirs of the higher mountains. From this it is evident, without any formal measurements, that A GLACIER IS ICE IN MOTION.

Geographical Distribution of Glaciers.—Glaciers are not peculiar to any country or region of the earth. It may be that there are extensive snowy mountains wholly devoid of them, as is supposed to be the case in tropical South America; but even this exception requires confirmation.

There are peculiarities in the form of mountains, and still more in climate, which, as we shall see, favour the formation of glaciers, or may even totally prevent it.

Although it is only of late years that glaciers have been generally acknowledged to exist in the Himalaya, the descriptions given many years ago by Captain Hodgson of the source of the Ganges could leave no doubt as to the fact on the mind of any one familiar with the glaciers of the Alps. "The Bhagiruttee or Ganges," he writes in 1817, "issues from under a very low arch at the foot of the grand snow-bed. . . . . . . Over the debouche the mass of snow is perfectly perpendicular, and from the bed of the stream to the summit, we estimate the thickness at little less than 300 feet of solid frozen snow, probably the accumulation of ages. It is in layers of some feet thick, each seemingly the remains of a fall of a separate year."[1] The level of the source of the Ganges is 12,900 feet, and the chief error of this description is in the interchange of the word *snow* for ice, and in the absence of a clear perception that the ice could not have always lain there, some thousand feet below the snow-line, but must have travelled progressively down the valley, producing the phenomena of rents and superficial rubbish-heaps which Captain Hodgson describes in another paragraph.

For many years after 1817 the glaciers of the Himalaya, if mentioned at all, are so under the false name of snow-beds, and their relations to physical geography were wholly neglected. This arose from the imperfect education of those clever men who have at different times explored our Indian possessions, who being chiefly bred in that remote land had little acquaintance with the scientific literature of Europe, and still less with its physical features. Scarcely any of our Himalayan travellers had previously visited the Alps.

It is since 1840 that we have acquired more correct information as to the glaciers of India. Mr Vigne, in his interesting *Travels in Kashmir*, has described the perfectly characteristic features of the glaciers of some of the sources of the river Indus occurring in the territory of Little Thibet, about Lat. 35°. Colonel Madden and Captain Richard Strachey directed attention to the glaciers of the central Himalaya (Kumaon) at the source of the rivers Pindur and Kuphinee, in Lat. 30° 20′, at the level of 11,300 and 12,000 feet respectively, the height of the snow-line being there about 15,000 feet.[2] The phenomena and mode of progression of these glaciers, as noted by Captain R. Strachey, appear identical with those which we shall presently describe as characteristic of those of Europe. Farther in the interior of the same chain Dr Thomas Thomson has lately described[3] numerous glaciers filling valleys of the central Himalaya (particularly that on the north side of the Bardar or Umasi pass, Lat. 33° 20′, Long 76½° E.), which probably exceeds in size any other yet described. Dr Joseph Hooker, in his interesting *Himalayan Journals*, has described in detail the glaciers of the eastern portion of the same range in the territories of Sikkim and Nepaul, where the gigantic mountain Kinchinjunga rears its head to 28,178 feet above the sea, whence the ice descends (he states) in one unbroken mass of 14,000 feet of vertical height to the source of the Thlonok river. Both Dr Thomson and Dr Hooker concur in ascribing to the Himalayan glaciers a formerly much greater extension towards the plains of India, which has left geological evidence of their former sojourn in the lower valleys, in the masses of transported rock and rubbish there accumulated. Thus, instead of glaciers being rare or unexampled phenomena in the east, as was at one time supposed, we find them developed on a scale commensurate with that of the stupendous mountains with which they are connected, and that from one end to the other of the Himalayan range.

Passing over the less important glaciers of the Caucasus and Altai, we come to the glaciers of Europe, which are principally confined to two great mountainous districts, the Alps and the high lands of Norway.

Referring for minute topographical details to the works which have been published more particularly in connection with the subject, and with those countries,[4] we may state generally, that wherever (in Europe) any considerable area of mountainous country rises above the snow-line, there glaciers are found in more or less abundance. In the Alps this level is, on an average, about 7200 feet, including glaciers of all descriptions (Schlagintweit). The great glaciers have of course the lowest mean level. Of these there are, on the same authority, sixty in the whole Alpine chain. Glaciers commence on the south-western prolongation of the chain in the region of Mont Pelvoux and Monte Viso (Lat. 45°), and they extend on the N.E. to the Gross Glockner in Carinthia. The best known and most important glacier-bearing groups in the interval are those of Mont Blanc, Monte Rosa, the Bernese Alps (Finsteraarhorn and Jungfrau), and the Oertler Spitz in the Tyrol. The most considerable individual glaciers are the Mer de Glace of Chamouni, the Gorner glacier near Zermatt (Monte Rosa), the lower glacier of the Aar (Bernese Oberland), the Aletsch glacier and glacier of the Rhone (Vallais), and the Pasterzen glacier (Carinthia). Of these, the first, third, and last have been made the subjects of the most careful surveys and observations.

In Great Britain no mountain fully attains the height of the snow-line, consequently there are no glaciers. But patches of snow, with a more or less icy structure, remain through the summer in the clefts of some of the Scottish hills. Geological appearances, however, strongly indicate the formerly greater extension of glaciers, especially in Scotland and Wales.

In Norway we find two principal groups of glacier-bearing mountains—those in the Bergenstift and those within the arctic circle. The former were well described by M. Durocher.[5] Professor J. D. Forbes, in a recent work,[6] has detailed his observations on most of them, has given an enumeration of all the known glaciers of Norway, and has compared their conditions and structure with those of the glaciers of the Alps. Of the Bergen group, those of Justedal are the best known, and probably the best worth visiting. Justedal is connected with the inmost ramification of the intricate Sognefiord. On the Fjærlandsfiord, another branch of the same inlet, two important glaciers are found, one of which terminates only 105 feet above the sea level, in Lat. 61°. The Hardanger fiord, somewhat farther south presents one fine glacier, the Bondhuusbræ. The more northern group of Norwegian glaciers commences at Fondal, just within the limits of the arctic circle, where numerous glaciers descend almost to the sea level. About Lat. 70°, on the promontory of Lyngen, are several glaciers, and in the neighbouring Jokulsfiord is one which is stated actually to enter the sea, and to break off in miniature icebergs. About the North Cape the mountains are not sufficiently high to afford any perpetual snow.

Iceland, with a summer temperature far inferior to that of Norway, abounds in glaciers, which, however, have not been very particularly described. Those of Swina-fels and Holaar are stated to be large and characteristic.

The glaciers of Spitzbergen have been minutely described by Dr Scoresby[1] and by M. Martins.[2] They appear to be essentially of the same nature, and subject to the same laws as those of Switzerland, but modified by the depression of the snow-line and the extreme shortness of the summer. The texture is less icy, the rate of progression probably slower; as the superficial fusion is not great, they descend in vast sheets into the waters of the sea (as at Magdalena Bay), where they form icebergs. The western coasts of Greenland appear to offer the same phenomena, but on a grander scale.

The interior of arctic North America has too even a surface, and perhaps too dry and rigorous a climate, to present glaciers in perfection.

In South America, about Lat. 47°, where the climate is one of the worst in the world, numerous glaciers, resembling probably those of Iceland, have been described by Captain King and Mr Darwin. Sir James Clark Ross, in his antarctic voyage, has described and represented by admirable views the stupendous icy barriers which fringe the coast of the inhospitable southern continent.

After reviewing the descriptions of glaciers in all regions of the world, we recur to those of the Alps as presenting all the characteristic features of glaciers in perfect development, and under circumstances the most convenient for study.

General Phenomena of Alpine Glaciers.—The manner in which a glacier protrudes itself into a valley, far below the level of perpetual snow, has been already mentioned. The inference being obvious, that since it is continually melting (during summer) in all its parts, yet retains its general form and place, the waste below must be supplied by the continual advance of the glacier forwards and downwards, we shall consider in the meantime the *motion of the glacier* as an established fact to which we shall afterwards devote a separate and special discussion. It very frequently happens that the termination of the greater glaciers takes place in an alluvial flat in the bottom of a large alpine valley (as in the glaciers of the Mer de Glace, Brenva, Rhone, Lower Aar, and those of Grindelwald). From a vault in the green-blue ice, more or less perfectly formed each summer, the torrent issues, which represents the natural drainage of the valley, derived partly from land springs, partly from the fusion of the ice. That of the Arveiron, near Chamouni, is perhaps the best known, but almost every glacier possesses such a vault.

Most usually the glacier terminates amidst a wilderness of stones borne down upon its surface and deposited by its fusion. Sometimes these blocks are heaped up in mounds called *moraines*, which, when in front of the lower end of a glacier, are called its *terminal moraines*, and mark in a characteristic and certain manner the greatest limit of extension which the glacier has at any one time attained. Sometimes a glacier is seen to have withdrawn very far within its old limits, leaving a prodigious barren waste of stones in advance of it, which, being devoid of soil, nourishes not one blade of grass. At other times the glacier pushes forward its margin beyond the limit which it has ever reached (at least within the memory of man), tears up the ground with its icy ploughshare, and shoves forward the yielding turf in wrinkled folds, uprooting trees, moving vast rocks, and scattering the walls of dwelling houses in fragments before its irresistible onward march.[3]

The lower end of a glacier is usually steep; sometimes with a dome-shaped unbroken outline, more frequently broken up by intersecting cracks into prismatic masses which the continued action of the sun and rain sharpen into pyramids, often assuming (as in the glacier of Bossons at Chamouni) grotesque or beautiful forms.

The united or crevassed condition of the glacier generally depends almost entirely on the slope of its bed. If it incline rapidly, numerous transverse fissures are formed from the imperfect yielding of the ice during its forced descent along its uneven channel. These cracks often extend for hundreds of yards, and may be hundreds of feet in depth; but their greatest depth is not accurately known, since they are rarely quite vertical. In many cases, however, the crevasses are comparatively few in number, and the glacier may be readily traversed in all directions. This is especially the case if a glacier of considerable dimensions meets with any contraction in its course. The ice is embayed and compressed, and its slope lessens, just as in the case of a river when it nears a similar contraction preceding a fall. Such level and generally traversable spaces may be found about the middle regions of the Mer de Glace, the lower glacier of Grindelwald, the lower glacier of the Aar, and in many other cases. The last named glacier is perhaps the most remarkably even and accessible of any in Switzerland. The slope of its surface is in many places only 3°. The Pasterzen glacier in Carinthia is even less inclined. It is in such portions of a glacier that we commonly find *internal cascades*, or "moulins." These arise from the superficial water of a glacier being collected into a considerable mass by a long course over its unbroken surface, and then precipitated with violence into the first fissure it meets with. The descending cascade keeps open its channel, which finally loses the form of a fissure, presenting that of an open shaft, often of immense depth.

Nearly connected in their origin with the internal cascades are the *gravel cones*, occasionally seen on the surface of glaciers, which appear to be formed in this way:—a considerable amount of earthy matter derived by the superficial water-runs from the *moraine*, accumulates in heaps in the inequalities of the ice, or at the bottom of the "moulins." As the glacier surface wastes by the action of the sun and rain, these heaps are brought to the surface, or rather the general surface is depressed to their level. If the earthy mass be considerable the ice beneath is protected from the radiation of the sun and from the violent washing of the rain; it at length protrudes above the general level of the glacier, and finally forms a cone which *appears* to be entirely composed of gravel, but is in fact ice at the heart, with merely a protecting cover of earthy matter. These singular cones are very well seen on the glacier of the Aar, but on most others they are comparatively rare.

The similar protective action of large stones detached from the moraines and lying on the surface of the ice often produces the striking phenomenon of *glacier tables.* Stones of any considerable size almost invariably stand upon a slightly elevated pillar of ice; but when they are broad and flat they occasionally attain a height of 6 and even of 12 feet above the general level. A striking instance has been described and drawn by Professor Forbes, in his *Travels in the Alps of Savoy.*

To this peculiar tendency of glaciers *apparently* to elevate heavy and opaque bodies above their surface—*in reality* to have their surface depressed beneath them—is no doubt mainly owing to the striking, and at first sight perplexing, fact, that stones or dirt are scarcely ever seen imbedded in the massive ice of glaciers. The Swiss peasants attribute to them an intrinsic power of rejecting impurities. The fact is, that year by year, and month by month, fresh thicknesses of virgin ice become revealed by the fusion of the surface. That ice, formed in the highest mountain hollows, never was or could be impure. The rocks and earth have fallen upon the surface since; and, by the conditions which we have mentioned, once there, there they remain. Even those blocks which fall into the crevasses are usually arrested at no great depth, and by the general lowering of the glacier-surface, soon attain its level.

[2] *Bibliothèque Universelle*, 1840.

[3] Such a sudden and disastrous increase took place in many of the glaciers of Switzerland and Savoy in 1818 (occasioning the catastrophe of the Val de Bagnes), and in those of the Bergenstift in Norway about 1740. The retreat of a glacier far within its old moraines is well exemplified in most of the glaciers of the latter country, and especially in that of Nygaard.

The superficial waste of a glacier is thus a very important phenomenon. Owing to it the body of the ice has its vertical thickness rapidly diminished during the heats of summer, and, as we have already intimated, the lower end of a glacier has its position determined by the amount of this waste. Suppose a glacier to move along its bed at the rate of 300 feet per annum, and imagine (merely for the sake of illustration) its yearly superficial waste to be 20 feet: then the thickness of the glacier will diminish by 20 feet for every 300 feet of its length, or at the rate of 360 feet per mile; so that the longitudinal section of a glacier has the form of a wedge; and however enormous its original thickness, after a certain course we must at length come to the thin end of the wedge, and *that* the more rapidly as the causes of melting increase towards the lower extremity. These causes are indeed so various that it is difficult to estimate them with accuracy. We have (1) the direct solar heat; (2) the contact of warm air; (3) the washing of rain. All these causes act on the surface, and produce the *ablation* of the surface. Besides these, the ice of the glacier wastes somewhat beneath by the contact of the soil and the washing of the inferior streams. This may be called its *subsidence.* Further, the natural slope of the rocky bed of the glacier causes any point of the surface to stand absolutely lower each day in consequence of the progressive motion. These three causes united produce the *geometrical depression* of the surface. Professor Forbes has shown how the several effects may usually be distinguished by observation.[1] During the height of summer, near the Montanvert, he found the daily average *ablation* to be 3·62 inches, the daily *subsidence* to be 1·63 inches. Seven-tenths of the geometrical depression are due therefore to the former cause, and three-tenths to the latter. This is a very large amount, and it is certain that during the colder period of the year, and whilst the glacier is covered with snow, the subsidence is not only suspended, but that the glacier recruits in thickness a portion of its waste during the season of summer and autumn. To this subject we shall again return.

One point about *moraines* we have not yet mentioned. As we ascend any considerable glacier we almost invariably observe *several* parallel trails of *debris* extending throughout its length, and not mixing with one another. These *medial moraines* may in all cases be traced to a rocky promontory where two tributary glaciers have united. The rocky masses detached by frost and rain which have rolled upon the margin of the confluent glaciers are borne along by the progress of each to the point of union. But where the icy streams unite the trails of rock do so also; and being continually retained on the surface by the causes we have mentioned, float, as it were, down the middle of the common glacier, preserving throughout the distinctive character of their origin. Four such medial moraines may readily be traced to their sources on the great glacier of Chamouni; but the grandest specimen of a medial moraine is that on the glacier of the Lower Aar, effectively represented in one of the plates in M. Agassiz' work (*Etudes sur les Glaciers*).

The middle region of the great glaciers of the Alps extends from the level of about 6000 to 8000 feet above the sea. The inclination is usually there most moderate—say from $2\frac{1}{2}°$ to 6°. But this is not invariably the case. Beyond 8000 feet we reach the snow line. The snow line is a fact as definite on the surface of a glacier as on that of a mountain, only in the former case it occurs at a somewhat lower level. It cannot be too distinctly understood that the fresh snow annually disappears from the glacier proper. Where it ceases entirely to melt, it of course becomes *incorporated* with the glacier. We have therefore arrived at the region where the glacier *forms;* everywhere below it only *wastes.* This snowy region of the glacier is called in French *névé;* in German, *firn.* As we ascend the glacier it passes gradually from the state of ice to the state of snow. The superficial layers are more snowy and white, in fact nearly pure snow; the deeper ones have more colour and consistence, and break on the large scale into vast fragments, which at Chamouni are called *seracs.* The *névé* moves, as the glacier proper does, and it is fissured by the inequalities of the ground over which it passes. These fissures are less regular than those of the lower glacier. They are often much wider, in fact of stupendous dimensions, and being often covered with treacherous snowy roofs, constitute one of the chief dangers of glacier travelling. The constitution of the *névé* may be well studied on the Glacier du Géant, a tributary of the Mer de Glace.

The mountain-clefts in which large glaciers lie, usually expand in their higher portions (in conformity with the ordinary structure of valleys) into extensive basins in which snow is perpetual, and which therefore contain the *névé*, the true origin and material of the glacier, which is literally the overflow of these snowy reservoirs. The amount of overflow, or the discharge of the glacier—upon which depends the extent of its prolongation into the lower valleys—depends in its turn on the extent of the *névé* or collecting reservoir. Glaciers with small reservoirs, of necessity perish soon. Their thickness is small, and consequently the wedge of the glacier soon thins out. Such glaciers are common in confined clefts of the higher mountains. Being destitute of reservoirs, they soon terminate abruptly. Such are the *glaciers of the second order* described by De Saussure. They are exceedingly numerous in all glacier-bearing chains of mountains, but from their comparative smallness and inaccessibility, they usually attract but little attention. Their slope is often very great—from 20° to 40°.

Structure of Glacier Ice, and Dirt Bands.—The ice of the glacier proper has a very peculiar structure, quite distinct from the stratification of the snow on the *névé* (the relics of its mode of deposit), and one which requires special notice. When we examine the appearance of the ice in the wall of an ordinary crevasse (especially if it be tolerably near the side of the glacier) we are struck with the beautiful *vertically laminated structure* which commonly it presents, resembling delicately-veined marble, in shades varying from bluish-green, through green, to white. It sometimes resembles the marble called in Italy *cipollino.* When we trace the direction of the planes constituting the laminated structure, by observing them on the surface of the glacier (where they are usually well seen after rain, or in the channels of superficial water-runs), we find that where best developed (or not very far from the sides of the glacier) these laminæ are nearly parallel to the sides, but rather incline from the shore to the centre of the ice stream as we follow the declivity of the glacier.

The general *out-crop* of the veined structure may best be seized at a glance by means of a correlative phenomenon thus described by Professor Forbes, who first observed it:—" On the evening of the 24th July (1842), the day following my descent from the Col du Géant, I walked up the hill of Charmoz to a height of 600 or 700 feet above the Montanvert, or 1000 feet above the level of the glacier. The tints of sunset were cast in a glorious manner over the distant mountains, whilst the glacier was thrown into comparative shadow. This condition of half-illumination is far more proper for distinguishing feeble shades of colour on a very white surface like that of a glacier than the broad day. Accordingly, whilst revolving in my mind, during this evening's stroll, the singular problems of the ice world, my eye was caught by a very peculiar appearance of the surface of the ice, which I was certain that I now saw for the first time. It consisted in a series of nearly hyperbolic brownish bands on the glacier, the curves pointing downwards, and the two branches mingling indiscriminately with the (lateral) moraines, presenting an appearance of waves some hundred feet apart, and having opposite to the Montanvert the form which I have attempted to show upon the map,[1] where they are represented in the exact figure and number in which they occur. . . . . . . I was satisfied, from the general knowledge which I then had of the 'veined structure' of the ice, that these coloured bands probably followed that direction."[2] Farther examination confirmed this conjecture, and showed that these superficial discolorations in the form of excessively elongated hyperbolas are due to the recurrence (at intervals of some hundred feet along the course of the glacier) of portions of ice in which the veined structure is more energetically developed than elsewhere, and where, by the decomposition of the softer laminæ, portions of sand and dirt become entangled in the superficial ice, and give rise to the phenomena of *dirt bands*, which thus at a distance display (though in a manner requiring some attention to discover) the exact course of this singular structure on the surface of the glacier. The annexed figure, No. 1, displays the superficial form of the dirt bands, and the course of the structural laminæ projected horizontally. No. 2 shows an ideal transverse section of the glacier; and No. 3 another vertical section parallel to its length. These three sections in rectangular planes will serve to give a correct idea of the course of this remarkable structure within the ice, but a more popular conception will be formed of it from the imaginary sections of a canal-shaped glacier in the annexed woodcut, No. 4. The structure of the compound glacier, originally double, becomes gradually single; and the *frontal dip* of the laminæ at the loop of the horizontal curves which in the upper region of the glacier is nearly vertical, gradually slopes forwards until at the lower termination it has a very slight dip inwards, or indeed may be reversed and fall outwards and forwards. The general form of a structural lamina of a glacier rudely resembles that of a spoon.

---

[1] Eleventh Letter on Glaciers. *Ed. Phil. Journal*, 1846. Observations of the ablation of the ice have also been made by MM. Martins and Agassiz. The amount, of course, depends materially on the elevation and exposure of the glacier as well as on the weather and season.

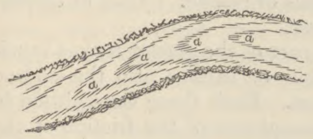

Fig. 1.

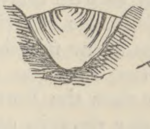

Fig. 2.

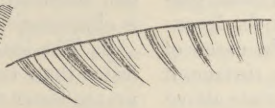

Fig. 3.

This structure and the accompanying dirt bands have been recognized by different observers in almost all glaciers, including those of Norway and of India. The interval between the dirt bands has been shown in the case of the Mer de Glace (and therefore probably in other cases) to coincide with annual rate of progression, and in the higher parts of the glacier (towards the *névé*) to be accompanied by wrinkles or inequalities of the surface which are well marked by the snow lying in them during the period of its partial disappearance.[3]

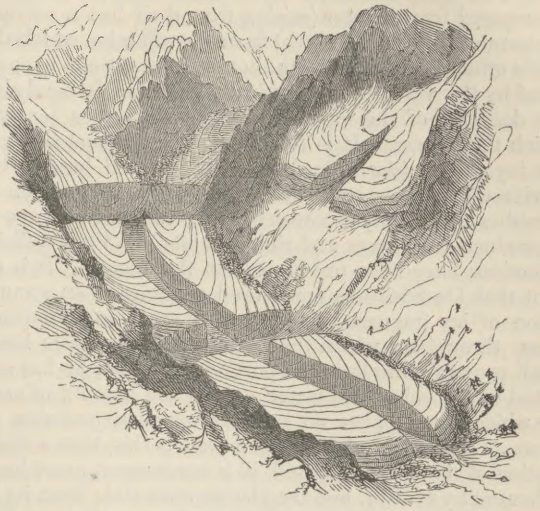

Fig. 4.

The Motion of Glaciers, and its causes.—The most characteristic and remarkable feature of glaciers is their motion downwards from the *névé* towards the lower valley. The explanation of it is by far the most important application of mechanical physics connected with the subject.

Obvious as the fact itself must appear by what has been already stated, manifest confusion has obtained in the minds of intelligent persons regarding it. Thus Ebel, in his well-known Swiss guide-book, affirms the motion of the glaciers of Chamouni to be 14 feet, and those of Grindelwald 25 feet in a year; quantities which, if they have any meaning, must refer to the *apparent* advance of the lower termination of those glaciers into the valley, which therefore only indicate the difference of the real motion, and of the waste in any particular season, and which may become *null*, or even *negative*, if the summer be more than usually warm. The peasants, however —who are inevitably made aware of the progressive motion of the ice by observing the progressive advance of conspicuous blocks on its surface—commonly ascribe to the glaciers the more correct measure of several hundred feet per annum.

M. Hugi, of Solcure, measured, with some accuracy, year by year, the progress of a conspicuous block on the glacier of the Aar, which he found to be 2200 feet in nine years, or about 240 feet per annum.[4] M. Agassiz continued some of these annual measures, but only in a rough way by causing his guides to reckon the distance of a block on the moraine by lengths of a pole or rod from a fixed rock some thousand feet off. These measures appear not to have been altogether trustworthy.

The principal theories to account for the progressive motion of glaciers which were prevalent previous to 1842, may be briefly characterized as De Saussure's and De Charpentier's, though each had been maintained in times long antecedent by the earlier Swiss writers. The first may for brevity be called the *gravitation* theory, the latter the *dilatation* theory. Both suppose that the motion of the ice takes place by its sliding bodily over its rocky bed, but they differ as to the force which urges it over the obstacles opposed by friction and the irregularities of the surface on which it moves.

---

[4] Agassiz, *Etudes sur les Glaciers*, p. 150.

The following quotation from De Saussure explains his views with his usual precision:—"These frozen masses, carried along by the slope of the bed on which they rest, disengaged by the water (arising from their fusion owing to the natural heat of the earth) from the adhesion which they might otherwise contract to the bottom—sometimes even elevated by the water—must gradually slide and descend along the declivity of the valleys or mountain slopes (*croupes*) which they cover. It is this slow but continual sliding of the icy masses (*des glaces*) on their inclined bases which carries them down into the lower valleys, and which replenishes continually the stock of ice in valleys warm enough to produce large trees and rich harvests."[1] Very sufficient objections have been urged against this theory. It is evident that De Saussure considered a glacier as an accumulation of icy fragments, instead of a great and continuous mass, throughout which the fissures and *crevasses* bear a small proportion to the solid portion; and that he has attributed to the subglacial water a kind and amount of action for which there exists no sufficient or even probable evidence. The main ojection, however, is this, that a sliding motion of the kind supposed, if it commence, must be accelerated by gravity, and the glacier must slide from its bed in an avalanche. The small slope of most glacier-valleys, and the extreme irregularity of their bounding walls, are also great objections to this hypothesis.

The Dilatation theory ingeniously meets the difficulty of the want of a sufficient moving power to drag or shove a glacier over its bed, by calling in the well-known force with which water expands on its conversion into ice. The glacier being traversed by innumerable capillary fissures, and being in summer saturated with water in all its parts, it was natural to invoke the freezing action of the night to convert this water into ice, and by the amount of its expansion to urge the glacier onwards in the direction of its greatest slope. In answer to this it is sufficient to observe, in the first place, that during the height of summer the portions of those glaciers which move fastest are never reduced below the freezing point, and that even in the most favourable cases of nocturnal radiation producing congelation at the surface, it cannot (by well-known laws of conduction) penetrate above a few inches into the interior of the glacier. Again, the ascertained laws of glacier motion are (as will be immediately seen) entirely adverse to this theory, as it is always accelerated by hot weather and retarded by cold, yet does not cease even in the depths of winter.[2]

It is singular how slow observers were to perceive the importance to the solution of the problem of glacier motion of ascertaining with geometrical precision the amount of motion of the ice, not only from year to year, but from day to day, whether constant or variable at the same point, whether continuous or by starts; if variable, on what circumstances it depended, and in what manner it was affected at different points of the length and breadth of a glacier.

This method of studying the question was taken up by Professor Forbes of Edinburgh. His observations were commenced on the Mer de Glace of Chamouni, in June 1842. Between the 26th and 27th of that month the motion of the ice opposite a point called the "Angle" was found, by means of a theodolite, to be 16·5 inches in 26 hours; between the 27th and 28th, 17·4 inches in 25½ hours; and from about 6 A.M. to 6 P.M. on the 28th the motion was 9·5 inches, or 17·5 inches in 24 hours; whilst even the proportional motion during *an hour and a half* was observed. No doubt could therefore remain that the motion of the ice is *continuous* and tolerably uniform—in short, that it does not move by *jerks*. He also ascertained about the same time that the motion of the ice is greatest towards the centre of a glacier and slower at the sides, contrary to an opinion then maintained on high authority. He next found that the rate of motion varied at different points of the length of the same glacier, being on the whole greatest where the inclination of its surface is greatest. As the season advanced, he observed notable changes in the rate of motion of the same part of the ice, and connected it by a very striking direct relation with the temperature of the air. These facts were established during the summer of 1842, and promptly published. By means of occasional observations during the following winter and spring by his guide, Auguste Balmat of Chamouni, and by a more full comparison of the entire motion of a glacier for 12 months with its motion during the hot season of the year, another generally received error was rectified: the motion of the glacier continues even in winter, and it has a very perceptible ratio to the summer motion. Last of all, it was found that the *surface* of a glacier moves faster than the ice nearer the bottom or bed.[3]

These and some minor laws of motion are undoubted expressions of the way in which glaciers move; and having been successively confirmed by succeeding observers, seem to admit of but one expression in the form of an approximate theory, and it is that given to them by Professor Forbes: "A glacier is an imperfect fluid or a viscous body, which is urged down slopes of a certain inclination by the mutual pressure of its parts."[4] The analogy subsisting between the motion of a glacier and that of a river (which *is* a viscous fluid;—were it not so, its motion would be widely different) will be best perceived by stating more precisely its laws of motion in order.

1. Each portion of a glacier moves, not indeed with a constant velocity, but in a *continuous* manner, and not by sudden subsidences with intervals of repose. This, of course, is characteristic also of a river.

2. The ice in the middle part of the glacier moves much faster than that near the sides or banks; also the surface moves faster than the bottom. Both these facts obtain in the motion of a river in consequence of the friction of the fluid on its banks, and in consequence also of that internal friction of the fluid which constitutes its viscosity.

Thus, at four stations of the Mer de Glace, distant respectively from the west shore of the glacier
100 230 305 365 yds.,
the relative velocities were...1·000 1·332 1·356 1·367.

3. The variation of velocity (as in a river) is most rapid near the sides, whilst the middle parts move nearly uniformly. This and the preceding laws are also fully brought out by the subsequent experiments of M. Agassiz on the glacier of the Aar, and of MM. Schlagintweit on the Pasterzen glacier.[5]

4. The variation of velocity of a glacier from the sides to the middle varies nearly in proportion to the absolute velocity of the glacier; whether that absolute velocity change in the same place in consequence of change of season, or between one point and another of the length of the same glacier, depending on its declivity. (See (5.) and (6.) below.) These facts, clearly brought out in Professor Forbes's observations of 1842, present a striking analogy to the phenomena of rivers, as observed by Dubuat.[6]

5. The glacier, like a stream, has its pools and its rapids. Where it is embayed by rocks it accumulates, its declivity increases, and its velocity at the same time. When it passes

down a steep, issuing by a narrow outlet, its velocity increases. Thus the approximate declivities of the inferior, middle, and superior region of the Mer de Glace (taken in
the direction of its length) are ....15° 4½° 8°
and the relative velocities are as the numbers............................ 1·398 ·574 ·925[1]

6. A fact not less important than any of the preceding, and equally well-established, not only by the observations of Professor Forbes, but by those of succeeding experimenters, is this: that increased temperature of the air favours the motion of the ice; and generally whatever tends to increase the proportion of the watery to the solid constituents of a glacier, as mild rains, and especially the thawing of the superficial snow in spring. The velocity does not, however, descend to nothing even in the depth of winter. Indeed, in the lower and most accessible portions of the Mer de Glace (or Glacier des Bois) and the Glacier des Bossons, the ratio of the winter to the summer motion is almost exactly 1 : 2. On endeavouring to establish a relation between the velocity of the glacier and the temperature of the ambient air, we find that these two quantities diminish together in an almost regular manner down to the freezing-point; below which the velocity seems to remain constant.[2]

The circumstances of motion detailed in the six preceding propositions appear to be reconcileable with the assumption of what may be called the *Viscous* or *Plastic Theory* of glacier motion, and with that alone.

Plastic Nature of Glacier Ice.—Notwithstanding the apparent paradox of calling a vast mass of coherent ice a *semifluid* body, there is something about a glacier which almost inevitably conveys to the mind the idea of a *stream.* This may be traced in the descriptions of unscientific tourists, of poets, and of some of those who have addressed themselves more seriously to the question of the real nature of these bodies. To the latter class of observers belong Captain Basil Hall and Monseigneur Rendu, bishop of Annecy, who had much more than hinted at the possibility of a true mechanical connection between the descent of a glacier and that of a mountain torrent, or of a stream of lava. But until the actual conditions of motion were reduced to rule, it was impossible to know how far the analogy was real or apparent.

The viscous theory of glaciers, as deduced from observation by Professor Forbes, though now very generally accepted, had to struggle with numerous and strongly-urged objections; of which the oftenest repeated was, that ice is by its nature a brittle solid, and not sensibly possessed of any viscous or plastic quality. In answer to this, it may be urged that the qualities of solid bodies of vast size, and acted on by stupendous and long-continued forces, cannot be estimated from experiments on a small scale, especially if short and violent; that sealing-wax, pitch, and other similar bodies mould themselves, *with time*, to the surfaces on which they lie, even at atmospheric temperatures, and whilst they maintain, at the same time, the quality of excessive brittleness under a blow or a rapid change of form; that even ice does not pass at once, and *per saltum*, from the solid to the liquid state, but absorbs its latent heat throughout a certain small range of temperature (between 28°·4 and 32° of Fahrenheit), which is precisely that to which the ice of glaciers is actually exposed; that, after all, a glacier is not a crystalline solid, like ice, tranquilly frozen in a mould, but possesses a peculiar fissured and laminated structure, through which water enters (at least for a great part of the year) into its intrinsic composition. But, waiving the inferences from all these facts, the main argument in favour of the view now maintained is this, that admitting the preceding propositions as to the velocity of its parts (which no one now contests), the quasi-fluid or viscous motion of the ice of glaciers is not a theory but a FACT. A substance which is seen to pour itself out of a large basin through a narrow outlet without losing its continuity,—the different parts of which, from top to bottom, and from side to centre, possess distinct, though related velocities, which moves over slopes inconsistent with the friction between its surface and the ground on which it rests—which surmounts obstacles, and, even if cleft into two streams by a projecting rock, instead of being thereby anchored as a solid would necessarily be, reunites its streams below, and retains no trace of the fissure, leaving the rock an islet in the icy flood—a substance which moves in such a fashion cannot, in any true sense of the word, be termed a rigid solid, but must be granted to be ductile, viscous, plastic, or semifluid, or to possess qualities represented by any of these terms which we may choose to adopt as least shocking to our ordinary conception of the brittleness of ice.[3]

Origin of the Veined Structure of Ice.—Any mechanical theory of glaciers must be more or less imperfect which does not explain the remarkable veined or ribboned structure of the ice, which, with its peculiar course through the interior of the glacier, has been described at page 637; In applying the theory of *quasi-fluid* motion to explain this structure, two great difficulties are experienced; first, our confessed ignorance of the *modus operandi* of those molecular forces which induce pervading structures of this kind; secondly, our imperfect acquaintance with the laws of motion of semifluids under the action of gravity, even in simple cases. Nevertheless it seems possible to prove, partly from admitted mechanical principles, partly from direct experiments, that the tendency of the motion is to produce such a structure.

The fundamental idea is this, that the veined or ribboned structure of the ice is the result of internal forces, by which one portion of ice is dragged past another in a manner so gradual as not necessarily to produce large fissures in the ice, and the consequent sliding of one detached part over another, but rather the effect of a *general bruise* over a considerable space of the yielding body. According to this view, the delicate veins seen in the glacier, often less than a quarter of an inch wide, have their course *parallel* to the direction of the sliding effort of one portion of the ice over another. Amongst other proofs of this fundamental conception that the veined structure is the external symbol of this forced internal motion of a body comparatively solid, we may mention one very striking instance recorded by Professor Forbes, as observed on the glacier of La Brenva, on the south side of Mont Blanc, subsequently to the publication of his principal work on the subject. In this case the ice of the glacier, forcibly pressed against the naked rocky face of an opposing hill is turned into a new direction; and in thus shoving and squeezing past a prominence of rock, he observed developed in the ice a "veined structure" so beautiful, that "it was impossible to resist the wish to carry off slabs, and to perpetuate it by hand specimens." This perfectly developed structure was visible opposite the promontory which held the glacier in check, and past which it struggled, leaving a portion of its ice completely embayed in a recess of the shore behind it. Starting from this point as an origin, the veined laminæ extended backwards and upwards into the glacier, but did not spread laterally into the embayed ice. They could, however, be traced from the shore to some distance from the promontory into the icy mass. The direction of lamination exactly coincided with that in which the ice *must* have moved if it was shoved past the promontory at all. That it *did* so move was made the subject of direct proof, by fixing two marks on the ice opposite the promontory, one on the nearer, the other on the farther side of the belt of ice which had the lamination best developed. The first mark was 50 feet from the shore, and moved at the rate of 4·9 inches daily; the other mark was 170 feet farther off, and moved almost *three times* faster, or 14·2 inches daily. Throughout this breadth of 170 feet there was not a single longitudinal crevasse which might have facilitated the differential motion. A parallelogram of compact ice, only 170 feet wide, was therefore moving in such a manner, that, whilst one of its sides advanced only a *foot*, the other advanced a *yard*. No solid body, at least no rigid solid body, can advance in such a manner; it is therefore plastic, and the veined structure is unquestionably the result of the struggle between the rigidity of the ice and the *quasi-fluid* character of the motion impressed upon it. That it is so is evident not only from the direction of the laminæ, but from their becoming distinct exactly in proportion to their nearness to the point where the bruise is necessarily strongest.[1]

---

[1] The absolute velocity of a glacier depends upon so many circumstances besides its declivity that this law must not be sought to be verified, except *under like conditions.* The breadth and depth of a glacier (as of a river) no doubt materially affect its rate of motion, and its elevation has a not less important influence. Small lofty glaciers of the second order move slowly over steep inclinations. See *Phil. Trans.*, 1846, p. 177.

[2] *Phil. Trans.*, 1846, p. 191; and *Edin. Phil. Journal*, 1847.

[3] For a fuller reply to the objections which have been urged against the theory of the plasticity of glaciers, see *Phil. Trans.*, 1846, particularly pp. 162, &c. The confirmatory observations of MM. Agassiz and Schlagintweit on other glaciers, and their adoption of views virtually the same with those of Professor Forbes, have proved convincing to a majority of those who at first rejected a theory apparently opposed to commonly received notions. See Mousson, *Die Gletscher der Jetzt-zeit,* who says, p. 162, speaking of the plastic theory, "Er steht noch heute unangefochten da."

This observation sufficiently illustrates the general fact, that the veined structure appears most vividly in a direction parallel to the sides of glaciers, being caused by the friction of the rocky shore compelling a forced molecular separation of the middle parts from the side parts of the glacier.

But we have seen (p. 637) that the direction of the horizontal section of these laminæ gradually inclines inwards, so as to form loops on the surface of the glacier. The portion of these loops next to the shore, which is at first parallel to the shore, but which gradually inclines towards the axis or middle of the glacier, is conceived to be owing to the differential motion of the parts retarded by lateral friction, as in the case of the glacier of La Brenva just mentioned. But, moreover, the opposing resistance of the shore-ice immediately in front will give a tendency to molecular dislocation in a direction sloping towards the middle of the glacier where the current moves fastest, in consequence of the friction being less. When we arrive at a distance from the shore comparable to the *depth* of the ice, then the friction due to the *bed* of the glacier communicated through its plastic layers to the surface combines with the lateral friction in determining the lamination in a direction at once upwards and towards the middle; and when we reach the middle region of the ice the lamination takes place entirely in the vertical plane, completing the *spoon-shaped* arrangement of those surfaces of dislocation, of which the form has already been illustrated at p. 637. As, however, this differential motion in the vertical plane is not at first readily admitted (and has been overlooked by writers on hydraulics, though it must equally take place in *very* sluggish waters), we shall here introduce a figure in illustration of it. The series of particles, m_1, m_2, &c., are supposed to be acted on by a force partaking of the nature of hydrostatic pressure, derived from the ice at a higher level in the rear of the point in question. Each particle is ready to move in the direction in which the effective pressure is greatest. Near the bottom, at m_6, the frontal resistance arising from the lower ice in front and retarded by friction, is very great, but so also is the pressure of the superincumbent ice. The motion of the particle will take place under the joint action of these two resisting forces, as shown by the direction of the arrow. As we approach the surface, the latter of the two resistances (the weight of the glacier ice) is always diminishing, and bears a less and less proportion to the former. Near the surface, therefore, the tendency to slide will be more and more directly vertical, as the arrows indicate.[2] This consideration seems adequate to explain the remarkable phenomenon of the *frontal dip*, with its gradual fall as we approach the extremity of the glacier, where, of course, the horizontal resistance from the ice in advance becomes nothing.

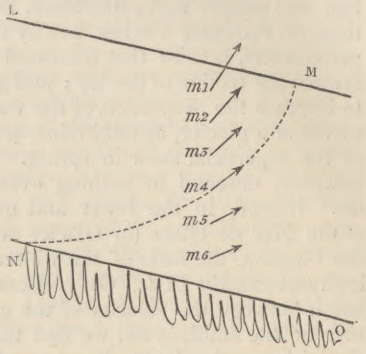

Fig. 5.

It has been deduced from M. Agassiz' observations on the glacier of the Aar (which is remarkable for the uniformity of its section, and its uniform but small slope), that the ice does actually undergo a compression from back to front as it forces its way down the valley; and as ice is not sensibly compressible, this diminution of the horizontal area, which any given section of the glacier (between two vertical transverse planes) exhibits in successive years, can only be explained by admitting that the ice accumulates in a vertical direction.[3]

This fact also corresponds with the convex surface which the slowly-moving glaciers present. Such a surface is seen in the precisely analogous case of viscous bodies, such as pitch, and in clayey land-slips.

It also satisfactorily accounts for the otherwise mysterious way in which, during winter, the glacier recovers the level which it had lost by ablation during summer (page 636, col. 1). When snow covers the whole surface the motion of all points of the length of a glacier approaches equality. The higher parts move relatively faster than the lower, tend, as it were, to overtake them, and thus to squeeze the yielding mass in a vertical direction. (J. D. F.)

GLACIS, in *Fortification*. See FORTIFICATION.

GLADBACH, or MÖNCHEN-GLADBACH, a flourishing manufacturing town of Rhenish Prussia, province of Düsseldorf, 16 miles west of the town of that name, on the small river Niers. Its chief manufactures are linen, cotton, and silk goods. Pop. about 5000.

GLADIATORS, in *Roman Antiquity*, men who fought publicly with *gladii* or swords in the forum, circus, or amphitheatre for the amusement of the populace. Gladiatorial fights had their origin in the ancient practice of sacrificing prisoners of war at the tomb of an illustrious chief or warrior who fell in battle. Thus Achilles (*Iliad*, book xxiii.) is described as sacrificing twelve Trojan youths to the manes of Patroclus; and in the *Æneid*, the hero of that poem is mentioned as sending captives to Evander to sacrifice at the funeral pyre of his son Pallas. This custom was at a later period so far modified that, instead of being offered up like sheep, captives were made to fight around the funeral pyre, and the victors in these combats were allowed to escape with life. Though these fights were originally limited to public funerals, yet it afterwards became the fashion at Rome for every private individual of any consequence to leave by will a certain sum of money for a gladiatorial show at his funeral. As a natural result of this system, such exhibitions soon became widely diffused, and were regularly organized for all public festivals, especially such as were set on foot by the ædiles or other magistrates who had any object to gain by courting the favour of the people. The first gladiators are said to have been exhibited in Rome in the year 264 B.C. by Marcus and Decimus Brutus, at the funeral of their father. On this occasion only three pairs of combatants fought; but the sport became rapidly popular and fashionable, and we find Julius Cæsar in his ædileship exhibiting 320 couples. Under the empire, the passion for gladiatorial shows amounted to a madness. Titus organized one which lasted for 100 days; and Trajan, in celebrating his triumph over Decebalus, exhibited no fewer than 5000 pairs of combatants. Though the loss of human life in these games of murder was fearful, and though their demoralizing influence on the popular mind was undeniable, yet many of the leading men of Rome who had no interest in upholding them, commended them strongly as diffusing among the people a warlike spirit and a contempt of death. The evil became at length so crying that Constantine issued an edict abolishing the gladiatorial shows, which, however, continued a favourite pastime till the reign of Honorius. The gladiatorial system was often fraught with the greatest danger to Rome. One of the most memorable results of this system was the rebellion of Spartacus, a gladiator of Capua, who, with an army of desperadoes like himself, overran Italy in the year 76 B.C., defeated several times the forces sent against him, kept his country in unceasing terror for three years, and was at last defeated and slain by M. Crassus, after performing prodigies of valour.

[3] Ninth Letter on Glaciers. *Edin. Phil. Journal*, 1845.

Gladiators were either prisoners of war, condemned malefactors, or volunteers who fought for pay. Malefactors were said to fight either *ad gladium*, in which case they were to be killed within a year, or *ad ludum*, in which, if they survived, they were allowed to claim their discharge at the end of three years. Freemen who became gladiators were said to be *auctorati;* and on entering the service were obliged to take a very stringent oath to their masters. They commonly belonged to the very lowest dregs of the people; but under the empire men of patrician rank often appeared in the arena. This practice was latterly interdicted by Severus. The schools in which the gladiators were trained were termed *ludi*, and the persons who trained them were called *lanistæ*. Sometimes they were the personal property of the lanista, who let them out at a fixed price. Sometimes they belonged to citizens, and were merely trained by the lanista. The care and expense bestowed on their training, diet, and general management were extraordinary.

When a gladiatorial fight had been arranged, the combatants entered the arena and began a mock-fight, called *prælusio*. This done, the trumpets sounded, and the sport became earnest. When a gladiator was wounded, the spectators cried out *habet*, and the wounded man lowered his weapons in token of submission. If he had fought well, the audience on whose will his fate depended depressed their thumbs, to indicate that they wished his life to be spared. If, on the other hand, he had displayed neither courage nor address, they held up their thumbs, and the victor immediately passed his sword through the body of his fallen foe. Palms were awarded to the conqueror. Gladiators on retiring from the service were presented with a wooden sword (*rudis*); whence Horace, in humorous allusion to his advancing years, talks of himself as a gladiator "jam rude donatus." They resumed that rank of life which they had quitted on entering the service. Thus a freeman emerged into his ancient liberty, and a slave into his old servitude. Any one, however, who had once been a gladiator was considered to have degraded himself, and was not allowed to aspire to patrician honours.

There were various classes of gladiators, called according to their arms or modes of fighting. Of these may be mentioned the Andabatæ, who fought blindfold, and often afforded great mirth to the spectators; the Catervarii, who fought in troops and not in pairs; the Essedarii, who fought from chariots like the ancient Britons; the Hoplomachi, who fought armed cap-à-pie; the Laqueatores, who tried to strangle each other with nooses; the Mirmillones, who fought with the weapons of ancient Gaul; the Samnites, who used the arms of the old inhabitants of Samnium, especially the oblong scutum; the Thraces or Threces, armed with a dagger and a round buckler, who were generally pitted against Mirmillones; and the Retiarii, whose chief weapon was the net (*rete*), from which they took their name. The Retiarius had no defensive armour of any kind, and was lightly clad, that nothing might interfere with his speed of foot, on which his life depended. His object was to throw his net over the head of his heavily-armed antagonist, whom, if he succeeded in entangling him, he slew with the three-pointed lance (*tridens* or *fuscina*), which was the only weapon he was allowed to carry besides his net. If he missed his aim, he immediately took to flight, and continued running until he had prepared his net for another throw. The pursuers of the Retiarii were called Secutores.

Gladiators formed admirable models for the sculptor. One of the finest pieces of ancient sculpture that have come down to us is the "Dying Gladiator" of the Capitoline Museum, on which Byron composed his memorable stanza, beginning with the lines—

> "I see before me the gladiator lie:
> He leans upon his hand—his manly brow
> Consents to death, but conquers agony," &c.
> *Ch. Harold*, Canto iv. 140.

GLADOVA or KLADOVA, a town of Servia, on the Danube. See DANUBE.

GLAMORGANSHIRE (Welsh *Gwlad Morgan*), a maritime county of South Wales, bounded on the N. by Brecknock, on the N.W. by Caermarthen, on the W. and S. by the Bristol Channel, and on the E. by the county of Monmouth. Its greatest length from east to west is about 53 miles, and its greatest breadth from north to south about 29 miles.

Glamorgan, with the exception of some flat tracts on the borders of the Bristol Channel, consists of a succession of hills and valleys, the general character of the country becoming more mountainous as we proceed inland, until on the borders of Brecknock the surface is "a sea of hills." None of the mountains rise to a great height, the most lofty—Llangeinor—being only 1859 feet. Although the mountains are not lofty, yet, owing to their fine bold forms, the scenery of this county is marked by considerable grandeur and great beauty. The lower parts of the country are richly wooded, but the timber generally is of small size.

The valleys of Glamorgan have long been famous for their great beauty, and the charming scenery they contain. The vale of Glamorgan has been called with truth the garden of Wales; and here the climate is so mild that the myrtle and many other tender plants flourish luxuriantly in the open air. The Vale of Neath has long been known to tourists as the waterfall district of South Wales; and although the finest of these are at the upper end of the valley in the county of Brecon, still the Glamorgan part of the valley can boast of some well worthy of a visit. The Swansea valley also contains some pieces of fine scenery, and is throughout marked by great beauty. Besides these, the principal valleys are the Rhymney, the Taff, the Rhondda, and the Llwchwr.

The rivers of Glamorgan are mostly unimportant streams. The chief are the Rhymney, in the vale of that name, forming the county boundary on the east; the Ogwr, which flows into the Bristol Channel at Bridgend; the Taff, which forms the important harbour of Cardiff; the Neath and the Tawe, which both discharge their waters into Swansea Bay; and the Llwchwr, which forms the county boundary on the west, and, falling into Caermarthen Bay, forms the estuary known as the Burry river, on which the thriving town of Llanelly is situated.

The chief geological feature of Glamorgan is the coal measures, which extend nearly over the whole county, and are bounded by a narrow band of millstone grit (the "Farewell Rock" of the miners), and mountain limestone, nearly coincident with the county boundary on the north. In the extreme south and south-west, the Devonian, the magnesian limestone, and the lias show themselves.

The climate is mild, and the plains on the coast, as well as the inland valleys, are very fertile. Agriculture, although better than in some of the other Welsh counties, is still in a backward state, and much remains to be done to bring it to that condition which the soil and the climate would warrant. The farms are seldom large, and the buildings but little suited to "high farming." The crops chiefly raised are wheat, beans and pease, oats, barley, vetches, turnips, and potatoes. The cattle of the county are numerous and of good quality, and great numbers of sheep and ponies are reared in the more mountainous parts.

The industry of Glamorgan is chiefly applied to its coal and iron mines, which are of immense extent; indeed the whole county may be said to be a gigantic coal and iron mine. It is to this that it owes its pre-eminence as the most important of all the Welsh counties. In the neighbourhood of Merthyr Tydvil the iron works are carried on on a scale seldom surpassed; and within a short circuit there are upwards of sixty blast furnaces, employing many thousands of workmen, some of the largest works having from 4000 to 6000 persons engaged in them. Vast quantities of coal and iron are annually exported; and Cardiff, which a few years ago was a small and unimportant town, is gradually becoming one of the most important shipping ports in the Bristol Channel, solely from the great export of minerals and its excellent docks, erected by the late Marquis of Bute, who was also lord of the manor of some of the richest mineral fields.

Besides the coal and iron, a great trade is carried on with Cornwall for the melting of tin and copper ores. The tin is used for the production of tinned iron, and the copper ore is smelted chiefly at Swansea, where there are some of the most extensive copper works in the kingdom.

Glamorgan possesses many ancient ruins of castles, and has been from remote times a district of great importance. It has also some fine cromlechs and other old British remains; and the Sarn Helen, an ancient Roman road, traverses the county. The district to the south of Swansea is called Gower, and is famed for the beauty of its coast scenery, as well as for its people, who are descendants of Flemings, planted here by Henry I., and who retain many characteristics pointing them out as a wholly distinct race from the Welsh, with whom they intermingle but little.

Glamorgan is well supplied with means of transport, for besides its ports, it has four railways and a canal, and numerous tramways.

The county is divided into 128 parishes and 10 hundreds, and is situated in the diocese of Llandaff.

In 1847, the number of day schools was 327, with 15,674 scholars. The number of Sunday schools was 381, of which 92 were Church of England, with 5908 scholars; 92 Calvinistic Methodists, with 8626 scholars; 101 Independents, with 10,188 scholars; 61 Baptists, with 5610 scholars; 21 Wesleyans, with 1709 scholars; 14 other denominations, with 1472 scholars. In the Sunday schools, the proportion per cent. in which Welsh and English were used as the language was as follows:—English, 29·7; Welsh, 34·5; both languages, 35·8. English is much used by the people, except in the remote agricultural districts.

Population.			Increase.	Per Cent.
1831		126,612	Between 1831 & 1841	35
1841		171,188	... 1841 & 1851	35
1851	Males... 120,748 Females 111,101	231,849	In 50 years	223
			Annual rate	2·38

Area in square miles, 856; in statute acres, 547,494. Pop. to a square mile, 268 persons, or 51 houses.

The county returns two members to parliament; the borough of Merthyr Tydvil, one; the Cardiff district of boroughs, one; and the Swansea district of boroughs, one. Total, five. Annual value of real property assessed to property-tax, 1850-1, L.850,440.

GLAMOUR, or GLAMER, an old term of popular superstition in Scotland, denoting a kind of magical mist believed to be raised by sorcerers, and which deluded the spectators with visions of things that had no real existence, altered the appearance of those which really did exist, and produced other effects equally wonderful. The eastern nations have a similar superstition, as we learn from the *Arabian Nights Entertainments*, and other works of oriental fiction.

GLANCE-COAL, anthracite. See COAL.

GLAND, a term applied to those organs of the body in which the process of secretion is carried on. See ANATOMY.

GLANDFORD BRIGG or BRIDGE, a market-town of England, county of Lincoln, 24 miles N. by E. of the town of that name. It is situated on the Ancholme, by means of which it carries on a considerable trade in corn, coal, and timber. It has a handsome church with a lofty tower, and a free grammar-school. Market-day Thursday. Pop. (1851) 2201.

GLANVILL, or GLANVIL, JOSEPH, was born at Plymouth in 1636. He received his education in the university of Oxford; in 1666 obtained the cure of Abbey Church at Bath; in 1678 became prebend of the church of Worcester; and died at Bath, Nov. 16, 1680, in the forty-fourth year of his age. This writer—the first who in England presented philosophical scepticism under a systematic form—deserves more marked attention than has hitherto been accorded to him; nor can we observe without surprise that Brücker has not given him any place in his *Critical History of Philosophy*. Two parties then existed in England—one of which abused the name of philosophy, in order to accredit atheism; and the other the name of religion, in order to justify superstition. Glanvil deplored this double aberration; he felt that philosophy itself required a reform, and he laboured to prepare rather than to produce it himself. It is in this light, and from this point of view, that his writings should be studied and judged. Of these, the two principal are, *The Vanity of Dogmatizing, or Confidence in Opinions, manifested in a Discourse of the shortness and uncertainty of our knowledge of its principles, with Reflections on Peripateticism, and an Apology for Philosophy*, 1661, in 8vo; and *Scepsis Scientifica, or Confessed Ignorance the Way to Science*, an essay on the vanity of dogmatizing and confident opinion, London, 1665, in 4to. The latter of these works procured him the honour of being admitted a member of the Royal Society of London. Montaigne and Charron appear to have served as his guides, and he has borrowed much from both; he reviewed the principal objects of human knowledge, and endeavoured to show, in regard to each of these, the weakness and impotence of reason. The Peripatetic doctrine, and the system of Descartes—which he appears to have especially had in view to combat—themselves furnished him with arms; and in the rapid advancement of physical science at this period, he also endeavours to discover grounds for rendering more sensible our ignorance in the study of nature. Hobbes is the frequent object of his criticism. In general he endeavours to prevent the abuse of rational speculations; and it is only in the observations to which they have led that he seeks for considerations fitted to inspire the distrust which he inculcates. His views respecting the sources of human error are presented with much perspicuity and method, often with striking novelty. The manner in which he treats the great question of causation is the more remarkable, because it appears to have opened the way to Hume in an investigation which has produced one of the greatest revolutions which philosophy has experienced in modern times. According to him, we know only that things occur, and succeed one another, not how they are produced; we see their relation of coincidence, but not the tie which connects them; and hence the relation of the effect to the cause is, as far as we are concerned, a fact, and not a veritable law. Glanvil compares dogmatism to a narrow prison in which the human mind is confined, and beyond the walls of which it cannot extend its view. The offspring of ignorance and of pride, dogmatism is, according to him, the father of error; and scepticism is called in to apply a remedy, not by employing negations as arbitrary, but by weighing with impartiality the proofs. Doctrine like this was, however, liable to be mistaken or misrepresented; and we need not wonder, therefore, that at the period when Glanvil wrote he was considered by the greater number of readers as an absolute sceptic, and treated as such. The partisans of the prevailing systems regarded with more aversion the men who provoked discussion than they did those who rejected their doctrines without examination. Hence Glanvil was very fiercely attacked; but he justified himself in his answer to one of his opponents, which is subjoined to his *Scepsis Scientifica;* and he also undertook the defence of philosophy, conceiving that this belonged of right to those who desired to bring her back to her proper and legitimate sphere. It is singular enough, however, though by no means without example, that this writer, who had not only shown, but even exaggerated, the infirmity of human reason, paid himself a strange tribute to its weakness; for, after having combated scientific dogmatism, he not only yielded to vulgar superstitions, but actually endeavoured to accredit them in his *Philosophical Considerations concerning the Existence of Sorcerers and Sorcery*, published in 1666, in 4to. The story of the pretended drum, which was said to have been heard every night in the house of an inhabitant of Wiltshire (Mr Mompesson), a story which made much noise in the year 1663, and which is supposed to have furnished Addison with the idea of his comedy of the *Drummer*, appears to have given occasion to this work. It might have been imagined that such a tale would have been treated with derision by Glanvil, and that the philosopher could have had no other object than to turn into ridicule the credulity of his country. For such a supposition, however, there seems to be little or no room; and, in point of fact, this production gave rise to a controversy which only terminated with the life of Glanvil. At his death he left a piece enitled *Sadducismus Triumphans*, which was printed in 1681, 8vo, reprinted with some additions in 1682, and translated into German in 1701. He had there collected twenty-six relations or stories of the same description as that of the *Drum*, in order to establish, by a series of facts, the opinion which he had expressed in his *Philosophical Considerations.* Glanvil supported a much more honourable cause when he undertook the defence of the Royal Society of London, under the title of *Plus Ultra, or the Progress and Advancement of Science since the time of Aristotle*, 1658, in 12mo. His object was to refute a foolish ecclesiastic who had alleged that Aristotle possessed individually more knowledge than could be found in the Royal Society, or even in all the men of the seventeenth century. By this production he drew upon himself a violent antagonist in the person of one Stubbe, a physician at Warwick; but, after an animated dispute, the doctor, by some mischance, lost his life, and his generous antagonist, in a funeral sermon which he preached on the occasion, pronounced an eulogium on his memory.

Besides the works already noticed, Glanvil wrote, *Lux Orientalis*, 1662; *Philosophia Pia, or Discourse on the Religious Character, and the Tendency of Experimental Philosophy; Essays on Several Important Subjects in Philosophy and Religion*, 1676, in 4to; *An Essay Concerning Preaching;* and *Sermons.* After his death in 1681, there were published other sermons and posthumous works in one volume 4to. The style of Glanvil is clear, easy, and animated; and to the student of the philosophy of the human mind his works are full of instruction. (J. B—E.)

GLARUS, or GLARIS, a canton of Switzerland, is bounded on the N. and N.E. by St Gall, on the E. and S. by the Grisons, and on the W. by Uri and Schwyz. Its greatest length is about 33 miles, and greatest breadth 16; and its area 280 square miles, of which little more than one-fifth is arable. It consists chiefly of the great valley of the Linth, which crosses it from S. to N.; and of the valleys of the Sernft and Klön, affluents of the Linth. The greater part of the surface is overspread with mountains, of which many are covered with perpetual snow. The principal chain, which stretches from the Haustock to the Scheibe, has an elevation of nearly 10,000 feet, and contains many glaciers; the chief summits are Dödiberg and Scheibe. From the Dödiberg an offset detaches itself from this chain, and divides the waters of the Linth from those which flow into the Reuss through the valleys of Schwyz and Uri. The elevated and extensive group of Glärnisch belongs to this offset, and rises 9400 feet above sea-level. The surface of the canton inclines generally towards the north to the shores of the Lake of Wallenstadt, and towards the low country between that lake and that of Zürich. The lakes are numerous, but less remarkable for their extent than for the magnificent scenery in their vicinity. The climate of Glarus is very severe, so that only the milder sheltered districts and deeper valleys are habitable during the whole year. Even in these the snow mostly remains till near the 1st of May. The principal rocks are conglomerate, generally under mountain limestone; but in some districts there occur vast accumulations of grauwacke. This is especially the case in the Sernftthal. Though ancient mines of copper, silver, and iron, were wrought in different places, the minerals are not now of much value. Marble, gypsum, and slate abound; and even coal in some unimportant seams. From the nature of the surface and climate but a small proportion of the canton can be cultivated with the plough; yet a good deal of fruit is raised, especially cherries. Alpine pastures necessarily occupy the greater part of the accessible surface. The most fertile district stretches through the Linththal, in which most of the corn is produced. The prevailing kind of timber is pine, which covers many of the mountains; after it the principal kinds are beech, ash, maple, and a very few oaks. The flora—ranging over an altitude commencing at 1500 feet above sea-level, and continuing to the utmost verge of vegetation—is very rich; and, considering the limits of the canton, is remarkable for its variety. The wild mammals are not very numerous, being chiefly limited to the marmot, hare, badger, fox, and chamois. Of domestic animals, about 10,000 cows and 5000 sheep are fed on the mountain slopes during the summer months, and constitute the principal part of the wealth of the district. Besides these, a great many goats are kept, but they take a wider range in search of food than the sheep and cows. The principal manufactures of Glarus include woollen, cotton, linen, and silk goods, prints, muslins, paper, writing-slates, and many wooden articles. The trade of the canton is chiefly carried on with Italy and Germany; and the principal exports are cattle, butter, cheese, skins, leather, wood, and chamois-skins. This is the seat of the peculiar manufacture of *schabzieger*, or "green cheese," which is made of the milk of goats and cows, mixed with churned milk. The curds are brought down in sacks by the peasants from their mountain chalets, each sack containing about 200 lbs., for which they receive 36 francs. This cheese owes its peculiar colour, smell, and flavour, to the blue pansy (locally called *klee*, and botanically *Trifolium melilot cærul.*), an herb grown in small inclosures beside most of the cottages, which is dried, ground to powder, and then thrown into a mill like a cider-mill, along with the curd, in the proportion of 3 lbs. of *klee* to 100 lbs. of curd. After being ground for about 2½ hours, the pulp is put into shapes, and there left to dry, when it is ready for use; but it is not considered to have attained perfection or to be fully ripe until it is one year old, though it will keep for a long time. The wholesale price of this kind of cheese is about 3½d. per lb.; and it is mostly exported to America. The principal imports of the canton are corn, wine, oil, salt, metals, glass, silks, and colonial produce. The constitution of Glarus is very democratical; and it occupies the seventh place in the Swiss Confederation. The government is in the hands of the entire male population above sixteen years of age, being about 7000, who meet annually on the first Sunday in May, in "General Assembly" (Landsgemeinde), to appoint their magistrates, &c., and accede to or reject the laws proposed by the executive body, which consists of a council of 80 members, of whom three-fourths are Protestants, and the rest Roman Catholics; both persuasions enjoying equal rights, and alternately electing the presidents of the General Assembly and Council. The executive is delegated to a landamman with three coadjutors. Both Protestant and Roman Catholic clergy are paid by the government. Taxation is very light; the state expenditure is defrayed by a poll-tax of 6d. upon every male arrived at the age of sixteen years; a property tax of 3d. upon every 100 francs (or L.4, 3s. 4d.) worth of property; and the rent of state property, customs, excise, fines, &c. On Sundays there are voluntary subscriptions for the poor; but there are no poor-laws properly so called, though any one known to have the means of contributing, being observed not to give, may be summoned before the council and compelled to contribute. One of the most remarkable of the laws is that only a son or a daughter can inherit property. Should a man die without issue, his property, if it was inherited, reverts to government; but if he had purchased the property, he can bequeath it by will. Each of the sixteen *tagwen* or communes has one or more schools, of which the masters are paid by the state at the rate of L.35 per annum. Though all instruction in these schools is gratuitous, yet parents are obliged to send their children to school. Glarus furnishes 482 men to the army, and 3615 francs to the treasury of the Swiss Confederation. The population of Glarus in 1851 was 30,213, of whom 26,281 were Protestants, and 3932 Roman Catholics; of the whole, 28,969 were citizens of the canton, 978 citizens of other cantons, and 248 foreigners. The people of Glarus are remarkable for their industry and independence of character; they are the most Swiss of all the Swiss. The chamois hunters of this canton hold the highest rank for boldness and attachment to the chase. Instruction is so general, that there is no one unable to read and write; and offences are so few that there is rarely any one in prison. In spiritual matters the Protestants are governed by a synod, and the Roman Catholics are subject to the see of Constance. Numerous ancient medals found at Mollis corroborate old traditions in proving that the Romans occupied some stations on the Lake of Wallenstadt. In 490 A.D. an Irish monk named Fridolin, who founded the convent of Seckingen on the Rhine, near Lauffenburg, exerted himself in propagating Christianity in this canton, where he built a church in honour of St Hilarius; whose name, being corrupted into Glarus or Glaris, became the appellation of the district or canton. The whole valley afterwards became the estate of the convent, and was governed by a mayor or bailiff, whose nomination in the course of time became vested in the Hapsburg family. The tyranny of these officers compelled the people of Glarus to unite themselves to the Helvetic Confederation in 1352; and in 1388 they obtained the memorable victory over the Austrians at Näfels, which secured their independence. From 1506 to 1516 the reformer Zuinglius was curate of Glarus; and the new doctrines soon spread through the canton from the valley of Sernft, where they first took root. Civil dissensions immediately sprung up on the adoption of Protestantism; these have, however, long disappeared in consequence of the judicious means used to prevent collision of parties in the administration of the government. In recent times some interesting events have transpired in this lofty district. In 1799 Suwarrow retreated before the French across the Prägel, down the Klönthal, and up the Sernftthal.

Glarus, a Swiss town, capital of the canton of the same name. It is chiefly remarkable for its secluded situation at the base of the Glärnisch and Schilt, encompassed and shut in by the Alps, whose bare and bleak precipices and peaks contrast strikingly with the milder verdure around their base. It stands on the left bank of the Linth, in a narrow part of the valley, and is a bustling town, containing 4500 inhabitants, actively engaged in the manufacture of cottons, muslins, woollen cloth, and hardwares. It contains a number of mills, and one printing press; and the parish church, an ancient Gothic edifice, is harmoniously used as a place of worship for both Protestants and Roman Catholics. The other public buildings are the free school, for 700 children, the hospital, a new government house, and the old town-house in a square planted with lime trees. The situation of the town is at once wild and melancholy. In midwinter the mountains so overshadow the place that the sun is not visible during more than four hours a-day. The streets are narrow and crooked; the houses are painted in fresco with fantastic devices, and have the time of their erection marked on them; some of these date back to the twelfth century. The Linth is here crossed by two bridges. The environs of Glarus contain many romantic walks, with commanding positions from which magnificent views may be obtained.

GLASGOW.

The commercial and manufacturing metropolis of Scotland, and in population the second city in Great Britain, is situated on the banks of the River Clyde, in the lower ward of the county of Lanark, at the distance of about 400 miles N.W. of London, and 42 miles W. of Edinburgh, in 55. 51. 32. N. Lat., and 4. 17. 54. W. Long. Its greatest length from east to west is 3 miles, and its breadth from north to south 2 miles, and circumference about 8 miles. The Clyde, upon which the city of Glasgow is situated, is one of the principal rivers in Scotland, and has its rise among the mountains that separate the counties of Dumfries and Lanark. The length of this stream, from its source to its junction with the western sea, is about 100 miles. Along its whole course it is beautified by magnificent natural scenery, and embellishments of art. Its banks are crowded with the abodes of industry and a thriving population. The site of Glasgow occupies both sides of the river, and though at the distance of above thirty miles from the influx into the sea, the tide, which flows a considerable way above the town, gives it a command of trade and means of ready conveyance for commercial purposes to every quarter of the globe.

Origin of Glasgow.

As many other towns, not only is the etymology of the name a matter of conjecture, but the earlier state of the city is shrouded in obscurity. Into the discussion of either of these our limits forbid us to enter; but it may be briefly observed as to the first, that the most probable conjecture of antiquarians and etymologists is, that Glasgow derives its name from the two Celtic words signifying "a dark glen," being, as is supposed, the ravine or wooded sloping banks of the Molendinar burn at the east end of the cathedral; and with regard to the second—concerning the origin of the city itself—it may be stated that although Glasgow is certainly one of the most ancient of Scottish towns, there is not a tittle of evidence to show that a single stone of it had been laid until "Rome had filled the world with her renown, and fallen at length amid the ruins of her own greatness." At the period of the Roman power in Britain, the province of Valentia in which Glasgow is situated was inhabited by a tribe called the Damnii; and on the retirement of the Roman legions, those comparatively peaceful provincials were left to defend themselves and their territory during a period of nearly four centuries, first against the inroads of the Picts, then against the invasion of the Saxons from the east, and latterly against the assaults of the martial Scots, who, emigrating from Ireland, settled in the districts now called Argyleshire and Galloway. It is considered more than probable, that Alpine, the last king of the Scots, lost his life when fighting against the Strathclyde Britons.

All Glasgow chroniclers commence their accounts of the city with the story of St Kentigern, who is supposed to have laid the foundation of the holy edifice round which the few huts or wooden houses which then constituted the town were congregated. The period at which this early seat of the church was founded, was about the middle of the sixth century. From the pious, benevolent, and amiable character of its ecclesiastical founder, he acquired the appellation of Mungo, a word used in several languages as an epithet of fondness and endearment. In the year 539, St Kentigern, then twenty-five years of age, is said to have taken leave of his episcopal instructor, St Servanus, Bishop of Orkney, and to have come to Glasgow, where from his great sanctity he was chosen by the king and clergy of the district their bishop, his consecration having been performed by St Columba. At this time Marken was king of the Strathclyde Britons; and having become jealous of the spiritual influence of St Kentigern, ultimately became his persecutor, and compelled him to seek refuge in Wales, where he sojourned several years and founded the see of St Asaph. Under the more benign rule of the successor of Marken, St Kentigern was recalled to Glasgow, where, on his arrival, having preached to a great multitude, a monkish legend records that the earth on which he stood was instantly upheaved into a little knoll so that the preacher might easily be seen and heard by all present. To this has been attributed the motto of the city, "Let Glasgow flourish by the preaching of the Word."

Following the procedure of the first teachers of Christianity, who established their churches on the spots which had been previously hallowed by the habitual performance of the people's devotions, it is commonly supposed that St Kentigern founded his church on the vestiges of a Druidical circle, which he did about the year 560; and here he continued to minister till his death, which took place in 601, leaving the infant town to spring up under the shadow of the church the foundation of which he had laid, and under which it is also said he was buried. Such is the account which unvarying tradition and ancient chronicles have handed down concerning the origin of Glasgow, and which receives additional confirmation from the armorial bearings of the see. These are, argent, a tree growing out of a mountain base, surmounted by a salmon in fesse, all proper; in the salmon's mouth an amulet, or, on the dexter side a bell pendent to the tree, of the second. Setting aside all monkish fables respecting the origin of each separate part of these armorial bearings, it may without much doubt be conceded that the tree referred to the ancient forest which surrounded the cathedral, the bell to the cathedral itself, the ring to the episcopal office, and the fish to the scaly treasures which the neighbouring Clutha then offered to its metropolitan master.

From the death of St Kentigern till the year 1050 an impenetrable obscurity gathers over the annals of Glasgow. From that period successive bishops are noticed; but it was not till the year 1115 that full light began to fall on its history. The importance of the see is then demonstrated from a preserved deed recorded in the ancient register of the episcopate. From this it appears that David, when Prince of Cumbria, ordered an investigation to be made as to the lands and churches belonging to the bishopric of Glasgow. In this document the foundation of the church, and the ordination of St Kentigern are related, and also that after his death he was succeeded by many bishops, but that in consequence of the many revolutions and confusion incident thereto which followed, all traces of the church and even of Christianity were destroyed. From this document it appears quite evident that while no traces of the church's history can be found, the cathedral itself not only existed, but was richly endowed.

David having succeeded his brother Alexander I. on the throne of Scotland in the year 1124, at once promoted his chaplain, John Achaius to the bishopric in 1129. On the nones of July 1136 the newly built church was dedicated, on which occasion King David I. endowed it with the lands of Perdeyc (Partick); and subsequently this saintly king restored to the bishop a long list of possessions formerly belonging to the see. In the reign of Malcolm, the church of Glasgow received many gifts from the crown; and during the reign of Pope Alexander III. a bull was issued enjoining the clergy and people of the diocese to visit annually the cathedral church of Glasgow.

While William the Lion was founding free burghs in

Scotland, the great lords of the church obtained privileges of the same nature for the cities erected around their cathedrals. Such was the origin of the burgh of Glasgow. The royal charter rendering Glasgow a burgh, and giving it a market with freedoms and customs, was granted between the years 1175 and 1178. In the early part of this reign the cathedral possessed 25 churches, 17 of which seem to have been mensal. Between 1189 and 1192, Bishop Joceline appears to have been anxiously engaged in the restoration of his cathedral church. The original church erected by Bishop John, chiefly of wood, had been recently destroyed by fire, and Joceline founded a society to collect funds for its restoration. His energy and success in this matter must have been great, since we find that on the 6th June 1197 his new church was sufficiently advanced to be dedicated. After a long episcopate, he died at his old Abbey of Melrose on the 17th March 1199, and was buried on the north side of the choir. During the next century seven bishops occupied the episcopal chair, among the most remarkable of whom were Bondington, who greatly advanced the building of the cathedral, and Robert Wisheart, who latterly stood forward as the most strenuous opponent to the encroachments of Edward I. This monarch spent a fortnight in Glasgow in the autumn of 1301. He resided at the Friars Preachers, but was constant in his offerings at the high altar and the shrine of St Mungo. It may be stated of Wisheart, that when Wallace, almost single-handed, set up the standard of revolt against Edward, the bishop of Glasgow instantly joined him. When Robert the Bruce, friendless and a fugitive, raised the old war cry of Scotland, the same bishop supported him. And when Bruce was proscribed by Edward and under the anathema of the church, Bishop Wisheart assoilzied him for the sacrilegious slaughter of Comyn, and prepared the royal robes for his coronation. Wisheart was taken prisoner in 1306 and was not liberated till after the battle of Bannockburn. He died in 1316, having lived to see Robert the Bruce firmly seated on the Scottish throne, and was buried in the cathedral betwixt the altars of St Peter and St Andrew. In 1321, John de Lindesay was elected bishop. In 1337, when, returning from France to Scotland, the ship which conveyed him and many noble Scottish ladies, with L.30,000 in money, and the treaty between France and England, was taken by the English; and it is said the bishop died of grief before reaching the land. He was succeeded by William Rae, of whom nothing is known except that he built the stone bridge over the Clyde at Glasgow, and was followed by Mathew de Glendonwyn, who during his episcopate made preparations for rebuilding with stone the wooden steeple of the cathedral, which had been consumed by lightning, but who was prevented from accomplishing this through death, which event took place in 1408. On his demise William de Lawedre succeeded, who built the crypt below the chapter-house, and the stone steeple as far as the first battlements. In 1425 John Cameron was elected bishop. He built the great tower of the bishop's palace, and also the chapter house begun by his predecessor. In 1447 William Turnbull was chosen bishop. During a short incumbency he obtained from King James II. in 1420 a charter, erecting the town and the patrimony of the bishops into a regality. This ecclesiastic will be ever regarded with affectionate gratitude as the founder of the University of Glasgow, which was effected through a bull of Pope Nicholas V. in the year 1451. Turnbull was succeeded by Muirhead, Laing, Carmichael, and Blackadder. During the incumbency of the last, the see of Glasgow was made archiepiscopal through the religious enthusiasm of James IV., who in early life had been a canon of the cathedral. The bull declaring the see of Glasgow metropolitan is dated in 1491. Its suffragans were the Bishops of Dunkeld, Dunblane, Galloway, and Argyle. In 1488, Blacadder, in conjunction with the Earl of Bothwell, negotiated a marriage between King James III. of Scotland and the Lady Margaret, eldest daughter of King Henry VII. of England. This union laid the foundation of the title of the Scottish kings to the English throne. Blackadder was followed by James Bethune, Gavin Dunbar, Alexander Gordon, and James Bethune, abbot of Arbroath, who was consecrated at Rome in 1552. At the Reformation in 1560, the latter archbishop retired to France, carrying with him all the relics, documents, and plate which pertained to the See. Since the renovation of the cathedral in 1129, it appears that there had been 26 Roman Catholic bishops, and four Roman Catholic archbishops. From the Reformation till the Revolution, the church in Glasgow was governed by 14 Protestant archbishops, the first, James Boyd, created in 1572, and the last, John Paterson, in 1687.

While the early history of Glasgow may be said to be almost entirely associated with its cathedral and its ecclesiastics, there are a few matters connected with its civil history which may not be uninteresting. The first charter granted by William the Lion to the city was in 1178, another was in 1190, and by a deed in 1268, still extant, it appears that the town was then governed by a provost and bailies, and that it was then in all respects an organized corporation, having persons in official situations for the investing and transferring of property, and with courts of justice for determining disputes amongst the inhabitants. In the year 1300 a battle between the Scots under Wallace and the English under Percy, was fought in the High Street, when victory declared for the former, and the latter are said to have lost their leader with 700 men. Glasgow was successively visited by the plague in the years 1350, 1380, and 1381, and numbers perished by this fearful disease. About 1524 a council convened by the Earl of Angus, and consisting of a great part of the nobility of the kingdom, was held at Glasgow, for the purpose of strengthening that nobleman's overgrown power; but the Duke of Albany being then in France, and hearing of the circumstance, and being assisted by the French king, ere long landed in Scotland with a considerable force, which so intimidated Angus that he retired from the country. In 1538 the first sacrifice of life was made by the church in the vain hope of arresting the Reformation. Jerome Russell, a member of the Glasgow convent of Franciscans, and a youth named Kennedy, of eighteen years of age, were condemned for heresy, and were burned alive, suffering most heroically. About 1542 the bishop's castle, while garrisoned by the Earl of Lennox, sustained a siege from the Regent Arran. It surrendered upon terms which were violated, and the garrison were all put to the sword. Soon after an engagement took place between the same parties at what was called the Butts, at the east end of the city, when 300 men fell, and the regent obtained a victory, in consequence of which the town was plundered. In 1560, the Reformation having taken place, superintendents took the position of bishops. In 1563 a great dearth occurred. In 1566 Queen Mary visited the city for the purpose of seeing her husband Darnley, who had been taken ill when residing with his father in his house at the Limnerfield; and in 1568 many of the citizens fought against her at the battle of Langside, which proved fatal to the hopes of that unfortunate sovereign. In 1570 the castle was again besieged, but in vain, by the Hamiltons. Episcopacy, though in a crippled state, was restored in the person of James Boyd of Trochrig. In 1578, the General Assembly having questioned the legalty of the episcopal function, Boyd ceased to act. To him succeeded in 1581 Robert Montgomery, who resigned in 1585, when William Erskine, a layman, was nominated to the see and revenues. In 1588, however, the temporalities were restored to Archbishop Beaton, at whose death in 1603 Spottiswood, the historian, succeeded to the vacant mitre. In 1638 the famous Assembly of the Presbyterian Church was held at Glasgow, when episcopacy was abjured; churchmen were declared incapable of sitting in the Scottish parliament; and in the following year every person who refused to sign the Solemn League and Covenant was debarred from church ordinances. During the next fourteen years Glasgow suffered great calamities. In 1645 Montrose, after his victory at Kilsyth, marched into the city during a visit of the plague, and levied a heavy contribution upon the inhabitants; and in the same year three of the prisoners taken at Philiphaugh, viz. Sir Walter Rollock, Sir Philip Nisbet, and Ogilvie of Inverquarity, were executed at Glasgow. In 1648 Provost Stuart and the other magistrates were superseded in their offices for their contumacy towards Charles I., and were for some days put in prison. New municipal rulers were elected; and as a punishment on the old, four regiments of foot and horse were sent to the city, with orders to quarter solely on the magistrates, council, and session. In the following year the city was in the horrors of plague and famine; and in two years thereafter Oliver Cromwell took up his quarters, and held his levees in Silvercraig's land in the Saltmarket. When there he visited the cathedral; on which occasion Mr Zachary Boyd, the minister, having inveighed against the general, Thurlow, his secretary, said he would shoot the scoundrel. "No, no," said Cromwell; "we will manage him in his own way;" and having invited the clergyman to dine with him, Oliver concluded the entertainment by prayer, which lasted three hours! In 1652 a great fire took place, by which about one-third of the town was destroyed, the loss being estimated at one hundred thousand pounds sterling. Soon after the restoration of Charles II., Episcopacy being restored in Scotland, 14 ministers belonging to the Presbytery of Glasgow were turned out and took leave of their flocks. During the gloomy ecclesiastical period which succeeded, the citizens of Glasgow, who were chiefly Covenanters, were persecuted with unremitting fury. Numbers were hanged in the streets, while guards were placed at the city ports on Sunday to prevent the inhabitants from attending field preaching. In 1678, immediately after a second dreadful fire had sent a thousand families to the street, the Tolbooth, in which a great number of persons were confined, chiefly for religious opinions, was broken open by the citizens, and the prisoners set at liberty. On hearing that this had been done, the government of the day sent an army of Highlanders to Glasgow, where they exercised the most wanton acts of cruelty and oppression, which ere long led to the battles of Loudon Hill and Bothwell Bridge, and ended in the execution of Cargill, the minister of the Barony Parish of Glasgow, in Edinburgh, and in the martyrdom at Glasgow of James Nisbet, James Lawson, and Alexander Wood, who died "for their adherence to the word of God, and Scotland's covenanted work of reformation." On the abdication of James II. the city raised a regiment of 500 men to support their Presbyterian views; and on the 4th June 1690 the town was declared free by a charter of William and Mary, with power to elect their own magistrates, which was done by a poll of the burgesses. In 1697 the citizens suffered severely from the Darien Scheme, in which many of them adventured their means. The Union in 1707, which has since proved so beneficial to Scotland and England, was most unwelcome in Glasgow, and threatened to cause riot; but in 1715, when the Stuarts' claim to the throne was attempted to be established by the sword, Glasgow at once took her side with the House of Hanover, and raised a battalion of 600 men to aid the Duke of Argyle in quelling the insurrection. In 1725 the extension of the malt tax caused a serious tumult in Glasgow; on which occasion the house of Daniel Campbell of Shawfield, the M.P. for the city, was completely gutted, and six persons killed and seventeen wounded by the soldiers called out to quell the disturbance. The magistrates were committed to their own jail for dereliction of duty, but were soon afterwards released. In 1745, when Charles Edward Stuart again attempted to win the crown, Glasgow was once more on the side of religious liberty, and on that occasion raised for the service of the government two battalions of 450 men, both of which, it is well known, suffered severely at the fight of Falkirk. On the return of the rebels from Derby they threatened to burn the city, but were prevented by Cameron of Lochiel. A heavy contribution was levied both in money and goods, which, with the charge of maintaining the rebel army in free quarters for ten days, the period Prince Charles resided in the Shawfield mansion in Trongate, cost the community about L.14,000 sterling, L.10,000 of which was subsequently recovered by a grant of the British parliament. On the breaking out of the American war in 1775 a regiment of 1000 men was raised at the expense of the city; at the same time the merchants fitted out fourteen privateers, mounting from 12 to 22 guns each, and carrying in whole about 1000 men. During the spring of 1782 a most remarkable inundation of the Clyde occurred, causing great distress and misery to the inhabitants in the lower part of the town, on which occasion the river rose 20 feet above its ordinary level. When the conflict consequent on the French Revolution commenced, the military spirit of the city was roused in support of the constitution and its safety. In 1794 the town volunteers mustered 1300; and in 1798 about L.14,000 was subscribed by the inhabitants for carrying on the war. On the resumption of the conflict after the short peace of Amiens, upwards of 4000 volunteers started up at their country's call. In 1813 the citizens subscribed L.5200 towards the relief of sufferers in the Russian campaign, and L.4554 for the sufferers in Germany. Illuminations for victories followed each other in rapid succession, there being one after the battle of Leipzig, another after the taking of Paris, and a third at the victory of Waterloo. On the latter occasion Glasgow forgot not, amid the exultation of success, the claims of the widows and orphans which the event produced. To the large fund then raised throughout the country she contributed no less than L.7578, 13s. 4d. In 1816-17, great distress having been experienced by the working classes, a subscription to the amount of L.12,871, 1s. 7d. was raised for their relief. This was followed by a serious outbreak of typhus fever, when another voluntary contribution was raised of L.6626, 14s. 1d. to meet the deadly emergency. In 1819–20 the working classes were again thrown into great distress from want of employment; and during the winter an exceedingly feverish state of mind among these persons manifested itself, and created great alarm. On Easter day of 1820 a treasonable proclamation was found posted up in the city; and the next day work was almost universally given up, and a crisis seemed approaching. On Wednesday the city presented a lively picture of a beleagured town; but through the display of a strong military force, and the activity of the magistracy, all was soon rendered tranquil. The only result of the whole ferment which is now to be regretted is the miserable catastrophe which followed in the wake of the special commission which met soon afterwards at Glasgow to try those who were engaged in this *Radical* insurrection; on which occasion a poor old weak creature called James Wilson was hanged and beheaded—a punishment which, considering to what extent vile spies were then employed, is now considered to have been both sanguinary and impolitic. Of the remaining events of a purely historical character connected with Glasgow, we shall limit ourselves to only one more; and that is to the auspicious and ever-memorable visit which Queen Victoria and her illustrious consort made to the city on the 14th August 1849, being the only sovereign of Scotland or England who had entered Glasgow since Mary Queen of Scots, no less than 283 years before. The enthusiastic manner in which her Majesty was then everywhere greeted from upwards of half a million of her subjects on her landing at the harbour, and during her whole progress through the gaily ornamented streets, must have been highly gratifying to the object of such unbounded expression of loyalty and attachment; and when it is added that from the judicious arrangements which were made by those entrusted with the details, everything passed off without the slightest accident, it is certain that this event will ever remain an important episode in the annals of Glasgow.

Although Glasgow may justly be said to be one of the most ancient cities in Scotland, it is at the same time one of the most *modern* of the larger towns of Great Britain. It was, it appears, a place of some consideration at the commencement of the twelfth century, when the foundation of its cathedral was laid; and yet at the beginning of the nineteenth century it had given proofs only of progress equal to those of many other towns in the empire. The fact is that to its wealthy church and its numerous body of ecclesiastics, and afterwards to the establishment of its university, the city owed all the importance which it then possessed. Glasgow only held in 1556 the eleventh place of rank among the other towns of Scotland. The agitation consequent on the introduction of the Reformed religion proved for some time prejudicial to the opulence of the city. The money which had formerly been expended among the citizens by the bishop and clergy was now diverted into other channels, and the advantages resulting from the university were also for a time lost; for as the reformers generally despised human learning, the college was in a manner deserted. According to the assessment of the burghs in 1695, Glasgow was reckoned the second in Scotland. For the great accession of wealth in little more than a century, it may be mentioned that the inhabitants had, for a very considerable time even before the restoration of Charles II., the sale both of raw and refined sugars for the greatest part of Scotland; they had a privilege of distilling spirits from their molasses free of all duty and excise; the herring fishing was also carried on to a considerable extent; they were the only manufacturers of soap, and they annually sent hides, linen, &c., to Bristol, from whence they brought back in exchange tobacco, sugar, and English manufactured goods, with which they supplied the greater part of the kingdom. Immediately after the signing of the Union an increasing impetus was given to commerce, and consequently to the progress, of Glasgow. The American colonies, hitherto exclusively the field for English enterprise, were opened up to the merchants of the west of Scotland; partnerships were at once formed, and vessels chartered, and thereafter built, for carrying on, at first an extensive barter trade, and at length a regular commercial intercourse with Virginia, Maryland, and Carolina. In 1735 the Virginian merchants in Glasgow could boast of having fifteen large vessels belonging to the ports of the Clyde engaged in the tobacco trade, besides many others which they had chartered from other ports. In short, between the years 1760 and 1775 Glasgow became the great emporium for tobacco in the empire, for while the whole import in 1772 was 90,000 hogsheads, Glasgow alone imported 49,000. This trade may be said to have got its death-blow on the breaking out of the American war; but although the period during which it flourished was by no means long, many monuments of its success and greatness have been left either in the princely estates purchased from its gains, or in the magnificent city mansions reared for the accommodation and comfort of the merchant princes who then conducted it. At that period, however, wealth was chiefly confined to those engaged in this traffic; and the style of living by the two classes into which the inhabitants were divided was more marked than that which now exists between the peer and the successful tradesman. Business being paralyzed for a time by the American war, a universal cry of distress was heard throughout the town. At length the exertions of the citizens were thrown into other channels;—the West Indies offered its sugar cultivation to some, and the introduction of the cotton manufacture attracted others. Through these means many years did not elapse before riches became more widely diffused, and before a more general respectability became apparent. By the time that the French revolution again brought the country into war, the city had increased very considerably, and during the few years that preceded that event, foreign commerce was found to be daily increasing, while manufacturing establishments were rising on every hand. The fruits of this industry soon exhibited themselves in the extension of the city. Handsome private mansions were being erected, while public edifices devoted to religion or amusement were seen rapidly rising throughout the city. The general character of the people, which at a more early period was remarkable for its ascetic severity and apparent sanctity of manners, had somewhat changed; and the inhabitants of Glasgow, in liberality, had become more in unison with the feeling and conduct of their neighbours. While commerce and manufactures had thus given the city a stimulating and onward progress, science and art had also added their mighty aid in effecting improvement. As a proof of this it may be mentioned that in 1759 the first act for deepening the river Clyde was obtained; and that in 1764 James Watt made in Glasgow his first model of a steam-engine, to the benefits derived from which the city and its harbour owe much of its prosperity. Necessity and utilitarianism combined to sweep away many of the old landmarks, and a desire for greater comforts brought about improvements in the cleaning, lighting, and paving of the city. With the introduction of the cotton manufacture, that of linens, lawns, and cambrics, which had been a species of staple since 1725, was superseded, but many others had been added to the handicrafts which then existed in the town. A bottle-house for the manufacture of green bottles had been erected so far back as 1730, and one for that of crystal was erected in 1777. Mr Harvey also, at the risk of his life, had introduced the inkle loom into the town in 1732; while a large manufactory of delft pottery was put in motion. The printing of calicoes, first introduced at Pollockshaws, within a short distance of the city, in 1742, had extended; while the brewing of beer and ale, hitherto restricted to mere cauldron brewing, was carried on to a great extent both within and without the town. The manufactures which were established previous to and since the commencement of this century yearly increased, and at this period Glasgow made its first great stride in population, wealth, and importance, which render it at present *cosmopolitan* both in its commerce and crafts. Glasgow, in fact, now unites within itself a portion of the cotton-spinning and weaving manufactures of Manchester, the printed calicoes of Lancashire, the stuffs of Norwich, the shawls and muslins of France, the silk throwing of Macclesfield, the flax-spinning of Ireland, the carpets of Kidderminster, the iron and engineering works of Wolverhampton and Birmingham, the pottery and glass-making of Staffordshire and Newcastle, the ship-building of London, the coal-trade of the Tyne and Wear, and all the handicrafts connected with or dependent on the full development of these various and important branches. Glasgow also has its distilleries, breweries, chemical-works, tan-works, rope-works, dye-works, bleach-fields, and paper manufactories, besides a vast number of staple and fancy hand-loom fabrics, which may be strictly said to belong to the locality. Glasgow, also, in its commercial relations, trades with every quarter of the globe; and its merchants deal in the various products of every country. It hence will appear that one branch of manufacture or trade may be dull, while another may be prosperous; and, accordingly, Glasgow does not feel any of those universal depressions which so frequently occur in places limited to one or two branches of manufacture or commerce.

Population.

In order to bring the progressive and present state of Glasgow more palpably into view, the following statistical comparisons have been prepared, which will at once prove the rapid and steady advance of a city which is scarcely rivalled but certainly not surpassed by any in the world. The first and most striking evidence of the increasing importance of Glasgow will be found in the following chronicle of its progressive and present population:—

Year.	Population.	Year.	Population.
1560	4,500	1811	110,460
1708	12,766	1821	147,043
1763	28,300	1831	202,426
1785	45,889	1841	280,682
1801	83,769	1851	347,001

Of the 347,001 inhabitants of 1851, 163,731 were males, and 183,270 females. It is right to state that the population within the parliamentary district, from which is excluded part of the ancient burgh, was only 329,096. Neither of these numbers, however, fully expresses the true population of Glasgow and its suburbs. Taking the whole population of the four parishes which now constitute the city and its growing suburbs, and which have formed the boundaries within which the mortality of Glasgow has been taken, we find that it had reached, on the 31st March 1851, to no less than 360,138, of which 170,179 were males, and 189,959 were females. According to calculations founded on the increase of dwelling-houses and otherwise, the population in 1855 may fairly be assumed to exceed, within the last-mentioned territory, 400,000. From Dr Strang's analysis of the census of 1851, we find the population located as follows:—

	Males.	Females.	Total.
Ten parishes of old burgh of Glasgow	70,329	77,786	148,115
Barony parish within parliamentary boundary	56,670	66,264	122,934
Gorbals and Govan parishes, within boundary	29,059	32,423	61,482
	156,058	176,473	332,531
Harbours	1,088	38	1,126
Total within old burgh and parliamentary boundary	157,146	176,511	333,657
Barony parish beyond parliamentary boundary	6,585	6,759	13,344
Govan do. do. do.	5,886	6,064	11,950
	169,617	189,334	358,951
Small portion of Govan parish, county of Renfrew, but close to parliamentary boundary	562	625	1,187
	170,179	189,959	360,138

From the same source we find the character of the population at the census of 1851 to have been 283,506 born Scotch, 64,185 Irish, 8930 English, 1065 foreigners, 815 colonists, British subjects, and 450 not ascertained. The ages being—

Age	Number	Age	Number
Under 1	11,618		
1 and under 5	33,070	60 and under 70	10,847
5 ... 10	37,657	70 ... 80	3,973
10 ... 15	36,385	80 ... 90	829
15 ... 20	40,295	90 ... 100	75
20 ... 30	78,176	100 and upwards	4
30 ... 40	51,024	Unknown	452
40 ... 50	34,156		
50 ... 60	20,390		358,951

While the above figures, indicating the place of nativity, show that the Irish form 15·93 per cent. of the gross population, they are far below the reality; for although the children born in the city of Irish parents, and who are imbued with all the characteristics, habits, feelings, and religious sentiments of their fatherland, have been lately most numerous, they are all placed in the census returns as Scotch. The truly Irish population may be fairly assumed to be little short of 90,000.

While the population has thus increased, it may be reasonably supposed that the means of accommodating that population have increased along with it, and the following table of the gross number of dwelling-houses, shops and warehouses, and other possessions, will best show that such has been the case, but which are limited to the parliamentary and burgh boundaries, with an assumed population, for 1855, of 375,000:—

Houses, warehouses, and shops.

1845,	distinct possessions,	65,028	Gross rental,	L.866,150
1850,	...	76,034	...	1,017,362
1855,	...	82,490	...	1,241,590

It hence appears that the distinct possessions have increased 17,462 since 1845, and 6466 since 1850; while the gross rental has also increased between the first and last period L.385,440, and since 1850, L.224,228. The following is a detailed statement of the gross number and rental of dwelling-houses, shops, warehouses, and other possessions within the municipal and parliamentary city, from Whitsunday 1854 to Whitsunday 1855:—

		No.	Rental.
Occupied.	Dwelling-houses and other premises occupied in connection with dwelling-houses	70,793	L.655,436
	Shops, warehouses, counting-houses, and other places of business, public works, &c.	10,271	565,163
		80,964	L.1,220,599
Unoccupied.	Dwelling-houses and other premises occupied in connection with dwelling-houses	1,175	L.11,632
	Shops, warehouses, counting-houses, public works, &c.	351	9,359
		1,526	L.20,991

	No.	Rental.
Possessions occupied	80,964	L.1,220,599
... unoccupied	1,526	20,991
	82,490	L.1,241,590

In comparing this table with that of 1851 an increase will be found, in 1855, of dwelling-houses, to the extent of 6466; of shops and warehouses, and other places of business, and of public works, of 509; while the increase of rental has been, in the course of only four years, L.76,720 on the former, and L.80,698 on the latter. The comparative numbers of dwelling-houses in three different classes of rentals, in 1851 and 1855, are as under:—

	1851.	1855.	Increase.
Total dwelling-houses at L.5 and under,	35,791	36,648	857
... Above L.5 and under L.10,	14,748	18,665	3,917
... At L.10 and upwards,	14,963	16,655	1,692
	65,502	71,968	6,466

Hence it appears that the greatest increase is in houses between L.5 and L.10, clearly indicating an improving condition in the habitations of the working-classes.

Water supply.

While from the foregoing statement may be easily gathered the growing number and advancing comforts of the inhabited houses, and also the increasing size and elegance of the shops and warehouses, perhaps nothing indicates the progress of Glasgow more than the great and increasing consumption of water. Prior to the year 1806 the city depended chiefly for its supply on twenty-nine public wells, and a few private pump wells. About that period was formed the Glasgow Water Company to pump water from the Clyde; this was soon followed by the Cranston Hill Company, which ultimately became united. In 1846 another company was established to furnish water by gravitation, limited, however, to the supply of the inhabitants on the south side of the river, who may now (1855) be estimated at about 80,000. The daily supply in 1854–55 sent in by both establishments to Glasgow and its suburbs, amounted to about 15,300,000 gallons, which, after making a due deduction for the use of factories, dye-works, and other trade purposes, cattle, &c., left nearly thirty gallons a-day for each inhabitant, supplying also in 1854–55 within the mere boundaries of the city, no fewer than 6638 plunge and shower baths, and 12,114 water-closets in private houses. While this is certainly a very large supply of water, and such as no other town can boast of, still its quality is indifferent; and to meet this desideratum, powers have just been obtained to bring water from Loch Katrine to the extent, if necessary, of forty millions of gallons per day, and to vest the whole water supply in the hands of the corporation.

Gas supply.

After water there is nothing which marks a city's onward progress more than its consumption of gas. Previous to 1817 Glasgow was dependent, like all other places, on oil and candle for light. During that year the first Gas Light Company was instituted, which was followed by another in 1843. On the 15th September 1818, the streets were first lighted with this economical agent; and thereafter it began to be used in dwelling-houses and factories. In 1840, for example, the quantity of gas consumed in Glasgow and its suburbs was 173 millions of cubic feet, whereas, in the year 1854, it has reached the enormous amount of nearly 589 millions of cubic feet. The average cost of every 1000 cubic feet being 4s., it follows that the sum paid for gas must have amounted in 1854 to L.117,800. The number of street lamps lighted by the police in 1835 was 2888, whereas the number lighted in 1854 amounted to 7500.

Scotch manufactures, particularly cotton.

The first steam-engine in Glasgow connected with cotton-spinning was erected in 1792; but it was not till the beginning of the present century that any considerable quantity of yarn was spun in Scotland. In 1850 the number of spindles employed in cotton-spinning connected with or dependent on Glasgow amounted to 1,683,093, and the cotton consumed amounted to about forty-five millions of pounds, or 120,000 bales. At present (1856) the consumption does not appear to have increased. The power loom was first introduced into Glasgow in 1793 by Mr James Robertson, who brought two from the Hulks in the Thames. In the following year forty looms were fitted up at Milton, and in 1801 Mr John Monteith had 200 looms at work at Pollockshaws, near Glasgow. In 1831 the power looms in or dependent on Glasgow had increased to 15,137; in 1850 they amounted to 23,564, and produced the daily average of 625,000 yards of cloth; at present (1856) there are about 26,000 or 27,000 power looms, and consequently the daily produce is not only greater from this cause, but also from an increase in speed. The number of persons employed in the cotton factories throughout Scotland, and which may be said to be all connected or dependent on Glasgow, in 1850 was 8797 males, and 27,528 females, total 36,325, while the motive power was, steam, 71,005 horse-power; water, 2812. In addition to the cotton spun for weaving, there are several very large manufactories of sewing thread; and to that of power-loom weaving there must be added all the beautiful fabrics that are still made by the hand-loom, and which employ a vast number of persons, and a large capital. These consist of muslins, plain and fancy harness curtains, jaconets, cambrics, ginghams, checks, and coloured tissues of all kinds; while, of late years, mixed fabrics consisting of cotton and silk, cotton and linen, and cotton and wool, have all been manufactured to a great extent. To the many thousand hand-loom weavers that still reside in Glasgow, must be added those who reside in all the villages for many miles round, and even in some of the more distant towns in Scotland and north of Ireland, to form any adequate idea of the extensive and widespread textile manufacturing interests of Glasgow.

Embroideries.

There is one branch of manufacture connected with cotton, to which it would be wrong not to particularly allude, and that is the embroidering of muslins, better known under the common designation of "sewed muslins." This is comparatively a new manufacture, having only been first started in Scotland about the year 1825. At that period there were only two or three persons engaged in the manufacture; now there are fifty or sixty. The importance of this branch may in some measure be estimated from the fact that it gives employment to a vast number of females in the rural districts for whom no other useful work is provided in the intervals of field labour. In Ireland alone, where it is practised from the Giant's Causeway to Cape Clear, and from St George's Channel to the Achill and other remote islands, it is a source of great comfort to the female population, as it enables them to add to the food and clothing of their families without entailing on them any of the evils of the factory system, the work being supplied to them by agents of the large manufacturers, scattered over all the country, and executed entirely at their own firesides. As the workers are only engaged a portion of their time at this species of industry, it is impossible to estimate their numbers; but it is computed that the amount paid in the western counties of Scotland and in Ireland reaches no less a sum than three quarters of a million sterling annually. Like all other fancy trades, it has been subject to its periods of depression; but its progress has been regular, from a total produce of a few thousand pounds a-year paid for labour in 1825, to the amount above stated, the greatest increase having, however, taken place since 1845.

Coal and iron.

The next great branches of industry, of which Glasgow is the central mart, are its coal and iron trades. Although coal, from a pretty remote period, has been wrought round the city chiefly for domestic uses, it has only been since the introduction of the steam-engine, and still more since the discovery of the economical mode of smelting iron by the hot blast, that the vast and closely packed mineral wealth of its neighbouring districts has been at all fully developed and turned to profit.

In 1854 no fewer than 6,448,000 tons of coals were drawn from the pits in the western districts around Glasgow, of which 2,152,800 tons were consumed in the manufacture of pig-iron, 367,200 in the conversion of pig into malleable, making in all 2,520,000 tons used in connection with the manufacture of iron; while 926,221 tons were shipped, and 148,312 tons sent beyond the boundaries by railways, leaving for the manufacturing and domestic uses of the Glasgow district 2,853,427 tons. The produce of pig-iron in the two western counties of Lanark and Ayr in 1854 was 717,600 tons, 122,684 tons of which were shipped direct to foreign countries, and 294,194 tons were sent coastwise from the Clyde, Port Dundas, and other ports of the Clyde estuary; while 22,865 tons were sent away by railways, and 171,360 were converted into malleable iron, leaving the remaining 106,497 tons for foundry and other purposes of the district. Of malleable iron there was manufactured in the district 122,400 tons. The value of the coal and iron industries to the district in 1854 was L.4,872,866, of which there was paid in wages to 33,908 persons employed in them L.1,973,937. The great progress of the pig and malleable iron manufactures may be best shown as follows:—In 1830 there were only 16 blast furnaces going in the west of Scotland, in 1854 there were 102, the produce of them in 1830 being 40,000 tons, whereas in 1854 the produce was 717,600. In 1842 the production of malleable iron was only 35,000 tons, in 1854 it amounted to 122,400.

Iron ship-building and marine engine making.

Of all the branches of industry, however, belonging to Glasgow and its harbour, there is assuredly none of modern date which has made such rapid progress as that of steamboat building and marine engine making. From the first start of the little "Comet" in 1812 till 1820, there were at the most only one or two river steamers launched yearly, and of a tonnage so small as to be scarcely worth notice. About that period this manufacture received a new impulse, and began at once fairly to develop itself.

From 1821 to 1830, there were 38 steamers built, with a tonnage of 4200; from 1831 to 1840, there were 94 steamers, with a tonnage of 17,623; from 1841 to 1850, there were 167 steamers, with a tonnage of 81,447, while during the three years from 1851 to 1853 there were 206 steamers, with a tonnage of 141,713. The present magnitude of this industry may however be best appreciated from the fact that during the years 1853 and 1854 the then 32 shipbuilders on the Clyde had constructed or contracted for no fewer than 266 vessels, including both steam and sailing, having an aggregate tonnage of 168,000, for which also marine engines were made, or in progress, of 29,000 horse-power; the average of these vessels being 630 tons, and involving the enormous cost of nearly five millions sterling.

Other branches of industry.

Of the many other industries existing in Glasgow, it is only necessary to allude to the chemical works, of which those of St Rollox are understood to be the largest in the world, covering as they do twelve acres of ground, and employing upwards of 1000 workmen, making use of 20,000 tons of salt, and consuming from 70,000 to 80,000 tons of coals annually.

The manufactured products consist chiefly of vitriol, chlorate of lime, of bleaching powder, soda, and soap. The stalks of this establishment are among the most remarkable objects in the city, one of which being 450 feet high, 50 feet diameter at the base, and 14 feet at the top. The chemicals produced elsewhere in Glasgow consist of iodine, bichromate of potash, cudbear, naphtha, pitch oil, pitch, sulphate of ammonia, carbonate of ammonia, pyroligneous acid and its combinations with lead and iron, nitric and muriatic acids with their combinations, and alum, prussiate of potash, &c. Within the bounds of the Glasgow district there are ten distilleries of spirits, producing annually when in full work about 2,500,000 gallons, and in the city and suburbs there are five breweries. Of late years the manufacture of glass and pottery has wonderfully increased, and the making of tobacco pipes is carried on to a greater extent in Glasgow than in any other place in Great Britain.

The river and harbour.

To the progressive rise and present position of the river Clyde and its harbour may be justly attributed the importance and prosperity of Glasgow. The fact is, this city now possessing an inland navigation, and a stream harbour unequalled perhaps in Europe, and which has been accomplished first by the intelligence of the corporation, and in later years by a trust formed partly of the corporation and partly from other bodies of the citizens. About the beginning of the present century the depth of the Clyde at Glasgow was scarcely 5 feet, and there were few or no vessels at its port, and these consisted of craft drawing merely a few feet of water, none certainly exceeding 30 or 40 tons burthen. In 1820 the average available depth of the Clyde at high water during neap tides was 9 feet, which admitted vessels drawing 8½ feet. In 1840 the depth was increased to 14 feet, whereas in 1855 the average depth at high water during neap tides is 19 feet. To show the greatness of the improvements that have been made, it may be mentioned that while only one vessel arrived at the harbour of Glasgow in 1835 of 300 to 350 tons burthen, there arrived during 1854 19 vessels of 1000 tons and upwards. The following is the number of the sailing and steam vessels which arrived at the harbour of Glasgow, with their registered tonnage, during the years ending July 1828, 1840, 1850, and 1854.

Year.	Under 40 tons.	40 to 60.	60 to 80.	80 to 100.	100 to 150.	150 to 200.	200 to 250.	250 to 300.	300 to 350.	350 to 400.	400 to 450.	450 to 500.	500 to 600.	600 to 700.	700 and upwards.
1828	2117	2847	4605	1399	213	20	14	1	0	0	0	0	0	0	0
1840	3256	4286	3945	2975	922	326	171	284	107	118	90	2	4	0	0
1850	4319	2245	2894	3204	733	517	321	128	213	145	110	34	151	15	23
1854	5570	1922	3140	3715	1830	524	214	450	126	425	109	35	49	30	63

The whole number and tonnage arriving at the harbour of Glasgow during the same period were as follows:—

Years.	Sailing Vessels.		Steam Vessels.	
	No.	Tonnage.	No.	Tonnage.
1828	4405	214,315	7,100	481,946
1840	5337	271,942	11,149	894,387
1850	5857	391,033	9,195	873,159
1854	6322	504,008	11,880	1,090,804

The progress and present condition of the river and harbour, however, are probably best exhibited by the following abstract of the revenue of the trust at six different periods:—

In 1800 it was	L.3319 16 1	In 1840	L 46,481 1 9
1820	6,328 18 10	1850	64,243 14 11
1830	20,296 18 6	1854	86,580 5 11

In the progressive, and during the last years most rapid increase of the income of this trust, may be said to be mirrored the palpable progress of Glasgow. The increase of income in little more than fifty years has been nearly thirtyfold, while during even the last four years the increase is L.22,336, 11s., being more in one twelvemonth than the whole revenue amounted to only twenty-five years previous.

Custom-house duties and registered ships.

The next striking index to the progress and present position of Glasgow will be found in the amount of duties levied at its custom-house, and the number of its registered ships.

Years.	Duties.	No. of ships.	Tonnage.
Jan. 5, 1801	L.469 13 6½	0	0
... 1812	3,124 2 4½	35	2,620
... 1820	11,000 6 9	85	6,604
... 1830	59,013 17 3	233	40,978
... 1840	468,974 12 2	351	71,878
... 1850	640,568 7 9	507	137,909
... 1855	668,556 9 4	601	192,895

The following is the amount of duty received at Glasgow on the undermentioned articles during the year 1854-55;—

Butter	L.286	Raisins	L.2,348	Sugar	L.49,436
Cheese	336	Molasses	6,017	Tea	237,520
Coffee	7,123	Rum	8,577	Tobacco	243,507
Corn	10,937	Brandy	37,057	Wine	44,308
Currants	611	Geneva	1,881	Wood	3,435

Post-office.

The last matter connected with the progress of Glasgow to which we will advert is her post-office. At the period of the Union the whole postage revenue of Scotland, notwithstanding the very high rates charged for letters compared with the present, was L.1194, and in 1781 the revenue for Glasgow was only L.4341. In 1853, with a penny postage, it amounted to L.47,063, 7s. 5d. From 1842 to 1853 the increase had been L.20,353, 11s. 11d.; of money orders there were, in 1852, 144,787, amounting to L.267,444, 2s. 4d.,—the increase in eight years being in number 73,986, and in money L.133,414, 11s. 9d. Letters received and delivered in Glasgow in 1852, 15,597,504; letters received and forwarded in Glasgow in 1852, 19,496,880.

Ecclesiastical institutions and buildings.

During the reigns of Catholicism and Episcopacy in Scotland, Glasgow was first the seat of a bishop, and then of an archbishop. It is now merely the place of meeting of the Presbytery of Glasgow and the Synod of Glasgow and Ayr, of the Established Church and of the Free Church, and the District Synod of the United Presbyterian Church. Ecclesiastically, the ancient burgh comprehends ten parochial divisions, the other portions of the city having, either partly or wholly, within their bounds, the parishes of Barony, Calton, Gorbals, Govan, and Maryhill. Of nine of the Established churches within the ancient burgh the Corporation are patrons. The stipends of ministers belonging to the Establishment are paid out of the teinds or seat-rents. The following table gives the statistics of the several church sects at the census of 1851.

Religious Denominations.	Places of Worship.	Number of Sittings.
Establishment	25	28,206
Free Church	30	27,449
United Presbyterian	23	24,184
Episcopalian	5	3,690
Catholic	7	7,914
Independent	11	6,010
Baptists	7	1,711
Other denominations	35	15,114
	143	114,278

It appears that Glasgow, with a population of 333,657, had no fewer than 143 places of worship, affording sitting-room for 114,278 persons; and when it is added that there were three or four chapels or churches belonging to the Establishment which were either vacant or not returned, and likewise a considerable number of places of worship belonging to other religious denominations, which, from want of returns, are not included in this list, it is perhaps not too much to say, that there were church sittings provided in Glasgow in 1851 for at least 120,000. And when it is further considered, that of the above population there are not fewer than 80,000 Roman Catholics, which reduces the Protestants to 253,657, and that the sittings in the Catholic chapels amount to only 7914 (there are three, four, and even six different services in each of these every Sunday), it would appear that there are 112,000 sittings provided in Glasgow for her 250,000 Protestant inhabitants.

The cathedral and other churches.

The venerable cathedral, now in a state of complete repair, is acknowledged to be one of the best specimens of old English Gothic. It occupies a prominent position on the north-east side of the city, and stands about 104 feet above the level of the Clyde. Its form is that of a large cross, with exceedingly short transepts. Its length from east to west is 319 feet, its breadth 63, the height of the choir 90, and of the nave 85 feet. At the intersection, it has a tapering octagonal spire, which rises to the height of 225 feet. Since the late removal of the galleries in the choir, and of the modern stonework between the nave and the choir, the Cathedral is now seen in all its beautiful primeval condition. In this edifice there are 147 pillars, and 159 windows, some of them of exquisite workmanship. The crypt under the choir is scarcely equalled, and certainly not surpassed anywhere for architectural effect. *St Andrew's*, as a modern church, is one of the most elegant in the city. It is situated in St Andrew's Square, and is nearly a fac-simile of St Martins-in-the-Fields in London. *St David's* in the Gothic, and *St George's* and *St Enoch's* in the Roman style, belonging to the Establishment, are handsome structures; while the Gothic edifices of *St John's*, *St Matthew's*, and others, belonging to the Free Church, are elegant in design, and ornamented with lofty spires. Among the many churches belonging to the dissenters, perhaps there is none more striking than the one in Renfield Street, and none so beautiful as that lately built for the Congregational body, in the western line of Bath Street, the spire of which is a model of perfection. The Catholics too, in addition to their ornate Gothic chapel in Clyde Street, have lately added several ecclesiastical ornaments to the city.

Educational institutions.

The University.—This ancient and celebrated seminary of learning was founded by a bull of Pope Nicholas V. in 1451. It formed a corporate body, consisting of a chancellor, rector and dean, with doctors, masters, regents, and students, in the several faculties into which it was divided. One of these was known as the Pedagogium, or College of Arts. This school of learning was first situated in Rotten Row. In 1459, James Lord Hamilton bequeathed to the principal regent of that college some buildings and several acres of land, on part of which the present structure was afterwards erected. The College of Arts was restored and endowed by James VI. During the period which intervened between 1577 and 1688, the university underwent many changes; but in the year 1693, each of the Scottish colleges having received a grant of L.300 per annum out of the bishops' rents, the Glasgow institution again revived; and having received other public and private gifts, its progress has been since uninterrupted. The academic body of the university consists at present of the chancellor, the lord rector, the dean of faculty, the principal and vice-chancellor, twenty-two professors, and one lecturer. The whole business of the university is transacted in three distinct courts, viz., the senate, the faculty, and the comitia. (See UNIVERSITIES.) The students are divided into *togati* and *non-togati;* the former wear a gown of scarlet cloth, and belong to the Latin, Greek, logic, moral philosophy, and natural philosophy classes; the latter are unrestricted in their dress, except the students of divinity. There are bursaries connected with the college founded by thirty individuals, held by upwards of sixty students, from four to six years each; the amount payable to each varies from L.5 to L.25, a few being worth L.40, and one L.50. In addition to these are the more valuable bursaries bequeathed by Mr Snell and the Bishop of Rochester. The former afford L.120 per annum for each of ten Scottish students at Baliol, Oxford, and the latter L.15 for each of four, and which sum is generally bestowed in addition to four of the exhibitions under Snell's bequest. The present buildings were principally erected in 1593 and 1658. The spire, which is 153 feet in height, is chiefly interesting from possessing a thunder-rod which was reared under the auspices of Franklin in 1772. In the divinity and faculty halls are a few historical pictures and several portraits.

The university has had from its origin men of the highest talent, and literary and scientific eminence, among its professors and office-bearers. The names of Melville, Baillie, Leishman, Burnet, Simpson, Hutchison, Black, Cullen, Adam Smith, Reid, Millar, Richardson, Sandford, and Thomas Thomson, are conspicuous, while the names of Edmund Burke, Sir James M'Intosh, H. Brougham, Jeffrey, Thomas Campbell, Alison, Macaulay, and other distinguished persons, are to be found in the lists of lord rectors.

University Library.

The library was commenced almost simultaneously with the foundation of the college, and consists of upwards of 60,000 volumes, among which are some very rare and beautiful editions of the classics and several valuable MSS. The bibliomaniast may here see Zacharias Boyd's metrical version of the Bible, and a splendid copy of the Alexandrian version of the Scriptures. The library is supported from the interest of money left for this purpose, and the fees of students, but chiefly from the grant of upwards of L.700 per annum, which the college receives from the Exchequer as an equivalent for the loss of the Stationer's Hall privilege.

Hunterian Museum.

Immediately behind the university buildings stands the *Hunterian Museum*, a beautiful fabric erected in 1804, from a design by Starke. The building exhibits six Doric columns, bearing a pure Doric frieze and entablature, and surmounted by a glass cupola. It was reared for the reception of the magnificent collection of curiosities which the late Dr William Hunter bequeathed to the university, where he was educated. The contents of this valuable museum have been valued at L.130,000. The medals alone are accounted worth L.40,000; and the library, together with the rich collection of illuminated manuscripts, have been estimated at little short of the same sum. The naturalist will find here a beautiful collection of minerals, shells, quadrupeds, birds, insects, and fossils; the physiologist, an apartment filled with the most curious anatomical preparations; while the devotee of art will be gratified with some of the best specimens of Rubens, Guido, Domenichino, Murillo, Correggio, Giordano, N. Poussin, Zucherelli, Salvator Rosa, Sneyders, Weenix, Wouvermans, and Reynolds.

College Gardens.

Immediately behind, and surrounding the museum are the *College Gardens*, set especially apart for the use of the students. They are planted with trees, and ornamented with walks and shrubbery. This spot may be said to have obtained a semi-classical notoriety, from being the scene chosen by Sir Walter Scott for the rencontre of Rashleigh and Francis Osbaldistone, in the romance of Rob Roy.

Anderson's University.

Anderson's University.—This institution was founded by Mr John Anderson, professor of natural philosophy in the university of Glasgow in 1795, and endowed by him with a valuable philosophical apparatus, museum, and library. It is governed by 81 trustees, and is intended as a means of bringing a literary and scientific education more within the reach of the mass of the community. Every branch of study taught in the college, with the exception of divinity, is given here. Drs Garnett and Birkbeck were the original professors of natural philosophy and chemistry; and it was here that the first mechanics' class was established in Great Britain. The number of students in the session 1854–55 amounted to 1685, being an increase since 1852–53 of 578.

High School.

The High School or Grammar-School in John Street, under the charge of the Corporation, is the oldest educational institution in the city. It appears a grammar-school existed in Glasgow in the early part of the fourteenth century, being then dependent on the Cathedral church. Up to 1834 its masters only taught Latin and Greek, but at that period the school underwent a complete alteration. Two of the classical masterships were suppressed, and in lieu of these, teachers of English grammar, foreign languages, writing, arithmetic, geography, mathematics, and drawing, were introduced. The name was also changed from the Grammar to the High School.

The Mechanics' Institution.

The Mechanics' Institution, which was founded in 1823, for more effectually diffusing science among the working-classes, is situated in Hanover Street. Lectures are here given on chemistry, natural philosophy, and popular anatomy, while teachers give instruction in English grammar and composition, drawing and music. Attached to the institution are a reading-room and library, the latter containing upwards of 5000 volumes.

Normal and other schools.

There are two normal schools for the training of teachers; the one under the control of the Established, and the other under that of the Free Church. There has also been established an excellent school of design, which is well attended, while, during the last few years, several educational institutions of a semi-public semi-private kind have been formed, chiefly in the western parts of the town, for the instruction of the children of both sexes of the higher classes. The number of elementary schools is very great, and daily increasing. According to Dr Strang's tables, the education statistics of Glasgow, at the census of 1851, were as follows:—

Number of week-day schools	281
Number of evening schools	109
Day scholars on books	31,508
Day scholars attending 31st March 1851	28,356
Evening scholars, adults, attending	5,090
Total day and evening scholars attending, being	33,446

out of a population of 34,343 at 5 and under 10 years of age, and 33,202 at 10 and under 15 years of age.

These figures, however, do not express the precise educational destitution, the number between 5 and 10 years of age being estimated at about 6000 or 7000; and although the number in this last category has of late years been gradually reducing through the increased zeal of ecclesiastical educationalists, as well as the benevolence of general philanthropists, still there is left a wide field of ignorance to cultivate, and which, it is feared, can only be reclaimed by some governmental and unsectarian system of tuition. One of the most striking facts connected with the educational statistics of Glasgow is, that in 1851 there were 436 Sabbath schools, which were attended by 43,056 young persons.

Literary and scientific institutions.

Although Glasgow can boast of having had many learned and able men at various times born or resident within its borders, still its inhabitants cannot lay claim to having much of a literary character. About the middle of last century a literary society was established, consisting chiefly of the professors and clergy of the city and neighbourhood, and reckoned amongst its distinguished members, Professors Simson, Adam Smith, Traill, Reid, John Millar, and the Messrs Foulis the celebrated printers. Another literary and commercial society was also formed about the beginning of the present century, in which Drs Chalmers and Wardlaw, and other able men, took an interest, and where essays are still read, and discussions take place on the literary, commercial, statistical, and political topics of the day. A philosophical society was also established in 1802, which, uniting as it now does the man of science with the practical chemist and mechanic, forms a most effective nucleus for mutual encouragement and advancement. In 1808, a society for promoting astronomy was formed, which in due time erected an observatory, at first placed on Garnethill, which was thereafter removed to a rising ground about two miles west of the city, where it now stands. It is occupied and conducted by the professor of astronomy in the University. In addition to an Antiquarian Society, there is the Maitland Club, an institution similar to the Bannatyne of Edinburgh, for the printing of curious and rare manuscripts, illustrative of the history, literature, or antiquities of Scotland. Nearly 100 quarto volumes have been already printed by this brotherhood. There are 21 newspapers and mercantile lists published in Glasgow, irrespective of a host of penny papers which the altered state of the law has produced, some of which have a very large circulation. The first newspaper published in the west of Scotland was the Glasgow *Courant*, which appeared in the year 1715; since which time many have been established and disappeared. The first circulating library was established in Glasgow in 1753, and lent out books at one halfpenny per volume. At present there are many circulating as well as public and private libraries. We have already alluded to that of the College, and we may now mention those belonging to Anderson's University, to the Faculties of Physicians and Surgeons, and Procurators, the Philosophical Society, and also to those founded by Mr Stirling, and established under the title of the Glasgow Public Library.

Newspapers and libraries.

Letterpress printing.

In consequence of an invitation from the magistrates, George Anderson was induced to come to Glasgow in 1638, and here printed an account of the celebrated Assembly of the Church of Scotland which met in that year. The printing of books, however, does not appear to have succeeded well until the Messrs Foulis commenced in 1741, after which and during a succession of years they sent forth from their press works, and particularly editions of the classics, which for accuracy and beauty have never been surpassed in Great Britain. Letterpress printing is now carried on to a very great extent. Besides the great number of newspaper printing offices, many of which have steam-presses, the printing of books is pursued with great vigour and to a considerable extent.

Civic institutions.

The Corporation.—From the period when Glasgow was first created into a royal burgh by William the Lion about 1178, numerous alterations have taken place in its political and municipal constitution. At present, it possesses all the advantages of being a royal, municipal, and parliamentary burgh. It is governed by a lord provost, 8 bailies, and 39 councillors, in addition to whom the dean of guild from the merchants, and the deacon convener from the Trades' Houses, are members of council *ex officiis*. During the term of their office, the bailies are justices of the peace within the county of Lanark, while two out of the council are chosen for holding a species of admiralty jurisdiction over the River and Firth of Clyde. The income of the burgh in 1855 was L.20,124, 6s. $3\frac{1}{2}$d., and the expenditure L.19,139, 16s. 9d. The sheriffs, consisting of the principal and three substitutes, who have a co-ordinate jurisdiction with the magistrates, hold regular criminal, civil, registration, and small-debt courts; and during three times in the year a circuit court of justiciary is held in the city. Since the passing of the Reform Bill, Glasgow sends two members to the House of Commons. The number of registered electors on the roll is 19,500, although scarcely 6000 are actual voters.

The Merchants' and Trades' Houses.—These two bodies or minor corporations formerly exerted considerable political power; but since the passing of the Reform Bill they have restricted their attention chiefly to the management of their property and funds, and which they expend on the support of their aged members and on education. In 1854 the Merchants' House consisted of 1500 members, of whom 36 are directors. Persons on entering pay L.10, for which they have a right to participate in the property and privileges of the institution. The Merchants' House has existed since 1605. Its annual revenue is considerable; and during the year 1854 it distributed in charity amongst its decayed members L.1656, 7s. 5d. The Trades' House is an equally ancient, honourable, more numerous, and wealthy body. In 1846, its revenues, with those of the fourteen incorporations, of which it is the representative, amounted to no less than L.10,972, 19s. 5d., while the number of freemen on the roll was 3234.

The Dean of Guild Court.—This tribunal, to which is referred all questions regarding the boundaries and construction of streets and buildings, consists of the dean of guild, with four assistants from the Merchants' House, and four from the Trades' House; the town-clerks are assessors.

The Police.—Previous to 1800, when the first police act was obtained for the city, the peace was chiefly maintained by the citizens themselves, under what was called "watch and ward," with the assistance of the town-officers. Since that period, the establishment, which was governed by commissioners chosen by the rate-payers, was successively remodelled by different acts of parliament, and in 1846 the commissioners were superseded, and the whole management of the officers of police, statute labour, and sewerage of the city, was placed under a committee of the town council, consisting of the lord provost, the 8 bailies, the dean of guild, the deacon convener, and 18 of the councillors. The chief superintendent of the police is chosen by the lord provost, the sheriff of the county, and the 8 bailies. There are six police courts held within the city, which are presided over by the bailies, assisted by legal assessors.

During the year 1853 there were 15,777 persons brought before the magistrates in these courts. The cost to the community of the city police in 1854, including lighting, cleansing, fire department, and interest on debt, was L.64,726, 8s. 7d. The fines recovered amounted to L.3204, 13s. 9d. The police force consisted of 1 chief superintendent, 6 assistants, 13 lieutenants, and 612 other persons; in all 632. The paving and keeping the streets during 1854 cost L.23,800, 11s. 11d. The annual assessment at present (1856) for police and statute-labour purposes is 1s. 6d. per pound on the rental of the city.

The Prisons.—After the removal of the Old Tolbooth at the Cross, which, like other jails in the country, was very indifferent, a new prison was erected at the south end of Saltmarket Street; but this being found both inappropriate and inadequate, a large prison has been since erected on the site of the bridewell in Duke Street, and which now contains the whole criminal and civil prisoners of the city and neighbourhood. This establishment contains about 554 cells; and during the year 1854 there were 4209 criminal and 169 civil prisoners passed through the prison, the daily average being, of criminals 574, and of debtors 17. The average cost per head of the criminals was L.17, 0s. 10d., less earnings L.2, 14s. 5d. Nett cost L.14, 6s. 5d.

Houses of Refuge.—These asylums, chiefly for juvenile delinquents, are perhaps the best conducted in the country. Here the offspring, generally, of degraded parents, brought up in idleness and vice, and exposed to the crying necessities of hunger, and thereby easily induced to enter on a career of crime, find instruction and a home. Where, too, not a few of the many children rather of misfortune than of vice have been arrested in their criminal course, and have thus been saved from the cruelest of all woes, that of becoming, through the punishment of a prison, additional victims of that melancholy mass of "dishonoured ones," whom the conduct of a cold and unpitying world renders utterly irreclaimable. Of these houses there is one for boys and another for girls. In the former 229 boys were admitted during the year 1854, while in the latter 130 were living in the house on the 30th June of the same year.

The poor.

The Poor.—Glasgow, as regards poor-rates, is divided into four parishes—viz. Glasgow Proper, the Gorbals, the Barony, and Govan; the two latter being only partly within the parliamentary city. The following were the numbers on the poor-roll in 1854 in the various parishes.

	Glasgow Proper.	Gorbals.	Barony.	Govan.
No. on Out-door Roll...............	3126	290	2991	585
... of Orphans on do...............	528	12	348	28
... of Paupers in Poor-house ...	955	10	834	388
... ... in Lunatic Asylum....	138	9	116	21
... ... in Deaf and Dumb do.	3	...	9	2
... ... in Blind do.	1	...	...	...

The cost per head of the out-door poor for year 1854, exclusive of expenses of management, was, Parish of Glasgow L.5, 1s. 2d., Gorbals L.2, 7s. 6d., Barony L.3, 10s. 8d. Govan L.5, 16s. 2d. The cost of orphans per head, including clothing and school fees, being, Glasgow L.6, 11s. 9d., Gorbals L.4, Barony L.6, 14s., Govan L.6, 19s. 6d. The number of casual poor receiving relief during 1854 was, Glasgow 1809, Gorbals 166, Barony 1907, and Govan 1694.

Markets, abattoirs, and consumption of food.

In former days, Glasgow was celebrated for its market places; at present the greater part of the business formerly transacted in markets is now carried on in private shops. The only markets now worthy of notice are the cattle and horse market, situated at the east end of the town, which is of great extent, and most conveniently laid out for the purposes intended; and the large structure called the "bazaar," situated in Candleriggs Street, for the sale of vegetables, fruit, butter, cheese, eggs, &c.

In illustration of the business transacted in the former, it may be mentioned that in the year 1854 there were 36,009 oxen, 114,780 sheep, and 59,737 lambs, and about 9500 pigs, sold within its walls, besides a very large number of milch cows and horses. In the latter, there was of fruit, 620 tons of apples, and upwards of a million of lbs. of pears, plums, cherries, gooseberries, and currants; of onions 918 tons, and of cheese 1100 tons. There are three public shambles in the city, in all of which there were slaughtered, during the year 1854, oxen 27,881, calves 2004, sheep 94,027, lambs 44,098, goats 36, and pigs 4633. The annual amount of fresh and salted butcher meat used in Glasgow has been estimated at 45 millions of pounds weight, which, at 6d. per lb., is little short of L.1,125,000. The fresh fish sold or consumed in 1854 was 3367 tons, which at 3d. per lb., amounted to L.94,276. The bread consumed was calculated to be 144 millions of pounds weight, which, taking the 4 lb. loaf of both qualities to be on an average 8d., shows a gross cost of L.1,200,000.

Fairs.

There are three great fairs in Glasgow during the year, the chief of which is that held in the month of July. This great carnival lasts for a week, and affords the chief holidays for the working classes.

Commercial institutions.

The leading commercial institution in Glasgow is *The Chamber of Commerce*, which was instituted in 1783, under the auspices of Patrick Colquhoun, Esq., author of the *State of the Police of London*, at that time a merchant in Glasgow, for the purpose of encouraging and protecting trade, and keeping a watchful eye on whatever might be supposed to affect the commercial interests of Glasgow and its neighbourhood. It is governed by a chairman and 30 directors. The next in importance is the *Royal Exchange*, and *Lloyd s Room*, where the merchants daily congregate to transact business and to insure vessels against sea and fire risk. The annual subscribers to this institution are about 2000. There are also several other mercantile associations, such as the *East India Association*, the *West India Association*, &c., for the protection of their several particular interests. There are eleven banks and branch banks in Glasgow, which are all joint-stock companies. Five are properly Glasgow institutions, originating and having their principal establishments there; the rest are Edinburgh establishments, or partly Edinburgh and partly Glasgow.

Banks.

Of the former are the *Union Bank of Scotland*, a handsome building situated in Ingram Street; the *Western*, a Venetian edifice on the east side of Miller Street; the *Clydesdale*, a plain building in Queen Street; the *City*, a rather elegant structure in Virginia Street; and the *North British*, which does not issue notes, George's Street. Of the latter are the Royal Bank, Bank of Scotland, British Linen Company, Commercial, National, and Edinburgh and Glasgow. The edifices in which these establishments carry on their business are particularly handsome, and have of late years added much to the beauty of the city. The first local bank in Glasgow was the *Ship*, which began business in 1749; and the next greatest local bank was the *Glasgow*; both of these have merged in the Union Bank of Scotland.

National Savings Bank.

In 1815, the first attempt made in Glasgow to establish an institution for the accumulation of the savings of the community was the Provident Bank. This, and some others of a like kind, in 1836 were all merged in the National Savings Bank, which, during a career of 18 years, has not only received sums to the extent of L.3,325,168, 11s. 8d., and repaid of these L.2,640,422, 17s. 7d., but has credited depositors with interest to the extent of L.19,631, 14s. 10d., and had at the close of 1854 an accumulated deposit of L.659,460, 10s. 4d. The number of deposits during the year was 87,100, of which number 73,645 were in sums varying from one shilling to five pounds.

Charitable institutions.

There are few cities in which more charitable institutions are to be found than in Glasgow. Here are retreats for the poor and aged, houses for the houseless, hospitals for the sick, homes for the deaf, dumb, blind, and insane, and schools for the ragged and neglected. The sums annually dispensed by the Merchants and Trades' Houses and Incorporated Trades, and by other societies, go far to keep down the regular poor-rate; while this unseen charity preserves many thousands from feeling the degradation of public pauperism. Among the more important institutions may be mentioned Hutcheson's Hospital and the Royal Infirmary, the former dispensing in 1854 charity to 53 men and 410 women to the amount of L.3829, 15s., and educating and clothing 174 boys, at the cost of L.1123, 13s. 9d.; while the latter ministered to the distresses of no fewer than 5074 inmates in the house, and afforded medical relief at the dispensary to 6766, at an expense of L.10,076, 0s. 3d. The amount raised by religious and benevolent societies, irrespective of widows' funds, benefit societies, charity schools, maintenance of paupers, and for payment of the various denominations of clergy, cannot be less than L.30,000 a-year.

Public buildings.

The public buildings, exclusive of the churches, banks, and others which we have already mentioned, may be limited to the following:—The ROYAL EXCHANGE, the most elegant edifice in the city. The portico consists of twelve fluted Corinthian columns supporting a rich frieze and pediment. The north and south sides of this building are ornamented with a handsome colonnade of similar columns, while the back is chiefly occupied by a large window. If the exterior does honour to Mr David Hamilton, its architect, the interior is no less worthy of his acknowledged taste and talent. The newsroom, which is 122 feet in length by 60 broad, is fitted up according to the purest principles of Grecian architecture. Its roof boasts all the rich ornament of the Corinthian, and is supported by eighteen fluted columns of the same order, surmounted by a beautiful entablature. The ROYAL INFIRMARY, founded in 1792. It is in the Roman style of architecture, from a design by Adams. It is situated in a wide *Place* near to the cathedral. It has accommodation for about 240 medical and surgical patients, with a fever hospital capable of holding 220 more. The NEW CITY AND COUNTY BUILDINGS, in connection with the New Merchants' Hall, in Wilson and Hutcheson Streets, form a magnificent pile, from a design by Messrs Clarke and Bell. In these buildings are all the municipal and county offices, the Council Chamber, Sheriff and Dean of Guild Courts, Justice of Peace Court, and the hall for the meetings of the Merchants' House. The TRADES HOUSE, in Glassford Street, having a very fine hall for the meetings of that important body. The JUSTICIARY COURT, and other courts of justice, are situated at the south-west corner of the public green. These form a large and elegant building of the Grecian Doric, from a design by Starke. The front of this edifice will remind the virtuoso of the Athenian Parthenon, while he will scarcely fail to regret that such a building should have been injured by so low a situation. This building, which is 215 feet in length by 114 in breadth, cost the corporation upwards of L.34,000. Its interior has lately been altogether altered, and contains three public courts of justice, with every accommodation for jurors, witnesses, &c. The TONTINE, at the Cross, containing the Old Exchange-room and the Town Hall, is one of the most striking structures in the city. The front of this building is supported by an elegant piazza, which is surmounted by two stories crowned by an enriched entablature, a balustrade, and vases. In the Town Hall are portraits of all the British sovereigns, and an excellent picture of John Duke of Argyll, by Ramsay. Not far from this handsome building is the spire of the old Tolbooth, which stood on the site of the adjoining tenement. The top of this spire is surmounted by a light and airy piece of open stonework in the shape of an imperial crown, in which is placed a set of musical bells, which are daily played between two and three o'clock. Of the other public edifices, we can only allude to the TOWN'S HOSPITAL, HUTCHESON'S HOSPITAL, the TRADES' HALL, the ASSEMBLY ROOMS (now the ATHENÆUM), the CORN EXCHANGE, the WESTERN CLUB HOUSE, and the LUNATIC ASYLUM at Gartnavel.

Bridges.

Previous to the year 1768 there was only one bridge across the Clyde at Glasgow; and this continued for nearly six centuries to be the only communication between the north and south sides of the river. In that year a new one was founded, under the title of the JAMAICA STREET BRIDGE. Both of these structures have lately been swept away; and the bridges, now five in number, which span the Clyde at Glasgow, are all of modern construction.

The one immediately close to the harbour, called the GLASGOW BRIDGE, being the lowest of the series, was begun in the year 1832, from a design by Thomas Telford of London, and finished at a cost of L.34,000, and including compensation to owners and tenants of adjoining property, of L.40,000. It consists of seven arches, is 560 feet in length and 60 feet over the parapets, and is cased with Aberdeen granite, but, with all this breadth, it is already found narrow enough for the great traffic. It is altogether a graceful, light, and elegant structure. The next bridge eastward is PORTLAND STREET SUSPENSION BRIDGE, consisting of a single span of 412 feet, for foot passengers, and cost L.8000. It was commenced on 2d Dec. 1850, but not opened till May 1853. The third occupies the site of the ancient structure erected by Bishop Rae, from a design by Messrs Walker & Burgess of London, and is called the VICTORIA BRIDGE; it was commenced in 1850. It is built of heavy blocks of freestone, and cased with Dublin Bay granite. Victoria Bridge is altogether one of the most beautiful and strongest erections in Europe. It consists of five arches, each of which forms a very flat segment of a circle. The span of the centre arch is 80 feet, and the rise 10 feet 6 inches; the span of each of the adjacent arches is 76 feet, and the rise 9 feet 4¾ inches; while the span of each of the outward arches is 67 feet, with a rise of 7 feet 2 inches. Each of the two centre piers is 10 feet in thickness. The total length of the bridge to the end of the wing-walls is 467 feet; and the total river space occupied by piers 38 feet. This bridge is 60 feet broad over the parapets. The fourth, called HUTCHESON'S BRIDGE, is built on the site of one which was commenced in 1794, but carried away by a flood before completion. The present structure, which was begun in 1829, and completed in 1834, at a cost of L.30,000, is from a design by Mr Stevenson. It is of freestone, with five arches, and is only 34 feet broad between the parapets, and possesses none of the beauty of either of the other stone structures. Lastly, a SUSPENSION BRIDGE, just finished, situated a short distance eastward from Nelson's Monument, and which has been erected at a cost of about L.5500. The three stone bridges are managed by trustees, consisting of the town-council and certain gentlemen named by the counties of Renfrew and Ayr. The revenue from toll-duties for the year 1854–55, was L.6555, 10s. 5d.; the expenditure L.3220, 18s. 4d.; and the debt L.60,045, 1s. 2d.

Monuments and statues.

The public monuments consist of an obelisk on the public green, erected by subscription to the memory of Lord Nelson; a pillar, surmounted by a statue by Forrest, in the Necropolis, in honour of the reformer John Knox; and a column, with a statue, in the centre of George Square, in memory of Sir Walter Scott. There are three equestrian statues in the city; the oldest, that of William III., presented by Governor Macrea, and erected at the Cross; the next is that in bronze of the Duke of Wellington, by Marochetti, having bronze bas-reliefs on the pedestal, representing his first and last great battles—it was erected by private subscription, at a cost of L.10,000; and last, that of Queen Victoria in St Vincent Place, also by Marochetti, erected by subscription, to commemorate her Majesty's visit to Glasgow in 1849. There are four pedestrian bronze statues scattered over the town; the first, that of Sir John Moore in George Square, by Flaxman; the second, that of James Watt, also in George Square, by Chantrey; the third, that of James Oswald of Auchincruive, late M.P. for the city, in Crescent Place, by Marochetti; and the last, of Sir Robert Peel, not yet placed. There are likewise three marble pedestrian statues; the first, of William Pitt, by Flaxman, erected in the Town Hall at the Cross; the second, of James Watt, by Chantrey, in the Hunterian Museum; and the third, of Kirkman Finlay of Castletoward, late M.P. for the city, by Gibson, placed at the entrance to the Merchants' Hall, in Hutcheson Street.

Places of amusement and pleasure grounds.

The Theatre-Royal, situated in Dunlop Street, and lately rebuilt, is a large and elegant structure, in which, in addition to the usual performances of tragedy, comedy, and farce, has of late years been added Italian operas. The first regular theatre opened in Glasgow was in 1764, which having been burned, a new one was erected on the site of the present Theatre-Royal in 1785, which having been found, from the increasing taste for theatricals, too small, was abandoned, and a splendid edifice was erected by subscription in 1805 in Queen Street, at a cost of L.18,000. This, too, having been consumed by fire in 1829, the present theatre was got up entirely through the exertions of the late Mr J. H. Alexander, long its indefatigable manager. There is another theatre, situated in West Nile Street, called *The Prince's*, which is opened during summer.

The City Hall is situated in Candleriggs, and was originally erected by the corporation to meet the demands for great public meetings. It has latterly been remodelled, and is used for concerts, lectures, &c. A splendid organ has also been added to it at a cost of little less than L.1500. This hall can easily accommodate 2000 or 3000 persons.

The M'Lellan Rooms.—These consist of three large saloons, recently erected by the late Mr Archibald M'Lellan, with the view of giving accommodation to a large and valuable collection of pictures which he bequeathed to the citizens. They are tastefully fitted up, and occasionally serve the purposes of the old dancing assembly rooms in Ingram Street, now converted into an Athenæum.

The Public Green.—This large and well-kept park has been long famed, and is situated at the south-east side of the city. It consists of about 130 or 140 acres. It is much used by the population as a place of recreation, and by the military as a place of drill.

The Botanic Garden lies about a mile north-west from the city, and extends to about forty acres. It occupies the slope which overlooks the wooded banks of the Kelvin. It is tastefully laid out in plots and walks, and boasts a rare and valuable assemblage of curious trees and plants brought from every quarter of the globe. It is furnished with hot and green houses, and water-tanks and rock-work suitable for all kinds of plants. It has two collections, arranged according to the systems of Linnæus and Jussieu, for the use of the students of botany attending the university, the college having contributed L.2000 for the exclusive privilege of their professor giving prelections there. On certain days the working classes are admitted at a charge of a penny each; and as a proof that this boon is taken advantage of, it may be mentioned that during the fair week of 1854 no fewer than 24,822 visited these gardens.

The West-End Park.—The corporation, with the view of improving the city and benefiting the health of the citizens, lately purchased the lands of Kelvin Grove, &c. at a cost of L.100,000. Part of this has been assigned for the sites of handsome domestic residences, and part for the formation of a park for the recreation of the public. The latter is nearly completed, after a plan by Sir Joseph Paxton, and when finished will be one of the finest promenades connected with any city in Europe. The views from the high grounds are splendid, commanding the whole valley of the Clyde, the mountains of Dumbarton and Argyll, Gottfeldt in Arran, Benlomond, &c., while the lower grounds are ornamented with the finest timber, and the flowering shrubs which originally awakened the poet's lyre in praise of "Kelvin Grove."

Climate.

The climate of Glasgow, like most parts of the island, is variable. Lying in the narrowest part of the isthmus betwixt the Forth and Clyde, the air is frequently refreshed by temperate breezes from the sea. The wind is south-west and west for nearly two-thirds of the year. Fogs are not so common as on the east coast; but there are more rainy days than in Edinburgh. The winters are mild, and the springs free from the biting east winds so prevalent on the sides of the Firth of Forth. The following is the meteorology of Glasgow for the years 1851, 1852, 1853, and 1854:—

Days in which rain or snow fell—average of each year	185·75	inches.
Mean quantity of rain that fell each year	37·22	...
Winds, S. 36¼ days, S.W. 55½, W. 83, N.W. 5½, N. 16¼, N.E. 18¼, E. 44½, S.E. 9½, Calm 67¼.		
In 1851 the mean height of barometer was	29·742	inches.
Thermometer, mean max. and min. being	47·1	...

Health, mortality, and disease.

In consequence of burial records having been regularly kept since 1699, the mortality of Glasgow has been always well known; and from these tables it appears, that during the years from 1848 to 1854—which, however, include two visitations of cholera—the deaths amounted to 86,934, being an annual average of 12,417, which, measured by the real population of 1851, shows 1 death in 29 of the population. This, however, is a high exceptional figure of mortality, arising altogether from the presence of cholera. The census year, taken alone, which may be considered a fair average twelvemonth, having only shown 1 death to 33·5. One peculiarity, however, connected with Glasgow mortality is very striking, and that is the great proportion of deaths being under five years of age.

During the seven years from 1848 to 1854 the annual average number of infantile deaths was 5535; and when measured in the population of 1851 under five years of age, shows the deaths of 1 to 8·10, the proportion of infantile deaths to the whole deaths during the same period being 44·56 per cent. The diseases which have chiefly carried off the infant population during the last seven years were, measles 1 in 795, hooping-cough 1 in 539, scarlatina 1 in 711, croup 1 in 2118, and small-pox 1 in 816·6, of the mean population of 1851. The leading agent in swelling the annual bills of mortality among adults is consumption, that insidious and fell distemper having carried off, from 1848 to 1854, 14,933 individuals, or annually on the average of 2133, being 1 in 168·84, or 0·59 per cent. of the mean population of 1851. It appears that this malady destroys regularly every year more than one half of the number which cholera carried off during each of its three visits to Glasgow. It appears also that this distemper has much increased in this locality since the close of the last century, the deaths from phthisis in 1775 being only 1 in 267, whereas in 1854 the mortality was 1 in 168. Upon the whole it appears that while Glasgow shows itself unfavourable to human life during childhood, and that particularly among the working classes, it exhibits that its climate is suitable to adults, being in this respect one of the healthiest cities in the kingdom. The number of deaths in 100 living from fifteen to sixty years of age, being 1·41, London 1·56, Birmingham 1·50, Manchester 1·83, and Liverpool 1·76.

Cemeteries.

To meet the requirements of the large mortality of Glasgow there are twenty-two places of sepulture; and although it is to be regretted that so many of them are still found surrounded by the crowded habitations of the living, it is, at the same time, satisfactory to know that extramural burial is daily on the increase. Every succeeding year shows a growing taste on the part of the living to imitate the civilized nations of antiquity by carrying forth their dead beyond the boundaries of the city. Of late years several beautiful garden cemeteries have been formed, such as Sighthill, Dalbeth, the Southern and Eastern Necropolis, &c., on the plan of the Glasgow Necropolis *par excellence*, which may be fairly accounted the parent garden cemetery of Great Britain. This picturesque burying-ground occupies a rocky eminence on the east of the cathedral, is adorned with trees, shrubs, and flowers, and is already crowded with many striking and elegant monuments. It possesses several winding walks, and affords, from almost every point, the most splendid views of the city and neighbourhood. The singular diversity of its soil and substrata proclaims it to be, of all other spots, the most eligible for a cemetery, calculated, as it is, for every species of sepulture, and suitable for every sort of sepulchral monument. (J. S—G.)

GLASLYN, in North Wales, a romantic river, forming the south-eastern boundary of Snowdonia, has the first part of its course in Caernarvonshire, which it afterwards divides from Merionethshire. It rises in that part of Snowdon adjoining Glyder Vach, and, dashing down an almost perpendicular precipice, produces a fine cascade. On reaching a narrow meadow-valley it turns southward and falls into the beautiful lake Llyn Gwynant, from which it issues at its south-western extremity, and flows through a narrow beautiful vale studded with cottages among the rocks. Here it passes under the Pont-Bayn-y-Wyad, a stone bridge, whence a striking view of Snowdon presents itself. Further down the Glaslyn enters the fine lake of Llyn-y-Dinas, which it quits on the south, amid splendid scenery, and soon reaches the base of Dinas Emris, an isolated rock celebrated in early British history as the retreat of Vortigern. Its course then lies in a narrow vale between lofty hills till it arrives at the Pont-Suggin among most romantic scenery. Further down it flows through the lovely village of Bethgelert, whence it rushes on to the stupendous chasm of Aberglaslyn, whence again issuing, it dashes on through enchanting scenery, and at last glides silently into Cardigan Bay.

GLASS.

The general term *glass* is employed by chemists to denote all mineral substances which, on the application of heat, pass through a state of fusion into hard and brittle masses, and which, though not always transparent, exhibit a lustrous fracture when broken. The glass of commerce, however, to which our remarks are restricted, or the transparent and artificial substance which is usually distinguished by the generic name, is produced by the igneous fusion of siliceous earth with certain alkaline earths or salts, or with metallic oxides.

The etymology of the word has been much disputed. It is derived by some from the Latin *glacies*, ice, its resemblance to which is thought to have suggested the title. Others have remarked, that the common Latin designation of this substance is *vitrum;* and as the Romans applied this term, in common with the word *glastum*, to the plant which we call woad, they have deduced it from the latter of these, either because the ashes of this plant were used in the manufacture of glass, or because it exhibited something of the bluish colour which is procured from woad. *Glassum*, the name given to amber by the ancient Gauls and Britons, has also been assigned as the origin of the word. But none of these etymons appears very satisfactory. The most plausible theory is that which derives the term from the Saxon verb *glis-nian*, or the German *gleissen*, *splendere*, which are probably contractions of the Anglo-Saxon *ge-lixan*, to shine, to be bright. This view is in a great degree confirmed by the sense in which the term glass and its derivatives are employed by our older writers, who frequently apply it to shining or glittering substances, without reference to colour or transparency.

In the most remote ages the art of blowing glass into bottles, making it into vases, colouring it to imitate precious stones, melting it in enormous masses to make pillars, rolling and polishing it into mirrors, and tinting it in parts, were all perfectly well known. For its origin we must look to Egypt, the parent of so many collateral arts. The story of the Israelites having set fire to a forest, and the heat becoming so intense that it made the nitre and sand melt and flow along the mountain side, and that they afterwards did artificially what had been the result of accident, may be set down as equally fabulous with the story of the pirates, who are said to have landed on the sea beach, and wishing to make their cauldron boil, piled up some vitreous stones and placed on them a quantity of sea-weed and blocks of wood, causing so strong a heat that the stones were softened and ran down on the sand, which melting and mixing with the alkali became a diaphanous and glassy mass. The fictitious character of both these stories is proved by the simple fact that it requires the most intense furnace heat to insure the combination of the sand with the nitre.

Under these circumstances we are justified in believing that glass-making had its origin at the same time with the baking of bricks and pottery. The smelting of ores, too, required a furnace sufficiently intense to fuse the silicates analogous to glass, and hence it may be safely inferred, that in the age when melting and working metal was known the art of making glass was also practised. In the book of Job the most precious things are compared to wisdom, but still more precious are gold and glass. The Hebrews must have become acquainted with glass while in Egypt, and in consequence of their proximity to the Phœnicians; and it is now generally believed that these two nations had the merit of originating and establishing its manufacture. The Athenian ambassadors, in order to give an idea of the magnificence displayed at the court of the great King of Persia, said, that they drank in cups of glass and gold. Some writers affirm that the Egyptians in some instances sealed up their dead in a coating of glass, and glass-houses are said not to have been uncommon in that wonderful country. Some authors ascribe, with very plausible reason, the discovery of glass-making to the priests of Vulcan at Thebes and Memphis, the greatest chemists in the ancient world. The Egyptians are also known to have made enamels of divers colours which they applied on pottery, magnificent specimens of which are still extant, and are called Egyptian porcelain. These are chiefly covered with beautiful blue or green, and groups of flowers or designs are traced in black. Glass beads and other ornaments made of that substance, skilfully manufactured and beautifully coloured, have been found adorning mummies, which are known to be upwards of three thousand years old. It is certain that Tyre, Sidon, and Alexandria, were long celebrated for their glass, and furnished the greater proportion of that used at Rome. Under the Roman Empire the Egyptians still preserved their superiority in the art of glass-making, and it is said that Aurelian caused them to pay their tribute in that manufacture. Adrian mentions that he had received drinking-glasses of various colours from a priest of a famous temple in Egypt, and gives instructions that they are not to be used but on the greatest occasions, and on the most solemn feast days. To these places the art was exclusively confined for some centuries, and was an article of luxury, being chiefly in the form of urns or drinking cups of the most elaborate workmanship, and exquisitely embellished with raised, chased, or ornamented figures. The Barberini or Portland vase, composed of deep blue glass, with figures of a delicate white opaque substance raised in relief, is a splendid specimen, and was found in the tomb of Alexander Severus, who died A.D. 285.

The art of glass-making seems to have been introduced into Italy by the Romans after their conquests in Asia in the time of Cicero, and the first glass works there were said to have been near the Flaminian Circus. It is highly probable that these workmen were imported from Egypt. The use of glass seems rapidly to have increased, and to have become very common, for we find an emperor in the third century of the Christian era saying, that he was disgusted with so low and vulgar an object as glass, and that he would only drink from vessels of gold. By this time the manufacture of glass was so considerable that an impost was laid on it, and it was extensively employed in the decorations of buildings, while in glass mosaics were combined the most brilliant colours.

From the circumstance of coloured glass beads and amulets having been found among Druidical remains in this country, it has been argued by Pennant and others, that the art of making glass was known in Britain before its invasion by the Romans. It can hardly, however, be believed that a people who had made very trifling advances in civilization, and who, it is known, were entirely unacquainted with any other art, should be found not only conversant with the manufacture of glass, a complicated and highly ingenious process, but should excel in it; for the beads and amulets spoken of are of exquisite workmanship, and beautifully coloured in imitation of the rarest and most precious stones. There seems little doubt, therefore, that the ancient Britons procured these in the course of traffic with the Syrians, who visited the island, as we do those in the South Seas, to drive a trade with their savage inhabitants in toys and trinkets, giving them these in exchange for skins or other natural productions. By whatever means, however, these ornaments came into Britain, it is certain that they were in extensive use, though principally for religious purposes, long prior to the Roman invasion, as they are found in barrows or tumuli of a much older date. One at Stonehenge, in particular, on being opened, was found to be filled with them.

Glain Neidyr, or Druidical glass rings, generally about half as wide as our finger rings, but much thicker, have frequently been found. The vulgar superstition regarding these was, that they were produced by snakes joining their heads together and hissing, when a kind of bubble like a ring was formed round the head of them, which the others, continuing to hiss, blew on till it came off at the tail, when it immediately hardened into a glass ring. Success was thought to attend any one who was fortunate enough to find one of those snake-stones. They were evidently beads of glass employed by the Druids, under the name of charms, to deceive the vulgar. They are usually of a green colour, but some of them are blue, and others variegated with wavy streaks of blue, red, and white.

Glass utensils have been found in Herculaneum, which city was destroyed by an eruption of Mount Vesuvius in the reign of Titus (A.D. 79). A plate of glass also found there has occasioned much speculation as to its uses. Similar plates, to which Pliny gives the name of *vitreæ cameræ*, seem to have been employed, in a manner not very well understood by us, as panelling for their rooms. It is disputed whether or not glass was used in Herculaneum for windows.

Dion Cassius and Petronius Arbiter concur in their account of the discovery of malleable or ductile glass by a celebrated Roman architect, whose success in the restoration to its position of a portico which leaned to one side had roused the envy and jealousy of Tiberius, and occasioned his banishment from Rome. Thinking that his discovery would disarm the emperor's wrath, the artist appeared before him bearing a glass vessel, which he dashed upon the ground. Notwithstanding the violence of the blow, it was merely dimpled, as if it had been brass. Taking a hammer from his breast, he then beat it out into its original shape; but instead of giving him the reward which he had expected, the emperor ordered the unfortunate artisan to be beheaded, remarking, that if his discovery were known, gold would soon be held of as little value as common clay. This is probably another version of the story told by Pliny, of an artificer who made the same discovery, and whose workshop was demolished by those who had an interest in preventing the introduction of an article which would lower the value of gold, silver, and brass. Although it might not be justifiable to give unqualified disbelief to these stories, yet the knowledge we at present possess would restrict the possibility of such a discovery within the narrowest limits. The union of the properties of malleability and vitrification seems to be incompatible. Some metallic substances, by the application of intense heat, are reduced to the state of glass, but at the same time lose their malleability; which fact would seem to imply that it is impossible to communicate the latter property to glass. The extraordinary stories above mentioned have, however, been rationally enough explained by modern chemists. It has been observed by Kunckel, that a composition having a glossy appearance, and sufficiently pliant to be wrought by the hammer, may be formed: and by Neumann, that, in the fusion of muriate of silver, a kind of glass is formed, which may be shaped or beaten into different figures, and may be pronounced in some degree ductile. Blancourt, in his *L'Art de la Verrerie*, mentions an artist who presented a bust of ductile glass to the Cardinal Richelieu, minister of Louis XIII. But he does not seem to have been more fortunate than his predecessors; for he was doomed to imprisonment for life, for "the politic reasons," as Blancourt with much simplicity observes (we quote from the translation published in 1699), "which, it is believed, the cardinal entertained from the consideration of the consequences of that secret," which no doubt led him to fear lest the established interests of French glass manufacturers might be injured by the discovery. From expressions used by Blancourt in other parts of his work, we think, that by malleable glass, such as was produced by this artist, he understood some composition similar to those which Kunckel and Neumann discovered, and was not very exact in limiting the term to that vitreous substance which we now generally understand when we speak of glass.

The precise period at which the making of window-glass came into practice is not now certainly known. The Roman windows were filled with a semitransparent substance called *lapis specularis*, a fossil of the class of mica which readily splits into thin smooth laminæ or plates. This substance is found in masses of ten or twelve inches in breadth, and three in thickness; and, when sliced, very much resembles horn, instead of which it is to this day often employed by lantern-makers. The Romans were chiefly supplied with this article from the island of Cyprus, where it abounds. So good a substitute for glass is it said to have been, that, besides being employed for the admission of light into the Roman houses, it was also used in the construction of hot-houses, for raising and protecting delicate plants; so that, by using it, the Emperor Tiberius had cucumbers at his table throughout the whole year. It is still much employed in Russia instead of glass for windows.

There is no positive mention of the use of glass for windows before the time of Lactantius, at the close of the third century. But the passage in that writer which records the fact (*De Opif. Dei*, cap. 8), also shows that the *lapis specularis* still retained its place. Glass windows are distinctly mentioned by St Jerome, as being in use in his time (A.D. 422). After this period we meet with frequent mention of them. Joannes Philippinus (A.D. 630) states that glass was fastened into the windows with plaster.

The Venerable Bede asserts that glass windows were first introduced into England in the year 674, by the Abbot Benedict, who brought over artificers skilled in the art of making window-glass, to glaze the church and monastery of Wearmouth. The use of window-glass, however, was then, and for many centuries afterwards, confined entirely to buildings appropriated to religious purposes; but in the fourteenth century it was so much in demand, though still confined to sacred edifices and ornamental purposes, that glazing had become a regular trade. This appears from a contract entered into by the church authorities of York Cathedral in 1338 with a glazier, to glaze the west windows of that structure; a piece of work which he undertook to perform at the rate of sixpence per foot for white glass, and one shilling per foot for coloured. Glass windows, however, did not become common in England till the close of the twelfth century. Until this period they were rarely to be found in private houses, and were deemed a great luxury, and a token of great magnificence. The windows of the houses were till then filled with oiled paper, or wooden lattices. In cathedrals, these and sheets of linen supplied the place of glass till the eighth century; in meaner edifices lattices continued in use till the eighteenth.

The glass of the Venetians was superior to any made elsewhere, and for many years commanded the market of nearly all Europe. Their most extensive glass-works were established at Murano, a small village in the neighbourhood of Venice; but the produce was always recognised by the name of Venetian glass. Baron von Lowhen, in his *Analysis of Nobility in its Origin*, states that, "so useful were the glass-makers at one period in Venice, and so great the revenue accruing to the republic from their manufacture, that, to encourage the men engaged in it to remain in Murano, the senate made them all burgesses of Venice, and allowed nobles to marry their daughters; whereas, if a nobleman marries the daughter of any other tradesman, the issue were not reputed noble."

The skill of the Venetians in glass-making was especially remarkable in the excellence of their mirrors. Beckmann, who has minutely investigated the subject, is of opinion that the manufacture of glass mirrors certainly was attempted, but not with complete success, in Sidon, at a very early period; but that they fell into disuse, and were almost forgotten until the thirteenth century. Previously to this period, plates of polished metal were used at the toilette; and in the rudeness of the first ideas which suggested the substitution of glass, the plates were made of a deep black colour to imitate them. Black foil even was laid behind them to increase their opacity. The metal mirrors, however, remained in use long after the introduction of their fragile rivals, but at length they wholly disappeared; a result effected chiefly by the skill of the Venetians, who improved their manufacture to such a degree that they speedily acquired a celebrity which secured an immense sale for them throughout all Europe.

From Italy the art of glass-making found its way into France, where an attempt was made, in the year 1634, to rival the Venetians in the manufacture of mirrors. The first essay was unsuccessful; but another, made in 1665, under the patronage of the celebrated Colbert, in which French workmen who had acquired a knowledge of the art at Murano were employed, had better fortune. But a few years afterwards, this establishment, which was situated in the village of Tourlaville, near Cherbourg in Lower Normandy, was also threatened with ruin by a discovery or rather improvement in the art of glass-making, effected by one Abraham Thevart. This improvement consisted in casting plates of much larger dimensions than it had hitherto been deemed possible to do. Thevart's first plates were cast at Paris, and astonished every artist by their magnitude. They were eighty-four inches long and fifty inches wide, whereas none previously made exceeded forty-five or fifty inches in length. Thevart was bound by his patent to make all his plates at least sixty inches in length and forty in breadth. In 1695 the two companies, Thevart's and that at Tourlaville, united their interest, but were so unsuccessful, that, in 1701, they were unable to pay their debts, and were in consequence compelled to discharge most of the workmen, and abandon several of their furnaces. Next year, however, a company was formed under the management of Antoine d'Agincourt, who re-engaged the discharged workmen; and the works realized considerable profits to the proprietors, a circumstance which is attributed wholly to the prudent management of D'Agincourt.

Early in the fourteenth century the French government made a concession in favour of glass-making, by decreeing that not only should no derogation from nobility follow the practice of the art, but that none save gentlemen, or the sons of noblemen, should venture to engage in any of its branches, even as working artisans. This limitation was accompanied by a grant of a royal charter of incorporation, conveying important privileges, under which the occupation became eventually a source of great wealth to several families of distinction.

It has been said that the manufacturing of window-glass was first introduced into England in the year 1557. But a contract, quoted by Horace Walpole in his *Anecdotes of Painting*, proves that this article was made in England upwards of a century before that period. This curious document is dated in 1439, and bears to be a contract between the Countess of Warwick and John Prudde of Westminster, glazier, whom she employed, with other tradesmen, to erect and embellish a magnificent tomb for the earl, her husband. John Prudde is thereby bound to use "no glass of England, but glass from beyond seas;" a stipulation which, besides showing that the art of making window-glass was known and practised in England in the fifteenth century, seems also to indicate that it was inferior to what could be obtained from abroad. The finer sort of window-glass was made at Crutched Friars, London, in 1557. In the year 1635, Sir Robert Maxwell introduced the use of coal fuel instead of wood, and procured workmen from Venice; but many years elapsed before the English manufactories equalled the Venetian and French in the quality of these articles. The first flint-glass made in England was manufactured at the Savoy House, in the Strand; and the first plate-glass, for looking-glasses, coach windows, and similar purposes, was made at Lambeth, by Venetian workmen, brought over in 1670 by the Duke of Buckingham. From that period the English glass manufactories, aided by the liberal bounties granted them in cash upon glass sold for export, became powerful and successful rivals of the Venetian and French manufactories. The bounty on glass exported, which the government paid to the manufacturer, was not derived from any tax by impost, or excise, previously laid; for all such were returned to the manufacturer together with the bounty, thereby lessening the actual cost of the article from 25 to 50 per cent., and enabling the English exporter to compete successfully in foreign markets. This bounty provision was annulled during the premiership of Sir Robert Peel, together with all the excise duty on home consumption.

The art of glass-making was introduced into Scotland in the reign of James VI. An exclusive right to manufacture it within the kingdom, for the space of thirty-one years, was granted by that monarch to Lord George Hay, in the year 1610. This right his lordship transferred in 1627, for a considerable sum, to Thomas Robinson, merchant-tailor in London, who again disposed of it for L.250, to Sir Robert Mansell, vice-admiral of England. The first manufactory of glass in Scotland, an extremely rude one, was established at Wemyss in Fife. Regular works were afterwards commenced at Prestonpans, Leith, and Dumbarton. Crown-glass is now manufactured at Warrington, St Helens, Eccleston, Old Swan, and Newton, Lancashire; at Birmingham, Hunslet near Leeds, and Bristol. It is also manufactured of excellent quality on the Tyne and Wear. Great improvements have recently been made in the manufacture of crown-glass; and we believe this article, as made in England, is superior in quality to that of any other nation.

The manufacture of glass was introduced into the American States in 1790 by Robert Hewes, a citizen of Boston, who erected a factory in the then forest of New Hampshire. The chief aim of Mr Hewes was to supply window glass, but he did not succeed. Another attempt was made in 1800, when a factory was built in Boston for making crown window glass; but this was also unsuccessful, till a German named Lint, in 1803, took charge of the works, and the State of Massachusetts agreed to pay the proprietors a bounty on every table of window glass they made; after which the manufacture was carried on successfully, the glass steadily improving in quality, and becoming famed through all the states as Boston window glass. The same company, in the year 1822, erected new and more extensive works at Boston. The mystery attached to the art of glass-making followed it into America. The glass-blower was considered a magician, and myriads visited the newly-erected works, looking on the man who could transmute earthy and opaque matter into a transparent and brilliant substance, as an alchemist who could transmute base metal into gold.

Since the manufacture of flint glass was introduced into the eastern states there have been above forty companies formed from time to time, nearly thirty of which have proved failures. There are now ten in operation, two of which are at East Cambridge, three at South Boston, one at Sandwich, three near New York City, and one at Philadelphia. 48,000 tons of coal, 6500 tons of silex, 2500 tons ash, nitre, &c., and 3800 tons of lead are annually consumed in the manufacture of flint glass.

In the vicinity of Pittsburg, in the western states, are nine manufactories of flint glass and ten of window glass, and in the river towns are fifteen window-glass factories.

There is good reason for supposing that the art of colouring glass is coeval with the art of glass-making itself. It is certain that the art was known in Egypt at least 3000 years ago. We have already mentioned the beautiful imitations of precious stones, found adorning mummies which are known to have existed for that time. We meet with frequent mention of specimens of Eastern workmanship of consummate beauty, upon which great value was placed. The works of Caylus and Winkelmann furnish some striking instances of ancient skill in the formation of pictures by means of delicate glass fibres of various hues, which, after being fitted together with the utmost nicety, were conglutinated by fusion into a solid mass. The art of combining the various colours so as to produce pictures, such as is now practised, is comparatively of recent date. The earliest specimens of this kind of work discover a fictitious joining of different pieces of glass, differently tinged, and so arranged as, by a species of mosaic work, to produce the figure or figures wanted. The various pieces are held together generally by a vein of lead, run upon the back of the picture, precisely at their junction.

It has already been stated that the Romans combined the most brilliant colours in their mosaics; and there can be little doubt that these mosaics gave the first idea of painted or stained glass for windows in the early Christian churches. In all the early specimens of Norman glass, similar colouring and design are to be traced. Starting from the fourth century, there is frequent mention of coloured glass windows by Greek and Latin authors. St John Chrysostom and St Jerome talk of "windows of divers colours;" and Lactantius says, "that the soul perceives objects through our bodily eyes as through windows garnished with transparent glass." The early basilicas were all adorned with coloured glass, and the early Christian poets sung in ecstasies of the effect produced by the windows at sunrise. In the sixth century, Prudentia, speaking of one of these structures, says:—"The magnificence of this temple is truly regal. The pious prince who consecrated it has caused the vaults to be painted at great expense, and has clothed it with golden walls, so that the light of day may repeat the fire of the morning. In the windows is placed glass of various colours, which shine like meadows decked in the flowers of spring." An inscription on St^{a} Agnese states, that that basilica, rebuilt by the Emperor Honorius, was decorated with glass, which produced the most magnificent effect. In the sixth century, Sancta Sophia, at Constantinople, also received painted windows, which Paul the Silent praises highly. Procopius says, that day seemed to be born under the vaults of the temple; and after such glowing description it cannot be doubted that the glass was stained, not colourless.

The use of coloured glass, however, was not confined to Greece and Italy. It rapidly appeared in Gaul. Gregory of Tours, in the sixth century, also tells us that the church of St Julien de Brionde, in that town, had coloured glass windows; and the Bishop of Poictiers, describing Nôtre-Dame of Paris, admired the effect produced by the light falling upon the vaults and walls after passing through the painted glass, and compares it to the first tints of the morning sun.

In England, St Wilfred, who lived early in the eighth century, is said to have been the first to introduce painted glass windows, and for that purpose had workmen brought from France or Italy.

The first painted glass executed in England was in the time of King John; previously to this, all stained or painted glass was imported from Italy. The next notice of it occurs in the reign of Henry III. The treasurer of that monarch orders that there be painted, on three glass windows in the chapel of St John, a little Virgin Mary holding the child, and the Trinity, and Saint John the Apostle. Some time after, he issues another mandate for two painted windows in the hall.

Even at this early period, however, England boasted of eminent native artists in glass painting, amongst the first of whom was John Thornton, glazier of Coventry. This person was employed, in the time of Henry IV., by the dean and chapter of York cathedral, to paint the eastern window of that splendid edifice; and for the beautiful and masterly workmanship which he exhibited in this specimen of his skill, he received four shillings per week of regular wages. He was bound to finish the work in less than three years, and to receive, over and above the weekly allowance, one hundred shillings for each year; and if the work was done to the satisfaction of his employers, he was to receive, on its completion, a further sum of L.10.

From this period downwards there have been many skilful native artists, although the Reformation greatly impeded the progress of the art, by banishing the ungodly ostentation of ornamented windows from churches; indeed, so serious was this interruption, that the art had nearly altogether disappeared in the time of Elizabeth. Amongst the most eminent glass painters who first appeared upon the revival of the art, were Isaac Oliver, born in 1616, and William Price, who lived about the close of the seventeenth century. This artist was succeeded by a person at Birmingham, who, in 1757, fitted up a window for Lord Lyttleton, in the church of Hagley. To him succeeded one Pecket of York, who attained considerable notoriety, but who was entirely ignorant of the true principles of the art.

During all this time, however, and indeed until a comparatively recent date, painted glass was regarded as too costly and too magnificent an article to be otherwise employed than in decorating religious edifices or the palaces of nobles; and even in the latter case it was but sparingly used. Modern improvement has placed this beautiful ornament within the reach of very ordinary circumstances; and the art of staining glass is now practised with great success, and is extensively used in decorating our domestic as well as our palatial and ecclesiastical architecture.

The colours of modern artists, we venture to allege, notwithstanding what is often urged to the contrary, equal in variety and richness those of the ancients, and, with the superior knowledge which we now possess of the principles of drawing, and of bringing several colours together on a single sheet, encouragement alone is wanting to attract artists of talent and inventive genius to the pursuit of the art, and to carry it to a greater height of excellence than it has ever reached in the hands of their predecessors.

MANUFACTURE OF CROWN-GLASS.

In order to secure success to his operations, the glass manufacturer must bestow the utmost care upon the erection of his furnaces. They must be well and substantially built, of the best materials, of the most approved construction, and under the direction of a builder of tried skill and extensive experience. A false economy in these respects cannot fail of leading to the most ruinous results.

Crown-glass is the best kind of glass now employed in the glazing of windows, and is so called to distinguish it from the common, broad, or spread glass, which was in use before the introduction of crown-glass, but which, on account of its inferior quality, is now rarely used. In the manufacture of crown-glass the following furnaces and arches are required, viz. calcar arch, main furnace, bottoming hole, flashing furnace, nose hole, and annealing kiln.

A Calcar Arch for burning frit is a common reverberatory furnace, and is about ten feet long, seven feet wide, and two feet high. A building ground plan and elevation of one is shown in Pl. CCLXXII. figs. 4 and 5. The crown and sides are built of fire-brick, and the other parts of common brick. The bottom should be carefully joined and cemented, as the salt is apt to ooze through it.

The Main or *Glass-making Furnace* is an oblong, built in the centre of a brick cone, large enough to contain within it two or three pots at each side of the grate-room, which is either divided, as shown in the plan, or runs the whole length of the furnace, as the manufacturer likes. Pl. CCLXXII. fig. 3 is a ground plan, fig. 2 is an end elevation, and fig. 1 a front elevation, of a six-pot furnace. 1, 2, 3, fig. 1, are the working holes for the purpose of ventilation, for putting in the materials, and for taking out the metal to be wrought. 4, 5, 6, 7 are pipe holes for warming the pipes before beginning to work with them. 8, 9, 10 are foot-holes for mending the pots and sieges. 11 is a bar of iron for binding the furnace, and keeping it from swelling.

The arch, as shown in fig. 2, is of an elliptic form. A barrel arch, that is, an arch shaped like the half of a barrel cut longwise through the centre, is sometimes used. But this soon gives way when used in the manufacture of crown-glass, although it does very well in the clay-furnace for bottle-houses.

The best stone for building furnaces is fire stone from Coxgreen, in the neighbourhood of Newcastle. Its quality is a close *grain*, and it contains a greater quantity of talc than the common fire stone, which seems to be the chief reason of its resisting the fire better. The great danger in building furnaces is, lest the cement at the top should give way with the excessive heat, and, by dropping into the pots, spoil the metal. The top should therefore be built with stones only, as loose as they can hold together after the centres are removed, and without any cement whatever. The stones expand and come quite close together when annealing; an operation which takes from eight to fourteen days at most. There is thus less risk of any thing dropping from the roof of the furnace.

The inside of the furnace is built either of Stourbridge fire-clay annealed, or the Newcastle fire-stone, to the thickness of sixteen inches. The outside is built of common brick about nine inches in thickness.

The furnace is thrown over an ash-pit, or cave as it is called, which admits the atmospheric air, and promotes the combustion of the furnace. This cave is built of stone until it comes beneath the grate-room, when it is formed of fire brick. The abutments are useful for binding and keeping the furnace together, and are built of masonry. The furnaces are stoutly clasped with iron all round, to keep them tight. In four-pot furnaces this is unnecessary, provided there be four good abutments.

Bottoming Hole. Pl. CCLXXIII. figs. 3 and 4. Elevation and ground plan. The interior is of common fire-brick, the mouth either of common fire-brick or Stourbridge clay, and the outside entirely of common brick.

Flashing Furnace. Figs. 5 and 7. Elevation and ground plan. The outside is built of common brick, the inside of fire-brick, and the mouth or nose of Stourbridge fire-clay.

Nose Hole. Fig. 6. Elevation. This is a small aperture off the flashing furnace, and of the same materials. Fig. 7, ground plan.

Annealing Kiln. Figs. 8 and 9. It is built of common brick, except around the grate-room, where fire-brick is used.

The materials of which crown-glass is usually composed are kelp and fine white sand. Pearl ashes, or certain other alkalis, sometimes supply the place of the former of these substances. The quality of kelp is extremely various. That from Orkney is superior to what is made in Ireland, the Hebrides, or the lower parts of Scotland. It is found to contain less alkali, and to produce glass of a better colour.[1] For the glass-maker's purposes the kelp of the Orkneys is decidedly the best. It is freer from sulphur than the others, the presence of which makes the glass green, crude, and fretful. The following is the course pursued in the preparation of kelp. The fuci are cut from the rocks in the months of May, June, and July. They are then brought to the shore, and, after being spread out and dried, are thrown into a pit lined with stones, in which a large fire of peat has been previously kindled. On this fire the weed is heaped from time to time, until a large mass is accumulated, and the whole is reduced to a state of fusion. It is then well mixed and levelled, and allowed to cool. When sufficiently cold, it is taken from the pit, and broken into portable masses, for the convenience of transportation. To prevent the dissipation of the alkali, a thing very apt to occur, the greatest care is necessary in every part of this process; in the gathering and drying, as well as in the burning of the fuci; in the treatment of the mass whilst in a state of fusion; and in its exposure to the atmosphere during these operations. Kelp burners are but too frequently guilty of carelessness in this respect. In some places they burn the fuci in pits which are not lined with stones, and, of consequence, sand and earthy substances mingle with the fused mass.[2] It is no uncommon thing for the makers to increase the weight of kelp intentionally, foolishly thinking to procure a higher price for it by so doing. Such adulteration is, however, at once detected by the kelp merchant, and the article, which might otherwise have brought a good price, is reduced to less than a third of its value. The inferiority of the Lowland kelp to that of Orkney and the Hebrides, may with safety be attributed as much to this practice as to the inferiority of the fuci. Some idea, but at best a very uncertain one, of the quality of kelp may be formed by the examination of its external appearance. A chemical analysis of its properties can alone give security to the manufacturer. In preparing it for the manufacture of glass, it is first broken into small pieces, either by the hand or by a machine called a stamper. It is then put into a mill and ground into a fine powder, stones and all other extraneous matter being picked out. The powder is afterwards passed through brass wire sieves.

---

[1] Some eminent chemists assert that, although the usual quantity of kelp be added in the manufacture of glass, the weight of the glass produced is nothing more than the original weight of the sand. But this is not the case with the Orkney kelp, for though it has less alkali, it contains more insoluble matter than the West Highland kelp, and of course produces a larger quantity of glass. The West Highland yields glass of very inferior colour to that procured by the use of Orkney kelp.

[2] The best mode of preparing kelp, as invented by Colonel Fullarton, is by burning it in a reverberatory furnace, and throwing it down in the form of cakes, in the same manner as frit, which we shall afterwards have occasion to describe. When so prepared, it is more fit for the glass manufacturer, being free of extraneous matter. This method is now employed by extensive makers of kelp in Ireland.

With regard to the other component part of window-glass, namely, sand, that of the best description is procured from Lynn Regis, in Norfolk. That procured from Alum Bay, on the western coast of the Isle of Wight, is also of excellent quality. The superiority of this sand arises from the circumstance of its containing a greater quantity of minute transparent crystals than is found in the sand of any other place in the country. In preparing the sand, it is usually washed in a large vat with boiling or cold water, until the water runs off quite clear. The sand is then put into a calcining arch, where it is subjected to a strong heat for twenty-four hours. During this time it is kept red hot, and immediately on being taken out is plunged into pure cold water. This has the effect of dividing the particles of sand, and making it unite more readily with the alkali during the process of calcining. Some use nitre during this process, which consumes any sulphureous matter that may be present, or extraneous substances of an animal or vegetable nature, and reduces them to an earth not injurious to glass. When this operation is completed, it is removed into the mixing room, where the proportions of material are adjusted and mingled together, previously to their being *fritted* or calcined. Here the materials, the sand and the kelp powder, are carefully proportioned, generally in the degree of eleven of kelp to seven of sand, some manufacturers using eleven to eight, which are mixed up according to the judgment of the mixer. The majority of glass manufacturers are now giving up the use of kelp. Within the last few years the improvements in the manufacture of carbonate of soda have been very great, while it has also fallen considerably in price. Instead, therefore, of using such an impure alkali as kelp with sand, carbonate of soda with sand and lime is employed, which gives glass of as good a colour as plate, and is attended with many other advantages which the old materials do not possess. Manufacturers, instead of kelp, purchase sulphur, and with it make sulphuric acid. With sulphuric acid and muriate of soda they make sulphate of soda, to which lime, coal, &c. are added, and thus produce carbonate of soda, which, with sand and lime, is made into glass. The operations for preparing these materials are carried on within their own premises by several extensive glass manufacturers. The following mixture has been found to produce an excellent quality of glass:—3 cwts. Lynn sand; 2½ ditto carbonate of soda; 14 lbs. nitre; 14 ditto lime; 7 ditto charcoal; one fourth of the above weight of cullet.

This mixture will make a very excellent glass when the furnace is kept at a proper heat. The proportions must, of course, be regulated in some degree by the heat which the furnace attains. The addition of any other ingredient will injure the quality and colour of the glass. It may be either fritted or not before being put into the pots. The use of this mixture saves coals, time, and wages, as the founding occupies from sixteen to twenty hours only, whilst in other cases the time occupied by this process is from twenty to twenty-four hours. It can also be blown to a thinner and finer substance, and is thus liable to a less duty. When the sand and kelp are thoroughly mixed, the compost is put into a calcining arch or reverberatory furnace, where it is subjected to a heat so strong as to reduce it to a semifluid state. Whilst in this state, it is stirred without intermission, to prevent the formation of knots containing more sand than the rest of the batch, an effect resulting from the dissipation of the alkali by excess of heat. The process of calcining requires more or less time according to the varying properties of the ingredients composing the batch. From three to four hours is the time usually occupied by each batch. The frit, as the substance is now called, is taken from the furnace, spread upon a plate of iron whilst yet hot, and, before it becomes quite cold, divided into large cakes. In the opinion of many, it cannot be too old for use; as when new the glass made from it is full of what are called seeds. It is commonly kept about six months by opulent manufacturers. The last operation consists in throwing the frit into the melting pots, which are of the form represented in Plate CCLXXIV. fig. 2.

To prevent stones or clay from the furnace falling into the pot, those used in making flint-glass are always covered in on the top; and the same thing has been tried in crown pots, made with two openings, one in the front and one in the back, the back one to be plugged up when beginning to work from the front of the pot. This method succeeded very well, but was abandoned from the length of time it required; a circumstance which more than counterbalanced its advantages.

These pots or crucibles are made of the finest clay. That from Stourbridge in Worcestershire is considered the best. Great care is requisite in the selection, and in cleansing it from extraneous particles, the presence of which, even in the smallest degree, will injure the pot. A fine powder procured by grinding old crucibles is generally mixed, in a proportion seldom larger than a fourth, with what is termed the virgin clay. This mixture dries more rapidly, contracts less while drying, and presents a firmer resistance to the action of the fire and alkali used in the composition of glass than the mere unmixed clay. These ingredients having been mixed, they are wrought into a paste in a large trough, and carried to the pot loft, covered in such a way as to exclude dust and other minute particles. Here a workman kneads this paste by tramping it with his naked feet, turning it from time to time until it becomes as tough as putty. It is then made into rolls, and wrought, layer upon layer, into a solid and compact body, every care being taken to keep it free of vacuities, as latent air would, by its expansion in the furnace, cause an immediate rupture of the pots.

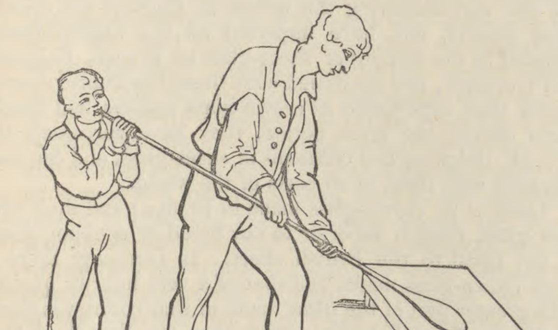
After pots are made, very great care is necessary to bring them to the proper state of dryness before taking them to the annealing or pot arch. In drying they commonly shrink about two inches in the circumference. When pots are made during summer, the natural temperature is sufficient. In winter they are kept in a temperature of from fifty to fifty-five degrees Fahrenheit. They remain in the room where they are made for a period varying from nine to twelve months. Being afterwards removed to another apartment, where the heat is from eighty to ninety degrees Fahrenheit, they are kept there for about four weeks. They are then removed for four or five days, more or less, according to their previous state of dryness, to the annealing arch (of which figs. 1 and 2, Plate CCLXXIII. is an elevation and ground plan), which is gradually and cautiously heated up till it reaches the temperature of the working furnace, whither, after being sufficiently annealed, they are carried as quickly as possible. Pots last upon an average from eight to ten weeks. Their value is usually estimated at L.8 or L.10 each. A section of a crown-glass pot, showing their usual dimensions, is given at Plate CCLXXIV. fig. 2.

To the frit thrown into these pots there is added a proportion, about an eighth, of cullet or broken crown-glass. After this has been done, the furnace is raised to the highest possible degree of heat. The pots are filled every third hour or so, according as the frit melts, till they are completely full. The intensity of the heat is then increased, if possible, till the metal, as it is now called, is reduced to fine liquid glass, which is then ready for the operations of the workman.[1] From twenty-four to thirty hours in all are required for this process, which is called founding.[2]

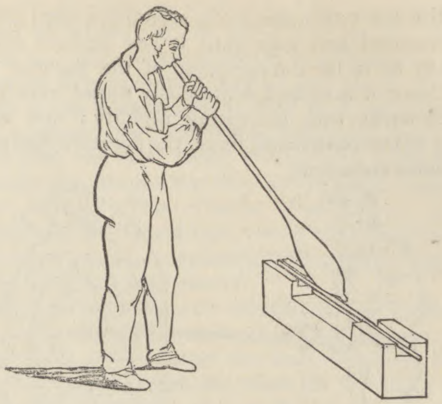
The furnace is slackened for about two hours, and the metal being now in a workable state, the first operator who approaches the furnace in which the pot of liquid glass is placed is the *skimmer*, who skims off all crude or extraneous substances from the surface of the metal. Next follows the *gatherer*, who is provided with an iron pipe or tube, six or seven feet in length, and of this shape.

Having previously heated that end of the tube which takes up the glass, he dips it into the pot of metal; and by turning it gently round, gathers about one and a half pound of liquid glass on the end of it. Having allowed this to cool for a little, he again dips it into the pot, and gathers an additional quantity, of from two and a half to three pounds. This is also permitted to cool as before, when the operation of dipping is again repeated, and a sufficient quantity of metal, from nine to ten pounds weight, is gathered, to form what is technically called a table or sheet of glass. The rod, thus loaded, is held for a few seconds in a perpendicular position, that the metal may distribute itself equally on all sides, and that it may, by its own weight, be lengthened out beyond the rod. The operator then moulds the metal into a regular form, by rolling it on a smooth iron plate, called the " marver," a term corrupted from the French word *marbre*.

He then blows strongly through the tube, when his breath penetrating the red-hot mass of glass, causes it to swell out into a hollow pear-shaped vessel, thus:

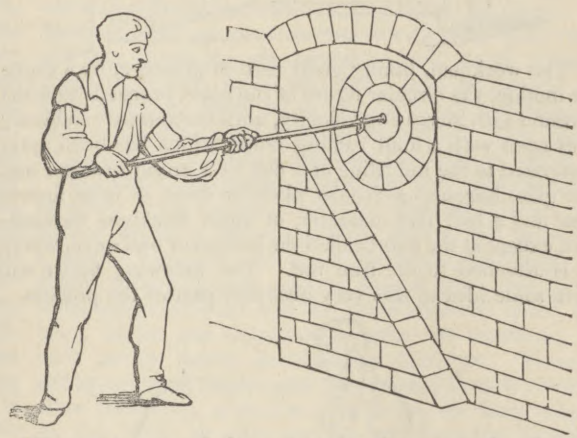


The tube with the elongated sphere of glass at the end of it is then handed to the *blower*, who heats it a second and third time at the furnace, pressing the end, between each blowing, against the bullion bar, so called from the part thus pressed forming the centre of the sheet or bull's eye, thus:

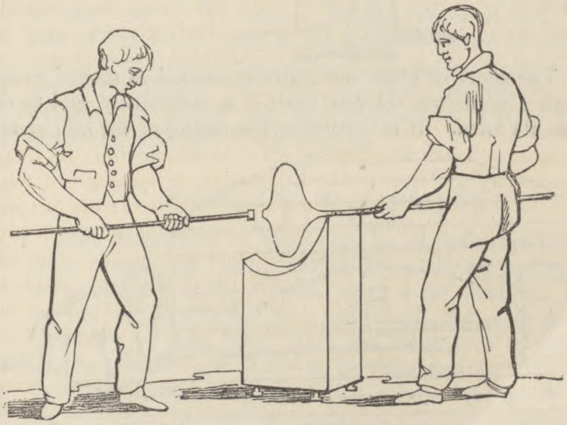


By the dexterous management of this operation, the glass is brought into a somewhat spherical form.

The blower heats a third time at the bottoming hole, and blows the metal into a full-sized globe thus:



When this part of the process has been completed, and the glass has been allowed to cool a little, it is rested on the casher box, and an iron rod, called a "*pontil*" or punty rod, on which a little hot metal has been previously gathered, is applied to the flattened side, exactly opposite the tube, which is detached by touching it with a piece of iron, dipped beforehand in cold water, leaving a circular hole in the glass of about two inches diameter. The operation of attaching the punty is shown by the following plate.



Taking hold of the punty rod, the workman presents the glass to another part of the furnace called the " nose hole,"

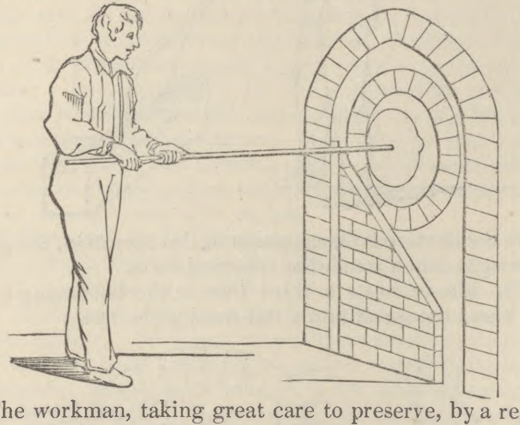
---

[1] The *sandiver* or glass gall is removed while the furnace is at its extreme degree of heat.

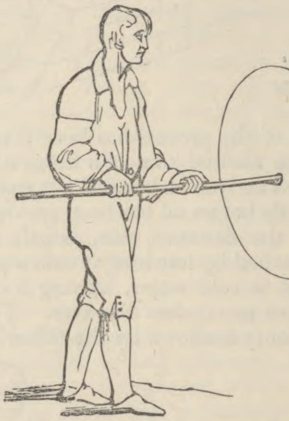
[2] A piece of wood about eleven inches long by seven broad, with a hole three inches by one inch, forms an excellent protection to the eyes from the heat to which they are exposed when examining the metal in the pots.

Crown-Glass.

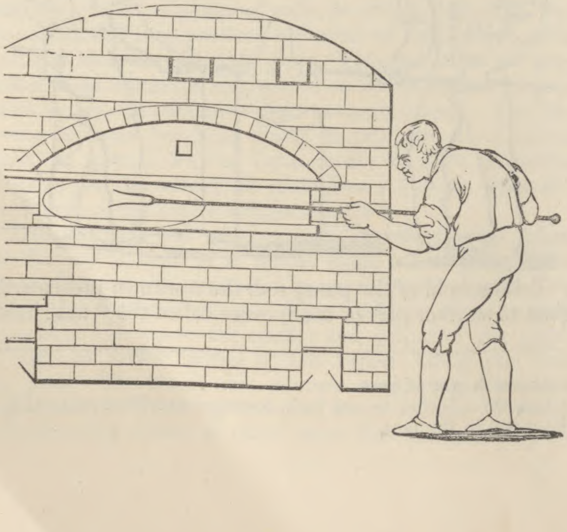
where the aperture made by its separation from the tube is now presented and kept until it has become sufficiently ductile to fit it for the operation of the flashing furnace. Whilst here, it is turned dexterously round, slowly at first, and afterwards with increasing rapidity; and the glass yielding to the centrifugal force, the aperture just mentioned becomes enlarged.



The workman, taking great care to preserve, by a regular motion, the circular figure of the glass, proceeds to whirl it round with increasing velocity, until the aperture suddenly flies open with a loud ruffling noise, which has been aptly compared to the unfurling of a flag in a strong breeze; and the glass becomes a circular plane or sheet, of from four to four and a half feet diameter, of equal thickness throughout, except at the point called the bullion or bull's eye, where it is attached to the iron rod. The following figure will give some idea of this very beautiful part of the process.



The sheet of glass, now fully expanded, is moved round with a moderate velocity until it is sufficiently cool to retain its form. It is carried to the mouth of the kiln or annealing arch, where it is rested on a bed of sand, and detached from the punty rod by a shears. The sheet or table is then lifted on a wide pronged fork, called a faucet, and put into the arch to be tempered, where it is ranged with many others set up edgewise, and supported by iron frames to prevent their bending. From four to six hundred tables are placed in one kiln.



A sketch of the interior of a crown-glass house, during the progress of these operations, has been given in Plate CCLXXIV. fig. 1.

The kiln having been clayed up, the fire is permitted to die out, and the heat diminished as gradually as possible. When the glass is properly annealed, and sufficiently cold to admit of its being handled, it is withdrawn from the oven, after the removal of the wall built into the front of the arch, and is then quite ready for the glazier's use. It is first, however, removed to the manufacturer's warehouse, where the circular sheets are cut into halves, and assorted into the different qualities, known to the tradesmen by the names of seconds, thirds, and fourths.

We conclude our remarks on the manufacture by observing, that the quality of glass does not depend upon the mixtures alone, but also upon the treatment it receives after it has been made, the quality of the coals, and management of the furnaces. Cleanliness in every department of the manufacture, a general knowledge of chemistry, and of the art in all its details, with the most unremitting industry, and skill in the direction and government of the operatives, are all essentially necessary for the production of good glass.

British Sheet.

MANUFACTURE OF BRITISH SHEET-GLASS.

This article is manufactured by Messrs Chances of West Bromwich, near Birmingham, and Messrs Hartley and Company, Sunderland, who, after having visited the glass manufactories of France, Belgium, and Germany, commenced, in 1832, the making of British sheet. The principle upon which it is manufactured is the same as that acted upon in the making of common or green glass. The metal is formed into cylinders, and then flattened into sheets. The French, Belgians, and Germans, having pursued this system for the last fifty years in making their window-glass, have much improved the old mode of making it; and as the parties who are now manufacturing this article in England are crown-glass makers, and have imported all the improvements adopted in the making of sheet-glass in France, Belgium, and Germany, and combined with these the improvements which their experience as crown-glass makers had taught them during the same period, they have surpassed the French, Belgians, and Germans in sheet-glass, and can now compete with them in all parts of the world.

There is no crown-glass made in France; and their window-glass, though superior to our broad or common glass, is not equal to the British sheet. In Germany there is little crown-glass made, and that of a very inferior quality. The greater part of the glass made in that country is sheet, and it is of much better quality than the French or Belgian. In Germany a common sort of glass is made, in the following manner: Three or four workmen form a partnership, and, having fixed upon a place in the woods where clay and sand are easily met with, they proceed to build a glass-house with wood and clay. They then make the pots, and, from the ashes of the wood which they burn, obtain potash, which, after it has been mixed with sand, they melt into glass. They blow the metal into cylinders, flatten it into sheets, cut, pack, in short, perform the whole operations from first to last, themselves. A good deal of the best of the glass made in this manner is sent to Nuremburg, where it is polished and sent into Holland. Some of it is sometimes smuggled into this country, and is known by the designation of Dutch glass.

The expense of making British sheet is about the same as making crown-glass, excepting in the case of large squares, when it is much less; in crown-glass it is very difficult to get a square 34 × 22, but in sheet-glass the common size is 40 × 30; nay, sheets are sometimes made as large as 50 × 36. Its other advantage over crown is, that it has none of that wavy or curved appearance, by which the vision is so much distorted in crown-glass; but, at the same time, sheet-glass has rather an unpleasant appearance when viewed from the outside of a building, in consequence of an unevenness of surface, technically termed *cockled;* when viewed, however, from the inside, it is difficult to distinguish it from plate-glass.

The materials employed in the making of sheet-glass are the same as those used in the making of crown-glass. The large melting furnace is also very similar; in France and Belgium they usually contain six or eight pots, but at the British manufactories such furnaces contain ten pots, each containing seven cwts. of metal, which requires fourteen hours to melt.

In a line with each pot, and four feet from the ground, are erected ten stages, with an open space between each, of about two feet, through which the workman swings his glass when making cylinders. When the metal is ready for working, the ten workmen take their stations, each having his own pot and stage, and also an assistant, and commence making the cylinders, as follows: After gathering the quantity of metal required (which varies from three to twenty pounds), the workman places it in a horizontal position upon a wooden block, which has been hollowed, so that, when the workman turns the metal, it shall form it into a solid cylindrical mass. In the mean time, the assistant, with a sponge in his hand, and a bucket of water by his side, lets a fine stream of water run into the block, which keeps the wood from burning, and also gives a brilliancy to the surface of the glass. The water, the moment it comes in contact with the glass, is raised to the boiling point, and, in that state, does no injury to the metal; but it is only when the metal is at a high temperature that such is the case; for, whenever the glass is cooled to a certain degree, it immediately cracks upon coming in contact with water. When the workman perceives that the mass of metal is sufficiently formed and cooled, he raises the pipe to his mouth at an angle of about seventy-five degrees, and commences blowing it, at the same time continuing to turn it in the wood block, till he perceives the diameter to be of the requisite dimensions, which are usually about ten inches. He then reheats this cylindrical mass, and, when it is sufficiently softened, commences swinging it over his head, continuing to reheat and swing till he has made it the desired length, which is commonly about forty inches. It is now in a cylindrical form, forty inches long and ten inches in diameter, one end being closed, and the other having the pipe attached to it. The workman now begins to open the end which is closed, for which purpose he encloses the air in the cylinder, by stopping the aperture of the pipe with his finger; and then placing the closed end of the cylinder towards the fire, it becomes softened, while at the same time the air within is expanding, and, in about thirty seconds, the glass becomes too soft to retain it, and bursts, a small aperture being formed at the point of the cylinder. The workman then turns the cylinder round very quickly, and, by keeping it warm at the same time, flashes it out perfectly straight; the other end, which is attached to the pipe, has now to be cut off. This is done in the following manner: The workman having gathered a small quantity of metal on the pontil, draws it out into a thread of about one eighth of an inch in diameter, laps it round the pipe end of the cylinder, and, after letting it remain there for about five seconds, withdraws it suddenly, and immediately applies a cold iron to the heated part, which occasions such a sudden contraction, that it cracks off where the hot string of glass has been placed round it. The workman having now formed a perfect cylinder of forty inches in length and ten in diameter, has, before it can be flattened, to split it on one side, so that it can be opened out; but before doing this, he is obliged to let it cool, and then, laying the cylinder horizontally upon a bench, draws a red hot iron two or three times along the inner surface. The cylinder, thus heated, immediately splits along the heated part, owing to the expansion of the glass when heated, its cylindrical form preventing its breaking at the point of expansion.

The blower having now completed his cylinder, hands it over to the flattener to make it into a flat sheet; to accomplish which, two furnaces are built together, the one for flattening the cylinders, the other for annealing the sheets, the former being kept at a much higher temperature than the latter. The cylinder, after being gradually reheated, is placed in the centre of the flattening furnace, upon a smooth stone, with the cracked side upwards. In a short time it becomes softened with the heat, and by its own weight falls out into a flat square sheet of forty inches by thirty. The flattener, with a piece of charred wood, rubs it quite smooth, and then places it in the annealing arch, where it remains about three days to be annealed. A workman will make sixty cylinders 40 × 50 in one day; and a flattener can flatten the same number in the same time. This glass can be made of any thickness from one-twentieth to half an inch.

The same enterprising companies also manufacture extensively every variety of coloured glass used by the glass-stainer, which is gathered, rolled, blown, and flattened, in a similar way with the sheet glass, the pot-metal being gathered from one pot, and the flashed glass from two, one containing colourless and the other coloured metal, which being blown and distended together are combined, while each portion retains its individual character. These oval and square glass shades used for covering French clocks and other ornaments, as well as glass dishes for dairy purposes, are also made by these parties; and since the abolition of the glass duties are much in demand.

There is another species of glass called broad or common window-glass, which is formed of the coarsest materials. The ingredients usually employed are, six measures of soap-boilers' waste, three of kelp, and three or four of sand. After these have been fritted for from twenty to thirty hours, they are removed while red hot to the pots in the working furnace, where, in the space of from twelve to fifteen hours, they are reduced to a fluid state. The metal is taken out in the manner already described, and blown into globes about a foot in diameter. A piece of iron dipped in cold water is run along them, and produces a crack nearly rectilinear; and, while yet warm and ductile, these spheres are opened out and flattened on a smooth iron plate at the mouth of the furnace.

MANUFACTURE OF PLATE-GLASS.

This description of glass may be manufactured in the same manner as broad window-glass, or by casting the materials in a state of fusion upon a flat surface. Little correct information has been published relative to the manufacture of plate-glass, from the reluctance of proprietors to permit their works to be examined by individuals capable of giving an intelligible account of them. If such are permitted to scan the mysteries, they are generally restricted to keep secret the information which they have acquired. The late Mr Parks the chemist, however, seems to have been exempted from this condition, and after having visited the premises of the British Plate-Glass Company, at Ravenhead, in Lancashire, he published a short account of the process as there carried on. Besides the above manufactory in Britain, may be mentioned that of Messrs Swinburne and Company, South Shields, the Thames Plate-Glass Company, the Union Plate-Glass Company, St Helen's; and W. A. A. West's, Eccleston. Plate-glass is also made at St Gobain in France, besides other places upon the Continent.

The following is Loysel's account of the relative proportions of the materials used at St Gobain, in the manufacture of plate-glass. White sand, 100 parts; carbonate of lime, 12 ditto; soda, 45 to 48 ditto; fragments of glass of like quality, 100 ditto; oxide of manganese, ¼. The following proportions of ingredients are said to produce the best description of this article. Lynn sand which has been well washed and dried, 720 parts; alkaline salt containing 40 per cent. of soda, 450 ditto; lime slaked and sifted, 80 ditto; nitre, 25 ditto; broken plate-glass, 425 ditto. These quantities produce one pot of metal which yields 1200 pounds of glass.

Great nicety must be observed in conducting the processes of this manufacture. The materials must be selected with the utmost care. The sand should be of the whitest and finest description, and well washed and passed through a sieve, previously to being mixed with the other ingredients. Soda is always preferred to potash, because it imparts a higher degree of fluidity to the glass, and also because the impurities which it contains are more easily dissipated by the heat. Lime acts as a flux, and manganese has the effect of giving a slightly reddish hue to the mixture by which the colours of the other materials are neutralized, so that scarcely any appreciable tint remains. Cobalt is likewise used in some manufactories, much for the same purpose as manganese. The broken glass, or *cullet* as it is technically called, is those fragmentary portions which are cut from the plates when they are squared, or that which may flow over in the process of casting. The sand, lime, soda, and manganese, being properly mingled in the proportions above given, are fritted in small furnaces, where the temperature is gradually raised to a red or white heat, and there maintained until no more vapour is evolved, nor change undergone by the mixture. This process occupies six hours, and after its completion the other ingredients are added, consisting of cullet and cobalt. At St Gobain there are two kinds of crucibles employed; the one in which the glass is melted is called a *pot*, and has the shape of an inverted truncated cone; the other is entitled a *cuvette;* it is kept empty in the furnace, and exposed to the full degree of heat. Forty hours are requisite to vitrify the materials properly, and bring the glass to a fit state for casting. The pots are skimmed in the manner already described. When the liquid mass has been properly refined, the cuvette is filled by a copper ladle, and after sufficient time is allowed for the bubbles created by this disturbance to escape, it is removed to the table where the plates are cast. Copper was the metal of which tables were formerly constructed; but cast iron has now been found to answer the purpose completely, and it is greatly superior to copper in this respect, that it remains uninjured during all the sudden transitions of temperature to which it must be subjected. The British Plate-Glass Company were the first to introduce this improvement. They procured a plate fifteen feet long, nine feet wide, and six inches thick. The sides are provided with metallic ribs, the depth being exactly the measure of thickness which it is desired the glass should be of. During the casting there is a similar rib temporarily attached to the lower end of the table. The cuvette being filled with melted glass, it is withdrawn from the furnace by means of a crane, taken to the upper end of the casting table, and after being properly scummed, and elevated to a sufficient height by means of a crane, it is emptied of its contents. The surface of the melted matter is then smoothed by means of a large hollow copper cylinder, which extends across the table, resting upon the side ribs. This is set in motion, and rolled over the glass, by which process it is spread out into a sheet of uniform breadth and thickness. When the plate has become completely hardened, it is carefully inspected, to see that no flaws or bubbles appear on the surface. Should any be found, the sheet is immediately divided by cutting through them. It is afterwards removed to the annealing oven, where it is placed in a horizontal position, and remains for about fifteen days. When glass is in a high state of fluidity it is liable to be injured even by a draught of air, so that the apartment must be kept as free as possible from disturbance. The opening or shutting of a door, by setting the air in motion, might impair the value of the plate. After having been withdrawn from the annealing oven, they have to undergo the operations of squaring, grinding, polishing, and silvering, before they are fit for the market. These processes have thus been described by a late writer upon the subject.

"The first process—that of squaring and smoothing the edges—is performed by passing a rough diamond along the surface of the glass, guided by a square rule; the diamond cuts to a certain depth into the substance, when, by gently striking the glass with a small hammer underneath the part which is cut, the piece comes away; and the roughnesses of the edge then left are removed by pincers. The plate is then taken to the grinding apartment.

"The next step is to imbed each of the plates upon a table or frame adjusted horizontally, and made of either freestone or wood, cementing the glass securely thereto by plaster of Paris. One plate being then reversed and suspended over another, the material employed in grinding their surfaces is introduced between the two, and they are made to rub steadily and evenly upon each other by means of machinery set in motion by a steam-engine." River sand and water were formerly used for the purpose of abrading the surface, but ground flint is now substituted, as answering the purpose better. When one side of each plate has been sufficiently ground, it is loosened from the frame, and turned over, so as to present the other surface to be ground in the same manner. Some degree of pressure is employed, by loading the upper plate with weights, as the grinding of each side approaches to completion. The process thus described used formerly to last during three entire days, but this time is now much abridged. The greatest attention is required in order to finish with the surfaces perfectly level and parallel, for which end a rule and plumb-line are employed.

By means of this grinding, the plates will have been made level; but they are too rough to receive a polish. To fit them for this, they must again be ground with emery powder of increasing degrees of fineness. The preparation and sorting of this powder are effected in the following simple and ingenious manner:—"A considerable quantity of emery is put into a vessel containing water, and is stirred about violently until the whole is mechanically mixed with the water. Emery is absolutely insoluble by such means; and if the mixture were left at rest during a sufficient time, the whole would subside in layers; the coarsest and heaviest particles sinking first, and so on successively, until the very finest particles would range themselves as the upper stratum. Previously to this, however, and while these finest grains are still suspended in the water, it is poured off into a separate vessel, and the emery is there allowed to settle. A fresh supply of water is poured into the first vessel, the contents of which are again violently agitated, and allowed partially to subside as before. A shorter interval is allowed for this than in the first case; and then the liquor is poured off into a third vessel, by which means emery of the second degree of fineness is separated. This operation is repeated in order to obtain powders having five different degrees of fineness. The deposits are then separately dried upon a stove to a consistence proper for making them up into small balls, in which form they are delivered to the workmen.

"In this further rubbing together, or, as it is called, *smoothing* of the glass plates, it must be understood that the coarsest emery is first used, and so on, substituting powders having increasing degrees of fineness as the work proceeds."[1]

These processes finished, the glass, although perfectly even, appears opaque or deadened on the surface, and requires polishing. This is effected in the following manner. A piece of wood is covered with numerous folds of woollen cloth, the layers being divided by some carded wool interposed between each, the whole forming a tolerably hard but elastic cushion, which is furnished with a handle. The plate is laid upon a bed of plaster, as already described, and the cushion being wetted, is covered with the red oxide of iron (the *colcothar* of commerce), and moved backwards and forwards upon the surface of the plate. Lastly, if the glass be intended for mirrors, it is silvered, that is, covered on one side with a thin coating of amalgam of tin and mercury.

The process of *blowing* plate-glass differs so slightly from the methods used in producing broad glass, that they need not be hère repeated. Any difference that does exist, arises from the great bulk and weight of the mass of glass operated upon.

STAINED OR PAINTED GLASS.

In an age like the present, when a high state of civilization and refinement demands the most careful and diligent cultivation of those arts which minister to the gratification of refined taste, Glass Painting, as an art now acknowledged indispensable in the decoration of our churches, palaces, &c., has assumed an importance not attained at any former period; and from its progress in connection with our present advances in artistic knowledge, we may safely infer, that if the noble elements in its nature and capabilities be fairly and legitimately applied, it will become the most potent agent in advancing the standard of architectural decoration. Within these few years in our own country, its progress has been altogether wonderful. Since the abolition of the duties on glass, Britain has produced the rarest and the richest coloured glass in endless profusion and variety. Light has been admitted into gorgeous apartments through domes filled with coloured glass of colossal dimensions, the decorations of which, worked out from the designs of the architects, enhance and give power to the other ornamentation of the interiors, and produce a *coup-d'œil* not previously known nor dreamt of. Stained-glass windows for churches have been, and are being executed in Britain, which, for appropriate design, brilliant colour, subdued tone, symmetrical proportion, minute manipulation, and variety of carefully considered detail, stand comparison with the best existing specimens of mediæval times. Windows for palatial and baronial structures have also been recently produced in this country, whereon are traced in imperishable lines, and blazoned in unfading colours, correct effigies of historical personages, representations of historical events, genealogical arrangements of heraldic bearings, and other legends and memorials, which will convey to distant times a favourable idea of the state of British art in the nineteenth century. The earliest record which we possess concerning the existence of this beautiful art is of the age of Pope Leo III., that is, about the year 800, a period in which many of the most magnificent ecclesiastical edifices on the Continent were erected. It is not known with certainty when stained glass was made use of for pictorial or figure subjects, but the historian of a monastery at Dijon, writing in the eleventh century, says, that there existed in his time in the church of his monastery some very ancient glass representing the mystery of the Holy Eucharist, and that this glass picture had been taken from the old church previous to its restoration. The earliest specimens of stained glass are composed of small pieces of glass, embued throughout with colour, united by grooved leaden joinings. It has been suggested, that this arose from the glass-makers of that period not being able to make it in larger pieces. If so, in so far as sparkling brilliancy in glass decorations is a desideratum, it might almost have been as well for the art that the manufacturers of the coloured metals had still been in the same position. Brilliancy is always increased in the same ratio with the number of pieces of glass in the composition.

Nothing could be more instructive or interesting than an investigation of the relative merits of the existing specimens of the art during the six centuries it was so diligently and effectively cultivated in connection with ecclesiastical architecture; but this inquiry would be too extensive to be opened up here. The following remarks, therefore, are confined to a few of the leading points in the glass of the various styles which prevailed in succession from the 11th to the 17th century, in which may be traced very clearly the progress of the architects, under whom the glass painters worked, from clumsy and servile imitators to bold and original designers.

The Norman style, in its early period, was a direct though imperfect imitation of Roman architecture; but when pointed architecture had attained its greatest perfection, its chief feature was originality. During the gradual development of this, its peculiar characteristic, the openings in the walls by degrees were enlarged, until they ultimately became the principal points, and it was requisite that they should be judiciously decorated; and in no branch of art connected with pointed architecture can its onward movement be more clearly traced than in the painted-glass windows.

The painted glass of the eleventh and twelfth centuries, like the Norman architecture of which it formed a part, was stately and of a magnificent character. The colours were of the most vivid and positive description. There was no spot left for the eye to repose on; no neutral tints nor secondary colours were introduced. The whole of the ground and foliage were filled with intense colour, ruby and blue invariably preponderating. The same love of violent and striking contrast as is peculiar to man in a state of semi-barbarism was manifested in the colouring of the windows of that period, and the general effect must have been congenial to the romantic and martial spirit of the age of chivalry. The leading forms were massive and simple, consisting chiefly of the circle and square, filled up chiefly with clumsy imitations of the foliated ornament to be found in Roman architecture. When figures were introduced, they were like those in the Bayeux tapestry, marvellously correct in costume, though disproportionate in drawing, and filled up with strong positive colours, flat, and the outline defined chiefly by the strong thick lines of the lead, resembling those highly titled personages represented on packs of cards, or those in Chinese processions, as delineated by the native artists of the Celestial empire.

In the thirteenth century, the painted glass, like the primary pointed or early English architecture of which it formed a part, was of a light and elegant character. The glass painter had then acquired a more correct idea of what constituted beauty, both in form and colour. The positive colours were now used more sparingly, and indeed were almost confined to geometric bands, central points, and borders continued round each entire light. The general grounds were of a beautiful tint of neutral gray, produced by lines intersected at right angles, from which were relieved by bold lines scrolls of foliated ornament in clear colourless glass. The glass in the Sister windows of York Minster may be named as one of the finest existing specimens of this description. Figures and subjects also, when introduced, were better drawn than formerly. The faces were kept colourless, slightly shaded with brown of a rough gritty texture. The secondary colours were used in the draperies with a most delicious effect, softening and harmonizing the whole composition, and giving a lightness and variety previously unknown. In the leading forms of the ornamental portions also were seen repeated the geometric features of the building; and in the glass of the period we can recognise repetitions of the ground plans of the shafts, with the enrichments on the laps and on the mouldings of the windows and doorways. In the foliaged backgrounds, amid repetitions of the ancient Roman foliage, we now and then get fragments of simple foliage, such as trefoils, evidently taken from nature; and we are able to trace in progress an art which was shortly to become as original as beautiful, and dependent entirely on the artist's knowledge and appreciation of nature and geometry.

---

[1] Glass Manufacture, Lardner's *Cabinet Cyclopædia*, No. 26.

During the fourteenth and fifteenth centuries, when the secondary pointed or decorated style of architecture gradually developed its immense resources, and advanced steadily toward perfection, we find that the glass advanced in the same ratio as the art with which it was associated. In accordance with certain fixed rules of proportion, the glass artists elongated, intersected, diversified, and arranged rectangular, triangular, and curvilinear figures, and made these harmonious combinations their leading points for colour. They were thus enabled with certainty to produce a pleasing effect, and to fill up the detail according to their own fancy, with an imitation of the common weeds, flowers, and plants that they found growing around them. This principle was carried out in every portion of the detail in the remarkable structures then erected; and the exquisite imitations of vegetables and plants on the carving of the caps, friezes, and mouldings, show the extraordinary love of nature which must have animated these fraternities of artistic minds by whom these details were worked out. The monks of Melrose made "gude kail," says the old song, and from the exquisite manner in which that vegetable has been carved on some of the portions of that fine old abbey, one would conclude that the carvers must have shared largely and appreciated highly the "gude kail" of the holy brotherhood, a feeling no doubt also entertained by the glass painters of the structure whose works would doubtless exhibit similar genius with the glass of that period, which was well characterized by a rich juicy natural freshness, as well as an easy play of elegant outline and graceful proportion. In many instances also, the gray background produced by intersected lines was abandoned, and a tint of rough gray obscure substituted, which imparted to the whole a softer effect, and gave a better relief to the outlined foliage of which the diapering was composed. At this period also, glass painting had attracted artists of high genius, and the figures and subjects in the glass of the period are perfect specimens of what the art ought to be. These artists tested its capabilities, and how well and thoroughly they did so may be seen in Cologne Cathedral, where the flowing, bold, and elegant outline, the rough semi-transparent texture, the calm expressive countenances and attitudes of the figures of Durer and his contemporaries, fairly set aside and overpower the glowing, brilliant, but frowsy specimens there of modern German art, as practised in Munich, under the auspices of the Bavarian government. Perhaps, also, the ornamental glass of the period in that structure will be found equal to any in the world for geometrical symmetry and natural foliage, the latter imitated from the common weeds and plants indigenous to the locality. So fascinating and far-famed were the painted-glass windows of that period, so novel were the effects produced by the rich semi-transparent shadows and reflected lights, that Mr Eastlake conjectures that the increase of colour in shade which is so remarkable in the Venetian and early Flemish pictures may have been suggested by the rich and fascinating effects of the light modified by the slight shading on the stained glass through which it was transmitted. Over the Lady Chapel in the north aisle of York Minster are two windows of this period remarkable for the brilliancy and quiet feeling formerly alluded to as indispensable in glass painting of a high character.

After the decorated period painted glass degenerated first into the flat, tame insipidity of the perpendicular style, and then ran riot in the extravagant tortuosities and monstrosities of the capped, jewelled, and double gilt details of Elizabethan architecture, which it seems a fallacy to suppose was imported from Italy. At the time of its introduction a strong tide of feeling had set in against everything that pertained to the Roman Catholic religion, and it seems unlikely that after having diverged from the style with which that religion had so long been identified, the nation should have imported anything from Italy, its headquarters and chief stronghold. It rather seems probable that at a time when attempts were made to get quit of every existing form and style of architectural decoration, there would be awakened a strong desire for novelty; and when it is remembered that the newly discovered continent of America was visited by crowds of adventurers, it will not appear unlikely that many of these adventurers must have been delighted and dazzled with the magnificent and unique architectural structures which adorned the ancient cities of central America, and may have imported home and introduced into English architecture many of the features which we are accustomed to believe were originated in the Elizabethan era. The painted glass of that period partakes of the same character; and in Du Paix's great work on New Spain will be found something very like the origin of many of these peculiarities, eccentricities, and heterogeneous conglomerations which characterize the wood and stone carving, as well as the wall and window decorations of that extraordinary style of architecture.

From this rapid sketch of the history of the rise and decadence of painted glass, it appears that there is no limit to its capabilities; and that forming, as it does, a leading architectural decoration, it is as well adapted to one style as another. If the principles of harmonious colouring and symmetrical proportion be carefully attended to, as was the case in the best specimens of the art in the mediæval period, painted glass must ever be regarded as one of the most attractive decorations for church or mansion. It is no doubt a species of mosaic, and the artist must generally depend on harmonious combinations of colour and continuity and firmness of outline for the effect he intends to produce, as the brilliant colouring and mosaic character are lost in the same ratio as shading is introduced.

It is also true that windows are generally intended for the transmission of light, and that in some cases the sacrifice of light required for pictorial effect cannot be made. Yet who can resist the attractions of such pictorial glass as is to be found in the windows of St Gudule at Brussels, or St Jans Kirk at Gouda, where the principles of chiaroscuro and perspective are fully developed, where foreground and distance hold their proper places, and where the lights and brilliant colours are arranged in a manner to rival the best specimens of the ancient masters of painting in oil. This mode of treatment is not to be advocated for general use, but where there is light enough and to spare, and where men of high artistic powers apply themselves to glass painting, they may safely be left to their own genius, and allowed to render their conceptions as vividly and perfectly in glass as others do on canvas. The dull, heavy, uniform opacity which pervaded the glass of the last century, when it was made up in squares, the colours fused, and the whole work looked like cloth transparencies, is not to be tolerated. The brightest colours that can be produced in pot metals joined in the ancient way by leading ought always to be used; and although in general the effect of mosaics in low relief may be preferable, yet the shading and toning requisite to give full effect to a good pictorial design may be given without detracting greatly from the light.

Glass is the most enduring species of artistic medium, and it is to be hoped that this quality will yet cause eminent artists to leave the impress of their genius on painted windows. Had the art of painting on glass been known in the age of Phidias, we might have had preserved, in colours as vivid as when the works were executed, the Jupiter of Homer by Apelles, the pictorial embodiment of the Athenian character by Parrhasius. A singular fact illustrative of the durability of painted glass may here be stated in connection with York Minster. When the nave of that fine structure was destroyed by fire, the heat was so intense that many of the stones were calcined. When the leaden framing of the windows melted, the glass made of many small pieces fell down undamaged, and was afterwards carefully rebuilt in new leading and fixed in its original place, where it now remains the most fragile yet the most enduring portion of the ancient structure.

In ornamental painted glass the positive colours ought generally to be used sparingly, and confined to the chief points in the composition. When overloaded with colour, the sparkling brilliancy so desirable in painted glass is entirely lost. The general ground of the window should be of a neutral tint suitable in tone to its character and situation. In a southern aspect this tone should be of a cool gray, and the positive colours blue, green, and purple, ought to predominate over ruby, yellow, and orange. In a northern aspect the general ground should be of a warm sunny tint, and the warm ought to predominate over the cold colours. An eastern window ought to approximate in colour to a northern, a western to a south window.

It is always desirable to have a combination of straight and curved lines in the leading forms of painted glass. As in the human body, the effect of the elliptic curvature of the muscles is enhanced by the angular position of the straight lines on which they are placed, or by the sharp square indications of the bony extremities, in like manner the curvilineal lines in ornamental decorations appear to more advantage when balanced by a harmonious proportion of straight lines. A very important feature in glass is diapered work in the backgrounds, a great variety of designs for which may be obtained from plants and flowers by the wayside, in the field, or the garden; and the more homely these are, they are often the more suggestive and pleasing. Borderings are almost indispensable in all ornamental painted-glass windows. They bind together what might otherwise be disjointed and scattered, and afford scope for endless variety of design, both in form and colour. Heraldic symbols and emblazonments have always been amongst the most attractive features in stained-glass windows. The points which most shields form for a balance of positive colour; the crests, mantling, supporters, and mottoes, twisting or twining either quaintly or gracefully through the composition, not to speak of the interesting nature of heraldry as a guide through the intricate mazes of family connection, wending through the depths of ages—all tend to render it the most admirable field on which the glass painter can be engaged. For hall or library windows such devices are very appropriate, and indeed so highly are they appreciated, and so much is painted glass now coming into repute, that there is scarcely a new house of any pretensions without its library or staircase stained-glass window. In towns where back drawing-room windows look into mean or filthy lanes, what a delightful remedy is found in light sparkling stained glass. Either heraldic blazon, family monograms, or ornamental devices, may be used; and if the inner window be fitted up flush with the inner wall, and the room lighted at night mainly from lights placed between the outer and inner windows, the effect is chaste and beautiful.

Restorations of windows connected with ancient edifices afford fine media for embodying local legends or historical local incidents. In new structures for public purposes what place so fitting or so striking as the windows for representations of men eminent in connection with such institutions. Monumental windows have recently been introduced into churches with excellent effect, and they afford scope for invention as various as the characters of those whose virtues they are designed to commemorate. In churches even in Scotland stained glass is rapidly assuming its ancient importance, and there can be little doubt that it will ultimately be so much encouraged and cultivated that the windows of our public edifices will be the honoured medium of transmitting to remote posterity the works of the master-minds of British art.

Except in the name, painting on glass has no resemblance to any other department of the pictorial art but that of porcelain. Both the colours, and the process of their application throughout, are entirely different. While animal and vegetable substances are freely used as colouring matter in every other department of the pictorial art, they are wholly excluded in that of glass painting, where all the pigments used are subjected, after being laid on, to the operation of fire, to make them penetrate the body of the glass, or become fused on its surface—a process which would wholly destroy the colouring properties of such substances. All the colours employed in glass painting and staining are oxides of metals or minerals, as gold, silver, cobalt, which not only stand the fire, but require the powerful interference of that agent to bring out their brilliancy and transparency. Some colours, on the application of heat, penetrate the body of the glass, and, from this circumstance, are called stains; while others, being mixed with a vitreous substance called flux, become fused or vitrified on the surface. The former produces a variety of colours, and all of them are perfectly transparent. The produce of the latter are only semitransparent, but they may be made to yield any colour or tint required.

In preparing these colours, the most important point to be attended to is, to have all those that are to be used at the same time of an equal degree of softness. To attain this, those that are hard, and require a great degree of heat to make them effective, must be fixed first; leaving the soft colours, for which a slight heat only is necessary, to the last. If used promiscuously, and without regard to this precaution, some of the colours would be rendered too fluid, while others would be insufficiently fused, and the work in consequence spoiled.

GLAZING OF WINDOWS.

Putty, an important and indispensable article in the glazier's trade, is composed of whiting and linseed oil. Chalk is sometimes used instead of the former, but the expense and labour incurred in preparing it is much greater, and besides it generally contains sand, so that it is no object to the glazier to employ it. Whiting is in every way to be preferred; it must be thoroughly dried before the oil is added to it, otherwise the union will not be effected, or at least it will be very imperfect.

After the whiting has been thoroughly dried and prepared, it ought to be passed through a very fine sieve, and all the remaining lumps and knots pulverized, and then also passed through the sieve. Great care must be taken to keep the whiting free of sand and other extraneous substances.

When putty is to be made, put the proper quantity of oil into a tub or other open vessel, and gradually add the whiting whilst yet in a hot state, at the same time keeping the whole in motion with a stick, until it becomes of a sufficient consistency to admit of being wrought by the hand on a board or table. Having been removed thither from the tub, it must be wrought up with dry whiting, until it is converted into a compact mass. When brought to this state, it ought to be put into a hollowed stone or mortar, and beat with a wooden mallet till it becomes soft and tenacious, when more whiting must be added, until it has attained a proper consistency.

When putty is required of a superior degree of fineness, and which will also dry quickly, add a little sugar of lead or litharge; and if an increase of strength be wanted, a little white lead.

When the panes have been fitted into the cheeks of the sashes, they must be removed, and the checks well bedded with beat putty. This done, the panes are again returned to their places, and gently pressed or lodged in the bedding, the workman, as it were, humouring the glass should it be bent or twisted, and taking care that there is no hard extraneous substance mingled with the putty, which might endanger, if not actually break, the glass. When a pane is perfectly bedded it lies quite firm, and does not spring from the putty; but when, either from a perverse bend or twist in the glass, or any other accidental cause, it happens that it cannot be made to go quite close to the check, the vacant space must be carefully and neatly filled upon the back puttying, otherwise the window will not be impervious to the weather, and will be very apt to fall into decay by the admission of moisture.

The convex or round side of the pane, where such a shape occurs, should be presented to the outside, and the concave or hollow to the inside. When thus placed, they resist the weather better than if the hollow sides were exposed to it.

After the pane has been bedded, the next process is the outside puttying. This putty should be kept in the fore check, about the thirty-second part of an inch below the level of the inside check, so as to allow the thin layer of paint which binds these two substances together to join the putty and glass; and that it may not offend the eye by being seen from the inside; and that, when it is painted, the brush may not encroach on any visible part of the pane, leaving those ragged lines or marks which are so often seen from the inside on ill-finished windows, and which are so displeasing to the eye. This operation, and finishing the corners, are two nice points in the art, and therefore, when properly done, discover the neat-handed and skilful workman.

All frames or sashes of windows ought, before being glazed, to receive one or two coats of white paint, to which a small portion of red lead has been added to facilitate its drying, and to give increased strength and durability to the paint.

Lattice or Lead Windows.—This antique and singularly beautiful style of glazing has unaccountably fallen much into disuse, although of late years it has certainly undergone something like a resuscitation, in consequence of a revival of the public taste for stained glass, and a growing predilection for Mediæval architecture in churches, cottages, and the like. For these, and for staircase windows, and indeed all windows similarly situated, as in halls, lobbies, or the like, it is peculiarly adapted.

It may be proper to premise, that lead windows require stained or coloured glass for producing their fullest and best effects, and it was with stained glass only that they were originally constructed; but very neat and elegant windows are executed in this style with plain glass, where variety and beauty of figure are made to compensate in some measure for the absence of colour.

Lead windows may be made to any pattern, and in this there is great scope for the display of a correct taste. In the time of Elizabeth, this branch of the glazier's art was carried to great excellence, especially by one Walter Geddes, who was employed in glazing most of the royal and public buildings of that period. Geddes executed in this style some windows of transcendent beauty, displaying an endless variety of the most elegant and elaborate figures. The most useful and most common description of plain glass lead windows, however, are those of the diamond or lozenge shape; but, as already said, they may be made to any pattern desired.

The lead work can be adapted with ease to any pattern that may be chosen for the glass; and it can likewise be made to any breadth, from one-eighth to five-eighths of an inch.

The apparatus and tools necessary for producing this are, a glazier's vice, or lead mill, moulds for casting the lead into slender bars or rods of about eighteen inches in length, which is the first process; a three-fourth inch chisel; a hard-wood fillet for forcing the glass into the grooves in the lead frame-work; and an opener or wedge tool, made also of hard wood, or ebony, for laying open the grooves for the reception of the glass; two copper bolts for soldering, the end formed like an egg. A correct delineation of the vice or mill alluded to is given in Plate CCLXXV., in describing which, in its various connected parts, the same letters of reference are adapted to the different figures, so far as necessary, which, with the isometrical views, will facilitate the comprehension of their parts and properties.

Fig. 1, an end view, partly open, of a mould for casting three varieties of patterns, which are thus prepared for being forced through the machine. By an ingenious construction of the handle, it is made to lock and unlock by inclined planes, acting on studs *aa*. Fig. 2, a side view, also partly open; and fig. 3, an isometrical view of the mould prepared for pouring in the metal.

The metal or cast being removed from the mould, a pair of the dies (one only of each pair is represented), according to the pattern required, figs. 4, 5, 6, 7, are placed in the machine, as seen at *cc*, fig. 8, isometrical view. After they are put in, a thin iron cover (*b*, fig. 10), with an oblong hole in the middle, is put on to guide the metal into the rollers. Figs. 9, 10, and 11, represent three views of the machine as prepared for operating. In figs. 9 and 11, the metal *dd* is represented passing through the machine, which is accomplished by turning the winch handle *ee*, acting on two equal-sized toothed wheels *ff*. On the axles of these are two rollers *gg*, slightly serrated (dotted through in figs. 8 and 10); these rollers draw the metal through, while the dies give the desired form. To allow the axles and rollers to be placed in the frame or body of the machine A, the cover *h* is removed by unscrewing the bolt *i*, figs. 8, 10, 11. The toothed wheels *ff* are also taken off, by unscrewing the nuts *kk*. The tempering screw bolt *l* is for adjusting the dies after they are put in their place. The screw bolts *mm* are for fixing the machine to a table or bench.

Fig. 12 is an isometrical view of the cover *h*, removed to show the ports *nn*, through which the axles of the rollers pass.

Fig. 13 shows the shape of the bolt used for soldering the lead windows, and fig. 14 the opener already described.

The lead intended to be employed in window-making must be soft, and of the very best quality; and great care must be taken to have the moulds properly tempered, otherwise the lead will not be equally diffused in them, and the castings consequently not perfectly solid throughout, as they ought to be.

The castings are, as already noticed, usually about eighteen inches in length, and are afterwards extended by the mill represented by the figure above, to the length of five or six feet.

It may not be unnecessary to add, that the mill not only extends the lead, and reduces it at the pleasure of the operator to the dimensions required, but at the same time forms the grooves into which the edge of the glass is afterwards introduced in forming the window.

When the lead has been prepared in the manner described, the glazier ought to proceed to cut out the panes wanted. For this operation he must prepare by first outlining the full dimensions of the window, and then lining it off to the pattern required, shaping the panes accordingly. If the window is of a large size, this may be done by compartments, to be afterwards united, and thus be more conveniently wrought.

When all the glass has been cut for the window, the next thing to be done is to open the grooves in the lead with the opener or wedge tool. The panes are then, in order that they may be water-tight, fastened very firmly into the grooves with the wooden fillet already spoken of (which may be fixed on the handle of the chisel or cutting tool), the parallel lines of lead being secured in their proper places on the board, when the window is of the diamond shape, by a small nail at either end, until the course is finished, when the work is permanently fastened by running a small quantity of solder gently over the two connecting pieces of lead at each joint, or angular point. When the window has been completed, it should be removed from the working board to a flat table, and there covered with a thick layer of cement, composed of white lead, lamp black, red lead, litharge, and boiled linseed oil, with a half-worn paint-brush, and the composition carefully rubbed into every joint. This will render the window completely impervious to the weather, as the cement, if properly laid on, will fill every chink, where it will soon become as hard and durable as any other of the materials of which the window is composed.

The window, on being fitted into the frame, that is, on being set in its place in the building for which it is intended, ought to be supported with iron rods, extending three-eighths of an inch beyond the breadth of the frame on each side, running across it at the distance of from twelve to fourteen inches from each other, and secured to the lead frame-work at intervals with copper wire.

THE CUTTING DIAMOND.

Before the introduction of the diamond as an agent in cutting glass, that operation was performed by means of emery, sharp pointed instruments of the hardest steel, and sometimes red-hot iron. These were the only contrivances known and practised by the ancient glaziers.

In considering the diamond in its relations to the purposes of the window-glass cutter, there occur some circumstances not unworthy of remark. Amongst these, it may be noticed, that the cutting point of the diamond must be a natural one; an artificial point, however perfectly formed, will only scratch the glass, not cut it. The diamond of a ring, for instance, will not cut a pane, but merely mark it with rough superficial lines, which penetrate but a very little way inwards. Artificial points, corners, or angles, therefore, produced by cutting the diamond, are adapted only for writing or for drawing figures on glass, and such were those used by Schwanhard, Rost, and the other old artists who were celebrated for ornamenting glass vessels. The cutting diamond does not write so well on glass, from the circumstance of its being apt to enter too deeply, and take too firm a hold of the surface, and thus become intractable. It may further be noticed, that an accidental point produced by fracturing the diamond, is as unfit for cutting as an artificial one. Such a point will also merely scratch the glass. No point, in short, that is not given by the natural formation of the mineral, will answer the purposes of the window-glass cutter.

The large sparks, as the diamonds used for cutting glass are called, are generally preferred to the small ones, from the circumstance of their being likely to possess (although this is by no means invariably the case) a number of cutting points; while the very small sparks are not always found to possess more than one. Thus, if the point of the latter is worn or broken off, although the spark be turned, and reset in its socket, it will still be without the power of cutting, and consequently useless; while the former, on undergoing the same operation, will present a new and effective point.

The large sparks are called *mother sparks*, and are sometimes cut down into as many smaller fragments, bearing the same name, as there are natural points in them. Each of these, therefore, can have only one cutting point, and are consequently only proportionately valuable to the glazier, since they cannot be restored by resetting.

The Setting of Diamonds is a process with which every glazier ought to be acquainted; nor is it an art of difficult acquirement; some practice, and a little patience, are all that is necessary.

After having selected a stone, as clear and pellucid as possible, and of an octahedral shape, or as near to that form as it can be procured, the workman proceeds to ascertain which is its cutting point, or, if it has more than one, which is the best. This will be found to be that point which has the cutting edges of the crystal placed exactly at right angles to each other, and passing precisely through a point of intersection made by the crossing of the edges.

He then provides a piece of copper or brass wire, a quarter of an inch in diameter, having a hole drilled in one of its ends large enough to contain three-fourths of the diamond to be set. Having temporarily secured the diamond in this hole, the setter ascertains the cutting point by trying it on a piece of glass; and when he has discovered it, he marks its position by making a slight notch in the wire with a file or otherwise, exactly opposite to the cutting point, as a guide to him in his operations when he comes to fix it permanently in the socket head of the handle. When doing this, care is taken to keep it exactly parallel with the inclined plane of the socket head.

The cutting point having been ascertained, and the diamond fixed into its place, the wire is then cut off about a quarter of an inch below the diamond, and filed down to fit exactly into the aperture in the socket head, into which it must be soldered. The rough or superfluous metal around the stone is removed with a file; and, lastly, the setting is polished with emery or sand paper. Such is the most approved method of setting new diamonds, and it applies equally to the resetting of old ones. But in the latter case, the first process, that of detaching the stone from its bed, is accomplished either by means of a knife, or by applying the blowpipe.

The art of managing the diamonds in glass-cutting, so as to produce effective results, can only be attained by considerable experience. The diamond must be held in a particular position, and with a particular inclination, otherwise it will not cut, and the slightest deviation from either renders an attempt to do so abortive. In the hands of an inexperienced person it merely scratches the glass, leaving a long rough furrow, but no fissure. The glazier judges by his ear of the cut made. When the cut is a clean and effective one, the diamond produces, in the act of being drawn along, a sharp, keen, and equal sound. When the cut is not a good one, this sound is harsh, grating, and irregular. On perceiving this, the operator alters the inclination and position of his diamond, until the proper sound is emitted, when he proceeds with his cut.

The diamonds employed in glass-cutting are of the description known by the technical name of *bort*, a classification which includes all such pieces as are too small to be cut, or are of a bad colour, and consequently unfit for ornamental purposes. These are accordingly selected from the better sort, and sold separately, at an inferior price.

Though there are many substances that will scratch glass, the diamond was thought to be the only one that would cut it; but some experiments of Dr Wollaston have shown that this is not strictly correct. That eminent philosopher gave to pieces of sapphire, ruby, spinel ruby, rock crystal, and some other substances, that peculiar curvilinear edge which forms the cutting point in the diamond, and in which, and in its hardness, its singular property of cutting entirely lies, and with these succeeded in cutting glass with a perfectly clear fissure. They lasted, however, but for a very short time, soon losing their edge, although prepared at a great expense of labour and care; while the diamond comes ready formed from the hand of nature, and will last for many years.

MANUFACTURE OF FLINT-GLASS OR CRYSTAL.

This branch may be defined the art of forming useful and ornamental articles of glass, and is the most ancient department of glass manufacture. The manipulatory processes have scarcely been varied and only slightly extended since the earliest times. The progress of chemistry has supplied purer materials but introduced few new ones. Thus we find that baryta has replaced the lead, and soda the potash in ancient glass, while in the production of coloured glasses purer and additional metallic oxides are used. Yet this art has shown less tractability in the hands of the improver than perhaps any other industrial art.

The best flint glass or crystal is composed of silica, potash, and lead, the average proportion being one-half sand, one-third red lead or litharge, one-sixth carbonate of potash, and a little saltpetre, manganese, and white arsenic to correct and improve the colour or accidental impurities of the other materials. For inferior glass, or "tail metal" as it is technically called, soda is substituted for potash, and baryta for lead or litharge. In still cheaper "metal" for common small phials or bottles, a mixture approximating that for window-glass is used. For optical purposes the proportion of lead is increased to improve the refractive properties, which increase in proportion to the density of the medium. The specific gravity of the metals varies from about 3·6 to 2·5.

The furnaces employed are generally circular, and contain eight or ten pots of the form represented in fig. 2, Plate CCLXXVI. The "found," as the period of melting the materials is termed, commences generally on a Friday evening. The materials or "batch," and a portion of broken glass or "cullet" being mixed together are gradually introduced into the heated pot. Fig. 1, Plate CCLXXVI. represents the interior of a glass-house; the building in the centre being a large cone or chimney built over and around the furnace which is seen through the arches *a*. The holes into which the men at 5 and 6 are dipping iron tools are the openings through which the batch is introduced and the metal withdrawn. The grate is in the centre of the furnace, and there are flues at the back of the piers between the arches. As the batch melts there is a considerable evolution of gases, which at length subsides, when the metal begins to "fine" and reaches the "crisis." It is then cooled until about the consistency of thick honey. The evolution of the gases disperses air bubbles through it; and the glass-maker endeavours so to regulate the heat of the furnace that the bubbles may rise to the surface, burst, and leave the metal plain and fine, but if the heat be continued beyond the crisis, the quality of the metal is deteriorated. For some time after the greater part of the gas has escaped, little bells or beads, technically called "seeds," rise and are extricated more freely by agitation or alteration of temperature. If the metal becomes solid while these bubbles are rising, it retains them, and if the "crisis" is not quickly passed, although the seed may be overcome by long continued fusion yet bad colour and other defects arise. Strings and striæ, which upon close examination may be found in nearly all glass, are very common and troublesome. They may be caused by improper mixing of the materials, separation in the pot of metal of different densities, large grains of sand or pieces of refractory clay. But as strings and striæ in clear ice give pure water when melted, so in glass, mechanical rather than chemical means must be used for their prevention and cure. For optical glass Bontemps has carried out the recommendation of Faraday, and by systematically stirring the fluid glass has nearly reduced the manufacture of optical glass for large lenses to a certainty.

Crystal glass is popularly called colourless, but a practised eye quickly detects colour, which is more readily perceptible in the mass. It is probable that even pure silica, oxide of lead, and carbonate of potash will not produce colourless glass, but that there is a colour proper to glass as there is to air and water. But the main causes of colour in crystal are slight impurities, consisting of the oxides of iron or compounds of sulphur or carbon. A large excess of lead gives a yellow colour,—the oxides of iron, orange or olive-green tints, and compounds of sulphur or carbon, orange or blue. The peroxide of iron gives orange of a light tint, compared with the olive-green produced by the same quantity of the protoxide of iron. The addition of the black oxide of manganese or of saltpetre, produces purple, peroxidizes the oxide of iron, and, combined, forms what is called white, but practically an approach to black, and by a large dose of these materials glass of opaque blackness may be produced. Saltpetre also peroxidizes the iron, and heightens the colour due to manganese. Purity of materials is essential to success, and oxide of manganese was formerly called glass-makers' soap; but although it reduces the colour arising from iron, it does not annihilate it. Glass rendered colourless by manganese becomes pink by exposure to the direct rays of the sun, and if too much is used in the "batch" the metal is rendered pink, and is called high-coloured. Glass with too little manganese has a "low colour." The high colour may be reduced by the deoxidizing agency of a pole of wood, with which, in such case, the metal is stirred. Some of the high colour is lost in the annealing, and thick vessels remaining long in the "leir" or oven lose more than the light articles which are passed quickly through; therefore to obtain equality of colour, the metal for thick goods must be highest coloured. Arsenious acid is also employed as a corrective of colour. Sulphur is a powerful agent in colouring glass. Sometimes a pot of metal foams while melting and is of a dark amber or orange colour, which occasionally it retains when cool, or at other times changes to the light blue tint of the common soda-water bottle. Both tints are caused by the presence of sulphur, the orange by the larger quantity. One part of sulphur to two hundred of glass produces a dark colour; hence, by adding a sulphuret to the melted metal the tints can be deepened at will. Splitgerber shows that glass containing one of sulphur in three hundred of glass becomes at a moderate low red heat nearly black and opaque, but becomes more transparent at a higher temperature. Similar changes are produced by heat on sulphur in its pure state. At its melting point it is lemon-yellow; at higher temperatures it becomes orange, and gradually deepens nearly black, and at a still stronger heat is volatilized in yellow vapours. Similar results are obtained with glass coloured by gold, silver, and copper; glass coloured by sulphur takes a deeper stain from silver than other glass, but if overheated becomes a light greenish-yellow on the reverse, and dark chestnut on the obverse, and is rendered useless. In Bohemia, glass consisting only of potash, silica, and lime is stained of a bright scarlet colour by copper: the process is not followed in Britain probably in consequence of British glass always containing lead or soda.

The metallic colours used for flint glass are cobalt for blue; chromium or a mixture of iron and copper for green; manganese for purple; copper for deep scarlet or light blue; gold for crimson; antimony or iron for yellow; uranium for topaz. Glass coloured by the oxide of uranium exposed in a dark room to the dim light of the electric Aurora becomes translucent and illuminated throughout, and is partially so when exposed to the hydrogen flame. White enamel is obtained by the addition of oxides of arsenic, tin, fluor spar, or phosphate of lime, and coloured enamels are produced by adding the appropriate metallic oxides.

In the manipulation of the glass the men are arranged in sets of four, called chairs, and there are generally four chairs to a furnace. The principal workman of each chair is called the *gaffer*, the second the *servitor*, the third the *footmaker*, and a boy completes the set. The wages of these men vary from 60s. to 20s. per week. The work is heavy, and requires such skill and dexterity that few-first class workmen are found. The men work in six-hour shifts, there being a complete double set. The first operation of the glass-blower is to skim the metal, as most impurities float on its surface, and this is done with an iron rod heated at its extremity and dipped into the metal, a little of which adheres. This is flattened on an iron plate and repeatedly introduced, gradually growing larger until it gathers and removes all the floating matter from the surface of the metal. The operation of making crystal articles then goes on as follows.

An iron tube is heated at the end and dipped into the semifluid metal, see Plate CCLXXVI. figs. 5 and 6, a portion of which is collected, withdrawn from the pot, and then rolled on an iron plate called the *marver*, as in fig. 7, until it has acquired the circular shape seen there. The *marver* also equalizes the heat of the gathering, which the iron tube cools and stiffens, and which requires to be equally ductile in all its parts. The servitor now prepares a *post*, as a flattened round hot lump of metal on a punty or iron rod is called, and applies it to the end of the globe as shown in fig. 9. The two masses of glass are thus united together, and that attached to the hollow tube is separated by touching it, near to where the tube enters the globe, with a small piece of iron wetted with water. By this means the glass cracks, and a smart blow on the iron tube completes the disunion. The workman now takes the punty from his assistant, and laying it on his chair arm, rolls it backward and forward with his left arm, while with his right he moulds it into the various shapes required, by means of a very few simple instruments. By one of these called a procello, the blades of which are attached by an elastic bow like a pair of sugar tongs, the dimensions of the vessel can be enlarged or contracted at pleasure. Any superfluous material is cut away by a pair of scissors. For smoothing and equalizing the sides of the vessel a piece of wood is used. After the article is finished it is detached from the punty and carried on a pronged stick to the annealing oven or leir, a representation of which is given in Plate CCLXXVI. fig. 3.

For a fluted or ribbed *cane*, as a solid glass rod is technically called, the metal is forced into a mould of the requisite shape and then withdrawn; after which, if attached to another *post* and the two punties be twisted and drawn in opposite directions, the ribs become spiral lines, which become more acute as the drawing is extended. Venetian filigree work is produced in this way; and if in the hollow flutes of the mould coloured glass or enamels are inserted, and the gathering introduced, the coloured glass or enamels are welded to and withdrawn with it. When again heated, and twisted or drawn, these streaks of colour or enamel become spiral, and ornament the surface. If before being drawn the mass be redipped into the pot of crystal glass and then twisted, the spiral lines of colour or enamel become internal. By the repetition of this process spirals can be formed within spirals, and by placing these filigree *canes* side by side and welding them together, very curious and intricate patterns are obtained. By the ordinary process of blowing, vessels are formed with smooth and concentric interior and exterior surfaces, and do not exhibit the brilliancy of the crystal so much as when it has numerous inequalities. The most brilliant effect is produced by cutting, but moulding is much cheaper, and this branch of the art has now reached a high state of excellence. The moulds are generally of iron highly polished, and are kept a little below a red heat. The surface of the metal is injured by contact with the mould, but its transparency is restored by being reheated. A very exact regulation of the temperature is necessary in reheating fine mouldings; too little heat does not give the "fire polish," too much softens the metal and obliterates the mouldings. The moulds for pressed goods are made in pieces so hinged or connected as to close and leave a vacuity, the form of the article required, the hollow in which is not however produced by blowing but by the plunger of the press under which the mould is placed. The required quantity of metal is then dropt in, when the plunger descends and forces it into all parts of the cavity, completing the formation of the article, which is then stuck to a punty, and fire-polished and annealed.

What is called cased glass is crystal covered with coats of coloured glass. It is thus obtained. The gathering of crystal is thrust into a coloured or enamelled shell, which is previously prepared. The welding is completed by reheating; and two or more coats of different colours or enamels may thus be employed. When cut through to the crystal in various figures, the edges of the different colours on enamel are seen.

The Venetian frosted glass is obtained by immersing the hot metal gathering in cold water, quickly withdrawing it, reheating and expanding it by blowing, before it becomes so hot as to weld together the numerous cracks on the surface caused by the cold water. These cracks only penetrate where the metal has been cooled by the water, and remain as depressions until the article is finished.

Venetian vitro-di-trono consists of spiral lines of enamels or colours, crossing each other diamond-wise, in the body of the glass, and inclosing an air-bubble in the centre of each diamond. It is thus formed: a gathering is blown in the mould with the necessary canes twisted and blown out as formerly described for spiral filagree, the canes being left projecting from the outside like ribs or flutes. A similar piece is made and turned inside out. The projecting canes on this piece are inside, and the spiral lines reversed. The one piece is then placed under the other, and both are welded together. The ribs or flutes projecting from the two surfaces in contact inclose air in the diamonds, which gradually assumes the bubble shape. The vessel is then formed in the ordinary manner. The most beautiful regularity of lines is thus obtained; and when the ends are closed by the procellos, the lines are drawn to a centre as regularly arranged as if they had been turned in an engine.

Incrustations are formed by placing the substance to be incased on the surface of the article, and dropping melted metal on it, or by preparing an open tube of glass, inserting the object, and welding the open end. By suction instead of blowing, the metal is collapsed on the object, and the air withdrawn. From the unequal contraction between the object and the crystal by which it is surrounded there is much difficulty in the annealing, and to avoid the risk of breakage the object should be made of materials expanding and contracting like the glass itself.

The round, heavy paper weights containing various ornaments apparently in the body of the metal are made as follows:—Canes are made to the required pattern—say, for example, a star within a tube. A gathering of white enamel is formed in a star-shaped mould, and coated with crystal. After this is marvered, it is dipped into a coloured enamel, and drawn out into a cane; and if this is covered with crystal, the eye cannot detect the junction of the external crystal with that of the cane, but the enamel casing will appear as a tube with the star standing in the centre. Devices of numerous kinds are thus made in canes, and then welded together. The end is then ground, and, after being heated and incased in crystal, the lens-like shape of the paper weights adds to the effect by magnifying the incrusted canes.

The light-refracting properties of crystal are best shown by cutting and polishing. Fig. 4, Pl. CCLXXVI. represents a glass-cutter's mill. A is the pulley and band communicating motion to the mill, which is made of wrought or cast iron. Stones of various textures, or wood, sand, or emery, in water, are used with the metal mills, water only with the stones, and pumice-stone and putty-powder with the wood for smoothing and polishing. The articles are held in the hand, and applied to the mill while rotating. The punty marks are ground off tumblers, wine-glasses, and such like, by boys holding them on small stone mills. Ground or frosted glass is made by rubbing the surface with sand and water. Iron tools fixed on a lathe and moistened with sand and water are used to rough out the stoppers and necks of bottles, which are completed by hand with emery and water. The neighbourhood of the coal-fields is of course the chief seat of the manufacture, and probably the best crystal is now made in Manchester.

BOTTLE-GLASS.

Plate CCLXXIV., fig. 4, is a ground-plan, showing all the necessary buildings for two bottle-houses, and in one of the houses the ground-plan of a four-pot furnace and ash arches. The furnace is an oblong, similar to what we have described the crown-furnace to be, but arched over in the barrel shape. It is erected in the centre of the brick cone, above a cave, which admits the atmosphere to the grating. The working holes of this furnace, opposite each pot, for putting in the materials and taking out the liquid glass, are each about one foot in diameter. At each angle of the furnace there is also a hole about the same size communicating with the calcining arch, and admitting the flame from the main furnace, which reverberates on and calcines the materials in the arch. Fig. 1 shows the main furnace; 2, 3, 4, 5, the ash arches for calcining the materials; 6, 7, 8, 9, 10, 11, annealing arches; 12, two-pot arches; 13, what is considered an improved plan; 14, clay-house, for picking, grinding, sifting, and afterwards working the clay into paste for the purpose of manufacturing pots; 15, mill house for grinding clay; 16, a building containing a calcar furnace for experiments, or for preparing the materials, when the ash arch attached to the main furnace is under repair, including, 1, a sand crib, and, 2, an ash crib for sifting and mixing the materials, sufficient for two houses.

The common green or bottle-glass is made of the coarsest materials; sand, lime, sometimes clay, any kind of alkali or alkaline ashes, whose cheapness may recommend it to the manufacturer, and sometimes the vitreous slag produced from the fusion of iron ore. The mixture most commonly used is soap-maker's waste, in the proportion of three measures to one measure of sand. The green colour of this glass is occasioned by the existence of a portion of iron in the sand, and, it may be, also in the vegetable ashes of which it is composed.

When castor-oil or champaigne bottles are wanted, a portion of crown-glass cullet is added, to improve the colour. The impurity of the alkali, and the abundance of fluxing materials of an earthy nature, combined with the intense heat to which they are subjected, occasion the existence of but a very small proportion of real saline matter in the glass, and thereby render it better than flint-glass for holding fluids possessing corrosive properties.

The soap-maker's waste is generally calcined in two of the coarse arches, figs. 3 and 4, which are kept at a strong red heat from twenty-four to thirty hours, the time required to melt the materials and work them into glass, which is termed a journey. After the soap-maker's waste is taken out of the arch, it is ground and mixed with sand in the proportions already mentioned. This mixture is put into the fine arches, and again calcined during the working journey, which occupies about ten or twelve hours more. When the journey is over, the pots are again filled with the red-hot materials out of the fine calcining arch. Six hours are required to melt this additional quantity of materials. The pots are again filled up, and in about four hours this filling is also melted. The furnace is then kept at the highest possible degree of heat, and in the course of from twelve to sixteen hours, according as the experience of the founder may determine, the materials in the pots are formed into a liquid glass fit for making bottles. The furnace is now checked by closing the doors of the cave, and the metal cooling, it becomes more dense, and all the extraneous matter not formed into glass floats upon the top. Before beginning to work, this is skimmed off in the way already described in our account of crown-glass making. A sufficient quantity of coals is added at intervals, to keep the furnace at a working heat till the journey is finished.

After the pots have been skimmed, the person who begins the work is the gatherer, who, after heating the pipe, gathers on it a small quantity of metal. After allowing this to cool a little, he again gathers such a quantity as he conceives to be sufficient to make a bottle. This is then handed to the blower, who, while blowing through the tube, rolls the metal upon a stone, at the same time forming the neck of the bottle. He then puts the metal into a brass or cast-iron mould of the shape of the bottle wanted, and, continuing to blow through the tube, brings it to the desired form. The patent mould now in use is made of brass, the inside finely polished, divided into two pieces, which the workman, by pressing a spring with his foot, opens and shuts at pleasure. The blower then hands it to the finisher, who touches the neck of the bottle with a small piece of iron dipt in water, which cuts it completely off from the pipe. He next attaches the punty, which is a little metal gathered from the pot, to the bottom of the bottle, and thereby gives it the shape which it usually presents. This punty may be used for from eighteen to twenty-four dozen of bottles. It is occasionally dipped into sand to prevent its adhering to the bottle. The finisher then warms the bottle at the furnace, and taking out a small quantity of metal on what is termed a ring iron, he turns it once round the mouth, forming the ring seen at the mouth of bottles. He then employs the shears to give shape to the neck. One of the blades of the shears has a piece of brass in the centre, tapered like a common cork, which forms the inside mouth; to the other blade is attached a piece of brass, used to form the ring. The bottle is then lifted by the neck on a fork by a little fellow about ten years of age, and carried to the annealing arch, where the bottles are placed in bins above one another. This arch is kept a little below melting heat, till the whole quantity, which amounts to ten or twelve gross in each arch, is deposited, when the fire is allowed to die out.

GLASSITES or **Sandemanians**, a religious sect that first appeared in Scotland about A.D. 1728, when Mr Glass, a minister of the Scottish Established Church, avowed opinions on church government approaching very nearly to those of the Congregationalists. About 1757 Robert Sandeman appeared as an advocate of the same opinions, and in 1762 he organized a congregation. The prominent distinguishing doctrine of the Glassites relates to the nature of justifying faith, which Sandeman maintained to be "no more than a simple assent to the divine testimony passively received by the understanding." Certain peculiar practices also are observed by this sect, which are by them supposed to have been prevalent among the primitive Christians, such as weekly communions, love-feasts, mutual exhortations, washing each others' feet, plurality of elders, the use of the lot, and several others.

In 1851 the number of Glassite congregations in Great Britain was twelve, with aggregate accommodation for about 2000 persons.

GLASTONBURY, a municipal borough and market-town of England, county of Somerset, 24 miles S.W. of Bath. It occupies a peninsula (formerly an island, the *Avalonia* of the Romans) formed by the river Brue, between the Poldew and Mendip hills. Glastonbury was long celebrated for its abbey, one of the richest and most powerful of the monastic institutions in England. It is said to have been founded by Joseph of Arimathea, whose staff, according to the legend, was converted into a budding thorn, and hence the term "Glastonbury thorn." Having fallen into decay, the abbey was rebuilt with great splendour by Ina, king of Wessex, about 708. A.D. It was in great part rebuilt in the twelfth century, and was subsequently repaired or enlarged. At the dissolution of the monasteries in 1539, the last abbot, being unwilling to surrender his abbey, was hanged without trial. The abbey buildings were surrounded by a high wall inclosing about 60 acres. The remains of this structure consist of some fragments of the church, the chapel of St Joseph, and the abbot's kitchen. This last, which is in better preservation than any other part, is an octagonal building, with a turret surmounted by a double lantern. The town of Glastonbury took its rise from the abbey, to which also it was mainly indebted for its prosperity. It was destroyed by the Danes in 873, but was subsequently rebuilt by King Edmund. It was burnt down with part of the abbey in 1184, and was rebuilt by Henry III. Again it was destroyed, or nearly so, by an earthquake in 1276, after which it was gradually restored chiefly by the help of the abbey. It is governed by a mayor, four aldermen, and twelve councillors. In the centre of the town stands the cross, an ancient and now ruinous structure. The churches of St John and St Benedict are fine old buildings, and the former is surmounted by a beautiful tower. On a hill N.E. of the town is a curious old tower called the Tor, or Tower of St Michael. The other buildings of interest are St George's Inn, formerly the abbey hospitium; the tribunal, the abbey-house, gate-house, hospital of St John, and the town-hall. Many of the houses are composed of the stones of the abbey. It carries on some trade in timber, slates, tiles, and agricultural produce by means of a canal connecting it with the Bristol Channel. The silk manufacture is carried on to a small extent. St Dunstan was a native of this town. Pop. (1851) 3125.

GLATZ (Slav. *Kladsko*), a fortified town of Prussian Silesia, government of Breslau, and 52 miles S.S.W. of a town of that name. It stands in a narrow valley on the left bank of the Neisse, not far from the Austrian frontier. It is strongly walled, and is further defended by an old castle built on a high hill on one side, and by a regular modern fortress erected on a hill on the opposite side of the town. It has several Lutheran and Catholic churches, a gymnasium, asylum for destitute children, infirmary, a large barracks, and other military buildings. Its chief manufactures are linen, damask, broadcloth, leather, and hosiery. It surrendered to Frederic the Great in 1742, was retaken by the Austrians in 1759, and restored to Prussia at the peace of 1763. Pop. (1849) 8222, exclusive of the garrison, which amounted to 2342.

GLAUBER, **John Rodolph**, a German chemist, born at the commencement of the sixteenth century, was one of those who were most ardently occupied with "the great work"—the discovery of the philosopher's stone. Full of love and enthusiasm for the marvellous, he abandoned himself without reserve to the extravagant ideas which then prevailed in chemistry. His long and painful labours, pursued with indefatigable perseverance, and an energy worthy of a nobler object, were almost always directed towards the discovery of the panacea, the philosopher's stone, and other chimeras with which the alchymists amused themselves. Infatuated with the doctrine of the adepts, he may be said to have passed his life over alembics and furnaces; and, in fact, he is regarded as a second Paracelsus. Not less presumptuous than his model, he boasted of the discovery of several wonderful secrets. Whether he was truly convinced of the reality of his inventions, or whether, like empirics of all classes, he proposed to profit by the ignorance and blind credulity of men, he had the art to seduce many persons by promises as vain as they were exaggerated. He is even reproached with having carried on a vile traffic in pretended secrets, which he sometimes sold at an exorbitant price to different individuals, and afterwards published with his name in order to enhance his reputation. Devoid of the instruction and force of mind necessary to enable him to deduce just inferences from the numerous experiments which he had performed with ability and address, Glauber only attained a subaltern or secondary rank amongst the chemists. But he, nevertheless, discovered several important facts, which have materially contributed to make better known certain salts and some metals, which, eventually, had a marked influence on the progress of chemistry and materia medica. Thus, in examining the residue of the decomposition of sea-salt by the sulphuric acid, this laborious chemist discovered the sulphate of soda, to which his name is permanently attached under the denomination of Glauber's Salt. His writings on dry baths and sulphurous fumigations entitle him, in certain respects, to be regarded as the inventor of confined vapour baths, which have been latterly brought forward as a new discovery; and he is equally the inventor of several chemical medicaments, the use of which is still preserved in most of the pharmacopœias.

We are also indebted to him for a great number of works (thirty in all), an exact list of which may be found in the curious article entitled Glauber, in Adelung's *History of Human Folly*. A collection of them was printed in several volumes 8vo, and in two volumes 4to, at Frankfort, 1658, 1659, and translated into English by Pack, London, 1689, folio. Of these the principal are—*Deutschlands Wallfahrt*, Amsterdam, 1656, often reprinted; *Furni Novi Philosophici*, or Description of a new Method of Distilling, Amsterdam, 1648, 8vo, translated into French by Duteil, Paris, 1659, 8vo; *De Medicina Universali, sive de Auro potabili vero*, Amsterdam, 1658, 8vo; *Miraculum Mundi*, Amsterdam, 1653, 8vo; *Pharmacopœia Spagyrica*, Amsterdam, 1654, 8vo; *De Tartaro ex Vini fœcibus*, 1655, 8vo; *Dissertatio Medica Hermetica et Catholica magni Naturœ magisterialis Mysterii*, Frankfort, 1656, 8vo; *Consolation of Navigators*, Amsterdam, 1659, 8vo; *Opus Minerale*, Amsterdam, 1651, 8vo; *De Elia Artista*, Amsterdam, 1668, 8vo. Glauber published many other alchymical productions, which are neither less obscure or less enigmatical than the preceding. All his works are in German; and although most of them have the first words of the title in Latin, there is good ground for believing that Glauber did not understand that language. (J. B—E.)

GLAUCHAU, a town of Saxony, circle of Zwickau, on the right bank of the Mulde, 12 miles S.E. of Altenburg. It has several churches, a normal and other schools, an orphan asylum, poorhouse, two hospitals, two castles, and extensive manufactures of woollen and linen goods, hosiery, leather, iron and copper wares, &c. Pop. (1849) 10,350.

GLAUCOMA (γλαυκός), a disease of the eye, in which the crystalline humour assumes a bluish or greenish colour, and its transparency is diminished. (See Lawrence's *Lectures on Surgery.*)

GLAUCUS, son of Sisyphus and Merope, grandson of Æolus, and grandfather of Bellerophontes. He dwelt at Potniæ; despised the power of Venus or Aphrodite; and prevented his mares from breeding, in order that they might be the stronger for the race. Another version is, that he fed them on human flesh for the purpose of rendering them spirited and warlike. This roused the anger of Aphrodite, so that she destroyed him—some say by causing his horses to take fright and throw him out of the chariot, while he was contending at the funeral games in honour of Pelias; others, that his horses tore him to pieces, having drunk from the waters of a sacred well in Bœotia, which caused them to go mad. One of the lost tragedies of Æschylus was called Γλαῦκος Ποτνιεύς.

Glaucus, son of Hippolochus, and grandson of Bellerophontes, was a Lycian prince, who assisted Priam in the Trojan war. When he and Diomede, to whom he was bound by ties of hospitality, recognised each other in battle, they desisted from the contest, and exchanged arms. Glaucus was afterwards slain by Ajax, but his body was taken back to Lycia.

Glaucus, a son of Antenor; he fought in the Trojan war, but was killed by Telamonian Ajax.

Glaucus, one of the sons of Priam.

Glaucus, one of the sons of the Cretan king Minos, by Crete or Pasiphaë. When a child, playing at ball or pursuing a mouse, he fell into a cask of honey, and was smothered. He was, however, discovered by the soothsayer Polyidus of Argos, who was pointed out by Apollo for the purpose. Minos then desired him to restore his son to life; but failing to do this, he was buried alive with young Glaucus, when a serpent most opportunely revealed an herb which restored the dead body to life. The story of Polyidus was a favourite subject with ancient poets and artists.

Glaucus, a fisherman of Anthedon in Bœotia, who became a sea-god by eating part of the divine herb which Cronos had sown. A general belief prevailed in Greece that Glaucus every year, accompanied by marine monsters, visited all the coasts and islands, and delivered his prophecies. Fishermen and sailors especially were attentive to his oracles, in which they placed implicit confidence. He is said to have instructed even Apollo in the prophetic art. The stories about his various loves were favourites with the poets, but the place of his abode varied according to local traditions.

Glaucus, a sculptor in metal, who dwelt in Chios, and was considered by the Greeks as the inventor of the art of soldering metals. He lived about 490 B.C.

GLAZING *of Earthenware*. See POTTERY and STONEWARE.

GLEBE (Lat. *gleba*), in *Law*, the land annexed to a parish church, and belonging to the parson or vicar.

Glebe, among *miners*, a piece of earth containing some mineral ore.

GLEE, in *Music*, a composition for three or more voices, in simple counterpoint; the words generally upon some lively subject. When the words are grave or pathetic, and passages of fugue and imitation are introduced, the composition is more properly called a madrigal.

GLEIG, George, afterwards Bishop of Brechin, was born 12th May 1753, at Bog-Hall, in Kincardineshire. He received the rudiments of his education in the school of Arbuthnot, and passed from thence, at the age of thirteen, to King's College, Aberdeen, where his career was one of the most brilliant on record. His scholarship was of a high order; and in mathematics and the moral and physical sciences he carried off the first prizes. He won for himself also an exhibition or bursary before the close of the first session, and was selected, while yet an undergraduate, to assist Professor Skene in the instruction of his class. For, at the period of which we are writing, each professor in King's College, Aberdeen, carried his pupils through the entire academical course, and was therefore glad to avail himself of the co-operation of the ablest of his scholars, in order to bring up such as could not keep pace with their fellow-students except by extra care and labour bestowed upon them.

There is reason to believe that Mr Gleig, after taking his degree, might have aspired (in good hope) to the office of assistant-professor, with the certainty of succeeding to the first chair which should fall vacant. In this case, however, it would have been necessary for him to subscribe to the *Confession of Faith* of the Established Church of Scotland, and to take the oaths of allegiance and abjuration; but he was one of a family of Scotch Episcopalians which had adhered to the house of Stuart, and suffered for it; and the time had not yet come when Jacobites could, with a safe conscience, accept a descendant of the Elector of Hanover as legitimate sovereign of these realms. Mr Gleig, therefore, declined the tempting proposals that were made to him; and having resolved to take orders in the Episcopal Church, gave himself up for a while to the careful study of theology and a severe course of patristic reading. It is due to the subject of our memoir to add, that he never gave to the arguments of Irenæus or Chrysostom the respect which was due only to the statements of inspiration. His opinion of the degree of deference which ought to be paid to the fathers was this, that on matters of fact with which they were conversant their evidence deserved to be accepted as conclusive; that in the discussion of doctrinal questions their authority was not greater than that of any correct and learned modern who takes Holy Scripture for his guide.

Mr Gleig had barely attained his twenty-first year when he was ordained to the pastoral charge of a congregation in Pittenweem, in Fife. The condition of the Scottish Episcopal Church, though less perilous than it had been a few years previously, was then critical enough. The penal laws remained on the statute-book in all their ferocity; and it was still in the power of any common informer to force the magistrate into the execution of them. Mr Gleig, therefore, like his brethren in general, officiated, so to speak, by stealth, to a few faithful families who met in a room to worship God according to the manner of their fathers. Not that there prevailed among those in authority the slightest inclination to persecute either Episcopalians or Jacobites, as such. All fear of a renewed struggle for the throne had subsided, and with it was passing away the disposition to treat Episcopalians as necessarily disaffected persons, and the use of the Liturgy in Scotland as high treason. Still, the law, while it excluded from office under the crown all laymen who attended the ministrations of the Episcopal clergy, exposed the clergy themselves to imprisonment, and even to transportation, should it be proved against them that they had read the Liturgy to more than four persons over and above the members of their own families. The consequence was, that by little and little the lay members of the Scottish Episcopal Church fell away; and that such as could not bring themselves to conform to the Presbyterian ritual, brought down clergymen from England to officiate to them, under license from the civil government. This procedure, which at the outset might have been defended on the score of necessity, led by degrees to a habit of thinking at least as fatal to the Episcopalian principle as direct conformity to the Established Church. And Mr Gleig, with others brought up in a sterner school, uniformly protested against it.

The death of Prince Charles Edward and the peculiar position of his brother Cardinal York, removed at length the only obstacle which stood between the Scottish Episcopalians and the enjoyment of their full rights as citizens. In anticipation of this event, Mr Gleig had for some years previously laboured to soften down the prejudices of the body to which he belonged. A correspondence was opened with Moor, Archbishop of Canterbury, the Lord Chancellor Thurlow, and other leading statesmen, which gave good hope that a little yielding on the part of the Jacobites would ensure the repeal of the penal laws, and the restoration of the Episcopal Church to the condition in which it stood during the latter part of Queen Anne's reign. Mr Gleig, indeed, made a journey to London, in 1786, with a view to bring this important negotiation to an issue. Unfortunately, however, there were those among his brethren who could not be persuaded to accept free toleration except on their own terms; and an arrangement eminently advantageous to the little church was in consequence set aside. By and by a second treaty was set on foot, which relieved the Episcopal Church from the pressure of the law; but placed it, towards the sister Church of England, on a footing somewhat disadvantageous for both. For this defect in the bill, which gave to his church her status, Mr Gleig was not responsible; and he lived to see the most obnoxious clause in it so modified as to amount to a virtual repeal.

All this while the subject of our memoir was pursuing an honourable and useful career as a man of letters. He contributed to several of the leading magazines of the day; he was in correspondence with almost all the distinguished authors of the age; elected into the Royal Society of Edinburgh, he read at the meetings of that body several able papers on literary and scientific subjects. It is, however, because of his connection with the *Encyclopædia Britannica* that we are chiefly bound to make a record of his merits. Having contributed some able articles (especially that upon Instinct) to the third edition of that miscellany, he was chosen, on the death of Mr Ferguson, the original editor, to bring the work to a conclusion—a task which he accomplished with consummate ability, no slight portion of the matter being supplied by his own pen. The two supplemental volumes which appeared soon afterwards, he wrote almost entirely without any assistance whatever.

Mr Gleig removed from Pittenweem to Stirling in 1790; and married, soon afterwards, Janet, the youngest daughter of Robert Hamilton, Esq. of Kilbrachmont, and widow of Dr Fullton. By her he had four children, of whom one only (the present chaplain-general to the forces) survives.

Mr Gleig was consecrated Bishop of Brechin in 1808, and died at Stirling in February 1839, in the eighty-sixth year of his age.

He was a man of rare piety, unostentatious, charitable, and generous. As a metaphysician, he deserves to take rank with Dr Reid and Dugald Stewart. His learning was profound, his reading extensive, and his memory—till growing years and infirmities affected it—singularly tenacious. His conversational powers were, moreover, of a very high order, and his wit and humour remarkable. He has left behind him few separate writings—only a volume of sermons, and *Letters on the Study of Theology*—a very valuable treatise. But his edition of Stackhouse's *History of the Bible* contains much original matter, which deserves a better place than amid the pages of that heavy compilation. He was a regular contributor, for many of their best years, to the *Anti-Jacobin* and *British Critic*, and embellished an edition of Dr Robertson's works with one of the most agreeable lives of that eminent historian which have appeared. (G. R. G.)

GLEIM, Johann Wilhelm Ludwig, a German poet, born April 2, 1719, near Halberstadt, where he also died Feb. 18, 1803, at the age of eighty-three, after having occupied, during half a century, the lucrative situation of secretary to the chapter of Halberstadt. "Father Gleim," for such was the title accorded to him throughout all literary Germany, is considered one of the best German poets of his time. He distinguished himself particularly in his fables, tales, epigrams, and songs for children. His war-songs, composed for the Prussian army, were very popular, and his lighter strains obtained for him the designation of the Anacreon of Germany. Originally his poems appeared in periodical publications, but were republished at Leipzig in 6 vols. 8vo, 1798. A complete edition of his works was printed at Halberstadt in 7 vols. 8vo, 1811–13. The odes and songs (*Lieder*) of Gleim are not destitute of grace and elegance, but their monotony soon fatigues the ear. His fables are in general more simple and unaffected than those of Gellert, and deserve honourable mention. Still, the serious drawback in many of his romances is the close imitation of the pretentious style of Gongora, the Spanish poet, whose conceits sound badly when clothed in German phraseology; but the merit belongs to Gleim of having introduced to the Germans this kind of popular literature.

GLEIWITZ, a town in the Prussian province of Silesia, government of Oppeln, and 35 miles S.E. of the town of that name; on the Klodnitz, and on the railway between Oppeln and Cracow. It is the seat of a royal mining board, and has very extensive iron-works. Pop. (1849) 8506.

GLENCOE, a valley of Scotland, Argyllshire, extending for about 10 miles in a S.E. direction from Loch Leven. The lower portion of the glen next Loch Leven is cultivated and wooded, but the signs of cultivation gradually disappear on approaching the upper portion, which presents a scene of unmingled wildness and grandeur. On both sides mountains rise almost perpendicularly to a great height, while in the huge clefts of their rocky and blackened summits wreaths of snow may be seen all the year round. In the middle of the valley is the small lake Treachtan, from which issues the Cona. The well-known massacre of Glencoe occurred here in February 1692. See Britain, vol. v., p. 443–4.

GLENDALAGH, or Glandelagh. See Wicklow, County of.

GLENDOWER, or Glendwr, *Owen*, a famous Welsh chief, descended in the maternal line from Llewellyn, the last Welsh Prince of Wales, and notable for the long contest which he maintained against Henry IV. He was born in A.D. 1349, crowned by his followers and adherents in 1402, and died in 1415. See Wales, and Britain.

GLIN, a market-town and seaport of Ireland, county of Limerick, on the left bank of the estuary of the Shannon, 30 miles W. by S. of Limerick. It has a considerable trade in butter, grain, and salmon. Pop. (1851) 1243.

GLISSON, Francis, an English physician, born in 1597, at Rampisham, in the county of Dorset, was educated at Cambridge, and during forty years occupied the chair of medicine in that university. In 1634 he was admitted into the College of Physicians in London, of which he afterwards became president; and in 1639 this body appointed him professor of anatomy. He filled this situation with much credit at the commencement of the civil war, when he took refuge in Colchester; but after the surrender of that city to the parliamentary forces he went to London, and became a member of that association of learned men which afterwards formed the Royal Society.

In 1650 he published his treatise *De Rachitide, seu morbo puerili*, a malady then new in England, where it had only appeared about thirty years before. In 1654 appeared his *Anatomia Hepatis*, in 8vo, in which he first described the capsule of the *vena portarum*, known by his name; in 1672 the *Tractatus de natura substantiæ energetica, seu de vita Natura ejusque tribus primis facultatibus*; and in 1677, the year of his death, the book *De Ventriculo et Intestinis*, in 4to, the first work containing conjectures as to the nature of the simple fibre, and an exposition of the innate principle of irritability. Glisson was also the first who attributed the contraction of the heart, and of the other muscles, to the action of a stimulus on their irritable principle. The greater part of his works have often been reprinted in different countries. He was also the author of a treatise *De Lymphæductis nuper repertis*, Amsterdam, 1659, which, with his book entitled *Anatomica prolegomena et Anatomia Hepatis*, are considered the best of his works. Boerhaave regarded him as the most exact of all anatomists; but Glisson's views on physiology are now held in little estimation. (J. B—E.)

GLOBE, a sphere; a round solid body which may be conceived to be generated by the revolution of a semicircle about its diameter.

Artificial globes, for illustrating problems in geography and astronomy, are fully described, and their uses explained, under GEOGRAPHY, § *Mathematical Geography*, chap. iii.

GLOGAU, or GROSS GLOGAU, a strongly fortified town of Prussia, province of Silesia, and government of Liegnitz, on the left bank of the Oder, 35 miles N. of Liegnitz. The Dominsel or Cathedral island, in the Oder, is likewise strongly fortified, and is connected with the town by a wooden bridge. Glogau is the seat of a superior court, and has numerous churches, a synagogue, two hospitals, a Roman Catholic and a Protestant gymnasium, a citadel, and manufactures of woollens, cottons, hosiery, tobacco, paper, straw hats, &c. It carries on some trade by means of the river, and is connected by a branch with the Berlin and Breslau railway. Pop. (1849) 12,190, besides 3146 military. *Ober* or *Klein Glogau*, a town also in the province of Silesia, government of Oppeln, and 23 miles S. of the town of that name, on the right bank of the Hotzenplotz. It has a castle, a Roman Catholic seminary, and manufactures of linen and woollen goods. Pop. (1849) 4334.

GLOMMON, a river of Norway. See NORWAY.

GLOSS (γλῶσσα, tongue; Lat. *glossa*, interpretation), in literature, a comment in explanation of the text, particularly of an antiquated or obsolete word or phrase.

GLOSSARY, a dictionary explaining obscure and antiquated terms found in old authors. Such are Du Cange's Latin and Greek Glossaries, Spelman's Glossary, and Kennet's Glossary at the end of his *Parochial Antiquities*.

GLOSSOP, a township of Derbyshire, near the Manchester and Sheffield railway, 14 miles E.S.E. of Manchester. It is the chief seat of the cotton manufacture in Derbyshire, having in the town and neighbourhood above fifty cotton mills. It has also woollen and paper mills, dyeing, bleaching, and print works, iron foundries, &c. Pop. (1851) 5467.

GLOUCESTER, a city, and the capital of a county situated in the west midland census district of England. It is 106 miles from London by the highroad, and 114 miles by railway. The authorities are divided relative to the origin of Gloucester; some hold that it was founded by the Britons, who called it Caer-Gloew, signifying "the city of the pure stream;" others, that it was so called after its founder, Gloew, a British chief; others, that the Claudian legion, which landed in Britain with Julius Cæsar, having been stationed there to check the irruptions of the Silures, it was called Claud-cestra (Latin *castra*, signifying camp or barrack), now corrupted into Gloucester; and others, that the West Saxons having captured the city in A.D. 575 called it Gleaucester, whence comes the present name. It is certain that Gloucester became a Roman station under the name of Colonia *Glevium*; and at the present time the soil is rarely stirred without the discovery of pavements, altars, coins, pottery, and other Roman remains, and especially in the suburb of Kingsholm, which seems to have been a place of sepulture, situated, according to the Roman manner, beyond the bounds of the city. In the eighth century, Gloucester, it is stated by Bede, was one of the noblest cities in the land; but it was repeatedly ravaged and burnt by the Danish invaders, and in the civil wars of later ages. In the contest between Charles I. and the parliament, the citizens of Gloucester espoused the cause of the latter, though they professed to hold the city—"to obey the commands of the king, as signified by both houses of parliament;" but they really turned the tide against him, at a moment when the nation was wavering, by successfully resisting a siege carried on by 30,000 men. Gloucester was the only place in the south-west that the parliamentarians held; and if it had been lost the king would have been master along the whole course of the Severn. The inhabitants, rather than surrender the city, burnt its suburbs, thereby sacrificing property worth L.26,000; so that, to use the words of a civic dignitary of that time, "we are a garment without skirts, which we are willing to part withal, lest our enemy should sit upon them." The defences of Gloucester were levelled at the Restoration, but some portions of the walls still remain, and the trenches here and there have been turned into gardens. The city is seated on a gentle knoll, overlooking the river Severn; it is sheltered on the east by the Cotswold hills, and looks towards the Malvern hills, which, impressive by their magnitude, and softened by distance, rise up like shadows on the western horizon. North and south of the city the country is almost a dead level. The river Severn divides into two channels at Gloucester; these inclose the island of Alney, where Canute and Edmund Ironside met to fight a battle, but agreed instead to share Britain between them. The tide reaches Gloucester, though the city is forty miles from the mouth of the river; and at certain times, owing to a sudden contraction of the channel at Newnham, it rushes up in a great wave called the Bore, from seven to nine feet high. Gloucester consists of four principal streets, intersecting each other at the cross, where the Tolsey or guildhall stands, like the Roman forum of old; these streets, indeed, formed part of Roman roads traversing the county. Of late years a large number of new houses have been built in the suburbs beyond the boundaries of the city, but the city itself still retains many marks of its age—quaint old gables and timber houses being intermingled with handsome modern buildings, chief amongst which are four banking-houses. The discovery of a spring of saline chalybeate water on the south side of the city in 1814 led to the erection of what is now the handsomest portion of Gloucester.

The New Inn, the oldest inn, and perhaps the oldest house in the city, is a very remarkable building; it was built for pilgrims by Abbot Sebroke about the end of the fifteenth century. The chief public building is the cathedral, which is 427 feet long and 154 feet broad. The central tower, a beautiful structure in the perpendicular style, is 223 feet high. The cathedral is remarkable not only for general beauty, but as furnishing an epitome of the growth of ecclesiastical architecture in this country. It has gradually grown up from a monastery founded in 672 by Wulphere, king of the Saxons; it was twice burnt down and rebuilt in the eleventh century, and was completed in the fifteenth century. The crypt is early Norman, the nave later Norman, and nearly every style of Gothic architecture was incorporated in the building as it proceeded. The east window is the largest in England, and is ingeniously curved to give it an appearance of greater size. Among the historical personages buried within its walls are Robert and Richard, sons of William the Conqueror, and Edward II., who was murdered at Berkeley Castle, and lies in a beautiful canopied tomb; a great part of the building was erected with the offerings made by pilgrims at the shrine of the "sainted king." There is also a marble statue in memory of Dr Jenner, the discoverer of vaccination, who was a native of the county; and a monument to the Rev. Richard Raikes, the originator of Sunday schools, the first of which was held in Gloucester. The other public buildings of the city are the shire hall, containing two assize courts, and a large apartment used for public meetings, a building erected in 1814 by Smirke, and presenting externally an Ionic portico; the county jail, which stands on the site of the ancient castle, close to the Severn; the county lunatic asylum; the corn exchange, and a handsome market-house, both recently erected; a castellated militia store; a blue-coat school; a general infirmary; and St Bartholomew's Hospital, an almshouse for the maintenance of indigent citizens, built in the style of architecture which prevailed in the reign of Henry VIII., the period of its foundation. There are also three other almshouses, but though ancient their appearance is mean. Gloucester is divided into ten parishes, with several extra-parochial places attached to them; and there are fourteen churches, besides several handsome dissenting chapels in the city. While, however, some of the parishes have two or three churches, others have none. Oliver Cromwell declared that in Gloucester there were "more churches than godliness," and several were destroyed by public ordinance; one was converted into a guildhall. There are three endowed schools—the college school, founded by Henry VIII., as part of the cathedral establishment; the crypt school, founded in the same reign by Dame Joan Cooke, and a blue-coat hospital, founded by Sir Thomas Rich in 1666 for the education and maintenance of thirty boys.

Gloucester has returned two members to parliament since the 23d year of Edward I. It was created a county at an early period, and city as well as county assizes are held. It also possesses a court of quarter sessions. Richard III. granted a charter to the city, under which it elected a corporation consisting of a mayor, sheriff, twelve aldermen, and twelve burgesses; it is now governed by a mayor, six aldermen, and eighteen burgesses. The corporation formerly possessed a considerable income arising from land, but they were obliged to sell the property in 1855 to defray the cost of new water works, new markets, sewers, and other public improvements. The custom of borough English, by which landed property descends to the youngest son instead of the eldest, prevails in this city. The city and county were created a bishopric by Henry VIII., but the see is now united to that of Bristol. Gloucester was anciently very busily engaged in iron-founding and cloth-making; to these succeeded cap-making, pin-making, and bell-founding, but they have all ceased to exist. A considerable foreign commerce has, however, sprung up. Not long since the only vessels frequenting the port were a few coasters, which came up the Severn to the old Roman quays; but the tortuous and dangerous navigation of the river has been superseded by a noble ship canal sixteen miles long, falling into the Severn at Sharpness Point; and great quantities of timber and wheat are imported, and salt, iron, and coal are exported. The imports amounted in 1853 to 242,094 tons, and the exports to 59,989 tons. Gloucester is admirably situated for commerce, as it is the centre of a system of railways, as well as on the course of a large river navigated by steamers, and connected by canals with the interior of the country. In the reign of William the Conqueror the population of Gloucester, it is stated, was 2500; in 1801 it amounted to 7597; in 1811 to 8280; in 1821 to 9744; in 1831 to 11,993; in 1841 to 14,497; and in 1851 to 17,572. (F. C.)

GLOUCESTERSHIRE, a county in the west midland census district of England; its name is derived from its capital town, like all the other counties comprised within the Saxon kingdom of Mercia. This county is bounded on the N. by Worcestershire and Warwickshire, on the S. by Somersetshire, on the E. by Oxfordshire and Wiltshire, and on the W. by Herefordshire and Monmouthshire. Its boundary is formed on the W. by the river Wye, and on the S. by the Somersetshire Avon. The shape of the county is irregular; its greatest length is about 70 miles N. and S., and its greatest breadth 45 miles E. and W. Some parts of the county were formerly detached, and situated within the counties of Worcester and Warwick; and detached parts of Worcester and Wilts were situated within the boundaries of Gloucestershire; but by an act of parliament passed in 1844, these detached parts were incorporated with the counties by which they were surrounded. The area of Gloucestershire was thus diminished by about 3000 acres. The total area of the county, according to the tithe surveys, is 805,102 acres, exclusive of 17,688 acres of water, and nearly the whole of it is capable of cultivation. The county is divided into twenty-eight hundreds and 351 parishes, and contains two cities, Bristol and Gloucester, and twenty-eight market-towns.

Gloucestershire exhibits three natural divisions—the hill, the vale, and the forest. The hill country is an undulating tableland, on the summit of a range of hills called the Cotswolds, which gradually rise at Chipping-Campden, traverse the county nearly north and south on the eastern side, and pass out of the county into Somerset, forming the high ground on the north side of Bath. The average elevation of these hills is about 700 feet, though some of them are much higher, as for instance Cleeve Hill, which is 1134 feet. The vale is that part of the county extending from the slope of the Cotswolds to the east bank of the river Severn. The upper part of this expanse is locally known as the Vale of Gloucester, which is a continuation of the Vale of Evesham, and the lower part as the Vale of Berkeley. The forest formerly consisted of the whole district on the western bank of the Severn, but is now limited to that part of it which lies upon the slopes and between two high ridges, bounded by the Severn and Wye, and extending from East Chepstow to the Malvern range of hills. The hill, the vale, and the forest districts run parallel to each other, north and south; and if the views of geologists be correct, the vale was formerly the bed of a strait which connected the Bristol and Irish Channels. It is impossible to look down from any of the outlying hills of the Cotswolds upon the fertile Vale of Gloucester, watered by the tortuous course of the broad Severn, without being struck with the conviction that its beauty is the result of some great physical change; and Murchison has come to the conclusion, from the sandy nature of the soil, the shingle beaches raised high above the Severn, the indigenous marine plants, and the outlying hills—some of which present the same strata as the Cotswolds, but reversed, as if they had been undermined by water and toppled over from the cliffs—that the vale was once a rolling sea, the waves of which beat against the Cotswold cliffs on the east, and May Hill and the Malverns on the west; that the bed of the vale has been raised by volcanic action and the drifting of detritus; and that the lovely little hollows, beautifully rounded in the escarpment of the Cotswolds, were quiet little bays, worked by the tide of the ancient "Strait of Malvern."

The soil of the hill country is a few inches of calcareous sand, resting on freestone rubble, locally called *stone brash*. Every time it is ploughed a large quantity of stone is turned up, and the custom is therefore to plough very shallow furrows, leaving an alternate strip of the surface. There is so much lime in the soil that it requires much manure; this is supplied both by folding sheep, and by paring and burning the turf, and strewing the ashes upon the surface. Good crops of barley and oats are thus obtained, and even of wheat when the soil is mixed with clay. The poorest land on the hills, however, affords excellent pasturage for sheep; and these are the staple produce of the district. Sainfoin grows wild, and its cultivation yields abundantly. The Cotswold sheep, it is said, are the progenitors of the famous long-woolled sheep of Spain, and are certainly the finest breed in the south of England. They are hardy and prolific; the lambs quickly become clothed with fleece, and are proof against any degree of dry cold, as indeed is necessary to their existence, for the air of the hills is sharp and bracing, and vegetation is always a month later than in the vale. The indigenous breed has been greatly improved by crossing it with the Leicester sheep, and the produce has reached high perfection in point of shape, weight, quality, and fleece. Some of the Cotswold sheep have weighed eighty lbs. per quarter. The hill farmers are generally very enterprising, and the agriculture of the district has greatly improved of late years. This has been much aided by the establishment of the Royal Agricultural College of England, an institution incorporated by royal charter in 1845 for the purpose of instructing young men in the general sciences connected with agriculture, and in the practice of farming. For this purpose lectures are delivered by resident professors, and the pupils also engage in the practical cultivation of a farm of 700 acres attached to the institution. The college, situated near Cirencester, the chief town of the district, is a Gothic structure, ornamented by a central tower, and has hitherto contained on an average about 100 pupils. Notwithstanding the march of improvement, the naturally sterile and dreary look of the district still remains. There are few trees, as may be gathered from the name, for "wold" signifies in Saxon a place without wood; there are no hedgerows, but rough stone walls instead; the homesteads and cottages scattered over the farms, which run from 300 to 1200 acres, are hidden in the undulations of the ground, to shelter them from the biting blasts of winter; and thus the hills, thinly peopled in reality, appear to be depopulated. Descending to the vale, the soil is a rich deep loam, both black and red, and is well adapted for cattle; while a moist, mild climate, partly arising from defective drainage, is highly suitable for the growth of grasses and root crops. Fully one-half of the vale is in permanent pasture; and as the vale farmers rely on hay for the subsistence of their stock during the winter, they have become very skilful in making it. The hay is very frequently stacked on the third or fourth day after cutting, and is as green and sweet as new-mown grass; indeed, the hay made in this county is rarely equalled in quality elsewhere. The cattle in the vale are chiefly shorthorns, though the Herefords predominate in that part of the county adjoining Herefordshire. They are generally fine animals; one is kept for every four or six acres, and the total number in the vale cannot be much less than 10,000. Some are fed for distant markets, others used for dairy purposes. Where the grass is rich, feeding is preferred to rearing and to the dairy. The vale has long been famous for butter and cheese; that known as "double Gloucester" is made only in the Vale of Berkeley. The average produce is about 350 lbs. each cow; and dealers, judging of the quality of the produce from that of the land upon which the cattle are pastured, are accustomed to contract for the whole "make" of a farm. In former years the vale was famous for its vineyards; and, according to William of Malmsbury, who wrote in the twelfth century, the grapes grown in Gloucestershire, and the wine made from them, were very nearly as sweet as those of France. Wine-making has, however, entirely ceased in this county as well as throughout England; not, as the notion is, for want of heat, for Sweden produces excellent grapes, but because the vine requires an intensity of light rarely if ever observed in this misty climate. The surface of the vale country varies in character; north of Gloucester it is almost a dead level, while south of that city it presents a series of gentle undulations. The aspect of the vale is highly pastoral; grass lands succeed each other almost without interruption, they are hemmed in by a profusion of hedges and hedgerow timber, and dotted by apple, pear, and elm trees, which overshadow the soil, suck out its fertilizing properties, diminish the surface, while they impart richness and picturesque beauty to the landscape. The vale is subject to severe storms of wind and rain, the result of its position and the varying climate of the county.

The forest district formerly included the greater part of the county west of the Severn, but has now become contracted to a surface of 8 miles in length and the same in breadth, the boundary being a circuit of 30 miles. The centre of the forest is about 5 miles N.W. of Newnham, on the bank of the Severn. The surface is agreeably diversified by numerous undulations, varying in height from 120 to 1000 feet, and much of it has been suffered to become waste. The soil is a sandy peat; but though unfit for agricultural purposes, it is admirably adapted for the growth of timber, and it has formed one of the royal forests from time immemorial. In the middle ages it afforded a safe refuge for robbers, who used often to go afloat on the Severn and plunder the vessels. The commanders of the Spanish Armada had orders not to leave a tree standing in it, "if," says Evelyn, "they should not be able to subdue our nation." In the time of Charles I. the forest contained 105,537 trees; pressed for money, the king granted it to Sir John Wyntour for the sum of L.10,000, and a fee-farm rent of L.2000. The grant was cancelled by Cromwell; but at the Restoration the number of trees had been reduced to 30,000, and Wyntour having obtained another grant, destroyed all but 200 of the trees fit for shipbuilding. To repair the mischief, 11,000 acres were inclosed and planted; and at the present time the forest is nearly covered with timber in various stages of growth. The oaks are of the finest quality and size grown in England.

Generally speaking, the soil as well as the climate of Gloucestershire, except on the Cotswold Hills, is admirably adapted for mixed husbandry. The geological formation chiefly regulates the nature of the surface soil, which is of medium friability. Part of the county rests upon the blue lias and oolite, the new and old sandstones, and the mountain limestone; the soils are consequently somewhat retentive, but drainage would greatly improve them. There are extremely rich meadows on the banks of the Severn, where river deposits are still going on, and they might be rendered as fertile as any in England by freeing them from water. Not only, however, is drainage neglected, but the facilities for irrigation presented by the level surface, and the existence of streams of water, are overlooked. The soil is seldom stirred beyond a depth of ten inches, and the process of paring and burning is much used. The produce of wheat for the whole county averages from 20 to 25 bushels an acre. Barley is grown more generally than wheat, as it yields more money, though it is of inferior quality; oats are not much cultivated, as the horses employed in agriculture are fed on hay and chaff, and chemical analysis has demonstrated the accuracy of the local belief, that oats form a scourging crop. Beans of excellent quality are produced in the low-lying lands, as they luxuriate in a warm climate, and on a clay soil; the yield averages four quarters an acre. Teazles are also grown largely and profitably. Many of the farms have orchards, and a large quantity of cider and perry is made. The best cider, after being kept a year, resembles the light Rhenish wines; the worst is sold to retailers. It is less profitable to grow apple-trees than beef and mutton, but the farmers cannot get labourers without providing cider for them. The allowance is half a gallon daily for each man, and as much more as they can consume in harvest time. The horses of this county are a race peculiar to the S.W. of England—lean, slow, and clumsy; but attempts are now making to improve the breed by the introduction of Flemish and Suffolk stallions. Defective sight is very common amongst them,—this is attributable to inflammation caused by the dust of the limestone with which the roads are made, but chiefly to the mode of feeding; the animals are compelled to stuff themselves so full of chopped hay to satisfy their hunger, that when they exert themselves the collar used presses on the vessels of the neck, and checks the passage of the blood to and from the brain. Oxen are also much employed for draught; and, occasionally, a yoke may be seen drawing a cart with a pole, and even with solid wheels similar to those of the Roman times. A large number of pigs are reared, principally of the Berkshire breed. In curing bacon, instead of removing the hair with hot water, it is burnt off with straw.

Gloucestershire is at present the resort of invalids and pleasure-seekers, who form large populations at Cheltenham and Clifton, where there are medicinal springs. If the soil were better cultivated, not only would the beauty of the scenery be heightened, but the climate would be rendered even more salubrious than it now is.

Gloucestershire is a maritime as well as an agricultural county; its cities, Bristol and Gloucester, carry on an extensive foreign commerce. The approach to the first is by the Somerset Avon, and to the latter by the Severn. The navigation of the Severn below Gloucester is, however, very dangerous, owing to its tortuous course, rapid tides, and shifting sandbanks; and having been superseded by the Gloucester and Berkeley canal, it is now deserted except by a few country barges. This canal was commenced in 1794, but from want of funds it was not completed till 1827. Its entrance is at Sharpness Point, near Berkeley, and it terminates in very spacious docks at Gloucester. It is 16 miles long, without a single lock, is 18 feet deep, 60 feet wide, and is navigable by vessels of 600 tons fully laden. Prior to the construction of the canal, the trade of Gloucester was confined to a few coasters, which shot up and down the Severn at particular tides. Not only does the Severn, the second of the English streams, cease to be a river in this county, but the first, the mighty Thames, begins its existence within its boundaries. About three miles south of Cheltenham, at the back of Leckhampton Hill, two little streams take their rise, one at Thames Head, the other at Seven Springs, and mingling about a mile from their source, form the Chura, which becomes the Isis, and afterwards the Thames. It is a moot point which is the true head of the river; but the general opinion is in favour of the Seven Springs, which pour forth the greater volume of water. The springs lie in a little dell, close to a highroad, and are shaded by overhanging trees; the water issues forth clear and pure from seven openings. A canal unites the Severn and the Thames at points where vessels of 70 tons burthen can navigate them. It commences at Lechlade, on the latter, and joins the Stroudwater canal, which crosses the Gloucester and Berkeley canal, and opens into the Severn at Framilode. The summit level of the Thames and Severn canal is at Sapperton, near Cirencester; here it passes by a tunnel $2\frac{3}{4}$ miles long through a hill chiefly composed of hard rock, rising 250 feet above it. The tunnel is reached from the bank of the Thames by an ascent of 134 feet, which is effected by 14 locks; and from the bank of the Severn by an ascent of 243 feet, effected by 28 locks; the latter are concentrated between Sapperton and Wallbridge, in a space of $7\frac{3}{4}$ miles. The total distance from river to river is 39 miles. The other rivers of the county are the Upper Avon, which, after passing through the county for five miles, flows into the Severn at Tewkesbury; the Chelt rising near Cheltenham, the Ledden rising in Herefordshire, the Frome rising near Brimpsfield, and the Middle Avon rising near Berkeley, all of which also feed the Severn; the Colne rising to the east of Cheltenham, and the Leach near Northleach, tributaries of the Thames; and the Windrush, which rises near Winchcomb, and flows into Oxfordshire. The Wye is also occasionally included amongst the rivers of this county, but it merely skirts part of its western boundary. In addition to the canals already described, there is one which runs from the Severn at Gloucester to the city of Hereford, about 35 miles. A large sum of money has been spent in improving the Severn from Gloucester to Stourport, in Worcestershire, where it is connected with a system of canals ramifying throughout England. The county is also traversed north and south, and east and west, by railways, which intersect each other at Gloucester; these different means of communication afford great facilities to the trade of the county.

The mineral productions of the county are—good freestone found in the hills, paving-stone and grit in the forest, and an excellent limestone near Bristol. Lead is found in different parts of the county, but the veins are too poor to repay the cost of working them. There are also beds of coal alternating with ironstone a short distance north of Bristol and in Dean Forest. The ironstone in the former district is not worked, but iron mines were opened in the latter as early as the days of the Romans, and extensive workings, locally called *scowles*, partly attributable to that people, still exist. There are upwards of 200 coal mines in the forest, and they present the peculiarity, that while the highest and middle of the three seams of coal which it exhibits are worked by deep pits, the lowest seam is worked by adits or levels driven into the side of the hills until they strike the coal. This apparent anomaly is in accordance with a general law of stratified rocks, by which the strata lowest in geological position usually rise to the greatest altitude above the level of the sea. The forest is locally governed by two deputy-gavellers appointed by the crown to superintend the woods and mines, besides four verderers elected by the freeholders; but the office of the latter has become purely honorary, especially since the herds of deer which used to wander through the forest were destroyed, to put a stop to poaching and its demoralization. The mining customs of the forest are ancient and peculiar. From time immemorial, all persons born in the hundred of St Briavel's, who have worked a year and a day in a coal-mine become freeminers, and are entitled to work coal in any part of the forest not previously occupied. Of late the custom has grown up of assigning the permission formally obtained from the crown, or *gale*, as it is locally termed, to "foreigners," that is, persons who are not freeminers. But though the practice introduced capital, the operations of persons contending for the possession of mines to which no limit was assigned, led to contests underground, and created great confusion of rights. To remedy this, an act of parliament was passed in 1844, by which the ancient customs have been moulded into a rational and provident system of mining. The forest is traversed by tramroads, and has been opened on the east and west sides by locomotive railways. In the centre of the forest is the Speech House, where the king's officers used to meet to administer the forest laws, and the freeminers to regulate their affairs. It is now merely a picturesque inn, situated in the midst of highly romantic scenery.

Gloucestershire is also an important manufacturing county. The manufacture of woollen cloth has been established for centuries in the valleys or "bottoms" of the Cotswold Hills; and several of these valleys meet in the Stroud district, and are watered by clear and rapid streams, which, after supplying the mills, unite in one stream, the Frome, and flow into the Severn at Framilode. The parishes of Bisley, Minchinhampton, Painswick, Woodchester, Horsley, Stonehouse, Stanley, Ebley, Dursley, and Wotton-under-Edge, were formerly the principal seats of the manufacture; but it has fallen into decay in many of these parishes; and the town of Stroud is now the centre of the fine-cloth manufacture. Large and increasing manufacturing establishments have been formed in the immediate neighbourhood of that town, and give employment to several thousands of workmen. Since the introduction of power-looms into the chief establishments, the whole process of manufacturing is performed by machinery, which is of a very elaborate and superior description. Although the counties of Lancashire and Yorkshire have made greater comparative progress, this county is still unrivalled in the manufacture of fine woollen cloths. The best cloths are manufactured from the fine wools of Saxony and Silesia, and the consumption of the better description of Australian wools is also greatly increasing. Formerly, a large quantity of the wools from Cotswold, Hereford, and Southdown sheep, was used in making cloth for the East India Company's trade; but this branch of manufacture has become almost extinct. Most of the cloth manufactured in this county is intended for the home trade; the light texture and superficial character of the cloths usually required for exportation precludes the Gloucestershire manufacturers from engaging largely in the foreign trade; still they occasionally export to the colonies and America. The dyers in this district are celebrated for the scarlet colours which they produce, the beauty and brilliancy of which are attributed to some peculiar property in the water of the Stroud valleys. The dark blue colours dyed in this district are also of very durable quality. The greater part of the cloths are now dyed in the wool, and not in the piece as formerly, The Great Western railway passes through Stroud, connecting it with London and Wales; and the Midland railway connects it with the north and west of England.

Henry III. was crowned at Gloucester; Edward II. was murdered at Berkeley; the wars of the Roses were quenched at the battle of Tewkesbury, where Queen Margaret and her son, Prince Edward, were taken prisoners; and Charles I. lost his crown mainly through the repulse he sustained at Gloucester. The county is strewed with relics of past ages and events. It is traversed by four Roman roads—the Fossway, Ermine Street, Ikenild Street, and the Via Julia. Many Roman pavements have been found at Cirencester, Gloucester, and Woodchester, those at the latter place being far superior to all others in this country. Camps—British, Saxon, Danish, and Roman—exist in numerous places; and there are many interesting remains of the middle ages. Amongst these are the ruins of Sudeley Castle, near Winchcombe, built in the reign of Henry VII., by Ralph Boteler, and described by Fuller as being "of subjects' castles the most handsome habitation, and of handsome habitations the strongest castle;" Thornbury Castle, the intended strength of which having excited the jealousy of Henry VII., he destroyed it while in an unfinished state, and beheaded its owner, the Duke of Buckingham, in 1522; St Briavel's Castle, built in the time of Henry I., by Milo Fitzwalter, to curb the incursions of the Welsh, now the village post-office and prison; and Berkeley Castle, built prior to the time of Henry II., and now a fine example of the feudal residences of ancient times, in perfect preservation, and inhabited by a descendant of its founders, Earl Fitzhardinge. The machicolated gatehouse by which the castle is entered, the baronial hall and chapel attached, the keep and its towers, its dungeons, in one of which King Edward II. was murdered, serve to recal the times when the bold barons were petty kings. The chief mansions in the county are Badminton House, the residence of the Duke of Beaufort; Barrington Hall, of Lord Dynover; Oakley Park, of Earl Bathurst; Tortworth Park, of Earl Ducie; Sherborne House, of Lord Sherborne; Clearwell Court, of the Earl of Dunraven; Highnam Court, of T. Gambier Parry, Esq.; and Southam House, a perfect specimen of the domestic building of the time of Henry VII., the seat of the Earl of Ellenborough. Besides these, there are many other residences of note, though inferior in size.

Gloucester is formed into two divisions for election purposes, each of which returns two members.

Population of Gloucestershire.

In 1831		387,398	
1841		431,495	
1851	Males	218,187	458,805
	Females	240,618	

Area, in square miles, 1258; in statute acres, 805,102.

Pop. to a square mile, in 1851, 364 persons, or 69 houses.

The county returns 4 members to parliament—viz., 2 for the eastern division, and 2 for the western division; Cheltenham 1, Cirencester 2, Gloucester 2, Stroud 2, and Tewkesbury 2, in the eastern division; and Bristol 2, in the western division. Total 15.

Annual value of real property assessed to property tax, 1850–1, L.2,235,627.

Principal Towns and their Population in 1851.

Bristol (Gloucester and Somersetshires)	137,328	Newent	1,547
Cheltenham	35,051	Stroud	36,535
Cirencester	6,096	Tetbury	2,615
Dursley	2,617	Tewkesbury	5,878
Gloucester	17,572	Thornsbury	1,470
		Winchcomb	2,052

Religious worship.—Belonging to Church of England; places of worship, 433; sittings, 165,003. Other denominations, 495; sittings, 129,798.

Education.—Day schools, 1283; day scholars, 56,218; Sunday schools, 606; Sunday scholars, 59,154. (F. C.)

GLOVE (Sax. *glof*), a covering for the hand, with a separate sheath for each finger.

Among our ancestors, to throw down the glove or gantlet was equivalent to a challenge to single combat; and the person thus defied signified his acceptance of the challenge by taking up the glove, and casting down his own; which ceremony was regarded as a mutual compact to meet at the time and place specified. This custom, according to Favyn (*Theatre d'Honneur et de Chevalerie*), was derived from the Oriental mode of contracting sales of land and the like by giving the purchaser a glove, by way of delivery or investiture; and to this effect he quotes the book of Ruth, iv. 7, in which passage the Chaldee paraphrase renders by *glove* the word commonly translated 'shoe.' He adds that the rabbin interpret similarly that passage in Psalm cviii.—"over Edom will I cast out my shoe." It may be observed that in several of the modern European languages a glove is termed a *hand-shoe*.

The use of gloves is of high antiquity. There is reason to believe the ancient Persians wore them, since it is mentioned in the *Cyropædia* of Xenophon that on one occasion Cyrus went without his gloves; and we know they were used by the Greeks and Romans in certain kinds of manual labour. During the middle ages gloves were worn by ecclesiastical dignitaries and others as a mark of distinction; but as civilization advanced they gradually became common to all classes of the community.

The glove manufacture has long been an important branch of industry. The materials employed are very various, including the skin of the chamois, kid, lamb, beaver, doe, elk, and other animals, besides cotton, wool, silk, linen thread, &c. Glove-leather is prepared by curing the skins with alum, which renders them soft and pliable. Woodstock and Worcester, but particularly the former, are famed for the manufacture of kid-gloves of superior quality; and Dundee has long been celebrated for the excellence of its kid gloves. Those of France, however, still continue to maintain their superiority over the kid gloves of British make, and are very largely imported into this country. This also holds true of the ordinary French leather, the durability of which, combined with superiority of style and fitting, has occasioned the French boots and shoes to be preferred to those of British manufacture. Machinery is sometimes employed in sewing and pointing leather gloves, though only on a very limited scale in this country, almost the whole being made by the hand, and for the most part by females; but in Paris it is much used, and is said to have had the effect of reducing the price of gloves 30 per cent. below their former wholesale prices. Besides the English towns above mentioned, large quantities of leather gloves are produced in London, Yeovil, Ludlow, Leominster, and elsewhere. Limerick has long been famous for a very fine kind of ladies' leather gloves, known as *chicken gloves.* Until the year 1825 the importation of leather gloves and mits was prohibited, but since that time they have been admitted on payment of a certain duty. Large quantities of cotton gloves are made at Nottingham and Leicester. According to the census of 1851 the total number of persons employed in the glove manufacture in the kingdom was 32,982.

GLOVER, RICHARD, author of *Leonidas*, was born in 1712 in London. His father was a Hamburg merchant, and, as Richard was intended to join him in business, the youth's school-education was of the commonest kind. He early displayed a love of letters, however, and at the age of sixteen wrote a poem to the memory of Sir Isaac Newton, which was highly thought of at the time. In 1737 (the year of his marriage) appeared the work with which his name is now always associated—his *Leonidas.* This is an epic poem on the subject of the great Persian war with Greece; but as it was believed by some of the leading statesmen of the day to have a present political significance, it was very warmly commended by the regent and his court, by Lord Lyttleton, and the novelist Fielding. Through their influence the poem enjoyed a success altogether beyond its real merit, and in less than two years passed through three editions. Like the tragedies of *Boadicea* and *Medea*, published respectively in 1753 and 1761, the *Leonidas* exhibits a well-cultivated taste, some skill in versifying, and a good ear for music; but no passion, no poetry—none of the qualities, in short, which are the soul and marrow of the epic. In 1739 Glover wrote his *London, or the Progress of Commerce*, and a ballad entitled *Hosier's Ghost*, with a view, it is said, to rousing the nation to a Spanish war. This ballad is certainly effective, if it be nothing more, and was in its day nearly as popular as Cowper's ballad of *John Gilpin* at a later period. Glover was twenty-seven years of age when he wrote *Hosier's Ghost*, and he used to sing it regularly himself to the end of his life, though Hannah More, who tells us that she heard him sing it in his last days, is mistaken in saying that he was then past eighty. He died in November 1785, in the seventy-fourth year of his age.

During his lifetime Glover was highly esteemed for his practical qualities. He was distinguished as a city political leader, and ably advocated liberal views in opposition to

Walpole. On entering parliament in 1760, as member for Weymouth, he made a considerable figure in the house as a speaker, but was valued still more highly for his sound and sagacious views on commercial questions. (Johnson's *English Poets;* Chalmers's *Biog. Dict.;* Craik's *English Lit.*; Spalding's *English Lit.*)

GLOW-WORM, the female of *lampyris noctiluca.* See index to ENTOMOLOGY.

GLUCHOW, a town of European Russia, government of Tchernigov, and 140 miles E. by N. of the town of that name; on the Jasmen. It is surrounded by an earthen wall, has several churches and convents, and a considerable trade. It is the seat of three annual fairs, which are well attended. Pop. (1849) 8006.

GLUCK, CHRISTOPHER WILLIBALD VON, an eminent musical composer, born July 2, 1714, at Weidenwang, near Neumarkt, in the Ober-Palatinate, where his father resided as a forester. He was placed, from his twelfth to his eighteenth year, in the Jesuit seminary at Kommotau, where he acquired some practical knowledge of music.[1] In Italy, whither he went in the service of a nobleman, he received instructions from Martini, and produced his first opera at Milan. He came to England in 1745. The rebellion having then just broke out, foreigners were regarded with jealousy, and the opera was on that account closed; but through the exertions of Lord Middlesex it was re-opened with a temporary political performance called *La Caduta de' Giganti*, the music of which Gluck was employed to compose. He afterwards brought out his *Piramo e Tisbe*, which was little else than an assemblage of favourite airs from his previous works. The cold reception this opera met with first convinced him that music to be effective must be strictly adapted to the spirit and character of the poetical subject. This consideration induced Gluck to lay down certain general principles, which are said to have influenced all his subsequent labours in composition. These were, first, to impart to music all the force and expression it is capable of producing, and which was best attained by uniting it to simple but animated poetry full of natural and well-defined ideas; secondly, to make the air follow the rhythm and accents of the words, and construct the accompaniments so as to invigorate the sentiment, or to contrast them with it. The system he adopted may be described as one entirely subservient to the effect of dramatic performance, where the music is never estranged from the scene and situations of the characters, and where the interest results from the perfect interfusion of sound with sense.

His unsuccessful attempts in England at length induced Gluck again to visit Italy, where, in pursuance of his new design, he applied to the study of the classical Italian poets. His great object now was to connect himself with some man of true poetic genius; and he was so fortunate as to find such a co-operator in Calsabigi, who undertook to write dramas exactly to his taste.

The opera of *Orfeo* was the first attempt of Gluck in the new course he had shaped out for himself. It was produced at Vienna, and at first excited astonishment, which, however, soon gave way to delight; and the opera was performed in all the principal cities of Italy with rapturous applause. The Italians were transported with a style at once so novel and chaste, so masculine and energetic. When the *Orfeo* afterwards came to be translated into French, Rousseau was so much charmed with it that he did not miss a single representation; and it is in allusion to this circumstance that he says—"If so much exalted pleasure can be enjoyed in the space of two hours, it serves to convince us that life is really good for something."

In 1774 Gluck came to Paris, where he composed his famous operas of *Iphigénie en Aulide* and *Alceste*, which were received with a degree of enthusiasm unparalleled in the annals of music. By these successes Gluck came to be regarded as the national musician of France. The congeniality of his style with the standard favourites Lulli and Rameau called forth general admiration.

Gluck composed in 1774 his opera of *Armide*, which was followed by *Iphigénie en Tauride*, and some others; and after having completely revolutionized the music of France, he returned to Vienna, where he remained until his death, which took place in 1787.

Gluck has been well called the Michel Angelo of music. He was the originator of a school which has opened up great and various sources of enjoyment to taste, and mightily influenced the character of the whole art. His genius was of the highest order. His invention was unequalled, particularly in dramatic painting and theatrical effect. Some critics complain that he is defective in song; but an intimate acquaintance with his works disproves the assertion It is true that we cannot perhaps cull from his compositions such melodious flowers as luxuriate in the *chef-d'œuvres* of Cimarosa, Mozart, and Rossini, and which gratify the sense frequently as much when detached as when blended in their original wreath. The melodies of Gluck will not, with a few exceptions, stand the test of such a partition. They are essentially musical phrases which belong to a great and expanded work of imagination. They are the links of a chain, the component elements of a comprehensive design, which must be judged of relatively, and with reference to combination. Thus it is that, when we criticise Gluck, we should not examine his operas in detail. We must consider them as we would a noble edifice, in the aggregate of its beauty. The same spirit that actuates us in reading the epics of Virgil and Tasso should exercise its dominion when we listen to the music of Gluck.

Whatever may be the opinion of some persons in regard to the general effect of the music of Gluck, all are agreed in assigning to him the palm of superiority in his treatment of classical subjects, and depicting scenes of deep and overpowering grief. "He is," says an anonymous author, "the only master capable of grappling with a classical subject; he could give us, better than any,

> 'Ariadne passioning for Theseus' injury
> And unjust flight.'

No lovers, tyrannically separated for ever, have the despair of his." "It is," says a writer in the *Harmonicon*, "in scenes of great distress, in which the human heart is rent by complicated misery, or in situations where it is torn by the tempestuous fury of unbridled passions, that Gluck, transported beyond the bounds of ordinary genius, shows such energy and colouring of passion, as to become at once poet, painter, and musician. It may be that his expression of passion is sometimes too strong for common hearers: but

> 'Il échappe souvent des sons à la douleur,
> Qui sont faux pour l'oreille, mais sont vrais pour le cœur.'"

The operas of Gluck, much to the discredit of modern taste, are seldom heard in France or England; but in Germany they are frequently performed; and in Berlin, when any of his great operas are given, the theatres are crowded. The style of his airs is studied, and great attention bestowed on their effect; and there is a warmth and an intensity displayed by the performers in taking the recitative, and an energy in their action, which nothing but such music as Gluck's could inspire.

Gluck is described as having been of a frank and open character, although his temper was hasty and choleric. He was very rigid in exacting from performers the utmost purity and correctness of execution. (A. H.)

GLÜCKSTADT, a town of Denmark, capital of the duchy of Holstein, on the right bank of the Elbe, where it receives the small river Rhin, 28 miles N.W. of Hamburg. This town was founded by Christian IV. in 1616, and fortified in 1620. In 1627-8 it was in vain besieged for fifteen weeks by Tilly. In 1815 its fortifications were demolished, and in 1830 it was made a free port. It is the seat of several courts, and has a gymnasium, navigation school, &c. Its arsenal is now used as a prison and workhouse. The inhabitants are chiefly engaged in trade and navigation. Glückstadt is connected by railway with Altona, Kiel, and Rendsburg. It is traversed by several canals, but is very deficient in water for culinary purposes, so that the rain has to be carefully preserved in cisterns. Pop. (1849) 6186.

---

[1] See Anton Schmid's Life of Gluck (in German), Leipzig, Fleischer, 1855.

GLUE, inspissated animal jelly, much used as a cement, especially for wood. It is made from various animal substances, according to the uses for which it is designed. Common glue is prepared from the parings of hides, hoofs, and other offal, which are first digested in limewater to free them from grease and all extraneous matter, then washed in water, and afterwards boiled. The viscid solution thus obtained is first strained through a wicker basket, and then gently evaporated to a proper consistence. The heat is generally so regulated as to keep the liquid near the boiling point, without entering into ebullition. The liquid glue is poured into flat moulds; and when it has become firm, it is cut up into square pieces, and placed on a coarse net to dry. Glue improves by age, and that is considered as the best which, if steeped in cold water for three or four days, swells without melting, and resumes its former dimensions after being dried. The clear pale brown glue is the best, though the darker and less pure is often ignorantly preferred. A transparent and beautiful glue is made of the shreds and parings of vellum, fine white leather, or of isinglass. (See also Gelatine.)

A preparation of glue, convenient on account of the facility with which it is rendered fit for immediate use, is made by adding a small proportion of any good spirit, or of wood naphtha, to melted glue. It is to be kept in a well-corked bottle, and when required for use may readily be liquefied by placing the bottle in hot water. It answers all the purposes of ordinary glue.

Indian Glue, as it is called, consists of common glue melted with a little sugar, and moulded for convenience into small flat cakes. When used, the edge of the cake is moistened, and rubbed upon the surfaces to be united. It is a slight cement, used only for such purposes as mending prints, &c.

Jeffery's Marine Glue.—This powerful cement has been most successfully used as a substitute for pitch in the seams of decks, as well as for strengthening large timbers for naval purposes. It is said to consist of caoutchouc dissolved in coal naphtha, to which shellac (previously dissolved in wood naptha ?) in proper proportions is afterwards added. The joinings of built masts secured with this cement are said to have resisted separation by the wedge after ten years' service.

Liquid Glue.—Under this name is frequently sold a cement consisting of shellac dissolved in wood-naphtha.

GLUTEN, a viscid, elastic, grayish-coloured substance which exists in greater or less quantity in most plants that afford farina, as well as in the leaves of many esculent vegetables (such as the cabbage for instance), but more particularly in wheat, which of all the cerealia appears to contain, in proportion to its bulk, the greatest amount of nutriment, a property derived from its abounding in this substance. Gluten may be readily obtained from wheaten flour by making it into a paste, and then working the mass with the hands below a stream of water, when the starch and other soluble matters are carried away, and the gluten remains in a pure state. In its properties gluten bears a strong resemblance to animal substances; and, indeed, it is found by chemical analysis to contain a large proportion of nitrogen. Hence it may be considered as the most animalized of vegetable products.

GLUTTON. See index to Mammalia.

GLYCAS, Michael, a Byzantine historian, often called Siculus, from his supposed native island Sicily. The time when he flourished is very uncertain. He was probably an ecclesiastic. He knew several languages, and is justly reckoned among the better Byzantine historians on account of the terseness and perspicuity of his style. His MS. letters still extant are addressed to the last Constantine, who perished in the storming of Constantinople by the Turks in 1453. Their authenticity, however, has been questioned. His chief work is Βίβλος χρονική (or *Annals*), which is divided into four parts: the first treats of the creation of the world; the second narrates the history from the creation to Christ; the third, from Christ till Constantine the Great; and the fourth, from Constantine till the death of the emperor Alexis I. Comnenus, A.D. 1118. The best edition of this work is that by J. Bekker, in the Bonn collection of the Byzantines, 1836, 8vo.

GLYCERINE. Oils and fats, whether of animal or vegetable origin, are compounds of certain acids, such as the stearic, margaric, and oleic, with a base named glycerine. (See Oil.) Fatty substances may, in fact, be represented as salts of glycerine, and as such are capable of being resolved into their proximate elements like other salts. Thus, in the process of soap-making, a fat or an oil is saponified by means of potash or soda; that is, the caustic alkali unites with the stearic, margaric, or oleic acid, and glycerine is set free. If, for example, the stearate of glycerine be treated with caustic soda, the stearic acid unites with the soda, and forms stearate of soda, while the glycerine is liberated. A fatty body may also be decomposed by means of oxide of lead, as in the process for making diachylon plaster (*Emplastrum plumbi*). By boiling a mixture of finely pulverized or newly precipitated oxide of lead in water with any ordinary fat or oil, the lead unites with the fatty acids, and forms a solid compound, while the glycerine dissolves in the water. The solution contains a considerable portion of lead, which may be separated by passing sulphuretted hydrogen through it, and filtering; the solution is then evaporated to the consistence of syrup, and the evaporation is completed *in vacuo*, in the presence of sulphuric acid, until it ceases to lose weight.

The uncrystallizable inodorous syrup thus obtained has a sweet taste, and was hence termed by Scheele, who discovered it in 1789, the *sweet principle of oils*, or *glycerine*, from γλυκυς, sweet; but it was not until Chevreul undertook the investigation of fatty substances in general that the true chemical relations of this body were understood.

During many years large quantities of impure glycerine had been produced as a waste product in the preparation of lead plaster from olive oil and litharge, and in the manufacture of soap and of stearic candles. In this last example the palm oil or other fatty substance was decomposed by means of lime, and the liberated glycerine was allowed to run to waste. In the remarkable series of improvements in this manufacture, which are due to the scientific knowledge and enterprise of the managing directors of Price's Patent Candle Company at the Belmont Works, Vauxhall, London, the lime saponification was superseded by the action in the first instance of sulphuric acid, which combines with the whole of the fatty substance, and the glycerine is afterwards isolated under the action of water and of a high temperature in the form of sulphoglyceric acid, and is obtained pure by distillation. This process was partly superseded by the discovery made by Scharling in the year 1853, that neutral fats may be decomposed by the action of steam alone under great pressure.

In this process steam, at a temperature of from 550° to 600° Fahrenheit, is introduced into a distillatory apparatus which already contains a quantity of palm oil. Under these circumstances, the fatty acids take up their equivalents of water; the glycerine also combines with an equivalent of water, and the whole of these compounds distil over, and the condensed glycerine, from its greater specific gravity, sinks below the fat acids in the receiver. In this process a sufficient quantity of steam must be supplied, and the proper temperature be kept up, or *acroleine*, an acrid vapour, especially irritating to the eyes, will be produced by the decomposition of the glycerine. According to another process, contrived by Tilghmann, water mixed with the oil or fat which is to be decomposed, is forced through tubes at a temperature of from 500° to 600°, or even higher.

Glycerine is distinguished by remarkable solvent powers, and hence, as obtained by the former processes, it was scarcely possible to get rid of such impurities as lime or lead. Indeed, several specimens of the "pure glycerine" of the shops, which have been sold at double the price of common glycerine, have been found to contain lead—a circumstance which may have greatly interfered with the medicinal or economical application of this valuable substance. By this new process, however, glycerine is obtained in combination with water only; if it be discoloured it can be rectified by a second distillation, and it can be concentrated so as to have at the temperature of 60° a density of 1·240, in which case it contains 94 per cent. of anhydrous glycerine. It can even be concentrated to 1·260 or 98 per cent. of pure glycerine, the remaining 2 per cent. being combined water.

Since this new source of glycerine has been opened, a variety of applications have been made for it, and they are briefly stated in a paper read at the Glasgow meeting of the British Association (1855) by G. F. Wilson, Esq., F.R.S., one of the managing directors of Price's Patent Candle Company. The first suggestion of a use for glycerine which Mr Wilson has been able to trace was by Mr T. De La Rue, who, early in 1844, operating on some glycerine which he procured from Mr Warington of Apothecaries' Hall, tried the effect of it on a burn and irritation of the skin. He found it to have a soothing effect, and to keep the part moist, and he suggested the use of it to Mr Startin, through whose means it came to be extensively applied in the hospital for skin diseases. It is being introduced as an article of the toilet, as a soothing remedy for chapped hands and sun-burnt faces. In June 1849 Mr Thomas Wakley published in the *Lancet* the results of one year's experience on the use of glycerine in diseases of the ear, giving a number of cases in which it had proved a cure for deafness. M. Cap (*Journal de Pharmacie et de Chimie*, February and October 1854) suggests a number of valuable uses for glycerine as follows:—"Glycerine dissolves the vegetable acids, the deliquescent salts, the sulphates of potassa, soda, and copper, the nitrates of potassa and silver, the alkaline chlorides, potassa, soda, baryta, strontia, bromine, iodine, and even oxide of lead. It dissolves or suspends the vegetable alkaloids in the same manner as the aqueous liquids, and at the same time the resulting products may be used for the same purposes as though mixed with oil. Thus the salts of morphia dissolve in it completely, even cold, in all proportions. Sulphate of quinine, in the proportion of $\frac{1}{10}$th, dissolves in it when hot, but when cold separates into clots, which, when triturated with the supernatant liquid, give it the consistence of a cerate very useful for frictions and embrocations. It is the same with the salts of brucine, strychnine, veratrine, and most preparations of the same order, which enables us to consider that we have now, if not medicinal oils with a vegetable alkaloid base, at least a series of new preparations which will fulfil a perfectly analogous use in therapeutics."

M. Cap further speaks of glycerine as a solvent for sulphuret of potassium, sulphuret of lime, iodine, iodide of sulphur, iodide of potassium, iodide of mercury, for some chlorides, and for quinine and sulphate of quinine.

From the great solvent power of glycerine, Mr Wilson suggests that it might be injected into the bladder for the purpose of dissolving calcareous deposits; from its blandness it might not cause irritation, while as a solvent of urea and phosphate of lime it might answer the desired purpose. Some of the medical authorities have received glycerine for the purpose of this experiment. Glycerine is also used in the same way as cod-liver oil as a medicine. In the preparation of several medicines, glycerine has been most advantageously substituted for the syrup of sugar, with the effect of preserving the medicine in an active state free from change, and also of greatly improving its taste.

Glycerine has a remarkable preservative power on animal and vegetable substances, an application of it which formed the substance of a patent taken out by Mr Warington in 1846. A portion of a neck of mutton kept in glycerine for several months was cooked by Soyer, and eaten with great satisfaction. Glycerine has been used for mounting objects for the microscope, and also for preserving objects in natural history. Mr Wilson's first experiment was upon a brilliantly coloured two-pound trout, caught in one of the Perthshire lochs. Immediately on taking it out of the water a quantity of glycerine was poured over it, and a cloth wrapped round it. Next day it was again wrapped in a saturated cloth. Two days afterwards, in Edinburgh, the colour of the scales was unchanged. When it arrived in London, part was steeped in water, and then cooked. It was perfectly fresh and firm, but had lost nearly all its flavour. The uncooked portion, immersed in glycerine, was sent to Professor Owen, who suggested that the brilliant fishes of tropical seas might be brought home in kegs of glycerine. Specimens of trout, roach, and perch, preserved in glycerine, some of them for more than two months, were shown by Mr Wilson to have retained their natural colours.

Glycerine consists of $C_6 H_8 O_6$. The chemistry of glycerine involves a number of highly interesting points, for an account of which we must refer to a memoir by Berthelot in the *Annales de Chimie* for 1854. (C. T.)

GLYPTICS (γλύφω, I engrave), the art of engraving figures of any kind on precious stones or other hard substances, either in raised work (as in *cameos*), or by figures cut into the surface, when it is called *intaglio*. See ENGRAVING *on Precious Stones*, vol. viii., p. 813.

GMELIN, JOHANN FRIEDRICH, a German naturalist of some celebrity, was born at Tübingen in 1748. After taking his degree of M.D., he travelled through England and Holland, lecturing on his favourite subjects of botany and natural history, and finally settled at his native town as extraordinary professor of medicine. He afterwards removed to Göttingen in the same capacity, and remained there till his death in 1804. His name is preserved by his edition (the thirteenth) of Linnæus' *Systema Naturæ*, which, however, is hardly so well known as Cuvier's criticism of it, in which it is described as "an ignorant compilation, useless to the professor, and more likely to mislead the student than to enlighten or instruct him. In fact, under the pretence of giving a complete list of synonymes, he collected indiscriminately all the names which he found in different authors, without observing whether such a plant, animal, or mineral had been differently designated by different naturalists, so that the same name has often been given to distinct objects. This double error, which constantly recurs throughout Gmelin's work, shows that the too prolific writer had but a very superficial knowledge of his subject, and did not study the book of nature."

Though these charges of the great French critic are quite true, yet Gmelin's book is acknowledged to possess a certain value, as being the only book which even professes to include all the objects of natural history described up to the year 1790. His other works are not entitled even to that humble praise.

Gmelin, *Johann Georg*, a distinguished German naturalist, was born Aug. 12, 1709, at Tübingen. Soon after graduating as M.D., at the early age of nineteen, he went to St Petersburg, where, in 1731, he was appointed professor of chemistry and natural history. He was afterwards sent by the Empress Anna, along with G. F. Müller and a scientific party, to explore Siberia, which he penetrated as far as the Lena. After an absence of nine years and a half, Gmelin returned to St Petersburg, and published his *Flora Sibirica*. On revisiting Germany in 1747 he was chosen professor of chemistry at Tübingen, where he died in 1755, not long after the publication of his *Reise durch Sibirien*, or, *Travels in Siberia*. Linnæus named a genus of Asiatic plants *Gmelina* in honour of him.

Gmelin, *Samuel Gottlieb*, nephew of the preceding, was born at Tübingen in 1745. Like his uncle, he graduated as M.D. at the age of nineteen, but instead of practising medicine, he devoted himself to natural science. In 1766 he went to St Petersburg, and obtained leave from Catherine II. to join a scientific expedition then on the point of setting out to explore the S.E. possessions of the Russian empire. Departing in June 1768, he wintered at Woronetz, and thence sailed down to Tcherkask, the capital of the Cossacks of the Don. In the following year he reached Astrakhan, and explored the lower part of the course of the Wolga. In 1770 he directed his chief attention to the Caspian Sea and those parts of Persia that bordered on it, and wintered at Enzelli. Next year, after visiting the southern shores of the Caspian and the Persian provinces of Ghilan and Mazanderan, he returned to Astrakhan, and wrote out the narrative of his travels. The year 1773 he devoted to the Caspian; and in 1774, when on his way back to Russia, he was seized by Usmey Khan, of the Kaitak tribe, as a hostage, and was so ill-used by that chief that he died, June 27, at Achmetschet in the Caucasus. Some of his papers, however, were recovered, and published under the editorial care of the famous Pallas. His principal works are his *Historia Fucorum iconibus illustrata*, St Petersburg, 1768, 4to; *Voyages dans différentes parties de l'Empire de Russie, pour faire des Recherches relatives à l'Histoire Naturelle*, St Petersburg, 1770, 1774, 1784, in four vols. 4to; several Memoirs in the Collections of the Society of Haarlem, and of the Academy of St Petersburg.

GMUND, a town of Würtemberg, circle of Jaxt, on the Rems, 28 miles E.N.E. of Stuttgart. It is surrounded by old walls, flanked with towers, and has three very ancient churches, a handsome town-hall, normal school, hospital, deaf-mute institution, a blind and an orphan asylum, &c. The chief manufactures are woollens, jewellery, and wooden wares. Pop. 6898.

GMÜNDEN, a town of Upper Austria, circle of Traun, at the northern extremity of the Traun or Gmünden Lake, where the river Traun issues from it, 36 miles S.W. of Linz, with which it is connected by railway. It is noted for the beauty of its situation; and in the vicinity are numerous salt-mines, which afford employment to the greater part of its inhabitants. Pop. 3300.

GNESEN, a town in the Prussian province of Posen, government of Bromberg, 32 miles E.N.E. of Posen. In early times the archbishop of Gnesen was primate of all Poland, and the kings were crowned here. The archbishop of Gnesen now resides at Posen. Besides the cathedral there are eight Roman Catholic churches, convents, ecclesiastical seminary, &c. A great horse and cattle market is held here annually. Pop. (1849) 7341.

GNOME (γνώμων, from γιγνώσκω, *I know*), a name given by writers of the cabalistic school to a certain class of imaginary beings supposed to inhabit the inner parts of the earth, and to be the guardians of mines, quarries, &c. The reader need hardly be reminded of the admirable use that Pope has made of the gnomes and sylphs in the *Rape of the Lock*. Darwin, also, in his *Botanic Garden*, has employed similar machinery.

GNOMON, the style of a dial; so called because it makes known, by its shadow, the hour of the day. See Dialling.

GNOSSUS, an ancient town of Crete. See Cnossus.

GNOSTICISM, a general name applied to various forms of speculative heresy in the early Church, from the Greek γνωστικος, a verbal derivative of γινώσκω, I learn. The term is now only used in this heretical sense; but in the early ecclesiastical writers it had also a favourable signification. A *Gnostic* did not then necessarily denote a heretic. The enlightened and philosophical Christian was also called by this name. The expression abounds in this latter use in the writings of Clemens Alexandrinus. In the seventh book of the *Stromata* of that father, the Gnostic is considered to be the true and perfect Christian.

Gnosticism, in its different heretical forms, sprung out of the mixture of Oriental and Hellenic elements of culture with Christianity towards the close of the first, and throughout the second century. In one and all of these forms it may be said to represent the systematic attempts made by the prevailing religious philosophies to understand Christianity, and adapt themselves to it. Refusing to accept it in its simple historical character, in its simple majesty of divine truth, and having with it in these respects no affinity, these philosophies could not yet help recognising in Christianity a sublime spiritual power of which they must give an account. They sought, therefore, to find, from their own point of view, a theosophic meaning in it, and to bring it into alliance with their own wild and fantastic schemes of cosmogony.

The fundamental questions with which Gnosticism concerned itself are the same which in all ages have agitated inquiry and baffled speculation, viz., the origin of life and the origin of evil. How life sprung from the Infinite Source? How a world so imperfect as this could proceed from a supremely perfect God? The Oriental notion of matter as utterly corrupt is found to pervade all Gnostical systems, and to give so far a common character to their speculations. It may be said to be the ground-principle of Gnosticism.

Setting out from this principle, all the Gnostics agree in regarding this world as not proceeding immediately from the Supreme Being. A vast gulf, on the contrary, is supposed to separate them. In the general mode in which they conceive this gulf to be occupied they also agree, although with considerable varieties of detail.

The Supreme Being is regarded as wholly inconceivable and indescribable—as the unfathomable Abyss (Valentinus)—the Unnameable (Basilides). From this transcendent source existence springs by emanation in a series of spiritual powers (δύναμεις). It is only through these several powers or energies that the Infinite passes into life and activity, and becomes capable of representation. To this higher spiritual world is given the name of πλήρωμα, and the divine powers composing it, in their ever-expanding procession from the Highest, are called Æons.

So far a common mode of representation characterizes all the Gnostical systems. All unite in this doctrine of a higher emanation-world. It is in the passage from this higher spiritual world to the lower material one, that a speculative distinction of an important character begins to characterize them. On the one hand, this passage is apprehended as a mere continued degeneracy from the Source of Life, at length terminating in the kingdom of darkness and death—the bordering chaos surrounding the kingdom of light. On the other hand, this passage is apprehended in a more precisely

Dualistic form, as a positive invasion of the kingdom of light by a self-existent kingdom of darkness. According as Gnosticism adopted one or other of these modes of explaining the existence of the present world, it fell into two great divisions, which, from their supposed origin, have received the respective names of the Alexandrian and Syrian Gnosis. The one obviously presents more a Western, the other more an Eastern type of speculation. The Dualistic element in the one case scarcely appears beneath the Pantheistic, and bears resemblance to the Platonic notion of the ὕλη—a mere blank necessity, a limiting void. In the other case, the Dualistic element is clear and prominent, corresponding to the Parsic doctrine of an active principle of evil as well as of good—of a kingdom of *Ahriman* as well as a kingdom of *Ormuzd*.

In the Alexandrian Gnosis a link of subordination is preserved between the two kingdoms, separated as they are. For the ὕλη only becomes a living and active power of evil through the quickening impartation of some element from the higher kingdom in its progressive descent from the supreme Source. The stream of being in its ever-outward flow at length comes in contact with dead matter, which thus receives animation, and becomes a living source of evil. Its life and power, however, are withal only derived from the higher kingdom. But in the Syrian Gnosis the kingdom of darkness has no such dependence upon the kingdom of light. There appears from the first a hostile principle of evil in collision with the good.

Out of this main distinction other more special distinctions arise, still more clearly defining the one form of γνῶσις from the other. According as the two kingdoms are recognised as subordinate the one to the other, or as opposed to each other, it is obvious that different views will prevail as to the character of the Δημιουργός, or maker of this world, whose name and functions are so prominent in all systems of Gnosticism. In the one case, his relation to the supreme Source of life will be apprehended as more dependent—in the other, as more hostile. In the former view, the γνῶσις, while rising in its pride of speculation far above all mere earthly relations and historical religions, could yet find in these a point of contact, whereby the higher spiritual truth, penetrating this lower world, would gradually raise it to its own elevation. In the latter, no such point of contact is left between nature, or history, and the γνῶσις. Accordingly, while the Alexandrian form of Gnosticism was found to embrace Judaism, as a truly divine institution, although very inferior and defective in its manifestation of the Divine character, the Syrian rejected it as being wholly the work of the spirit of the lower world—the Δημιουργός warring with the supreme God. This anti-Judaical spirit is found developed to its extreme in *Marcion*.

The Gnostic conception of Christ, in so far uniform, is also of course greatly modified by the different relations which the systems thus bore to Judaism. In all he is recognised as a higher Æon, proceeding from the kingdom of light for the redemption of this lower kingdom of darkness. But, in the one case, however superior, he is yet allied to the lower angels and the Δημιουργός, governing this lower world. His appearance, accordingly, admits of being historically connected with the previous manifestations of the Divine presence upon earth. But, in the other case, he is apprehended as a being wholly distinct from the Δημιουργός, and his appearance takes place in this lower world without any previous preparation, in order that he may draw to himself all kindred spiritual natures held in bondage by the Power of this lower world. If any point of connection is admitted in this latter case betwixt Christianity and the lower world, it is certainly not found in Judaism or any historical religion, but in the theosophic schools, where an esoteric knowledge of the Supreme was cultivated.

The rise of Gnosticism can be traced back even to the apostolical age. Simon the Samaritan appears to have been a Gnostic. He appears, in fact, not merely to have taught a kind of Gnosticism, but to have represented himself as an impersonation of the Divine. This is implied in the statement of the Acts of the Apostles (viii. 10), and is plainly asserted by Irenæus (*Adv. Hær.* i. 23, § 1) and Jerome. Cerinthus, according to well-known tradition, disputed with St John; and the opening chapter of the fourth gospel was probably directed against his false Gnostical conception of the doctrine of the Logos. He is regarded by Neander as forming the connecting link between the Judaising and the Gnostic sects. He taught that this world was created by an Æon proceeding from the supreme God, and that this Æon was to be considered as the special ruler of the Jewish people, and the being through whom the supreme God revealed himself to them. The divine character of the Mosaic economy was thus recognised, but in a subordinate degree. In order to complete it, and to raise those under it to the full knowledge of the truth, Christ came a second Æon from the Source of Light. This higher Æon became united with the man Jesus at his baptism, and abode with him till his last sufferings and death. The human being was simply the organ or vehicle of the Divine; and the former alone suffered, or could suffer—the notion of the true Christ suffering being altogether abhorrent to Gnosticism. This higher Æon or Christ, Cerinthus further taught, would again unite himself to the man Jesus, and establish a blessed millenium in Jerusalem. The mixture of purely Gnostic and Jewish conceptions throughout this scheme of Cerinthus is obvious at a glance.

It was only, however, in the course of the second century that Gnosticism became developed under a succession of able teachers into definite and elaborate systems. Throughout the whole of this century, and onward into the third, Gnosticism constituted a very powerful element of disturbance, and, to some extent, of advancing culture in the Christian Church. It appears to have exercised a living sway over some of the highest minds drawn to the truth. Whatever absurd opinions may have long prevailed as to the Gnostic teachers, these are now entirely exploded under the more impartial and more critical labours of modern historians; and, wild as we may still think their speculations, such men as Basilides and Valentinus stand out in the pages of Neander and Bunsen as truly noble and earnestly thoughtful men.

These two teachers are the most illustrious representatives of the Alexandrian or Hellenic Gnosticism. Basilides, probably born in Syria, taught in Alexandria about the year 125. He represented existence as springing from the infinite and unnameable Source (θεὸς ἀνονομαστος) in a sevenfold series of Æons, under the several names, Νοῦς, Λόγος, Φρόνησις, Σόφια, Δύναμις, Δικαιοσύνη, Εἰρήνη. These, with the unknown and inexpressible Original, constituted the first octave (πρώτη ογδόας) of existence. From this first kingdom of spirits (οὐρανός) emanated a second, and so on in unbroken gradation, each successive kingdom forming a less perfect expression of the original. This sevenfold emanation is supposed to have repeated itself no fewer than 365 times, so that the whole spirit-world or πληρωμα was represented by the days of the year. From this correspondence he applied the mystical name of ἀβραξάς or ἀβρασάξ (whose letters denote 365) to this completed manifestation of the Primal essence. Through the contact of the lowest range of this spirit-world with the bordering chaos, and especially through the operation of the Archon (ἄρχων) or chief angel of this lowest kingdom, arose the present world. The Archon is the immediate creator of men, and the spiritual ruler of the Jews. He is not evil, but only limited, and unable in his strife with dead matter to raise those under his rule to a true communion with the Divine.

To effect this, the highest Æon, the Νοῦς, descended to earth and united himself with the man Jesus at his baptism. The higher aims of the redeeming Æon are not opposed by the Archon when made known to him; and being successfully accomplished, he separates from the man Jesus before his crucifixion, and ascends again to his kingdom of light, into which he has provided an entrance for all kindred and purified natures. The followers of Basilides continued into the fourth century, and rendered themselves in certain cases particularly obnoxious by their impious indifference to the crucified One, and the slackness of their moral code.

The system of Valentinus is perhaps the most elaborate and ingenious of all the Gnostical systems. This teacher came from Alexandria to Rome about the year 140, and died in Cyprus about 160. The principles of life, or Æons, were conceived by him to proceed from the ineffable Source (Βυθός προπάτωρ) in pairs. In the evolution of the primal being, there is first of all the consciousness of himself (ἔννοια, σιγὴ). Thence spring, on the one hand, three male or formative Æons, respectively named Νοῦς, Λόγος, and Ἄνθρωπος, and three female or receptive Æons, respectively named Ἀλήθεια, Ζωή, Εκκλησία. From the Λόγος and the Ζωή there spring further ten Æons, and from the Ανθρωπος and Εκκλησία twelve, making in all thirty, which form together the πλήρωμα. They were all duly arranged according to their nature and power, each occupying its proper position to all the others; and this order and proportion (ὁροθεσία) it was which constituted the harmony of the πλήρωμα. But through the passionate desires of the last Æon, the Σοφία, to attain to the full knowledge of the Βυθός, which is only given to the Νοῦς, disturbance was introduced into the πλήρωμα. Out of the same undue desire of the Σοφία arose the Achamoth (ἡ καπ σοφία), an untimely being, who, wandering outside of the πλήρωμα, came in contact with the surrounding void or dead matter, and communicated life to it. Hence sprang various orders of existence, some more allied to the spiritual, others more allied to the material element. The Demiurge, who is the production of the Σοφία, and represents her, is the immediate former of this mixed world, according to the course of which the spiritual natures are to be evermore separated from the material, and restored to the higher kingdom of light. In the meantime there arose a restorer of the disturbed harmony of the πλήρωμα, a saviour, variously represented as the Νοῦς or highest Æon, the Λόγος, the Christ. His redeeming power is first exercised in the Achamoth, who, becoming united to him, inspires the Demiurge with the same exalted ideas, and thus prepares the way for the redemption of the lower world. This is effected by the manifestation of the σωτηρ in the man Jesus, the psychical Messiah, with whom, as usual, he becomes united at baptism.

The most illustrious disciples of the Valentinian Gnosticism, which prevailed on till the sixth century, were Ptolemæus, Heracleon, and Marcus. Each of these had of course their own peculiarities of system—such theosophic dreams admitting of endless confusion and diversity.

Carpocrates of Alexandria, with his son Epiphanes, stand in some degree by themselves. Their Gnosticism appears, upon the whole, to have been of a simple character, arising more directly out of a mixture of Platonic ideas with Christianity. The Divine Being they conceived as simple unity (μόνας). Hence proceeded a succession of spirits, or angels, by the lowest of whom the world was formed and governed. The spirit of man is confined in the body as in a prison, and it is the aim of the γνῶσις to liberate the spirit from this confinement, and to enable it to attain to a truly divine communion. Pythagoras, Plato, and Aristotle are all representatives of such a γνῶσις—of that mystical contemplative spirit, by which man frees himself from bondage to the Demiurgi, or rulers of this world. Jesus was merely the man in whom this spirit was developed in the highest degree. The mystical abstract views of the sect are said to have led to great laxity of social and moral principle.

Among the most singular of the Gnostic sects were the Ophites or serpent-worshippers, whom we may mention here, as considered by Neander, to form the connecting link between the Alexandrian and the Syrian Gnostics. Very different opinions, however, prevail as to their proper position in a classification of the Gnostic systems. Bunsen, founding on the lately-discovered treatise of Hippolytus, would trace their origin even to the apostolical age. According to their doctrine, so far as it seems possible to find any consistent meaning in it, life sprung from the Abyss in a threefold order of emanation, viz., *the first man*, *the second man*, or *Son of man*, and *the Holy Spirit*. The last gave birth, by means of the first two, to the perfect masculine or heavenly nature—*the Christ*, and the defective female Σοφία. From this latter, in her descending contact with the lifeless void, proceeds the Δημιουργός, Jaldabaoth, who is an evil spirit or demon, altogether hostile to the higher world. Jaldabaoth, by means of the living principle transmitted to him, calls into being six planet-spirits, and, through their agency, men. In man, however, there was also implanted some portion of a higher spirit, and of a longing after the higher order of things. It is the aim of Jaldabaoth to crush and destroy this better spirit in man; but the Σοφία, awakened to a renewed consciousness of her heavenly origin, watches over him, and never ceases to impart to him fresh supplies of the spiritual influence. His redemption is at length completed by the manifestation of the heavenly nature, or *Christ of the Æon-world*, in the man Jesus. In this mystical process of conflict and redemption there is also in the Ophitic system a further agent, under the name of Ὀφιόμορφος. The distinct function of this agent seems involved in confusion, but the etymology of the term suggests that it must have been, in such a sect, of an important character.

The chief representatives of the Syrian or Oriental Gnosticism are Saturninus, Tatian, and Bardesanes, although some have classed the latter as a follower of Valentinus. The general characteristic of this Gnosticism, as we found already, was the more definite development of the doctrine of Dualism. This was associated with a more rigid practical asceticism, and altogether with a deeper and more earnest moral spirit.

In the system of Saturninus, who lived at Antioch under the emperor Hadrian, the Æon-world proceeded from the original Source (Πατὴρ ἄγνωστος) in a successive development, much the same as that of the preceding systems; but opposed to this spiritual kingdom stood a living principle of evil (ὁ Σατανᾶς). The lowest stage of the emanation-world consists of seven planet-spirits, at whose head is the God of the Jewish. These, removed to a distance from the supreme Source of Light, create the present world and men, and strive to defend them from the power of the prince of darkness. This, however, in their weakness and distance, they are unable to do, when God himself infuses into man sparks of the true light, and especially sends down an Æon fully animated by this light to be their redeemer. It remains for man, through ascetic self-denial, particularly through abstinence from marriage and the eating of flesh, to separate themselves from all contamination of the evil principle, and render themselves capable of sharing in the higher kingdom.

Tatian was an Assyrian, and a disciple of Justin Martyr at Rome. He distinguished himself, while yet an adherent to the common doctrines of the Church, by a well-known discourse on behalf of Christianity, addressed to the Greeks. It was after his return to Syria, about the year 170, that he appears to have adopted Gnostic views, and to have become particularly remarkable for his ascetic abstinence from marriage and the use of flesh, and of wine even in the celebration of the Lord's Supper.

Bardesanes flourished towards the end of the second century, in Edessa. Although he seems clearly to have adopted certain Gnostical tenets, and especially that of the independent existence of the evil principle, he yet retained his connection with the church, and even acquired a high reputation in it as a learned and accomplished man—one of the first of those hymn writers to whom, reaching down to Ephraim Syrus in the fourth century, the Syrian Church owed so much.

In Marcion and his school, as we formerly observed, is to be seen the extreme development of the Syrian Gnosticism on that side on which it naturally stood opposed to Judaism. Excommunicated, as is commonly alleged, by his father, who was bishop of Sinope, Marcion attached himself to a Gnostic of Antioch, of the name of Cerdo, and founded with him a Gnostic school. He taught that there were three principles (ἀρχαι), viz. the Θεὸς αγαθός, the Δημιουργός δίκαιος, and the ὕλη, with its ruler Satan. The Demiurge is of course the creator of this world and men, and the special guardian of the Jews, to whom he gave the Mosaic law. This law, however, was quite ineffectual to deliver them from the evil principle, and guide them to moral purity; and for this purpose Christ descended to earth with the appearance of a body, and proclaimed to men the good God, hitherto unknown. The God of the Jews, or the Demiurge, opposed him in this redeeming mission, and thus it was that the opposition between Christianity and Judaism became sharpened on the system of Marcion. The cause of Christ, however, triumphed on his apparent death. All who have faith in him have power to rise above the thraldom of the Demiurge, and enter into communion with their Lord, the giver of a new pneumatic life. In conformity with the spirit of his whole system, Marcion rejected the Old Testament, and, of the New Testament, accepted only the gospel of St Luke and ten of the Pauline epistles, with corruptions, however, in both cases. In a work, bearing the title *Antitheses*, of which some fragments still exist, it was his aim to prove in detail the opposition between Judaism and Christianity.

Gnosticism survived throughout the third, and even into the fourth century, passing, in its Syrian type, into Manichæism. Its influence on the Church, irrational in many of its aspects as it may now seem, is by no means to be considered wholly detrimental. It served by its opposition to impart depth and comprehensiveness to Christian science, to destroy the narrow spirit of Judaism, and to awaken the Church to a more expansive consciousness of its true doctrine and strength. GOA, formerly a celebrated city of Western India, and the capital of the Portuguese settlements in the East Indies, but now fast becoming a mass of deserted ruins. Its original grandeur may, however, be distinctly traced in its decay; the streets are straight, the houses regularly and handsomely built of stone in the European style, many of them large and magnificent, though now no longer inhabited. Among the public buildings are many noble churches, exhibiting specimens of architecture superior to anything attempted by Europeans in other parts of India, particularly the church and convent of St Augustin. Pangaum, which has supplanted the old city, is now the residence of the viceroy and of the chief Portuguese inhabitants, and the seat of the supreme court of judicature. The new town is connected with Goa by a stone causeway about 300 yards long. From this bridge it extends towards the harbour, but the site of Pangaum is said to be low and sandy, and its buildings poor and wretched. Algoada Point, which is in E. Long. 73. 57. 15., N. Lat. 15. 28. 18., forms the northern extremity of Goa Bay. It has a lighthouse and small fort on it; but the principal fort is situated close to the east on the S.E. side of the headland, where there is a well of excellent water, from which the shipping are supplied. Nostra Senhora de la Cabo, a large monastery, of a white appearance, is situated on the summit of the bluff point of land, about two miles and a half S.E. of Algoada, which forms the S. side of the bay. The common anchorage is abreast of Algoada Fort, the flag-staff bearing about north at half a mile distance from the shore. The bar at the entrance of the river is about two miles to the eastward of Algoada Point, having sixteen or eighteen feet on it at high-water of spring-tides. The bottom is hard and rocky; and the channel so winding and intricate, that a ship ought not to enter the river without a pilot. After the early part of May, when it is considered unsafe to remain at the anchorage in the roads, the Portuguese send their large ships, which cannot run into the river, to Marmagon Roads, four or five miles to the southward of Algoada Fort, where they are sheltered from the S.W. monsoon by mooring close under the N.E. side of that peninsula. The colonial settlement at Goa seems now to be almost abandoned by the mother country, and the inhabitants scarcely retain the national language or manners. The trade has also greatly fallen off, and the people are impoverished, so that the best families are reduced to gain a scanty subsistence by working at lace or muslin. Not more than three ships arrive from Portugal in the course of the year, and these generally proceed to the British settlements to complete their cargoes for Europe. The trade from Goa to China is carried on by one or two ships in the year, which are called China ships. These carry to Surat, and the ports to the northward, Chinese and European goods, and returning with cotton and other articles, call at Goa to complete their cargoes for China. They commence their trade at the most southern settlement, which is Ajengo, and thence they proceed to Cochin, Calicut, Tellicherry, and Mangalore, and then to Goa; at these different places they take in pepper, cardamoms, cassia lignea, and other articles, which they resell at their northern settlements, and complete the voyage within the year. A coasting trade is carried on in small vessels with the different ports on the coast, whence they return to Goa with produce, which forms the home cargoes of their ships. With Macao and the British settlements an inconsiderable trade is carried on; the imports consisting principally of piece goods, raw silk, grain, sugar, woollens, and a few European articles; whilst the exports are piece goods, betel-nut, hemp, and other articles of trifling amount. But Goa "the golden" exists no longer. Goa—where the aged Da Gama closed his glorious life—where the immortal Camoens sung and suffered—is now one vast and grassy tomb. And it seems as if its thin and gloomy population of priests and friars were spared only to chant requiems for its departed souls. During the sixteenth century, when its prosperity was at its highest, the Jesuits introduced themselves and established the Holy Tribunal; the home government became unsettled; the Mahratta power rose rapidly; pestilence broke out in the city; and thus, all these misfortunes conspiring, the downfall of the city was very much accelerated. The Inquisition was abolished in 1812 at the solicitation of the British government. In 1800 it was a city of churches, which the wealth of the province had been exhausted in erecting. At Goa the ancient specimens of architecture far excel anything that has been attempted in modern times in any other part of the East, both in taste and grandeur.

Goa was taken from its Hindu rajahs of Bijanagur by the Bhamenee sovereigns of the Deccan. On the arrival of the Portuguese on the Malabar coast it was an opulent place, well fortified, and subject to Zabaim, a potent prince, from whom it was taken by the Portuguese general Albuquerque. It was retaken by the native prince, after which

Albuquerque, having received reinforcements, again succeeded in 1510 in making himself master of the city after a bloody assault. He improved its defences, and constituted it the capital of all his conquests; and it has ever since remained in possession of the Portuguese, who during the sixteenth century extended their conquests, and obtained possession of numerous places on the sea-coasts of India. In the course of these operations they were involved in hostilities with the Mahrattas; and advancing inland, laid siege to the town of Pondah. Here they were surrounded by a large Mahratta force, and effected their retreat with great difficulty and serious loss. Having formed an alliance with Aurungzebe, they succeeded in repulsing the Mahrattas, with whom they at length concluded a peace. In 1518 the Portuguese power in India was at its height, and from this period it began to decline. The territory of Goa now extends from Lat. 14. 54. to 15. 45., and from Long. 73. 45. to 74. 26.; it is sixty-two miles in length from N. to S., and 40 in its greatest breadth, and contains an area of 1066 square miles. The population has been returned at 313,262. Of this number two-thirds are stated to be Christians of the Roman Catholic persuasion; but these are not under the direct jurisdiction of the Church of Rome, the throne of Portugal claiming the right of appointing its own bishop, and assuming the control and direction of the Catholic Church in its Indian possessions. The military force of the state of Goa consists of 3300 fighting men, of whom about 400 are Europeans. The revenues are estimated at L.71,920, an amount stated to be annually exceeded by the expenditure. The chief products are rice, pepper, cocoanuts, betel-nut, and salt, which latter article is manufactured to a very large extent. Besides Goa the only remaining Portuguese possessions in India consist of the unimportant settlements of Diu and Demaun. Goa is distant S. from Bombay 250 miles.

GOALPARAH, a town of Hindustan, presidency of Bengal, and the chief place of the British district of the same name, is situated on the south shore of the Brahmapootra, near the frontier of Assam. The district of which this town is the capital contains an area of 3506 square miles, with a population of 400,000. The principal crops of the district are cotton, tobacco, and sugar. Mustard also is said to be extensively grown. This district formed a portion of Bengal in 1765, when the British government obtained a grant of the Dewanny from the emperor of Delhi. The town of Goalparah is in E. Long. 90. 32., N. Lat. 26. 8.

GOAT. See index to MAMMALIA.

GOAT ISLAND. See NIAGARA. This is also the name of the smallest of the Bashee Islands in the Eastern Archipelago, and of a small island in the Pacific, 3 miles S.W. of Juan Fernandez.

GOBELIN, the name applied to a very exquisite species of tapestry, in honour of Giles Gobelin, a celebrated French dyer in the reign of Francis I., and the discoverer of a method of dyeing a beautiful scarlet, which was named after him. His house in the suburb of St Marcel at Paris, and the rivulet he made use of, are still called the Gobelins. An academy for drawing, and a manufactory of fine tapestries, were established in this quarter by Colbert in 1666; and hence the tapestries made there received the name of *Gobelin.*

GOBI or SHAMO, an extensive tract of desert country in Central Asia. See ASIA.

GOCH, a walled town of Rhenish Prussia, government of Dusseldorf, and circle of Cleve, on the left bank of the Niers, 8 miles S. of Cleve. It has an old castle; several distilleries; manufactures of woollen, linen, cotton, and silk goods; and 3919 inhabitants.

GOD. See THEOLOGY.

GODALMING, a municipal borough and market-town of England, county of Surrey, in a valley on the right bank of the Wey, 32 miles S.W. of London. It consists principally of one street, nearly a mile in length, on the high road between London and Portsmouth. The chief public buildings are the parish church, an ancient cruciform edifice with a lofty steeple, and the town-hall, a neat modern building. It has manufactures of paper, leather, parchment, hosiery; and some trade in corn, malt, bark, timber, and hoops, by the Wey, which is navigable hence to the Thames. The town is governed by a mayor, four aldermen, and twelve councillors. Pop. (1851) 2218.

GODAVERY, a large river of India, which has its rise in the Western Ghauts, seventy miles to the N.E. of Bombay, and which, with a circuitous curve, flows nearly over the whole breadth of the peninsula in a S.E. direction. After traversing, from W. to E., the British district of Ahmednuggur and the dominions of the Nizam or ruler of Hyderabad, receiving in its course the waters of the Doodna, the Manjara, the Manair, and the Wein Gunga, it crosses the Nizam's frontier into the British district of Rajahmundry through a deep chasm in the Eastern Ghauts, and entering the low tract which appears to have been formed from its alluvial deposits, it separates near the town of Rajahmundry into two principal channels, one of which falls into the Bay of Bengal a few miles south of the town of Coringa, and the other a little below Narsipore, forming between them the island of Nagur, comprehending 500 square miles, and which, being intersected by various ramifications from these rivers, includes several tide-harbours for vessels of moderate burden, and is highly fertile and productive. Ingeram, Coringa, Yanaon, and Narsipore are among the places situated at the mouth of this river, which appears to be the most considerable stream that rises between the Ganges and Cape Comorin. Its whole course may be estimated at nearly 800 miles, having, owing to the peculiar configuration of the Indian peninsula, which rises to its height much nearer the western than the eastern shore, nearly traversed the country from sea to sea. During the rainy season the Godavery rolls a prodigious volume of water towards the ocean, which being economized by means of a dam or annicut thrown across the river at the head of the delta, supplies to the rich alluvial soil the means of constant irrigation during the dry season. The value of this river as an instrument of communication, for commercial and military purposes, has been frequently urged upon the attention of the ruling authorities, and measures for the improvement of its navigation have at length been sanctioned; in many places it is more than a mile in breadth. During the dry season its bed consists in many places of an expanse of sand, the river being divided into numerous shallow streams. Extensive forests of teak trees line the shores of the river until it emerges from the Ghaut Mountains.

GODFATHERS and GODMOTHERS, persons who, at the baptism of infants, answer for their future conduct, and solemnly promise for them that they will renounce the devil and all his works, and follow a life of piety and virtue; and thus bind themselves to see that they be properly instructed in the duties of religion. This custom, which is of great antiquity in the Christian Church, was probably instituted to prevent children being brought up in idolatry in case their parents died before they arrived at years of discretion. The number of godfathers and godmothers is reduced to two in the Church of Rome, and three in the Church of England; but formerly there was no limit to the number.

GODFREY OF BOUILLON, Prince of Lorraine, and first Christian king of Jerusalem, was born in 1061 at Bézy, near Nivelle; died at Jerusalem, June 18, 1100. For the details of his life see CHIVALRY, and CRUSADES. (See also Gibbon, *Decline and Fall*, chap. lviii.; Michaud's *Histoire des Croisades*, &c., &c.)

Godmanchester
||
Godwin.

GODMANCHESTER, a municipal borough of England, county of Huntingdon, on the River Ouse. It is included within the parliamentary limits of Huntingdon, of which it forms a suburb, being only three-quarters of a mile S.S.E. It has a handsome church in the later English style, and a free grammar-school. Pop. (1851) 2337.

GODOLPHIN, Sydney, Earl of Godolphin, was a cadet of an ancient Saxon family of Cornwall. It is not known with certainty in what year he was born, but it was probably about 1640. He began his political career at an early age under Charles II., and was one of those who voted for the exclusion of the Duke of York from the throne in 1680. When that prince, however, became king on his brother's death, Godolphin was still continued in office, though in a subordinate situation at the treasury-board, of which during Charles's latter days he had been the head. On the accession of William of Orange, Godolphin took office under his government; and shortly after Queen Anne came to the throne, in 1702, he was made lord-high-treasurer, being the first person who had held that office since the Restoration. In 1706 Godolphin was created Viscount Rialton and Earl of Godolphin, and from this time is considered to have deserted his original party, and attached himself openly to the Whigs. In the struggle between him and Harley for the premiership, Godolphin was at first successful, but not being able to counterwork the intrigues of his rival he was suddenly and rudely expelled from office in 1710. He survived his loss of power for about two years, and died Sept. 15, 1712.

The character of Godolphin has been very variously estimated, and, indeed, presents such strange contradictions as to be scarcely intelligible. In manner he was cold and calm, and, as Tindal says, as modest and silent a man as ever was bred at a court. He had a faculty for despatching business thoroughly and rapidly, and such a command of temper that he had few or no personal enemies. He had also a real pride in his work, and sought always to have it done so that it would not require to be done again. Accordingly he was careful in the choice of his instruments, and was generally happy in searching out able men, who were at the same time men of integrity, to aid him in his undertakings. Of personal vanity he does not seem to have had much; and he was utterly inaccessible to a bribe —a somewhat rare virtue in those days. As a set-off against these good qualities, it must be stated that Godolphin was one of the keenest gamblers and horse-racers of his day, and that his intimates were often persons notable either as gamesters or jockeys. He was never charged, however, with any of the mal-practices which are supposed to be inseparable from a love of the dice-box and the turf. He used to say that he played merely because it delivered him from talking; but the great stain on the character of Godolphin is his treasonable correspondence with James, while he was for several years first lord of the treasury to William, and in the full confidence of his master. (Dalrymple's *Memoirs of Great Britain and Ireland;* Fox's *History of the Early Part of the Reign of James II.;* T. B. Macaulay's *History of England*, &c.)

GODWIN, Francis, son of Dr Godwin, bishop of Bath and Weils, was born at Havington, Northamptonshire, in 1561. After passing through the usual course of grammar-school instruction, he was sent to Christ Church College, Oxford, where he took his degree of bachelor in 1580, and that of master of arts in 1583. About this time he wrote an amusing piece on a philosophical subject, which he never published, but which appeared about five years after his death, under the title of *The Man in the Moon, or a discourse of a Voyage thither*, by Domingo Gonzalez, 1638, in 8vo. This satirical production, which displays considerable fancy and even genius, seems to have afforded to Swift several hints of which he availed himself in his

Godwin.

voyage to Laputa; and, what is still more remarkable, it shows the author to have been acquainted with the Copernican system. He also suppressed another piece, entitled *Nuncius Inanimatus*, or the *Inanimate Messenger*, intended to communicate various methods for conveying intelligence secretly, speedily, and safely; a production which appears to have been the prototype of Bishop Wilkin's *Mercury, or Secret and Swift Messenger*. It was published, however, in 1657, and afterwards translated by Dr Thomas Smith. Some time after he had taken his degree, Godwin entered into holy orders, and soon became rector of Samford-Orcais in Somersetshire, a prebendary in the church of Wilts, and canon-residentiary, also vicar of Weston-in-Zoyland, in the same county. Having turned his attention to the subject of British antiquities, he became acquainted with Camden, whom he accompanied in a journey through Wales in 1590, in search of curiosities; but, although he took great pleasure in these inquiries, he at length confined himself entirely to ecclesiastical history and antiquities. He was created bachelor of divinity in 1593, and doctor in 1595, when, having resigned the vicarage of Weston, he was appointed rector of Bishop's-Lidiard in the same county.

In 1601 he published his *Catalogue of the Bishops of England*, since the first planting of the Christian religion in this island—a work in which he embodied his collections in ecclesiastical biography, and which, through the intercession of Lord Buckhurst, to whom he acted as chaplain, procured him the bishopric of Llandaff. In 1615 he published another edition, with numerous alterations and additions; but this having been very erroneously printed, owing to the author's distance from the press, he recast the whole in an elegant Latin dress, and the year after sent it abroad to be printed. This last edition was dedicated to the king, who, in return, conferred upon him the bishopric of Hereford, to which he was translated in 1617. The work was afterwards reprinted, in the year 1743, with a continuation by Dr Richardson, the whole being in one volume folio, with a portrait of Godwin, and other embellishments. In 1616 he published, in Latin, *Rerum Anglicarum Henrico VIII., etc. regnantibus*, which was translated and published by his son, under the title of *Annals of England*, containing the reigns of Henry VIII., Edward VI., and Queen Mary, in folio. His last publication was a *Computation of the Value of the Roman Sesterce and Attic Talent*, which appeared in the year 1630.

After this he fell into a languishing disorder, which cut him off in April 1633. (J. B—E.)

GODWIN, *William*, an English author of great versatility, original power, and unwearied application, was the son of a dissenting minister, and was born at Wisbeach, Cambridge, March 3, 1756. He was educated for his father's profession, and afterwards officiated for four years as pastor of a congregation at Stowmarket in Suffolk. Many of the English dissenting ministers were at this time zealous political reformers. They felt the Test and Corporation Acts to be badges of persecution, and naturally wished to abate somewhat of the power of the High-church clergy and rural aristocracy, by whom they were regarded with suspicion and dislike. Godwin participated in these sentiments, but went much further than most of his brethren. He aimed at the complete overthrow of all existing institutions, political, social, and religious. An intellectual republic was the dream of his youthful ambition; and to promote its anticipated advent he resigned his clerical charge, repaired to London, and set about the work of regeneration with his pen, which at all times he valued as highly as ever monarch did his sceptre. This was in 1782, and the same year Godwin commenced his career as author by publishing a series of six sermons entitled *Sketches of History*. He wrote largely in the *Annual Register* and other periodicals, and associated with Horne Tooke, Holcroft, Thelwall, and others who, from their political doctrines and activity, were obnoxious to men in power. Godwin, however, was no platform agitator. He was the mildest of enthusiastic philosophers, and had no talent or inclination for public life. In 1793 appeared his greatest work on political science, *The Inquiry concerning Political Justice, and its Influence on*

General Virtue and Happiness. Though now rarely met with, this work was read with great avidity, and exercised no small influence in shaping the opinions and aspirations of many young men of genius, who were captivated with the author's argument for universal benevolence as the immediate motive of our actions, and the true basis on which to found society. The French Revolution had then run to its wildest excesses, and appeared rather as a beacon to warn off political adventurers than a light to steer by; but Godwin conceived that he could build upon the ruins of monarchy a glorious fabric of equal rights and happiness for all mankind. Still further to illustrate his peculiar views, and show the evils of our artificial system, he wrote and published next year his political novel of *Things as they are, or the Adventures of Caleb Williams*, which, with the other tales of Godwin, will be found noticed under the head of ROMANCE. The political object of Caleb Williams was overlooked by the mass of readers in the strong interest of the story, and in the author's vivid description of incidents and character. It is a work of great genius, and was the most popular of all Godwin's productions. His next important effort to propagate his opinions was in the form of a series of essays entitled the *Inquirer*, which appeared in 1796. A more remarkable exemplification of his views on social questions was afforded by his *Memoirs of the Author of the Rights of Woman.* This was the once celebrated Mary Wollstonecraft, whom Godwin had married, though neither approved of the "slavery" of wedlock The details and principles laid bare in this memoir shocked even Godwin's philosophical admirers. He had gone too far for English feeling, however modified by political sentiments; and though his own equanimity was probably never for a moment disturbed by the comments his work provoked, his position, both as a literary man and a citizen, was lowered by the publication. His next appearance was in the field of fiction. His *St Leon*, a tale of the sixteenth century, was published in 1799; and though the subject was avowedly of the miraculous class (his hero being invested with the fabulous powers of alchymy and the *elixir vitæ*, by which he commands all riches, and can renew his youth), the work contains many splendid and pathetic descriptions. The utter desolation of St Leon, who survives all the objects of his affection, and longs for dissolution notwithstanding his supernatural endowments, is one of the most powerful and harrowing pictures in the whole region of romance. The other works of Godwin during his long literary life were, *Antonio*, a tragedy, produced in 1801; a *Life of Chaucer*, in two quarto volumes—filled, of course, by a vast amount of episodical description and illustration—published in 1803; *Fleetwood*, a novel, 1805; *Faulkner*, a tragedy, 1807; an *Essay on Sepulchres*, 1809; *Lives of Edward and John Philips*, the nephews of Milton, 1815; *Mandeville*, a tale of the times of Cromwell, 1817; a *History of the Commonwealth*, in four volumes, published at intervals between 1824 and 1828; *Cloudesley*, a novel, 1830; and *Lives of the Necromancers*, 1834. Many other short and anonymous works proceeded from his ever-busy hand. For some years Godwin carried on business as a bookseller under the name of Edward Baldwin, and ushered into the world a number of small educational works. Into such humble usefulness had subsided the daring and sanguine speculatist, who was to overturn thrones, and regenerate the civilized world! Misfortune seems to have fallen upon him about the year 1816, as at that time we find Byron concurring with Mackintosh and Rogers as to some measures for his relief. In his latter years the government of Earl Grey conferred upon Mr Godwin a small office known as "Yeoman Usher of the Exchequer," to which were attached apartments in Palace Yard; and there the veteran author died, April 7, 1836, having completed his eightieth year. From the glimpses of Godwin's familiar life afforded by Charles Lamb, Hazlitt, and other associates, he appears to have been an easy complacent man, esteeming literature above all pursuits and distinctions, and enjoying his game of whist in the evenings with a few select and congenial friends. His latter works are distinguished by great elegance of style. Details are worked up with brilliancy and effect in his essays and novels; though in the delineation of passion he is often exaggerated and unnatural. His *History of the Commonwealth* disappointed the public. The subject was one that seemed peculiarly suited to his genius and research, but he taxed himself to be rigidly accurate and impartial; and in the process, he had neglected the animation and colouring necessary to give life and interest to his narrative. The work, however, is a valuable repository of facts. The theory of political optimism by which Godwin was first distinguished was successfully answered by Malthus and Dr Parr. It has been fairly refuted on philosophical principles. In excluding the particular affections, he deprives us, as Sydney Smith has remarked, of our most powerful means of promoting his own principle of universal good:—"For it is as much as to say that all the crew ought to have the *general* welfare of the ship so much at heart that no sailor should pull any *particular* rope, or hand any *individual* sail." A theory which runs counter to the natural feelings, habits, and business of mankind, can only be considered as one of the refinements of sophistry, put forth at a time of peculiar excitement and speculation. It is in the regions of fiction that Godwin earned his lasting and most distinctive laurels. As a general writer on so many classes of subjects, he is well entitled to honourable mention, but in romance only is he original and striking. His political theories and elaborate essays are already left behind in the onward progress of society in practical government and knowledge. A work of genius, however, such as *Caleb Williams* or *St Leon*, which appeals to the heart and imagination, and evinces the skill of the master, can never become uninteresting. (R. C—S.)

GODWIN, *Mary Wollstonecraft*, an English authoress of the last century, celebrated for her literary talents, her opinions, and her misfortunes. She was born in 1759, either in the environs of London, or at Loddon in Norfolk, where it is known that her father was in practice as a surgeon and apothecary not long after her birth. In 1768 she accompanied her father to Beverley in Yorkshire, where the only education she got was that afforded by the humble day-schools of the town. This was of itself sufficient to disgust her with the life she was obliged to lead; and her unhappiness was embittered by the cruel treatment of her father, who was a man of ill-regulated mind and ungovernable temper. "Mary Wollstonecraft was not formed," says the author of *Caleb Williams* in the memoir of his wife, "to be the unresisting and contented subject of a despot; but I have heard her remark more than once, that when she felt she had done wrong, the reproof or chastisement of her mother, instead of being a terror to her, she found to be the only thing capable of reconciling her to herself. The blows of her father, on the contrary, which were the mere ebullitions of a passionate temper, instead of humbling her, roused her indignation." She resolved to provide for herself; and on the death of her mother, went to live as a companion with a lady in Bath. In 1783, along with two of her sisters and a friend, she opened a school, first at Islington and afterwards at Newington Green. She was succeeding well in a very congenial sphere, when the news reached her of the serious illness of her attached friend at Lisbon, whom she instantly set off to nurse in her dying moments. On her return she found her school ruined by mismanagement, and was obliged to enter as governess the family of Lord Kingsborough. She had already made herself favourably known as an authoress by a little work *On the Education of*

Daughters, published in 1786. The success of this work tempted her to London to seek a livelihood there by her pen. During three or four years she was able not only to maintain herself but to educate two younger sisters, and prop up the fortunes of the family, which the imprudence of her father now threatened to involve in ruin. She contributed largely to the periodical press, and translated Lavater's *Physiognomy*, Salzman's *Elements of Morality*, and other works. In 1791 she emerged all at once into a publicity that was at once fame and notoriety by publishing an answer to Burke's *Reflections on the French Revolution*, and her still more noted *Vindication of the Rights of Woman*. In the latter work she maintains, as might be inferred from its title, that woman is called by nature to share with man the lofty functions which he has arrogated exclusively to himself; that man has no other superiority over the weaker sex than that of physical strength; and that it is only through the devotedness of her love that woman has fallen into that degradation in which the authoress believes her now to be. In 1792 she passed over into France, with the idea, as she expressed it, "of losing in the bosom of the public happiness the idea of her private misfortunes." Her hopes were cruelly deceived; for she had the misfortune to see nearly all the leading Girondists, among whom she had chosen her personal friends, perish on the scaffold. A still more bitter cup remained for her to drink in the French capital. An American, by name Imlay, had gained her affections, and seducing her under a promise of marriage, had failed to fulfil his vow. She had no sooner given birth to a child than she made two attempts on her life, which were both luckily unsuccessful. But her delicate sensibilities had sustained a shock which it required all her fierce energy of character to endure. In the interval between these two attempts on her life she wrote her *Letters on Norway*, which country she had visited during her stay at Paris. These letters amply attest the unimpaired strength of her intellect. In 1796 she became acquainted with the author of *Caleb Williams*, with whom she cohabited for some months before being formally married to him. Mrs Godwin had only completed her 38th year when she died in childbed, Sept. 10, 1797. Her posthumous works were published by her husband in the following year, with an interesting and touching memoir of her life.

GOES, or TER-GOES, a fortified town of Holland, province of Zealand, on the island of South Beveland. It has a harbour formed by a short canal communicating with the Scheldt, and carries on an active trade in corn, salt, hops, &c. Shipbuilding is also carried on, but the manufactures are unimportant. Pop. (1850) 5296.

GOETHE, JOHN WOLFGANG VON, a man of commanding influence in the literature of modern Germany throughout the latter half of his long life, and possessing two separate claims upon our notice; one in right of his own unquestionable talents; and another much stronger, though less direct, arising out of his position, and the extravagant partisanship put forward on his behalf for the last forty years. The literary body in all countries, and for reasons which rest upon a sounder basis than that of private jealousies, have always been disposed to a republican simplicity in all that regards the assumption of rank and personal pretensions. *Valeat quantum valere potest*, is the form of license to every man's ambition, coupled with its caution: let his influence and authority be commensurate with his attested value: and, because no man in the present infinity of human speculation, and the present multiformity of human power, can hope for more than a very limited superiority, there is an end at once to all *absolute* dictatorship. The dictatorship in any case could be only *relative*, and in relation to a single department of art or knowledge; and this for a reason stronger even than that already noticed, viz. the vast extent of the field on which the intellect is now summoned to employ itself. That objection, as it applies only to the *degree* of the difficulty, might be met by a corresponding degree of mental energy; such a thing may be supposed, at least. But another difficulty there is, of a profounder character, which cannot be so easily parried: those who have reflected at all upon the fine arts, know that power of one kind is often inconsistent, positively incompatible, with power of another kind. For example, the *dramatic* mind is incompatible with the *epic*. And though we should consent to suppose that some intellect might arise endowed upon a scale of such angelic comprehensiveness as to vibrate equally and indifferently towards either pole, still it is next to impossible, in the exercise and culture of the two powers, but some bias must arise which would give that advantage to the one over the other which the right arm has over the left. But the supposition, the very case put, is baseless, and countenanced by no precedent. Yet, under this previous difficulty, and with regard to a literature convulsed, if any ever was, by an almost total anarchy, it is a fact notorious to all who take an interest in Germany and its concerns, that Goethe did in one way or other, through the length and breadth of that vast country, establish a supremacy of influence wholly unexampled; a supremacy indeed perilous in a less honourable man, to those whom he might chance to hate, and with regard to himself thus far unfortunate, that it conferred upon every work proceeding from his pen a sort of papal indulgence, an immunity from criticism, or even from the appeals of good sense, such as it is not wholesome that any man should enjoy. Yet we repeat that German literature was and is in a condition of total anarchy: with this solitary exception, no name, even in the most narrow section of knowledge or of power, has ever been able in that country to challenge unconditional reverence; whereas, with us and in France, name the science, name the art, and we will name the dominant professor; a difference which partly arises out of the fact that England and France are governed in their opinions by two or three capital cities, whilst Germany looks for its leadership to as many cities as there are *residenzen* and universities: for instance, the little territory with which Goethe was connected presented no less than two such public lights; Weimar, the *residenz* or privileged abode of the Grand Duke, and Jena, the university founded by that house. Partly, however, this difference may be due to the greater restlessness, and to the greater energy as respects mere speculation, of the German mind. But no matter whence arising, or how interpreted, the fact is what we have described: absolute confusion, the "anarch old" of Milton, is the one deity whose sceptre is there paramount; and yet *there* it was, in that very realm of chaos, that Goethe built his throne. That he must have looked with trepidation and perplexity upon his wild empire and its "dark foundations," may be supposed. The tenure was uncertain to *him* as regarded its duration; to us it is equally uncertain, and in fact mysterious, as regards its origin. Meantime the mere fact, contrasted with the general tendencies of the German literary world, is sufficient to justify a notice, somewhat circumstantial, of the man in whose favour, whether naturally by force of genius, or by accident concurring with intrigue, so unexampled a result was effected.

Goethe was born at noonday on the 28th of August 1749, in his father's house at Frankfort on the Maine. The circumstances of his birth were thus far remarkable, that, unless Goethe's vanity deceived him, they led to a happy revolution hitherto retarded by female delicacy falsely directed. From some error of the midwife who attended his mother, the infant Goethe appeared to be still born. Sons there were as yet none from this marriage; everybody was therefore interested in the child's life; and the panic which arose in consequence, having survived its immediate occasion, was improved into a public resolution (for which no doubt society stood ready at that moment) to found some course of public instruction from this time forward for those who undertook professionally the critical duties of accoucheur.

We have noticed the house in which Goethe was born, as well as the city. Both were remarkable, and fitted to leave lasting impressions upon a young person of sensibility. As to the city, its antiquity is not merely venerable, but almost mysterious; towers were at that time to be found in the mouldering lines of its earliest defences, which belonged to the age of Charlemagne, or one still earlier; battlements adapted to a mode of warfare anterior even to that of feudalism or romance. The customs, usages, and local privileges of Frankfort, and the rural districts adjacent, were of a corresponding character. Festivals were annually celebrated at a short distance from the walls, which had descended from a dateless antiquity. Every thing which met the eye spoke the language of elder ages; whilst the river on which the place was seated, its great fair, which still held the rank of the greatest in Christendom, and its connection with the throne of Cæsar and his inauguration, by giving to Frankfort an interest and a public character in the eyes of all Germany, had the effect of countersigning, as it were, by state authority, the importance which she otherwise challenged to her ancestral distinctions. Fit house for such a city, and in due keeping with the general scenery, was that of Goethe's father. It had in fact been composed out of two contiguous houses; that accident had made it spacious and rambling in its plan; whilst a further irregularity had grown out of the original difference in point of level between the corresponding stories of the two houses, making it necessary to connect the rooms of the same *suite* by short flights of steps. Some of these features were no doubt removed by the recast of the house under the name of "repairs" (to evade a city bye-law), afterwards executed by his father; but such was the house of Goethe's infancy, and in all other circumstances of style and furnishing equally antique.

The spirit of society in Frankfort, without a court, a university, or a learned body of any extent, or a resident nobility in its neighbourhood, could not be expected to display any very high standard of polish. Yet, on the other hand, as an independent city, governed by its own separate laws and tribunals (that privilege of *autonomy* so dearly valued by ancient Greece) and possessing besides a resident corps of jurisprudents and of agents in various ranks for managing the interests of the German emperor and other princes, Frankfort had the means within herself of giving a liberal tone to the pursuits of her superior citizens, and of co-operating in no inconsiderable degree with the general movement of the times, political or intellectual. The memoirs of Goethe himself, and in particular the picture there given of his own family, as well as other contemporary glimpses of German domestic society in those days, are sufficient to show that much knowledge, much true cultivation of mind, much sound refinement of taste, were then distributed through the middle classes of German society; meaning by that very indeterminate expression those classes which for Frankfort composed the aristocracy, viz. all who had daily leisure, and regular funds for employing it to advantage. It is not necessary to add, because that is a fact applicable to all stages of society, that Frankfort presented many and various specimens of original talent, moving upon all directions of human speculation.

Yet, with this general allowance made for the capacities of the place, it is too evident that, for the most part, they lay inert and undeveloped. In many respects Frankfort resembled an English cathedral city, according to the standard of such places seventy years ago, not, that is to say, like Carlisle in this day, where a considerable manufacture exists, but like Chester as it is yet. The chapter of a cathedral, the resident ecclesiastics attached to the duties of so large an establishment, men always well educated, and generally having families, compose the original *nucleus*, around which soon gathers all that part of the local gentry who, for any purpose, whether of education for their children, or of social enjoyment for themselves, seek the advantages of a town. Hither resort all the timid old ladies who wish for conversation, or other forms of social amusement; hither resort the valetudinarians, male or female, by way of commanding superior medical advice at a cost not absolutely ruinous to themselves; and multitudes besides, with narrow incomes, to whom these quiet retreats are so many cities of refuge.

Such, in one view, they really are; and yet in another they have a vicious constitution. Cathedral cities in England, imperial cities without manufactures in Germany, are all in an improgressive condition. The public employments of every class in such places continue the same from generation to generation. The amount of superior families oscillates rather than changes; that is, it fluctuates within fixed limits: and, for all inferior families, being composed either of shopkeepers or of menial servants, they are determined by the number, or, which, on a large average, is the same, by the pecuniary power, of their employers. Hence it arises, that room is made for one man, in whatever line of dependence, only by the death of another; and the constant increments of the population are carried off into other cities. Not less is the difference of such cities as regards the standard of manners: how striking is the soft and urbane tone of the lower orders in a cathedral city, or in a watering place dependent upon ladies, contrasted with the bold, often insolent, demeanour of a self-dependent artisan or mutinous mechanic of Manchester and Glasgow.

Children, however, are interested in the state of society around them chiefly as it affects their parents. Those of Goethe were respectable, and perhaps tolerably representative of the general condition in their own rank. An English authoress of great talent, in her *Characteristics of Goethe*, has too much countenanced the notion that he owed his intellectual advantages exclusively to his mother. Of this there is no proof. His mother wins more esteem from the reader of this day, because she was a cheerful woman, of serene temper, brought into advantageous comparison with a husband much older than herself, whom circumstances had rendered moody, fitful, sometimes capricious, and confessedly obstinate in that degree which Pope has taught us to think connected with inveterate error:

> Stiff in opinion, always in the wrong,

unhappily presents an association too often actually occurring in nature, to leave much chance for error in presuming either quality from the other. And, in fact, Goethe's father was so uniformly obstinate in pressing his own views upon all who belonged to him, whenever he did come forward in an attitude of activity, that his family had much reason to be thankful for the rarity of such displays. Fortunately for them, his indolence neutralized his obstinacy. And the worst shape in which his troublesome temper showed itself, was in what concerned the religious reading of the family. Once begun, the worst book as well as the best, the longest no less than the shortest, was to be stedfastly read through to the last word of the last volume; no excess of yawning availed to obtain a reprieve, not, adds his son, though he were himself the leader of the yawners. As an illustration, he mentions Bowyer's *History of the Popes;* which awful series of records, the catacombs, as it were, in the palace of history, were actually traversed from one end to the other of the endless *suite* by the unfortunate house of Goethe. Allowing, however, for the father's unamiableness in this one point, upon all intellectual ground both parents seem to have met very much upon a level. Two illustrations may suffice, one of which occurred during the infancy of Goethe. The science of education was at that time making its first rude motions towards an ampler development; and, amongst other reforms then floating in the general mind, was one for eradicating the childish fear of ghosts, &c. The young Goethes, as it happened, slept not in separate beds only, but in separate rooms; and not unfrequently the poor children, under the stinging terrors of their lonely situation, stole away from their "forms," to speak in the hunter's phrase, and sought to rejoin each other. But in these attempts they were liable to surprises from the enemy; papa and mamma were both on the alert, and often intercepted the young deserter by a cross march or an ambuscade; in which cases each had a separate policy for enforcing obedience. The father, upon his general system of "perseverance," compelled the fugitive back to his quarters, and, in effect, exhorted him to persist in being frightened out of his wits. To his wife's gentle heart that course appeared cruel, and she reclaimed the delinquent by bribes; the peaches which her garden walls produced being the fund from which she chiefly drew her supplies for this branch of the secret service. What were her winter bribes, when the long nights would seem to lie heaviest on the exchequer, is not said. Speaking seriously, no man of sense can suppose that a course of suffering from terrors the most awful, under whatever influence supported, whether under the naked force of compulsion, or of *that* connected with bribes, could have any final effect in mitigating the passion of awe, connected, by our very dreams, with the shadowy and the invisible, or in tranquillizing the infantine imagination.

A second illustration involves a great moral event in the history of Goethe, as it was, in fact, the first occasion of his receiving impressions at war with his religious creed. Piety is so beautiful an ornament of the youthful mind, doubt or distrust so unnatural a growth from confiding innocence, that an infant freethinker is heard of not so much with disgust as with perplexity. A sense of the ludicrous is apt to intermingle; and we lose our natural horror of the result in wonder at its origin. Yet in this instance there is no room for doubt; the fact and the occasion are both on record; there can be no question about the date; and, finally, the accuser is no other than the accused. Goethe's own pen it is which proclaims, that already, in the early part of his seventh year, his reliance upon God as a moral governor had suffered a violent shock, was shaken, if not undermined. On the 1st of November 1755 occurred the great earthquake at Lisbon. Upon a double account, this event occupied the thoughts of all Europe for an unusual term of time; both as an expression upon a larger scale than usual of the mysterious physical agency concerned in earthquakes, and also for the awful human tragedy[1] which attended either the earthquake itself, or its immediate sequel in the sudden irruption of the Tagus. Sixty thousand persons, victims to the dark power in its first or its second *avatar*, attested the Titanic scale upon which it worked. Here it was that the shallow piety of the Germans found a stumbling-block. Those who have read any circumstantial history of the physical signs which preceded this earthquake, are aware that in England and Northern Germany many singular phenomena were observed, more or less manifestly connected with the same dark agency which terminated at Lisbon, and running before this final catastrophe at times so accurately varying with the distances, as to furnish something like a scale for measuring the velocity with which it moved. These German phenomena, circulated rapidly over all Germany by the journals of every class, had seemed to give to the Germans a nearer and more domestic interest in the great event, than belonged to them merely in their universal character of humanity. It is also well known to observers of national characteristics, that amongst the Germans the household charities, the *pieties of the hearth*, as they may be called, exist, if not really in greater strength, yet with much less of the usual balances or restraints. A German father, for example, is like the grandfather of other nations; and thus a piety, which in its own nature scarcely seems liable to excess, takes, in its external aspect, too often an air of effeminate imbecility. These two considerations are necessary to explain the intensity with which this Lisbon tragedy laid hold of the German mind, and chiefly under the one single aspect of its *undistinguishing* fury. Women, children, old men—these, doubtless, had been largely involved in the perishing sixty thousand; and that reflection, it would seem from Goethe's account, had so far embittered the sympathy of the Germans with their distant Portuguese brethren, that, in the Frankfort discussions, sullen murmurs had gradually ripened into bold impeachments of Providence. There can be no gloomier form of infidelity than that which questions the moral attributes of the Great Being in whose hands are the final destinies of us all. Such, however, was the form of Goethe's earliest scepticism, such its origin; caught up from the very echoes which rang through the streets of Frankfort when the subject occupied all men's minds: and such, for any thing that appears, continued to be its form thenceforwards to the close of his life, if speculations so crude could be said to have any form at all. Many are the analogies, some close ones, between England aud Germany with regard to the circle of changes they have run through, political or social, for a century back. The challenges are frequent to a comparison; and sometimes the result would be to the advantage of Germany, more often to ours. But in religious philosophy, which in reality is the true *popular* philosophy, how vast is the superiority on the side of this country. Not a shopkeeper or mechanic, we may venture to say, but would have felt this obvious truth, that surely the Lisbon earthquake yielded no fresh lesson, no peculiar moral, beyond what belonged to every man's experience in every age. A passage in the New Testament about the fall of the tower of Siloam, and the just construction of that event, had already anticipated the difficulty, if such it could be thought. Not to mention, that calamities upon the same scale in the earliest age of Christianity, the fall of the amphitheatre at Fidenæ, or the destruction of Pompeii, had presented the same problem as the Lisbon earthquake. Nay, it is presented daily in the humblest individual case, where wrong is triumphant over right, or innocence confounded with guilt in one common disaster. And that the parents of Goethe should have authorized his error, if only by their silence, argues a degree of ignorance in them which could not have co-existed with much superior knowledge in the public mind.

Goethe, in his Memoirs (book vi.), commends his father for the zeal with which he superintended the education of his children. But apparently it was a zeal without knowledge. Many things were taught imperfectly, but all casually, and as chance suggested them. Italian was studied a little, because the elder Goethe had made an Italian tour, and had collected some Italian books, and engravings by Italian masters. Hebrew was studied a little, because Goethe the son had a fancy for it, partly with a view to theology, and partly because there was a Jewish quarter, gloomy and sequestrated, in the city of Frankfort. French offered itself no doubt on many suggestions, but originally on occasion of a French theatre, supported by the staff of the French army when quartered in the same city. Latin was gathered in a random way from a daily sense of its necessity. English upon the temptation of a stranger's advertisement, promising upon moderate terms to teach that language in four weeks; a proof, by the way, that the system of bold innovations in the art of tuition had already commenced. Riding and fencing were also attempted under masters apparently not very highly qualified, and in the same desultory style of application. Dancing was taught to his family, strange as it may seem, by Mr Goethe himself. There is good reason to believe that not one of all these accomplishments was possessed by Goethe, when ready to visit the university, in a degree which made it practically of any use to him. Drawing and music were pursued confessedly as amusements; and it would be difficult to mention any attainment whatsoever which Goethe had carried to a point of excellence in the years which he spent under his father's care, unless it were his mastery over the common artifices of metre and the common topics of rhetoric, which fitted him for writing what are called occasional poems and *impromptus*. This talent he possessed in a remarkable degree, and at an early age; but he owed its cultivation entirely to himself.

---

[1] Of this no picture can ever hope to rival that hasty one sketched in the letter of the chaplain to the Lisbon factory. The plague of Athens as painted by Thucydides or Lucretius, nay even the fabulous plague of London by De Foe, contain no scenes or situations equal in effect to some in this plain historic statement. Nay, it would perhaps be difficult to produce a passage from Ezekiel, from Æschylus, or from Shakspeare, which would so profoundly startle the sense of sublimity as one or two of his incidents.

In a city so orderly as Frankfort, and in a station privileged from all the common hardships of poverty, it can hardly be expected that many incidents should arise, of much separate importance in themselves, to break the monotony of life; and the mind of Goethe was not contemplative enough to create a value for common occurrences through any peculiar impressions which he had derived from them. In the years 1763 and 1764, when he must have been from fourteen to fifteen years old, Goethe witnessed the inauguration and coronation of a king of the Romans, a solemn spectacle connected by prescription with the city of Frankfort. He describes it circumstantially, but with very little feeling, in his Memoirs. Probably the prevailing sentiment, on looking back at least to this transitory splendour of dress, processions, and ceremonial forms, was one of cynical contempt. But this he could not express, as a person closely connected with a German court, without giving much and various offence. It is with some timidity even that he hazards a criticism upon single parts of the costume adopted by some of the actors in that gorgeous scene. White silk stockings, and pumps of the common form, he objects to as out of harmony with the antique and heraldic aspects of the general costume, and ventures to suggest either boots or sandals as an improvement. Had Goethe felt himself at liberty from all restraints of private consideration in composing these Memoirs, can it be doubted that he would have taken his retrospect of this Frankfort inauguration from a different station; from the station of that stern revolution which, within his own time, and partly under his own eyes, had shattered the whole imperial system of thrones, in whose equipage this gay pageant made so principal a figure, had humbled Cæsar himself to the dust, and left him an emperor without an empire. We at least, for our parts, could not read without some emotion one little incident of these gorgeous scenes recorded by Goethe, namely, that when the emperor, on rejoining his wife for a few moments, held up to her notice his own hands and arms arrayed in the antique habiliments of Charlemagne, Maria Theresa—she whose children were summoned to so sad a share in the coming changes—gave way to sudden bursts of loud laughter, audible to the whole populace below her. That laugh on surveying the departing pomps of Charlemagne, must, in any contemplative ear, have rung with a sound of deep significance, and with something of the same effect which belongs to a figure of death introduced by a painter, as mixing in the festal dances of a bridal assembly.

These pageants of 1763–64 occupy a considerable space in Goethe's Memoirs, and with some *logical* propriety at least, in consideration of their being exclusively attached to Frankfort, and connected by manifold links of person and office with the privileged character of the city. Perhaps he might feel a sort of narrow local patriotism in recalling these scenes to public notice by description, at a time when they had been irretrievably extinguished as realities. But, after making every allowance for their local value to a Frankfort family, and for their memorable splendour, we may venture to suppose that by far the most impressive remembrances which had gathered about the boyhood of Goethe, were those which pointed to Frederick of Prussia. This singular man, so imbecile as a pretender to philosophy and new lights, so truly heroic under misfortunes, was the first German who created a German interest, and gave a transient unity to the German name, under all its multiplied divisions. Were it only for this conquest of difficulties so peculiar, he would deserve his German designation of Fred. the Unique (*Fritz der einzige*). He had been partially tried and known previously; but it was the Seven Years' War which made him the popular idol. This began in 1756; and to Frankfort, in a very peculiar way, that war brought dissensions and heart-burnings in its train. The imperial connections of the city with many public and private interests, pledged it to the anti-Prussian cause. It happened also that the truly German character of the reigning imperial family, the domestic habits of the empress and her young daughters, and other circumstances, were of a nature to endear the ties of policy: self-interest and affection pointed in the same direction. And yet were all these considerations allowed to melt away before the brilliant qualities of one man, and the romantic enthusiasm kindled by his victories. Frankfort was divided within herself; the young and the generous were all dedicated to Frederick: a smaller party, more cautious and prudent, were for the imperialists. Families were divided upon this question against families, and often against themselves; feuds, begun in private, issued often into public violence; and, according to Goethe's own illustration, the streets were vexed by daily brawls, as hot and as personal as of old between the Capulets and Montagues.

These dissensions, however, were pursued with not much personal risk to any of the Goethes, until a French army passed the Rhine as allies of the imperialists. One corps of this force took up their quarters in Frankfort; and the Comte Thorane, who held a high appointment on the staff, settled himself for a long period of time in the spacious mansion of Goethe's father. This officer, whom his place made responsible for the discipline of the army in relation to the citizens, was naturally by temper disposed to moderation and forbearance. He was indeed a favourable specimen of French military officers under the old system; well bred, not arrogant, well informed, and a friend of the fine arts. For painting, in particular, he professed great regard and some knowledge. The Goethes were able to forward his views amongst German artists; whilst, on the other hand, they were pleased to have thus an opportunity of directing his patronage towards some of their own needy connections. In this exchange of good offices, the two parties were for some time able to maintain a fair appearance of reciprocal good will. This on the comte's side, if not particularly warm, was probably sincere; but in Goethe the father it was a masque for inveterate dislike. A natural ground of this existed in the original relations between them. Under whatever disguise or pretext, the Frenchman was in fact a military intruder: he occupied the best suit of rooms in the house, used the furniture as his own; and, though upon private motives he abstained from doing all the injury which his situation authorized (so as in particular to have spread his fine military maps upon the floor rather than disfigure the decorated walls by nails), still he claimed credit, if not services of requital, for all such instances of forbearance. Here were grievances enough; but, in addition to these, the comte's official appointments drew upon him a weight of daily business, which kept the house in a continual uproar. Farewell to the quiet of a literary amateur, and the orderliness of a German household. Finally, the comte was a Frenchman. These were too many assaults upon one man's patience. It will be readily understood, therefore, how it happened, that, whilst Goethe's gentle-minded mother, with her flock of children, continued to be on the best terms with Comte Thorane, the master of the house kept moodily aloof, and retreated from all intercourse.

Goethe, in his own Memoir, enters into large details upon this subject; and from him we shall borrow the *denouement* of the tale. A crisis had for some time been lowering over the French affairs in Frankfort; things seemed ripening for a battle; and at last it came. Flight, siege, bombardment, possibly a storm, all danced before the eyes of the terrified citizens. Fortunately, however, the battle took place at the distance of four or five miles from Frankfort. Monsieur le Comte was absent, of course, on the field of battle. His unwilling host thought that on such an occasion he also might go out in quality of spectator; and with this purpose he connected another, worthy of a Parson Adams. It is his son who tells the story, whose filial duty was not proof against his sense of the ludicrous. The old gentleman's hatred of the French had by this time brought him over to his son's admiration of the Prussian hero. Not doubting for an instant that victory would follow that standard, he resolved on this day to offer in person his congratulations to the Prussian army, whom he already viewed as his liberator from a domestic nuisance. So purposing, he made his way cautiously to the suburbs; from the suburbs, still listening at each advance, he went forward to the country; totally forgetting, as his son insists, that, however completely beaten, the French army must still occupy some situation or other between himself and his German deliverer. Coming, however, at length to a heath, he found some of those marauders usually to be met with in the rear of armies, prowling about, and at intervals amusing themselves with shooting at a mark. For want of a better, it seemed not improbable that a large German head might answer their purpose: certain signs admonished him of this, and the old gentleman crept back to Frankfort. Not many hours after came back also the comte, by no means creeping, however; on the contrary, crowing with all his might for a victory which he averred himself to have won. There had in fact been an affair, but on no very great scale, and with no distinguished results. Some prisoners, however, he brought, together with some wounded; and naturally he expected all well disposed persons to make their compliments of congratulation upon his triumph. Of this duty poor Mrs Goethe and her children cheerfully acquitted themselves that same night; and Monsieur le Comte was so well pleased with the sound opinions of the little Goethes, that he sent them in return a collection of sweetmeats and fruits. All promised to go well; intentions, after all, are not acts; and there certainly is not, nor ever was, any treason in taking a morning's walk. But, as ill luck would have it, just as Mr Goethe was passing the comte's door, out came the comte in person, purely by accident, as we are told; but we suspect that the surly old German, either under his morning hopes or his evening disappointments, had talked with more frankness than prudence. "Good evening to you, Herr Goethe," said the comte; "you are come, I see, to pay your tribute of congratulation. Somewhat of the latest, to be sure; but no matter." "By no means," replied the German; "by no means; *mit nichten*. Heartily I wished, the whole day long, that you and your cursed gang might all go to the devil together." Here was plain speaking, at least. The Comte Thorane could no longer complain of dissimulation. His first movement was to order an arrest; and the official interpreter of the French army took to himself the whole credit that he did not carry it into effect. Goethe takes the trouble to report a dialogue, of length and dulness absolutely incredible, between this interpreter and the comte. No such dialogue, we may be assured, ever took place. Goethe may, however, be right in supposing that, amongst a foreign soldiery, irritated by the pointed contrasts between the Frankfort treatment of their own wounded, and of their prisoners who happened to be in the same circumstances, and under a military council not held to any rigorous responsibility, his father might have found no very favourable consideration of his case. It is well, therefore, that after some struggle the comte's better nature triumphed. He suffered Mrs Goethe's merits to outweigh her husband's delinquency; countermanded the order for arrest, and, during the remainder of their connection, kept at such a distance from his moody host as was equally desirable for both. Fortunately that remainder was not very long. Comte Thorane was soon displaced; and the whole army was soon afterwards withdrawn from Frankfort.

In his fifteenth year Goethe was entangled in some connection with young people of inferior rank, amongst whom was Margaret, a young girl about two years older than himself, and the object of his first love. The whole affair, as told by Goethe, is somewhat mysterious. What might be the final views of the elder parties it is difficult to say; but Goethe assures us that they used his services only in writing an occasional epithalamium, the pecuniary acknowledgment for which was spent jovially in a general banquet. The magistrates, however, interfered, and endeavoured to extort a confession from Goethe: he, as the son of a respectable family, was to be pardoned; the others to be punished. No confession, however, could be extorted; and for his own part he declares that, beyond the offence of forming a clandestine connection, he had nothing to confess. The affair terminated, as regarded himself, in a severe illness. Of the others we hear no more.

The next event of importance in Goethe's life was his removal to college. His own wishes pointed to Göttingen, but his father preferred Leipsic. Thither accordingly he went, but he carried his obedience no farther. Declining the study of jurisprudence, he attached himself to general literature. Subsequently he removed to the university of Strasburg; but in neither place could it be said that he pursued any regular course of study. His health suffered at times during this period of his life; at first from an affection of the chest, caused by an accident on his first journey to Leipsic; the carriage had stuck fast in the muddy roads, and Goethe exerted himself too much in assisting to extricate the wheels. A second illness connected with the digestive organs brought him into considerable danger.

After his return to Frankfort, Goethe commenced his career as an author. In 1773, and the following year, he made his maiden essay in *Goetz of Berlichingen*, a drama (the translation of which, remarkably enough, was destined to be the literary *coup d'essai* of Sir Walter Scott), and in the far-famed *Werther*. The first of these was pirated; and in consequence the author found some difficulty in paying for the paper of the genuine edition, which part of the expense, by his contract with the publisher, fell upon himself. The general and early popularity of the second work is well known. Yet, except in so far as it might spread his name abroad, it cannot be supposed to have had much influence in attracting that potent patronage which now began to determine the course of his future life. So much we collect from the account which Goethe himself has left us of this affair in its earliest stages.

"I was sitting alone in my room," says he, "at my father's house in Frankfort, when a gentleman entered, whom at first I took for Frederick Jacobi, but soon discovered by the dubious light to be a stranger. He had a military air; and announcing himself by the name of Von Knebel, gave me to understand in a short explanation, that being in the Prussian service, he had connected himself, during a long residence at Berlin and Potsdam, with the literati of those places; but that at present he held the appointment from the court of Weimar of travelling tutor to the Prince Constantine. This I heard with pleasure; for many of our friends had brought us the most interesting accounts from Weimar, in particular that the Duchess Amelia, mother of the young grand duke and his brother, summoned to her assistance in educating her sons the most distinguished men in Germany; and that the university of Jena co-operated powerfully in all her liberal plans. I was aware also that Wieland was in high favour; and that the German Mercury (a literary journal of eminence) was itself highly creditable to the city of Jena, from which it issued. A beautiful and well-conducted theatre had besides, as I knew, been lately established at Weimar. This, it was true, had been destroyed; but that event, under common circumstances so likely to be fatal as respected the present, had served only to call forth the general expression of confidence in the young prince as a restorer and upholder of all great interests, and true to his purposes under any calamity." Thinking thus, and thus prepossessed in favour of Weimar, it was natural that Goethe should be eager to see the prince. Nothing was easier. It happened that he and his brother Constantine were at this moment in Frankfort, and Von Knebel willingly offered to present Goethe. No sooner said than done; they repaired to the hotel, where they found the illustrious travellers, with Count Goertz, the tutor of the elder.

Upon this occasion an accident, rather than any previous reputation of Goethe, was probably the determining occasion which led to his favour with the future sovereign of Weimar. A new book lay upon the table; that none of the strangers had read it, Goethe inferred from observing that the leaves were as yet uncut. It was a work of Moser (*Patriotische Phantasien*); and, being political rather than literary in its topics, it presented to Goethe, previously acquainted with its outline, an opportunity for conversing with the prince upon subjects nearest to his heart, and of showing that he was not himself a mere studious recluse. The opportunity was not lost; the prince and his tutor were much interested, and perhaps a little surprised. Such subjects have the further advantage, according to Goethe's own illustration, that, like the Arabian thousand and one nights, as conducted by the Sultana Scheherezade, "never ending, still beginning," they rarely come to any absolute close, but so interweave one into another, as still to leave behind a large arrear of interest. In order to pursue the conversation, Goethe was invited to meet them soon after at Mentz. He kept the appointment punctually; made himself even more agreeable; and finally received a formal invitation to enter the service of this excellent prince, who was now beginning to collect around him all those persons who have since made Weimar so distinguished a name in connection with the German literature. With some opposition from his father, who held up the rupture between Voltaire and Frederick of Prussia as a precedent applying to all possible connections of princes and literati, Goethe accepted the invitation; and henceforwards, for upwards of fifty-five years, his fortunes were bound up with those of the ducal house of Weimar.

The noble part which that house played in the great modern drama of German politics is well known, and would have been better known had its power been greater. But the moral value of its sacrifices and its risks is not the less. Had greater potentates shown equal firmness, Germany would not have been laid at the feet of Napoleon. In 1806 the grand duke was aware of the peril which awaited the allies of Prussia; but neither his heart nor his conscience would allow of his deserting a friend in whose army he held a principal command. The decisive battle took place in his own territory, and not far from his own palace and city of Weimar. Personally he was with the Prussian army; but his excellent consort stayed in the palace to encourage her subjects, and as far as possible to conciliate the enemy by her presence. The fortune of that great day, the 14th of October 1806, was decided early; and the awful event was announced by a hot retreat and a murderous pursuit through the streets of the town. In the evening Napoleon arrived in person; and now came the trying moment. "The duchess," says an Englishman well acquainted with Weimar and its court, "placed herself on the top of the staircase to greet him with the formality of a courtly reception. Napoleon started when he beheld her, *Qui êtes vous?* he exclaimed with characteristic abruptness. *Je suis la Duchesse de Weimar. Je vous plains*, he retorted fiercely, *J'écraserai votre mari;* he then added, 'I shall dine in my apartment,' and rushed by her. The night was spent on the part of the soldiery in all the horrid excesses of rapine. In the morning the duchess sent to inquire concerning the health of his majesty the emperor, and to solicit an audience. He, who had now benefited by his dreams, or by his reflections, returned a gracious answer, and invited himself to breakfast with her in her apartment." In the conversation which ensued, Napoleon asked her if her husband were mad, upon which she justified the duke by appealing to his own magnanimity, asking in her turn if his majesty would have approved of his deserting the king of Prussia at the moment when he was attacked by so potent a monarch as himself. The rest of the conversation was in the same spirit, uniting with a sufficient concession to the circumstances of the moment a dignified vindication of a high-minded policy. Napoleon was deeply impressed with respect for her, and loudly expressed it. For her sake, indeed, he even affected to pardon her husband, thus making a merit with her of the necessity which he felt, from other motives, for showing forbearance towards a family so nearly allied to that of St Petersburg. In 1813 the grand duke was found at his post in that great gathering of the nations which took place on the stupendous fields of Leipsic, and was complimented by the allied sovereigns as one of the most faithful amongst the faithful to the great cause, yet undecided, of national independence.

With respect to Goethe, as a councillor so near the duke's person, it may be supposed that his presence was never wanting where it promised to be useful. In the earlier campaigns of the duke, Goethe was his companion; but in the final contest with Napoleon he was unequal to the fatigues of such a post. In all the functions of peace, however, he continued to be a useful servant to the last, though long released from all official duties. Each had indeed most honourably earned the gratitude of the other. Goethe had surrendered the flower of his years and the best energies of his mind to the service of his serene master. On the other hand, that master had to him been at once his Augustus and his Mæcenas; such is his own expression. Under him he had founded a family, raised an estate, obtained titles and decorations from various courts; and in the very vigour of his life he had been allowed to retire, with all the honours of long service, to the sanctuary of his own study, and to the cultivation of his leisure, as the very highest mode in which he could further the public interest.

The life of Goethe was so quiet and so uniform after the year 1775, when he may first be said to have entered into active life, by taking service with the Duke of Weimar, that a biographer will find hardly any event to notice, except two journeys to Italy, and one campaign in 1792, until he draws near the close of his long career. It cannot interest an English reader to see the dates of his successive appointments. It is enough to know that they soon raised him to as high a station as was consistent with literary leisure; and that he had from the beginning enjoyed the unlimited confidence of his sovereign. Nothing remained, in fact, for the subject to desire which the prince had not previously volunteered. In 1825, they were able to look back upon a course of uninterrupted friendship, maintained through good and evil fortunes unexampled in their agitation and interest for fifty years. The duke commemorated this remarkable event by a jubilee, and by a medal in honour of Goethe. Full of years and honour, this eminent man might now begin to think of his departure. However, his serenity continued unbroken nearly for two years more, when his illustrious patron died. That shock was the first which put his fortitude to trial. In 1830 others followed; the duchess, who had won so much admiration from Napoleon, died; then followed his own son; and there remained little now to connect his wishes with the earth. The family of his patron he had lived to see flourishing in his descendants to the fourth generation. His own grandchildren were prosperous and happy. His intellectual labours were now accomplished. All that remained to wish for was a gentle dismission. This he found in the spring of 1832. After a six days' illness, which caused him no apparent suffering, on the morning of the 22d of March he breathed away as if into a gentle sleep, surrounded by his daughter-in-law and her children. Never was a death more in harmony with the life it closed; both had the same character of deep and absolute serenity.

Such is the outline of Goethe's life, traced through its principal events. But as these events, after all, borrow their interest mainly from the consideration allowed to Goethe as an author, and as a model in the German literature, —*that* being the centre about which all secondary feelings of interest in the man must finally revolve,—it thus becomes a duty to throw a glance over his principal works. Dismissing his songs, to which has been ascribed by some critics a very high value for their variety and their lyrical enthusiasm; dismissing also a large body of short miscellaneous poems, suited to the occasional circumstances in which they arose; we may throw the capital works of Goethe into two classes, philosophic novels, and dramas. The novels, which we call *philosophic* by way of expressing their main characteristic in being written to serve a preconceived purpose, or to embody some peculiar views of life, or some aspects of philosophic truth, are three, viz. the *Werther's Leiden;* secondly, the *Wilhelm Meister;* and, lastly, the *Wahlver-wandschaften.* The first two exist in English translations; and though the *Werther* had the disadvantage of coming to us through a French version, already, perhaps, somewhat coloured and distorted to meet the Parisian standards of sentiment, yet, as respects Goethe and his reputation amongst us, this wrong has been redressed, or compensated at least, by the good fortune of his *Wilhelm Meister,* in falling into the hands of a translator whose original genius qualified him for sympathizing even to excess with any real merits in that work. This novel is in its own nature and purpose sufficiently obscure; and the commentaries which have been written upon it by the Humboldts, Schlegels, &c. make the enigma still more enigmatical. We shall not venture abroad upon an ocean of discussion so truly dark, and at the same time so illimitable. Whether it be qualified to excite any deep and *sincere* feeling of one kind or another in the German mind,—in a mind trained under German discipline,—this we will consent to waive as a question not immediately interesting to ourselves. Enough that it has not gained, and will not gain, any attention in this country; and this not only because it is thoroughly deficient in all points of attraction to readers formed upon our English literature, but because in some capital circumstances it is absolutely repulsive. We do not wish to offend the admirers of Goethe; but the simplicity of truth will not allow us to conceal, that in various points of description or illustration, and sometimes in the very outline of the story, the *Wilhelm Meister* is at open war, not with decorum and good taste merely, but with moral purity and the dignity of human nature. As a novelist, Goethe and his reputation are problems, and likely to continue such, to the countrymen of Mrs Inchbald, Miss Harriet Lee, Miss Edgeworth, and Sir Walter Scott. To the dramatic works of Goethe we are disposed to pay more homage; but neither in the absolute amount of our homage at all professing to approach his public admirers, nor to distribute the proportions of this homage amongst his several performances according to the graduations of *their* scale. The *Iphigenie* is built upon the old subject of Iphigenia in Tauris, as treated by Euripides and other Grecian dramatists; and, if we are to believe a Schlegel, it is in beauty and effect a mere echo or reverberation from the finest strains of the old Grecian music. That it is somewhat nearer to the Greek model than a play after the fashion of Racine, we grant. Setting aside such faithful transcripts from the antique as the Samson Agonistes, we might consent to view Goethe as that one amongst the moderns who had made the closest approximation to the Greek stage: *Proximus,* we might say, with Quintilian, but with him we must add, “*sed longo intervallo;* and if in the second rank, yet nearer to the third than to the first. Two other dramas, the *Clavigo* and the *Egmont,* fall below the *Iphigenie* by the very character of their pretensions; the first as too openly renouncing the grandeurs of the ideal; the second as confessedly violating the historic truth of character, without temptation to do so, and without any consequent indemnification. The *Tasso* has been supposed to realize an Italian beauty of genial warmth and of sunny repose; but from the common defect of German criticism—the absence of all sufficient illustrations—it is as difficult to understand the true nature and constituents of the supposed Italian standard set up for the regulation of our judgments, as it is to measure the degree of approach made to that standard in this particular work. *Eugenie* is celebrated for the artificial burnish of the style, but otherwise has been little relished. It has the beauty of marble sculpture, say the critics of Goethe, but also the coldness. We are not often disposed to quarrel with these critics as *below* the truth in their praises; in this instance we are. The *Eugenie* is a fragment, or (as Goethe himself called it in conversation) a *torso,* being only the first drama in a trilogy or series of three dramas, each having a separate plot, whilst all are parts of a more general and comprehensive plan. It may be charged with languor in the movement of the action, and with excess of illustration. Thus, *e. g.* the grief of the prince for the supposed death of his daughter, is the monotonous topic which occupies one entire act. But the situations, though not those of *scenical* distress, are so far from being unexciting, that, on the contrary, they are too powerfully afflicting.

The lustre of all these performances, however, is eclipsed by the unrivalled celebrity amongst German critics of the *Faust.* Upon this it is better to say nothing than too little. How trifling an advance has been made towards clearing the ground for any sane criticism, may be understood from this fact, that as yet no two people have agreed about the meaning of any separate scene, or about the drift of the whole. Neither is this explained by saying, that until towards the close of Goethe's life the *Faust* was a fragment; for no additional light was thrown upon the main question by the publication of the second part.

One work there is of Goethe's which falls into neither of the classes here noticed; we mean the *Hermann and Dorothea,* a narrative poem, in hexameter verse. This appears to have given more pleasure to readers not critical, than any other work of its author; and it is remarkable that it traverses humbler ground, as respects both its subject, its characters, and its scenery. From this, and other indications of the same kind, we are disposed to infer that Goethe mistook his destination; that his aspiring nature misled him; and that his success would have been greater had he confined himself to the *real* in domestic life, without raising his eyes to the *ideal.*

We must also mention, that Goethe threw out some novel speculations in physical science, and particularly in physiology, in the doctrine of colours, and in comparative anatomy, which have divided the opinions of critics even more than any of those questions which have arisen upon points more directly connected with his avowed character of poet.

It now remains to say a few words by way of summing up his pretensions as a man, and his intellectual power in the age to which he belonged. His rank and value as a moral being are so plain as to be legible to him who runs. Everybody must feel that his temperament and constitutional tendency was of that happy quality, the animal so nicely balanced with the intellectual, that with any ordinary measure of prosperity he could not be otherwise than a good man. He speaks himself of his own "virtue," *sans phrase;* and we tax him with no vanity in doing so. As a young man even at the universities, which at that time were barbarously sensual in Germany, he was (for so much we collect from his own Memoirs) eminently capable of self-restraint. He preserves a tone of gravity, of sincerity, of respect for female dignity, which we never find associated with the levity and recklessness of vice. We feel throughout, the presence of one who, in respecting others, respects himself; and the cheerfulness of the presiding tone persuades us at once that the narrator is in a healthy moral condition, fears no ill, and is conscious of having meditated none. Yet at the same time we cannot disguise from ourselves that the moral temperament of Goethe was one which demanded prosperity: had he been called to face great afflictions, singular temptations, or a billowy and agitated course of life, our belief is that his nature would have been found unequal to the strife; he would have repeated the mixed and moody character of his father. Sunny prosperity was essential to his nature; his virtues were adapted to that condition. And happily that was his fate. He had no personal misfortunes; his path was joyous in this life; and even the reflex sorrow from the calamities of his friends did not press too heavily on his sympathies; none of these were in excess either as to degree or duration.

In this estimate of Goethe as a moral being, few people will differ with us, unless it were the religious bigot. And to him we must concede thus much, that Goethe was not that religious creature which by nature he was intended to become. This is to be regretted: Goethe was naturally pious, and reverential towards higher natures; and it was in the mere levity or wantonness of youthful power, partly also through that early false bias growing out of the Lisbon earthquake, that he falsified his original destination. Do we mean, then, that a childish error could permanently master his understanding? Not so; *that* would have been corrected with his growing strength. But having once arisen, it must for a long time have moulded his feelings; *until* corrected, it must have impressed a corresponding false bias upon his practical way of viewing things; and that sort of false bias, once established, might long survive a mere error of the understanding. One thing is undeniable. Goethe had so far corrupted and clouded his natural mind, that he did not look up to God, or the system of things beyond the grave, with the interest of reverence and awe, but with the interest of curiosity.

Goethe, however, in a moral estimate, will be viewed pretty uniformly. But Goethe intellectually, Goethe as a power acting upon the age in which he lived, that is another question. Let us put a case; suppose that Goethe's death had occurred many years ago, say in the year 1785, what would have been the general impression? Would Europe have felt a shock? Would Europe have been sensible even of the event? Not at all: it would have been obscurely noticed in the newspapers of Germany, as the death of a novelist who had produced some effect about ten years before. In 1832, it was announced by the post-horns of all Europe as the death of him who had written the *Wilhelm Meister,* the *Iphigenie,* and the *Faust,* and who had been enthroned by some of his admirers on the same seat with Homer and Shakspeare, as composing what they termed the *trinity of men of genius.* And yet it is a fact, that, in the opinion of some amongst the acknowledged leaders of our own literature for the last twenty-five years, the *Werther* was superior to all which followed it, and for mere power was the paramount work of Goethe. For ourselves, we must acknowledge our assent upon the whole to this verdict; and at the same time we will avow our belief that the reputation of Goethe must decline for the next generation or two, until it reaches its just level. Three causes, we are persuaded, have concurred to push it so far beyond the proportion of real and genuine interest attached to his works. *First,* his extraordinary age; for the last twenty years Goethe had been the patriarch of the German literature: *secondly,* the splendour of his official rank at the court of Weimar; he was the minister and private friend of the patriot sovereign among the princes of Germany: *thirdly,* the quantity of enigmatical and unintelligible writing which he has designedly thrown into his latter works, by way of keeping up a system of discussion and strife upon his own meaning amongst the critics of his country. These disputes, had his meaning been of any value in his own eyes, he would naturally have settled by a few authoritative words from himself; but it was his policy to keep alive the feud in a case where it was of importance that his name should continue to agitate the world, but of none at all that he should be rightly interpreted. (T. DE Q.)

(Consult especially the original and profound views of Goethe's life and writings in Carlyle's *Miscellanies.* An admirable paper on Goethe in *Passing Thoughts,* by James Douglas, Esq. of Cavers, is one of the most eloquent and appreciative dissertations on his religious and philosophical opinions that has yet appeared. In Germany have recently appeared *Goethe's Leben,* von Heinrich Viehoff, 4 vols. 1847–1853; and *Goethe's Leben,* von J. W. Schäfer, 1851, Consult also *Goethe and his contemporaries,* by Mrs Austin; and Mr Oxenford's translation of *Eckermann's Conversations.* A complete and valuable biography of Goethe, with sketches of his age and contemporaries, has just (1855) appeared, by G. H. Lewes, in 2 vols. 8vo.)

GOG (גּוֹג) occurs in Ezek. xxxviii. 3, 14, and xxxix. 11, as a proper name.

Interpreters have given very different explanations of the terms Gog and Magog; but they have generally understood them as symbolical expressions for the heathen nations of Asia, or more particularly for the Scythians, a vague knowledge of whom seems to have reached the Jews in Palestine. Thus Josephus[1] has dropped the Hebrew word *Magog*, and rendered it by Σκύθαι: and so does Jerome; while Suidas renders it by Πέρσαι—a difference which matters but little in the main question, since Σκύθαι, in the ancient authors, is but a collective name for the northern but partially-known tribes;[2] and, indeed, as such a collective name, *Magog* seems also to indicate in the Hebrew the tribes about the Caucasian mountains.[3] Bochart[4] supports the opinion of Josephus, though by but very precarious etymologies. According to Reinegge some of the Caucasian people call their mountains *Gog*, and the highest northern points *Magog*.

GOGGRAH, a large river of Hindustan, the remotest feeder of which is the Eastern Kalee, having its source on the south-western declivity of the Himalayan range forming the northern boundary of the British district of Kumayon. The elevation above the sea of the source is between 17,000 and 18,000 feet. The Kalee takes a southerly direction, receiving in its course the Dhouli, the Gori or Gorigunga, the Chumulea, and the western Surjoo. The last-named stream is the most important of its feeders, and below the confluence the united stream is no longer called the Kalee, but variously the Sarda, the Sarjoo, and the Goggrah. By subsequent accessions it becomes a considerable river; and at Birimdeo, distant 148 miles from its source, it leaves the mountains and enters the plains of Bengal. From this point the Goggrah takes a south-easterly direction, and after a total course of about 600 miles falls into the Ganges in Lat. 25. 46., Long. 84. 40.

GOGO, a sea-port of Hindustan, in the peninsula of Kattywar and district of Ahmedabad, situated on the west side of the Gulf of Cambay. It is considered as a safe roadstead during the south-west monsoon, where ships may be supplied with stores and provisions, and repair any damage they may have sustained. The inhabitants, who are principally Mohammedans, build vessels of from 50 to 300 tons burden; and carry on a considerable trade with Bombay and other places, the chief export being cotton. The Lascars of this place are named Siddhees: they are descendants of the Abyssinians, and are held in much estimation for their nautical skill and bravery. It is an ancient town, and has fallen greatly into decay; but since it came into the possession of the British it has been gradually increasing in commerce and population. E. Long. 72. 21., N. Lat. 21. 39.

GOGUET, ANTOINE-YVES, a distinguished French writer, born at Paris Jan. 18, 1716. From his infancy he was connected by ties of friendship with Alexander Conrad Fugère, the learned editor of the *Journal des Savans;* they studied philosophy together at the college of Harcourt; and when Goguet undertook the work which distinguishes his name, Fugère assisted him with criticisms and materials. In the midst of these labours Goguet was cut off by an attack of small-pox, May 1, 1758, and his friend was so deeply affected by his bereavement that he only survived the shock three days. Goguet's work is entitled *De l'Origine des Lois, des Arts, et des Sciences, et des leur Progrès chez les anciens peuples*, Paris 1758, 3 vols. 4to. Of this valuable work there have been several editions; but the first is the best. An excellent translation of it was published at Edinburgh in 1761, in 3 vols. 8vo, by Dr Henry, the historian of Great Britain. The period embraced in the work extends from the establishment of civil society to the reign of Cyrus. It is divided into three parts, and each part into six books, which treat separately of government, the arts and manufactures, the sciences, commerce and navigation, the military art, and, lastly, manners and usages. The style is agreeable, though occasionally marred by traces of bad taste. At the end of each volume are discussed, in learned dissertations, those points the detailed examination of which could not easily enter into the body of the work. An *Eloge* of Goguet was printed in the *Année Littéraire*, 1758, tome iv., and in the supplement to the *Journal des Savans* for the month of July in the same year.

GOHUD, a fortified town of Hindustan, in the territory of Gwalior, or possessions of the Scindia family, situated on the route from Etawa to Gwalior, 28 miles N.E. of the latter. About the middle of the last century Gohud was a small village attached to the district of Gwalior, and the rannah's ancestors were zemindars of this village. Bheem Singh, the rannah, prior to the battle of Paniput, in 1761 acquired possession of Gwalior, but it was taken from him by the Mahrattas. When this nation lost the battle of Paniput, the rannah of Gohud attempted to shake off their yoke, but was conquered by Ragoonauth Row in 1766, and compelled to continue tributary. On a subsequent rupture Gohud was taken by Scindia, in 1784. A treaty was concluded by the British government, 17th Jan. 1804, with the rannah of Gohud, by which he was to be established in the sovereignty of Gohud, Gwalior, and a considerable number of adjacent districts. This treaty however was never carried into effect, and a new treaty was concluded, by which the rajah agreed to relinquish the country and fort of Gohud and the adjoining districts to Scindia, receiving in exchange from the British government the territory of Dholpoor, which is still ruled by his descendants. Gohud is in E. Long. 78. 26., N. Lat. 26. 25.

GOITRE, the name given to an encysted tumour seated in the thyroid gland; a disease of frequent occurrence among the Swiss Alps and in South America. See CRETINS.

GOIZUETA, a town of Spain, 27 miles N.W. of Pampeluna, and in the province of Navarra. It stands in a valley traversed by the river Urumea, a tributary of the San Sebastian, teeming with trout, salmon, and other excellent fish. In the vicinity of Goizneta there are iron and copper mines, but very inefficiently worked. Pop. about 3200.

GOLCONDA, a strong fortress of Hindustan, on a hill about six miles W.N.W. from Hyderabad, strongly defended both by nature and art, but being situated on a rock, it is excessively hot and unhealthy. The principal inhabitants and bankers of Hyderabad are permitted to reside in this fort, which is also the depository of the treasures of the Nizam. The wealth of Golconda is proverbial; but the diamond mines so often referred to by old writers have ceased to be remunerative. Golconda was once the capital of an extensive kingdom of native Hindu princes, which arose on the dissolution of the Bhamenee dynasty; but being taken by Aurungzebe by treachery in 1687, after a siege of seven months, the whole territory became incorporated with the empire of Delhi. In its vicinity are numerous handsome tombs. The fort is in Lat. 17.22., Long. 78.29.

GOLD is, next to iron, the most widely diffused metal on the face of the earth. It occurs in granite, the oldest rock known to us, and in all the rocks derived from it; it is also found in the vein-stones which traverse other geological formations. From other metals it is readily distinguished by its reddish-yellow colour, and from metallic compounds of a similar tint by its high specific gravity, which varies from 19·2 when it is fused, to 19·4 or 19·5 when it is hammered. Its chemical equivalent on the hydrogen scale is generally taken as 98·5, but some prefer to double this and make its

Gold.

atomic weight 197. Its symbol is *Au*, from the Latin *Aurum*.

Unlike the great majority of the metals, it does not rust, *i.e.*, oxidize in the air, neither does it, if pure, tarnish by exposure. In this respect, it contrasts strikingly with silver, which, though indifferent to the rusting action of oxygen, is rapidly blackened by the sulphuretted hydrogen of the atmosphere. Exposed gilding tarnishes, but only because it is alloyed with silver and copper, on which this prejudicial gas can act.

Gold is readily crystallizable, and always assumes one or other of the symmetrical shapes, such as the cube, or regular octahedron, which characterize the simplest crystallographic system. It is softer than silver, and nearly as soft as lead, so that in tenacity it is inferior to copper, silver, iron, and platinum, and a wire $\frac{1}{10}$th of an inch in diameter will support without breaking only 191 lb. On the other hand, it is the most ductile and malleable of the metals. One grain can be hammered into leaves sufficient to cover $56\frac{1}{4}$ square inches, and the thickness of the gold-leaf will not then exceed $\frac{1}{282,000}$ of an inch. When of this tenuity it is transparent, and transmits a faint but beautiful bluish-green light.

Gold melts at a high white heat, and remains unchanged in the hottest furnaces. In the focus of a lens, however, it is vaporized by the sun's rays; and the oxyhydrogen blowpipe or a large voltaic battery can also develop heat sufficient to volatilize it. It contracts in the act of solidifying from a state of fusion, and cannot, in consequence, be made to receive sharp impressions by casting it in moulds. Coins, accordingly, and plate are stamped or embossed, and afterwards chased and carved, if necessary, by cutting tools.

Gold does not dissolve in any of the ordinary acids, such as the nitric, sulphuric, hydrochloric, or acetic, but a rare acid, the selenic, can dissolve it. Its best solvent is a mixture of hydrochloric acid, with some oxidizing agent like nitric acid or oxide of manganese, which causes the hydrochloric acid to part with its chlorine. If the gold be in leaf, chlorine at once unites with it, and the resulting chloride is readily soluble in water. Bromine acts in the same way on the metal; and it may also be dissolved by boiling it with sulphur, potash, and water. The older chemists speculated on the possibility of Moses having dissolved the golden calf of the Israelites in this way.

Gold is also soluble in mercury, and advantage is largely taken of this property of quicksilver to dissolve the precious metal from its ores. The gold-amalgam resulting from the union of the metals is also extensively employed in gilding.

The most important chemical compounds of gold are the following, in referring to which the equivalent of gold is taken as 98·5.

The chlorides are two in number. The sesquichloride, Au_2Cl_3, is prepared in the mode above mentioned. It forms orange-red crystals, but in aqueous solution appears yellow. It is very easily decomposed by heat, light, organic substances, and all deoxidizing or reducing agents. A solution of this salt in sulphuric ether is sometimes used for gilding steel. The aqueous solution is employed in photography, and from it nearly all the other useful preparations of gold are made. When this salt is heated cautiously to about 392° Fahr., it loses two-thirds of its chlorine, and becomes the sub-chloride Au_2Cl.

The oxides correspond to the chlorides, and are obtained from them. The only important one is the sesquioxide Au_2O_3, prepared by precipitating the corresponding chloride by magnesia, and washing the precipitate with nitric acid and water. This oxide is of a yellow or brown colour, and by solution in potass, in cyanide of potassium, or sulphite of soda, forms a liquid which is used in gilding. A solution of the oxide in hyposulphite of soda is employed to protect and make more visible daguerreotype portraits on silver. The sulphurets of gold are not important.

Gold || Gold-beating.

Gold is readily identified by chemical tests. When its colour and specific gravity cannot be appealed to as means of identification, its behaviour with the stronger liquid reagents is had recourse to. It resists the solvent action of the most powerful acids or alkalies taken singly, but at once dissolves in *aqua regia* (a mixture of nitric and hydrochloric acid), or in any similar liquid containing free chlorine. The resulting solution is tested,—1. By adding to it a solution of protosulphate of iron. This causes the gold to separate in the condition of a very fine powder, which remains for hours suspended in the liquid, although it is more than nineteen times heavier than water. The finely divided metal appears brown by reflected, and bluish-green by transmitted light, and if dried and rubbed by any smooth solid, acquires the characteristic colour and lustre of the metal in mass. 2. By neutralizing the solution with carbonate of potass or soda, and boiling with excess of oxalic acid, when the gold separates in highly characteristic splendent flakes. 3. By adding to the solution diluted, a few drops of solution of protochloride of tin, when a rich purple precipitate falls. Very minute traces of gold may be discovered in this way. The precipitate, which has gone for centuries by the name of Purple of Cassius, appears to be a compound of oxide of gold and oxide of tin (Au_2O, Sn_3O_4). It is used to stain glass ruby-red, and to give to porcelain and enamel a rose-pink, crimson, and purple colour. (See Precious Metals.)

GOLDBEATING. The art of goldbeating is of great antiquity, being referred to by Homer; and Pliny states that one ounce of gold was extended to 750 leaves, each leaf being four fingers square, which is three times the thickness of the ordinary leaf gold of the present time. The ancient Peruvians made very thin sheets of gold, and nailed them together on the walls of their temples of worship; on the coffins of the Theban mummies specimens of original leaf-gilding are met with where the gold is in so thin a state that it resembles modern gilding. The art seems to have been practised in India, judging from the rude specimens of gilding at Tippo Saib's palace at Bangalore.

In modern times it has been practised in the capitals of the principal commercial countries of Europe. In England it was confined to London until within the present century. It has been introduced into Scotland and the United States of America within that period. It is now practised in several towns in England, and to a small extent in Ireland, at Dublin only.

The manufacture being attendant upon an advanced state of the arts, it is only found in old established countries, and is not yet practised in any of the British colonies.

From the existence here of some now obsolete-fashioned tools, similar to those at present in use at Paris, it would appear to have travelled to England from that quarter. The art has nowhere been so perfected as in London; but of late years, from intercourse with English goldbeaters, efforts have been made on the Continent, with the aid of English goldbeaters' skin, to rival the extreme fineness of the English product.

The ordinary size of a leaf of gold is 3 inches and 3-8ths, for the production of 2000 leaves of which from 18 to 19 dwts. of gold were allowed to the workman fifty years since in London, but now, owing to the improvement in the quality of the skin and superior skill on the part of the workmen, not more than an average of 16 dwts. are required, and with very skilful workmen it is sometimes accomplished with 14 dwts. This, however, is not to be taken as any test of the extreme malleability of gold; it is only the point to which it is desirable to attain for commercial purposes.

Experiments have been made to ascertain to what degree of thinness gold and silver could be reduced: it was found that one grain of gold was spread to the extent of 75 square inches, and the same weight of silver to the still more extraordinary dimension of 98 square inches. Taking one

Gold-beating.

cubic inch of gold at 4900 grains, it will be found that the gold was the 367,650th part of an inch in thickness, or about 1200 times thinner than ordinary printing paper. Thus, if this number of leaves of gold were placed on one another, they would constitute a pile an inch high; the same number of leaves of paper would form a pile half the height of the Monument of London. The silver, though spread over a much larger surface, was thickest, owing to the difference in its specific gravity; but, calculated by weight, silver is the most malleable metal with which we are acquainted, considerably exceeding that of gold. This experiment does not, however, determine the extent of the malleability of either metal, as the means employed to test it were found to fail before there was any appearance of the malleability of the metals being exhausted.

The gold used by the goldbeater is variously alloyed according to the variety of colour required. Fine gold is commonly supposed to be incapable of being reduced to thin leaves. This is an error. It is objectionable for commercial purposes on account of its greater cost. It also adheres on one part of a leaf touching another, thus causing a waste of labour by the leaves being spoiled; but for work exposed to the weather it is much preferable, as it is more durable, and does not tarnish or change colour.

The specimens of gold leaf exhibited by Mr E. S. Marshall, goldbeater of London, at the Great Exhibition of 1851, and for which the prize medal was awarded to him, were twelve in number, and embraced a regular gradation in colour from red down to nearly white, viz.,—red, pale red, extra deep, deep, orange, lemon, deep pale, pale, pale pale, deep party, party, and fine gold. The deeper colours were alloyed with from 12 to 16 grs. of copper per oz., but without any silver, as any alloy of silver with this quantity of copper would considerably impair the malleability. The middle colours contained from 12 to 20 grs. of silver, and from 6 to 8 grs. of copper to the ounce; the paler golds contained from 2 to 20 dwts. of silver to the ounce, but no copper, for the same reason that the silver was omitted in the red-golds.

The process of goldbeating is thus conducted. The gold having been alloyed according to the colour desired, it is melted in a crucible, at a higher temperature than is simply necessary to fuse it, as its malleability is improved by exposure to a greater heat; sudden cooling does not interfere with its malleable properties, differing in this property from some other metals. It is then cast into an ingot, and flattened into a ribbon of 1½ inch wide and 10 feet in length to the ounce. After being flattened it is annealed and cut into small pieces of about 6 grs. each, and placed between the leaves of a cutch, which is about half an inch thick and 3½ inches square, containing about 160 leaves of a tough paper manufactured in France. Formerly fine vellum was used for this purpose. The cutch is beaten on for about 20 minutes with a 17-pound hammer, which rebounds by the elasticity of the skin, and saves the labour of lifting, by which the gold is spread to the size of the cutch; each leaf is then taken out, and cut into four pieces, and put between the skins of a shoder 4½ inches square and ¾ths of an inch thick, containing about 700 skins, which have been worn out in the finishing process. The shoder requires about two hours' beating upon with a 9-pound hammer. As the gold will spread unequally, the shoder is beaten upon after the larger leaves have reached the edges. The effect of this is, that the larger leaves come out of the edges in a state of dust. This allows time for the smaller leaves to reach the full size of the shoder, thus producing a general evenness of size in the leaves.

Each leaf is again cut into four pieces, and placed between the leaves of a mould composed of about 900 of the finest skins, five inches square and three-quarters of an inch thick; this is the last and most difficult stage of the process; and on the fineness of the skin and judgment of the workman the perfection and thinness of the leaf of gold depend. During the first hour the hammer is allowed to fall principally upon the centre of the mould. This causes gaping cracks upon the edges of the leaves, the sides of which readily coalesce and unite without leaving any trace of the union after being beaten upon. At the second hour, when the gold is about the 150,000 of an inch in thickness, it for the first time permits the transmission of the rays of light. In pure gold, or gold but slightly alloyed, the green rays are transmitted; and in gold highly alloyed with silver the pale violet rays pass. The mould requires in all about four hours' beating with a 7 lb. hammer, when the gold will have arrived at the ordinary thinness for the gold leaf of commerce. It is then taken out of the mould, and the rough edges are cut off by slips of the rattan fixed in parallel grooves of an instrument called a waggon, the leaf being laid upon a leathern cushion for that purpose. The leaves thus prepared are placed into a book capable of holding twenty-five leaves each, which have been rubbed over with red ochre to prevent the gold clinging to the paper, and is used for gilding picture-frames, books, and for numerous other ornamental purposes.

The dryness of the cutch, shoder, and mould is a matter of extreme delicacy. They require to be hot-pressed every time they are used, although they may be used daily, to remove the moisture which they acquire from the atmosphere, except in extremely frosty weather, when they acquire so little moisture that then a difficulty arises from their over-dryness; the brilliancy of the gold is diminished, and it spreads very slowly under the hammer. On the contrary, if the cutch or shoder be damp, the gold will become that which is technically termed hollow or sieve-like; that is, it is pierced with innumerable small microscopical holes; and in the moulds in its more attenuated state it will become reduced to a pulverulent state. This condition is more easily produced in alloyed golds than in fine gold.

It is necessary that each skin of the mould should be rubbed over with calcined gypsum (the fibrinated variety) each time the mould may be used, in order to prevent the adhesion of the gold to the surface of the skin in the process of beating.

Dentist gold is gold leaf carried no farther in the process than that of the cutch, and should be perfectly pure gold.

By the above process silver is beaten, but not so thin, the inferior value of the metal not rendering it commercially desirable to bestow so much labour upon it. Copper, tin, zinc, palladium, lead, cadmium, platinum, and aluminium can be beaten into thin leaves, but not to the extent of gold or silver.

Shell Gold ‖ Gold Wire.

Shell Gold, used in painting and illuminating, is made by grinding gold leaves with honey, and afterwards separating the honey from the powdered gold by means of water When the honey is washed away, the gold may be put on paper or kept in shells. When used, it is commonly diluted with gum-water. The German gold powder, prepared in this manner from the Dutch gold leaf, is generally used; and when it is well secured with varnish, it answers the end in japanners' gilding tolerably well.

Gold Size, for burnished gilding, is prepared of one pound and a half of pipe clay, half an ounce of red chalk, a quarter of an ounce of black lead, forty drops of sweet oil, and three drams of pure tallow. The clay, chalk, and black lead are to be ground very fine, separately, in water, then mixed together; the oil and tallow are next added, and the mixture is ground to a due consistence.

Gold Thread is formed of flattened gold wire wrapped closely over a thread of yellow silk, by means of a wheel and iron bobbins.

Gold Wire is made by taking a cylindrical ingot of silver which has been superficially coated with gold, and drawing it successively through a series of holes in a hardened steel plate, each of which is a degree smaller than the preceding hole, and proceeding thus until the requisite degree of fineness is attained. It may be observed that in this process, however fine be the wire, its gilded surface exhibits no flaw even when viewed by the microscope. *Flattened gold wire* is the same wire after it has been passed between rollers of polished steel.

GOLD COAST. See Guinea.

GOLDAPP, a town, capital of a cognominal circle, in the province of East Prussia and government of Gumbinnen. It stands on a small river of the same name, 20 miles S. of Gumbinnen; and has several tanneries and breweries, and some trade in cattle. Pop. (1849) 3754.

GOLDAU, a village of Switzerland, canton of Schwytz, in a valley between the Rigi and the Rossberg. The former village of this name was entirely destroyed by a landslip of the Rossberg on 2d Sept. 1806, together with those of Bussingen, Rother, and part of Lowerz.

GOLDBERG, a town, capital of a cognominal circle, in the Prussian province of Silesia, government of and 14 miles S.W. of Liegnitz, on the Katzbach, an affluent of the Oder. It received its name from a gold mine in the neighbourhood, formerly productive, but now abandoned. Wallenstein was educated at the gymnasium of this town. The chief manufactures are woollen cloth, flannel, stockings, &c. At the hamlet of Wahlstadt, six miles E. of the town, the French were defeated by the Prussians on the 26th August 1813. Pop. (1849) 7119.

GOLDEN FLEECE, in *Mythology*, the fleece of the ram upon which Phrixus and Helle crossed the sea to Colchis, and which, being sacrificed to Jupiter, was hung upon a tree in the grove of Mars, guarded by two brazen-hoofed bulls, and a monstrous dragon that never slept. The fleece was carried off by Jason and the Argonauts. See Argonauts.

Many authors have endeavoured to show that this fable is an allegorical representation of some real history; while others explain it by the profit of the wool trade to Colchis, or the gold which was gathered in the rivers of that country by means of fleeces.

Golden Fleece, *Order of The*. See Fleece.

GOLDEN NUMBER, in *Chronology*, a number showing what year of the moon's cycle any given year is. See Calendar, vol. vi., p. 81.

GOLDONI, Carlo, a celebrated comic poet of Italy, whom his countrymen delight to call the Italian Molière, was born at Venice in 1707. His life falls naturally into three distinct parts; the strange career of his youth, the more sober era of his toils and struggles in middle age, and his old age of moderate independence and well-earned fame. Goldoni was brought up in the midst of fêtes and theatrical performances by his grandfather, a man of pleasure, whose chief amusement was in the society of players and musicians. In this company his mind received a bent which afterwards decided his course. He went through the usual studies of the young Italians of those days; but he gained little at the various schools and colleges to which he was sent, except a knowledge of life in all its varieties. This knowledge he enlarged by often exchanging the dull routine of work for the rambling life and reckless gaiety of a strolling player. His friends, little dreaming that he was in this way educating himself for his future calling, besought him to reform, to study law or medicine, and to bring no discredit on the family name. He chose the profession of medicine, and had no sooner made his choice than he abandoned it. He next tried the law, graduated after various mishaps at Padua, and began to practise at Pisa as an advocate with every prospect of success. In an evil hour he wrote a comedy, which was played by a strolling company at Venice amidst overwhelming applause. From that time he became a stage-poet; and though the companies for which he wrote were all itinerant and held in no high respect, yet Goldoni was too much of a Gil Blas to exchange a life so congenial to his temper for the tame monotony of burgher respectability. Being now in a sphere in all respects suited to him, he resolved to turn its capabilities to account. He found the stage occupied either by the opera, or by that species of comedy called the "commedia dell' arte," or "à soggetto,"—a kind of comic acting peculiar to Italy, and long the only pretender to the title of national. These plays were not written out in full. The plot was sketched, and the actors filled in the dialogue as they went along. The chief characters in these plays wore masks, thence called maschere, and caricatured the local humours and salient weaknesses of the various states of Italy. The success of such plays depended of course on the cleverness of the individual actors; and in the hands of good performers they became amusing enough. The majority of strolling players, however, had to conceal their lack of genuine wit and humour under personal scurrility or obscene inuendoes. Goldoni determined to reform the stage,—and as there was no drama at that time in Italy suited to the modern manners of the people, he wrote a vast number of plays descriptive of the life and habits of his countrymen. His reform he was obliged to effect by degrees. He began by writing only the more serious parts of his plays; then he wrote parts for the masks, which he strove to raise out of the region of the mere burlesque; then he discarded the masks almost entirely, aimed at a higher style, and besides criticising the manners, lashed the follies and vices of his countrymen. He was a keen observer of men, and wrote with much ease and variety. The best of his works are those written in the Venetian dialect, which are therefore not very readily appreciable by foreigners. To most Englishmen, indeed, the fine aroma of Goldini's diction is as much lost as the peculiar zest of broad Scotch or the local dialects of Yorkshire are thrown away upon an Italian. But all native critics agree in pronouncing them remarkable for raciness of humour and felicity of diction. He revels especially in descriptions of low life in Venice, where the national manners have longest preserved their most striking peculiarities; and these descriptions are sometimes so broad as to be quite inadmissible even on a French stage. As he wrote for bread, he often wrote in great haste, a fact which accounts for the inequality of his works and the mistakes into which he often falls, especially when he trenches upon foreign manners and customs. Despite these faults, however, it is hardly too much to call Goldoni the father, or at least the restorer, of the Italian comedy. His works are still highly popular among his countrymen; and though a reaction in favour of the "commedia dell' arte" was effected by his rival Gozzi, it ended with the life of that powerful but ill-regulated genius; and such comic writers as have since attained distinction in Italy profess themselves followers of Goldoni. The rivalry between Gozzi and Goldoni made a great noise in its day, and as a fact of considerable importance in the literary history of Italy is still interesting to us. It is pretty fully discussed by Ugoni in his *Letteratura Italiana*, and by Baretti in his *Manners and Customs of Italy*. The third and happiest portion of Goldoni's life was that spent in Paris. In 1761 he was invited to that city by the Italian company playing there, and wrote a number of plays, some of which were eminently successful. Among these may be numbered *Le Bourru Bienfaisant*, in French, which still maintains its ground as a standard play on the French stage. This play made him known at court (1771), where he was appointed teacher of Italian to the three daughters of Louis XV., and finally rewarded with a pension of 4000 francs. When the revolution broke out he was deprived of it. On the motion of Chénier, however, a decree was passed restoring it and paying up the arrears. But Goldoni died the very day after this decree was passed, January 8, 1793. The arrears and a small additional pension were paid to his widow. There have been countless editions of Goldoni's works, among which may be specified that of Venice in 44 vols. 8vo, 1794–5; and that of Lucca in 26 vols. 1809. Selections from his best plays still appear from time to time in Italy. He wrote in French, besides his play of *Le Bourru Bienfaisant*, a number of minor pieces, and a very interesting biography of himself under the title of *Mémoires pour servir à l'Histoire de sa vie, et à celle de son Théatre*, which appeared in 1787, when the author was in his 81st year.

GOLDSMITH or SILVERSMITH, one who makes vessels and ornaments of gold or silver. The goldsmith's work is either performed in the mould, or beat out with the hammer or other instrument. Works which have raised figures are cast in a mould, and afterwards polished and finished; plates or dishes of silver or gold are beaten out from flat plates; and tankards and other vessels of the kind are formed of plates soldered together, their mouldings being beaten out, not cast. The business of the goldsmith formerly involved the hammering of the metal from the ingot to the degree of thinness required; but the necessity for this laborious process is now entirely obviated by the flatting mill.

GOLDSMITH, OLIVER, one of the most pleasing English writers of the eighteenth century. He was of a Protestant and Saxon family which had been long settled in Ireland, and which had, like most other Protestant and Saxon families, been, in troubled times, harassed and put in fear by the native population. His father, Charles Goldsmith, studied in the reign of Queen Anne at the diocesan school of Elphin, became attached to the daughter of the schoolmaster, married her, took orders, and settled at a place called Pallas in the county of Longford. There he with difficulty supported his wife and children on what he could earn, partly as a curate and partly as a farmer.

At Pallas Oliver Goldsmith was born in November 1728. That spot was then, for all practical purposes, almost as remote from the busy and splendid capital in which his later years were passed, as any clearing in Upper Canada or any sheep-walk in Australasia now is. Even at this day those enthusiasts who venture to make a pilgrimage to the birthplace of the poet are forced to perform the latter part of their journey on foot. The hamlet lies far from any high road, on a dreary plain which, in wet weather, is often a lake. The lanes would break any jaunting car to pieces; and there are ruts and sloughs through which the most strongly built wheels cannot be dragged.

While Oliver was still a child his father was presented to a living worth about L.200 a-year, in the county of Westmeath. The family accordingly quitted their cottage in the wilderness for a spacious house on a frequented road, near the village of Lissoy. Here the boy was taught his letters by a maid-servant, and was sent in his seventh year to a village school kept by an old quartermaster on half-pay, who professed to teach nothing but reading, writing and arithmetic, but who had an inexhaustible fund of stories about ghosts, banshees and fairies, about the great Rapparee chiefs, Baldearg O'Donnell and galloping Hogan, and about the exploits of Peterborough and Stanhope, the surprise of Monjuich, and the glorious disaster of Brihuega. This man must have been of the Protestant religion; but he was of the aboriginal race, and not only spoke the Irish language, but could pour forth unpremeditated Irish verses. Oliver early became, and through life continued to be, a passionate admirer of the Irish music, and especially of the compositions of Carolan, some of the last notes of whose harp he heard. It ought to be added that Oliver, though by birth one of the Englishry, and though connected by numerous ties with the Established Church, never showed the least sign of that contemptuous antipathy with which, in his days, the ruling minority in Ireland too generally regarded the subject majority. So far indeed was he from sharing in the opinions and feelings of the caste to which he belonged that he conceived an aversion to the Glorious and Immortal Memory, and, even when George the Third was on the throne, maintained that nothing but the restoration of the banished dynasty could save the country.

From the humble academy kept by the old soldier Goldsmith was removed in his ninth year. He went to several grammar-schools and acquired some knowledge of the ancient languages. His life at this time seems to have been far from happy. He had, as appears from the admirable portrait of him at Knowle, features harsh even to ugliness. The small-pox had set its mark on him with more than usual severity. His stature was small, and his limbs ill put together. Among boys little tenderness is shown to personal defects; and the ridicule excited by poor Oliver's appearance was heightened by a peculiar simplicity and a disposition to blunder which he retained to the last. He became the common butt of boys and masters, was pointed at as a fright in the play-ground, and flogged as a dunce in the school-room. When he had risen to eminence, those who had once derided him ransacked their memory for the events of his early years, and recited repartees and couplets which had dropped from him, and which, though little noticed at the time, were supposed, a quarter of a century later, to indicate the powers which produced the *Vicar of Wakefield* and the *Deserted Village*.

In his seventeenth year Oliver went up to Trinity College, Dublin, as a sizar. The sizars paid nothing for food and tuition, and very little for lodging; but they had to perform some menial services from which they have long been relieved. They swept the court: they carried up the dinner to the fellows' table, and changed the plates and poured out the ale of the rulers of the society. Goldsmith was quartered, not alone, in a garret, on the window of which his name, scrawled by himself, is still read with interest. From such garrets many men of less parts than his have made their way to the woolsack or to the episcopal bench. But Goldsmith, while he suffered all the humiliations, threw away all the advantages of his situation. He neglected the studies of the place, stood low at the examinations, was turned down to the bottom of his class for playing the buffoon in the lecture room, was severely reprimanded for pumping on a constable, and was caned by a brutal tutor for giving a ball in the attic story of the college to some gay youths and damsels from the city.

While Oliver was leading at Dublin a life divided between squalid distress and squalid dissipation, his father died, leaving a mere pittance. The youth obtained his bachelor's degree, and left the university. During some time the humble dwelling to which his widowed mother had retired was his home. He was now in his twenty-first year; it was necessary that he should do something; and his education seemed to have fitted him to do nothing but to dress himself in gaudy colours, of which he was as fond as a magpie, to take a hand at cards, to sing Irish airs, to play the flute, to angle in summer, and to tell ghost stories by the fire in winter. He tried five or six professions in turn without success. He applied for ordination; but, as he applied in scarlet clothes, he was speedily turned out of the episcopal palace. He then became tutor in an opulent family, but soon quitted his situation in consequence of a dispute about play. Then he determined to emigrate to America. His relations, with much satisfaction, saw him set out for Cork on a good horse, with thirty pounds in his pocket. But in six weeks he came back on a miserable hack, without a penny, and informed his mother that the ship in which he had taken his passage, having got a fair wind while he was at a party of pleasure, had sailed without him. Then he resolved to study the law. A generous kinsman advanced fifty pounds. With this sum Goldsmith went to Dublin, was enticed into a gaming house, and lost every shilling. He then thought of medicine. A small purse was made up; and in his twenty-fourth year he was sent to Edinburgh. At

Edinburgh he passed eighteen months in nominal attendance on lectures, and picked up some superficial information about chemistry and natural history. Thence he went to Leyden, still pretending to study physic. He left that celebrated university, the third university at which he had resided, in his twenty-seventh year, without a degree, with the merest smattering of medical knowledge, and with no property but his clothes and his flute. His flute, however, proved a useful friend. He rambled on foot through Flanders, France, and Switzerland, playing tunes which everywhere set the peasantry dancing, and which often procured for him a supper and a bed. He wandered as far as Italy. His musical performances, indeed, were not to the taste of the Italians; but he contrived to live on the alms which he obtained at the gates of convents. It should, however, be observed, that the stories which he told about this part of his life ought to be received with great caution; for strict veracity was never one of his virtues; and a man who is ordinarily inaccurate in narration is likely to be more than ordinarily inaccurate when he talks about his own travels. Goldsmith, indeed, was so regardless of truth as to assert in print that he was present at a most interesting conversation between Voltaire and Fontenelle, and that this conversation took place at Paris. Now it is certain that Voltaire never was within a hundred leagues of Paris during the whole time which Goldsmith passed on the continent.

In 1756 the wanderer landed at Dover, without a shilling, without a friend, and without a calling. He had, indeed, if his own unsupported evidence may be trusted, obtained from the University of Padua a doctor's degree; but this dignity proved utterly useless to him. In England his flute was not in request: there were no convents; and he was forced to have recourse to a series of desperate expedients. He turned strolling player; but his face and figure were ill suited to the boards even of the humblest theatre. He pounded drugs and ran about London with phials for charitable chemists. He joined a swarm of beggars, which made its nest in Axe Yard. He was for a time usher of a school, and felt the miseries and humiliations of this situation so keenly, that he thought it a promotion to be permitted to earn his bread as a bookseller's hack; but he soon found the new yoke more galling than the old one, and was glad to become an usher again. He obtained a medical appointment in the service of the East India Company; but the appointment was speedily revoked. Why it was revoked we are not told. The subject was one on which he never liked to talk. It is probable that he was incompetent to perform the duties of the place. Then he presented himself at Surgeons' Hall for examination, as mate to a naval hospital. Even to so humble a post he was found unequal. By this time the schoolmaster whom he had served for a morsel of food and the third part of a bed was no more. Nothing remained but to return to the lowest drudgery of literature. Goldsmith took a garret in a miserable court, to which he had to climb from the brink of Fleet Ditch by a dizzy ladder of flagstones called Breakneck Steps. The court and the ascent have long disappeared; but old Londoners well remember both. Here, at thirty, the unlucky adventurer sat down to toil like a galley slave.

In the succeeding six years he sent to the press some things which have survived, and many which have perished. He produced articles for reviews, magazines, and newspapers; children's books, which, bound in gilt paper and adorned with hideous woodcuts, appeared in the window of the once far-famed shop at the corner of Saint Paul's Churchyard; *An Inquiry into the State of Polite Learning in Europe*, which, though of little or no value, is still reprinted among his works; a *Life of Beau Nash*, which is not reprinted, though it well deserves to be so; a superficial and incorrect, but very readable, *History of England*, in a series of letters purporting to be addressed by a nobleman to his son; and some very lively and amusing *Sketches of London Society*, in a series of letters purporting to be addressed by a Chinese traveller to his friends. All these works were anonymous; but some of them were well known to be Goldsmith's; and he gradually rose in the estimation of the booksellers for whom he drudged. He was, indeed, emphatically a popular writer. For accurate research or grave disquisition he was not well qualified by nature or by education. He knew nothing accurately: his reading had been desultory; nor had he meditated deeply on what he had read. He had seen much of the world; but he had noticed and retained little more of what he had seen than some grotesque incidents and characters which had happened to strike his fancy. But, though his mind was very scantily stored with materials, he used what materials he had in such a way as to produce a wonderful effect. There have been many greater writers; but perhaps no writer was ever more uniformly agreeable. His style was always pure and easy, and, on proper occasions, pointed and energetic. His narratives were always amusing, his descriptions always picturesque, his humour rich and joyous, yet not without an occasional tinge of amiable sadness. About everything that he wrote, serious or sportive, there was a certain natural grace and decorum, hardly to be expected from a man a great part of whose life had been passed among thieves and beggars, street-walkers and merryandrews, in those squalid dens which are the reproach of great capitals.

As his name gradually became known, the circle of his acquaintance widened. He was introduced to Johnson, who was then considered as the first of living English writers; to Reynolds, the first of English painters; and to Burke, who had not yet entered parliament, but had distinguished himself greatly by his writings and by the eloquence of his conversation. With these eminent men Goldsmith became intimate. In 1763 he was one of the nine original members of that celebrated fraternity which has sometimes been called the Literary Club, but which has always disclaimed that epithet, and still glories in the simple name of The Club.

By this time Goldsmith had quitted his miserable dwelling at the top of Breakneck Steps, and had taken chambers in the more civilised region of the Inns of Court. But he was still often reduced to pitiable shifts. Towards the close of 1764 his rent was so long in arrear that his landlady one morning called in the help of a sheriff's officer. The debtor, in great perplexity, despatched a messenger to Johnson; and Johnson, always friendly, though often surly, sent back the messenger with a guinea, and promised to follow speedily. He came, and found that Goldsmith had changed the guinea, and was railing at the landlady over a bottle of Madeira. Johnson put the cork into the bottle, and entreated his friend to consider calmly how money was to be procured. Goldsmith said that he had a novel ready for the press. Johnson glanced at the manuscript, saw that there were good things in it, took it to a bookseller, sold it for L.60, and soon returned with the money. The rent was paid; and the sheriff's officer withdrew. According to one story, Goldsmith gave his landlady a sharp reprimand for her treatment of him; according to another, he insisted on her joining him in a bowl of punch. Both stories are probably true. The novel which was thus ushered into the world was the *Vicar of Wakefield.*

But before the *Vicar of Wakefield* appeared in print, came the great crisis of Goldsmith's literary life. In Christmas week 1764, he published a poem, entitled the *Traveller.* It was the first work to which he had put his name; and it at once raised him to the rank of a legitimate English classic. The opinion of the most skilful critics was, that nothing finer had appeared in verse since the fourth book of the *Dunciad.* In one respect the *Traveller* differs from all Goldsmith's other writings. In general his designs were bad, and his execution good. In the *Traveller*, the execution, though deserving of much praise, is far inferior to the design. No philosophical poem, ancient or modern, has a plan so noble, and at the same time so simple. An English wanderer, seated on a crag among the Alps, near the point where three great countries meet, looks down on the boundless prospect, reviews his long pilgrimage, recalls the varieties of scenery, of climate, of government, of religion, of national character, which he has observed, and comes to the conclusion, just or unjust, that our happiness depends little on political institutions, and much on the temper and regulation of our own minds.

While the fourth edition of the *Traveller* was on the counters of the booksellers, the *Vicar of Wakefield* appeared, and rapidly obtained a popularity which has lasted down to our own time, and which is likely to last as long as our language. The fable is indeed one of the worst that ever was constructed. It wants, not merely that probability which ought to be found in a tale of common English life, but that consistency which ought to be found even in the wildest fiction about witches, giants, and fairies. But the earlier chapters have all the sweetness of pastoral poetry, together with all the vivacity of comedy. Moses and his spectacles, the vicar and his monogamy, the sharper and his cosmogony, the squire proving from Aristotle that relatives are related, Olivia preparing herself for the arduous task of converting a rakish lover by studying the controversy between Robinson Crusoe and Friday, the great ladies with their scandal about Sir Tomkyn's amours and Dr Burdock's verses, and Mr Burchell with his "Fudge," have caused as much harmless mirth as has ever been caused by matter packed into so small a number of pages. The latter part of the tale is unworthy of the beginning. As we approach the catastrophe, the absurdities lie thicker and thicker; and the gleams of pleasantry become rarer and rarer.

The success which had attended Goldsmith as a novelist emboldened him to try his fortune as a dramatist. He wrote the *Goodnatured Man*, a piece which had a worse fate than it deserved. Garrick refused to produce it at Drury Lane. It was acted at Covent Garden in 1768, but was coldly received. The author, however, cleared by his benefit nights, and by the sale of the copyright, no less than L.500, five times as much as he had made by the *Traveller* and the *Vicar of Wakefield* together. The plot of the *Goodnatured Man* is, like almost all Goldsmith's plots, very ill constructed. But some passages are exquisitely ludicrous; much more ludicrous, indeed, than suited the taste of the town at that time. A canting, mawkish play, entitled *False Delicacy*, had just had an immense run. Sentimentality was all the mode. During some years, more tears were shed at comedies than at tragedies; and a pleasantry which moved the audience to anything more than a grave smile was reprobated as low. It is not strange, therefore, that the very best scene in the *Goodnatured Man*, that in which Miss Richland finds her lover attended by the bailiff and the bailiff's follower in full court dresses, should have been mercilessly hissed, and should have been omitted after the first night.

In 1770 appeared the *Deserted Village*. In mere diction and versification this celebrated poem is fully equal, perhaps superior to the *Traveller;* and it is generally preferred to the *Traveller* by that large class of readers who think, with Bayes in the *Rehearsal*, that the only use of a plan is to bring in fine things. More discerning judges, however, while they admire the beauty of the details, are shocked by one unpardonable fault which pervades the whole. The fault which we mean is not that theory about wealth and luxury which has so often been censured by political economists. The theory is indeed false: but the poem, considered merely as a poem, is not necessarily the worse on that account. The finest poem in the Latin language, indeed the finest didactic poem in any language, was written in defence of the silliest and meanest of all systems of natural and moral philosophy. A poet may easily be pardoned for reasoning ill; but he cannot be pardoned for describing ill, for observing the world in which he lives so carelessly that his portraits bear no resemblance to the originals, for exhibiting as copies from real life monstrous combinations of things which never were and never could be found together. What would be thought of a painter who should mix August and January in one landscape, who should introduce a frozen river into a harvest scene? Would it be a sufficient defence of such a picture to say that every part was exquisitely coloured, that the green hedges, the apple-trees loaded with fruit, the waggons reeling under the yellow sheaves, and the sun-burned reapers wiping their foreheads were very fine, and that the ice and the boys sliding were also very fine? To such a picture the *Deserted Village* bears a great resemblance. It is made up of incongruous parts. The village in its happy days is a true English village. The village in its decay is an Irish village. The felicity and the misery which Goldsmith has brought close together belong to two different countries, and to two different stages in the progress of society. He had assuredly never seen in his native island such a rural paradise, such a seat of plenty, content, and tranquillity, as his *Auburn*. He had assuredly never seen in England all the inhabitants of such a paradise turned out of their homes in one day and forced to emigrate in a body to America. The hamlet he had probably seen in Kent: the ejectment he had probably seen in Munster; but by joining the two, he has produced something which never was and never will be seen in any part of the world.

In 1773 Goldsmith tried his chance at Covent Garden with a second play, *She Stoops to Conquer*. The manager was not without great difficulty induced to bring this piece out. The sentimental comedy still reigned, and Goldsmith's comedies were not sentimental. The *Goodnatured Man* had been too funny to succeed; yet the mirth of the *Goodnatured Man* was sober when compared with the rich drollery of *She Stoops to Conquer*, which is, in truth, an incomparable farce in five acts. On this occasion, however, genius triumphed. Pit, boxes, and galleries, were in a constant roar of laughter. If any bigoted admirer of Kelly and Cumberland ventured to hiss or groan, he was speedily silenced by a general cry of "turn him out," or "throw him over." Two generations have since confirmed the verdict which was pronounced on that night.

While Goldsmith was writing the *Deserted Village* and *She Stoops to Conquer*, he was employed on works of a very different kind, works from which he derived little reputation but much profit. He compiled for the use of schools a *History of Rome* by which he made L.300, a *History of England* by which he made L.600, a *History of Greece* for which he received L.250, a *Natural History*, for which the booksellers covenanted to pay him 800 guineas. These works he produced without any elaborate research, by merely selecting, abridging, and translating into his own clear, pure, and flowing language, what he found in books well known to the world, but too bulky or too dry for boys and girls. He committed some strange blunders: for he knew nothing with accuracy. Thus in his *History of England* he tells us that Naseby is in Yorkshire; nor did he correct this mistake when the book was reprinted. He was very nearly hoaxed into putting into the *History of Greece* an account of a battle between Alexander the Great and Montezuma. In his *Animated Nature* he relates, with faith and with perfect gravity, all the most absurd lies which he could find in books of travels about gigantic Patagonians, monkeys that preach sermons, nightingales that repeat long conversations. "If he can tell a horse from a cow," said Johnson, "that is the extent of his knowledge of zoology." How little Goldsmith was qualified to write about the physical sciences is sufficiently proved by two anecdotes. He on one occasion denied that the sun is longer in the northern than in the southern signs. It was vain to cite the authority of Maupertuis. "Maupertuis!" he cried, "I understand those matters better than Maupertuis." On another occasion he, in defiance of the evidence of his own senses, maintained obstinately, and even angrily, that he chewed his dinner by moving his upper jaw.

Yet, ignorant as Goldsmith was, few writers have done more to make the first steps in the laborious road to knowledge easy and pleasant. His compilations are widely distinguished from the compilations of ordinary bookmakers. He was a great, perhaps an unequalled, master of the arts of selection and condensation. In these respects his histories of Rome and of England, and still more his own abridgments of these histories, well deserved to be studied. In general nothing is less attractive than an epitome: but the epitomes of Goldsmith, even when most concise, are always amusing; and to read them is considered by intelligent children, not as a task but as a pleasure.

Goldsmith might now be considered as a prosperous man. He had the means of living in comfort, and even in what to one who had so often slept in barns and on bulks must have been luxury. His fame was great and was constantly rising. He lived in what was intellectually far the best society of the kingdom, in a society in which no talent or accomplishment was wanting, and in which the art of conversation was cultivated with splendid success. There probably were never four talkers more admirable in four different ways than Johnson, Burke, Beauclerk, and Garrick; and Goldsmith was on terms of intimacy with all the four. He aspired to share in their colloquial renown; but never was ambition more unfortunate. It may seem strange that a man who wrote with so much perspicuity, vivacity, and grace, should have been, whenever he took a part in conversation, an empty, noisy, blundering, rattle. But on this point the evidence is overwhelming. So extraordinary was the contrast between Goldsmith's published works and the silly things which he said, that Horace Walpole described him as an inspired idiot. "Noll," said Garrick, "wrote like an angel, and talked like poor Pol." Chamier declared that it was a hard exercise of faith to believe that so foolish a chatterer could have really written the *Traveller*. Even Boswell could say, with contemptuous compassion, that he liked very well to hear honest Goldsmith run on. "Yes, sir," said Johnson, "but he should not like to hear himself." Minds differ as rivers differ. There are transparent and sparkling rivers from which it is delightful to drink as they flow; to such rivers the minds of such men as Burke and Johnson may be compared. But there are rivers of which the water when first drawn is turbid and noisome, but becomes pellucid as crystal and delicious to the taste if it be suffered to stand till it has deposited a sediment; and such a river is a type of the mind of Goldsmith. His first thoughts on every subject were confused even to absurdity, but they required only a little time to work themselves clear. When he wrote they had that time; and therefore his readers pronounced him a man of genius: but when he talked he talked nonsense, and made himself the laughing-stock of his hearers. He was painfully sensible of his inferiority in conversation; he felt every failure keenly; yet he had not sufficient judgment and self-command to hold his tongue. His animal spirits and vanity were always impelling him to try to do the one thing which he could not do. After every attempt he felt that he had exposed himself, and writhed with shame and vexation; yet the next moment he began again.

His associates seem to have regarded him with kindness, which, in spite of their admiration of his writings, was not unmixed with contempt. In truth, there was in his character much to love, but very little to respect. His heart was soft even to weakness: he was so generous, that he quite forgot to be just; he forgave injuries so readily, that he might be said to invite them, and was so liberal to beggars, that he had nothing left for his tailor and his butcher. He was vain, sensual, frivolous, profuse, improvident. One vice of a darker shade was imputed to him, envy. But there is not the least reason to believe that this bad passion, though it sometimes made him wince and utter fretful exclamations, ever impelled him to injure by wicked arts the reputation of any of his rivals. The truth probably is, that he was not more envious, but merely less prudent than his neighbours. His heart was on his lips. All those small jealousies, which are but too common among men of letters, but which a man of letters who is also a man of the world does his best to conceal, Goldsmith avowed with the simplicity of a child. When he was envious, instead of affecting indifference, instead of damning with faint praise, instead of doing injuries slily and in the dark, he told everybody that he was envious. "Do not, pray, do not, talk of Johnson in such terms," he said to Boswell; "you harrow up my very soul." George Steevens and Cumberland were men far too cunning to say such a thing. They would have echoed the praises of the man whom they envied, and then have sent to the newspapers anonymous libels upon him. Both what was good and what was bad in Goldsmith's character was to his associates a perfect security that he would never commit such villany. He was neither ill-natured enough, nor long-headed enough, to be guilty of any malicious act which required contrivance and disguise.

Goldsmith has sometimes been represented as a man of genius, cruelly treated by the world, and doomed to struggle with difficulties, which at last broke his heart. But no representation can be more remote from the truth. He did, indeed, go through much sharp misery before he had done anything considerable in literature. But after his name had appeared on the title-page of the *Traveller*, he had none but himself to blame for his distresses. His average income, during the last seven years of his life, certainly exceeded L.400 a-year, and L.400 a-year ranked, among the incomes of that day, at least as high as L.800 a-year would rank at present. A single man living in the Temple, with L.400 a-year, might then be called opulent. Not one in ten of the young gentlemen of good families who were studying the law there had so much. But all the wealth which Lord Clive had brought from Bengal, and Sir Lawrence Dundas from Germany, joined together, would not have sufficed for Goldsmith. He spent twice as much as he had. He wore fine clothes, gave dinners of several courses, paid court to venal beauties. He had also, it should be remembered, to the honour of his heart, though not of his head, a guinea, or five, or ten, according to the state of his purse, ready for any tale of distress, true or false. But it was not in dress or feasting, in promiscuous amours or promiscuous charities, that his chief expense lay. He had been from boyhood a gambler, and at once the most sanguine and the most unskilful of gamblers. For a time he put off the day of inevitable ruin by temporary expedients. He obtained advances from booksellers, by promising to execute works which he never began. But at length this source of supply failed. He owed more than L.2000; and he saw no hope of extrication from his embarrassments. His spirits and health gave way. He was attacked by a nervous fever, which he thought himself competent to treat. It would have been happy for him if his medical skill had been appreciated as justly by himself as by others. Notwithstanding the degree which he pretended to have received at Padua, he could procure no patients. "I do not practise," he once said; "I make it a rule to prescribe only for my friends." "Pray, dear Doctor," said Beauclerk, "alter your rule; and prescribe only for your enemies." Goldsmith now, in spite of this excellent advice, prescribed for himself. The remedy aggravated the malady. The sick man was induced to call in real physicians; and they at one time imagined that they had cured the disease. Still his weakness and restlessness continued. He could not get no sleep. He could take no food. "You are worse," said one of his medical attendants, "than you should be from the degree of fever which you have. Is your mind at ease?" "No; it is not," were the last recorded words of Oliver Goldsmith. He died on the 3d of April 1774, in his forty-sixth year. He was laid in the churchyard of the Temple; but the spot was not marked by any inscription, and is now forgotten. The coffin was followed by Burke and Reynolds. Both these great men were sincere mourners. Burke, when he heard of Goldsmith's death, had burst into a flood of tears. Reynolds had been so much moved by the news, that he had flung aside his brush and palette for the day.

A short time after Goldsmith's death, a little poem appeared, which will, as long as our language lasts, associate the names of his two illustrious friends with his own. It has already been mentioned that he sometimes felt keenly the sarcasm which his wild blundering talk brought upon him. He was, not long before his last illness, provoked into retaliating. He wisely betook himself to his pen; and at that weapon he proved himself a match for all his assailants together. Within a small compass he drew with a singularly easy and vigorous pencil the characters of nine or ten of his intimate associates. Though this little work did not receive his last touches, it must always be regarded as a masterpiece. It is impossible, however, not to wish that four or five likenesses which have no interest for posterity were wanting to that noble gallery, and that their places were supplied by sketches of Johnson and Gibbon, as happy and vivid as the sketches of Burke and Garrick.

Some of Goldsmith's friends and admirers honoured him with a cenotaph in Westminster Abbey. Nollekens was the sculptor; and Johnson wrote the inscription. It is much to be lamented that Johnson did not leave to posterity a more durable and a more valuable memorial of his friend. A life of Goldsmith would have been an inestimable addition to the Lives of the Poets. No man appreciated Goldsmith's writings more justly than Johnson: no man was better acquainted with Goldsmith's character and habits; and no man was more competent to delineate with truth and spirit the peculiarities of a mind in which great powers were found in company with great weaknesses. But the list of poets to whose works Johnson was requested by the booksellers to furnish prefaces ended with Lyttelton, who died in 1773. The line seems to have been drawn expressly for the purpose of excluding the person whose portrait would have most fitly closed the series. Goldsmith, however, has been fortunate in his biographers. Within a few years his life has been written by Mr Prior, by Mr Washington Irving, and by Mr Forster. The diligence of Mr Prior deserves great praise; the style of Mr Washington Irving is always pleasing; but the highest place must, in justice, be assigned to the eminently interesting work of Mr Forster. (T. B. M.)

GOLEGA, a town of Portugal, province of Estremadura, 12 miles S.S.W. of Thomar on the Tagus, and 16 miles S.W. of Santarem. It is situated in a beautiful rich plain planted with olives, and producing abundance of cereal crops, as well as wine, oil, and sheep. Golega is especially celebrated for its annual fair, which is held on Nov. 11, and the two following days. Merchants from all parts of the kingdom, as well as from Old Castile, meet here for the purchase and interchange of numerous kinds of merchandise, especially woollen manufactures. Pop. (1855) 3742.

GOLF (Dutch *kolf*, a club), a well-known game, played with ball and club. It is said to be of Scottish origin; and it is certainly of very ancient date in Scotland, since there exist statutes prohibiting the game as early as the year 1457, lest it should interfere with the practice of archery. It is commonly played over *links* or commons with smooth grass and broken surfaces, by parties of one or more on each side, each party playing a separate ball; and the skill of a player consists in landing the ball in a given series of holes with the fewest strokes of the club. The balls were formerly made of thick leather, filled with feathers, but those generally in present use are of solid gutta percha. The clubs are of various shapes and materials to suit the position of the ball on the green, and its distance from the hole. To place the ball in a fit position for striking off is called *teeing*, and the green in the neighbourhood of each hole is called the *putting* ground.

GOLGOTHA, the name of the "mount" on which our Lord was crucified. See JERUSALEM.

GOLIUS, JAMES, an eminent Dutch orientalist, was born at the Hague in 1596. He studied at Leyden, and made such progress in his studies that at the age of twenty-one he was chosen professor of Greek at Rochelle. After a short time, however, he resigned that appointment and returned to Leyden to apply himself to the eastern tongues under Erpenius. To perfect his knowledge of Arabic, he went with the Dutch embassy to the emperor of Morocco, and was able while there to present to that potentate a petition written in Arabic. On returning home, he was chosen to succeed Erpenius in the chair of Arabic at Leyden in 1624. In the following year he set out on a tour through the east, visiting Arabia and Mesopotamia, and returning to Holland *viâ* Constantinople in 1626. The remainder of his life was spent at Leyden, where he died in 1667. He wrote many works, of which by far the greatest is his *Lexicon Arabico-Latinum*, fol., Leyd. 1653. It is based on the *Al-Sihah* of Djehéri, and was reckoned a wonderful monument of learning for that age. Indeed it has only recently been superseded by Freitag's Lexicon. Of Golius' other works may be mentioned his *Chadzrataladab min kelon Alarab, i.e., Proverbia quædam Alis imperatoris Muslemici, et Carmen Tograi poetæ*, Leyd. 1629; *Ahmedis Arabsiadæ vitæ et rerum gestarum Timuri historia*, Leyd. 1636. After his death, a Persian dictionary was found among his MSS., which was published, with additions by Castell, in his *Lexicon Heptaglotton*. (See Schnurrer's *Bibliotheca Arabica; Biog. Univers.*, &c.)

GOLLNOW, a town in the Prussian province of Pomerania, government of Stettin, and 14 miles N.N.E. of the town of that name, on the right bank of the Ihna. This was at one time a Hanse town. It has manufactures of linen and woollen goods, and copper wares. Pop. (1849) 5458.

GOLNITZ, a market-town of Hungary, county of Zips, 20 miles S.W. of Eperies. In the vicinity are iron and copper mines, which, with the iron forges, afford employment to most of the inhabitants. It is the seat of a mining board. Pop. 5100.

GOMBROON or BUNDER ABBAS, a seaport-town of Persia, province of Kerman, at the entrance of the Persian Gulf, nearly opposite the island of Ormuz, in 27. 18. N. Lat., 56. 12. E. Long. This was at one time the first seaport of Persia, and was then strongly fortified; but it is now a paltry town of about 4000 inhabitants, with no traces of its former condition but ruins of European buildings. The English were permitted to establish a factory here in 1613, and about 1620 the Dutch obtained the same privilege. When the island of Ormuz was taken by the English and Persians in 1622, merchants resorted thither in great numbers, and its commerce greatly increased. The English remained here till 1759, when the factory was taken by the French; and though afterwards re-established, it has long since been withdrawn on account of the unhealthiness of the climate. The town is surrounded by a mud wall about three-quarters of a mile in circumference, and the houses are rather commodiously built, but the streets are narrow and dirty. A considerable trade is still carried on. Though situated in Persia, it is a dependency of the Imâm of Muscat.

GOMERA, one of the Canaries. See CANARY ISLANDS.

GOMOR, a town of Hungary, capital of a cognominal county, on the Sajo, 90 miles N.E. of Pesth. It has a gymnasium, with a good library, and museum; and some trade in wine and tobacco. Pop. 1050. The county of Gomor has an area of 1694 square miles, and contained in 1850 160,674 inhabitants.

GOMORRAH, one of the cities of the plain or of the vale of Siddim, destroyed with Sodom by fire from heaven, on account of the wickedness of the inhabitants. Gen. xix.

GONDAR, a large town of Abyssinia, the residence of the *Negus* or nominal monarch of that country, is situated about 30 miles N. by E. of the lake of Dembea, on a lofty insulated hill, between two rivers which unite below the town. It is about 11 miles in circuit, but is built in a very straggling manner, and the houses are only of one story, and thatched. The only building of importance in the town is the palace, a square stone building flanked with towers, but a great part of it is now in ruins. There are no shops or bazaars, and all goods for sale are exposed on mats in the open market-place. It has some manufactures of sword-blades, knives, razors, fire-arms, &c.; and also some trade in elephants' tusks, coffee, honey, wax, slaves, &c. Pop. estimated as above 50,000.

GONDOLA, a kind of barge used chiefly on the canals of Venice, where gondolas supply the place of carriages. The gondola is flat-bottomed, very long and narrow (averaging about 30 feet by 4), and its two sharply-pointed extremities are curved upwards to the full height of a man. It is also provided with a small chamber placed near its centre, and elevated to a convenient height above the line of the gunwale. It is propelled by oars or a pole, by the gondolier, who stands at the stern. The word gondola is derived by Du Cange from the modern Greek κουντελας, a *bark* or *little ship;* Lancelot again deduces it from γονδυ, a term in Athenæus for a sort of vase.

The gondoliers of Venice were formerly an interesting part of the population, and were noted for the practice of whiling away time by singing alternately stanzas of poems, particularly of Tasso's *Jerusalem Delivered,* though with great changes from the original; but this custom has become almost entirely obsolete.

GONG, a Chinese musical instrument of percussion, formed entirely of metal, which yields a very loud and peculiarly harsh sound when struck with force. It is made of an alloy of tin and copper, and in form it nearly resembles the common tambourine. Gongs are much used in China for making loud sonorous signals, particularly on the canals, as well as for adding to the clangour of martial instruments.

GONGORA Y ARGOTE, LUIS DE, a gentleman of Córdova, was born Jan. 11, 1561, and educated at Salamanca, where it was intended by his father, himself an eminent lawyer, that he should qualify himself for the legal profession. It was too late; his taste for poetry was already developed; and the only permanent result of his university studies may be found in numerous ballads and other light compositions, often written in a bitter satirical vein, yet with simplicity and spirit. In fact, the greater part of his satirical, jocose, and amatory pieces, were written during his stay at the university, and are justly considered the best of his compositions as to style, language, and versification. Góngora's sarcastic muse was unfortunately but evidently embittered by his frequent struggles with poverty. At last, however, he took holy orders in his forty-fifth year, and received a scanty prebend in the cathedral of his native city. To improve his inadequate means, he went to Madrid, where, after eleven years of weary expectation, he was appointed one of the chaplains of Philip III., in whose court his peculiar talents found ample scope and appreciation. But suddenly a severe illness deprived him of memory, and he retired to Córdova, where he died, May 24, 1627.

The disciples of the Spanish classic school were already tainted with the extravagant ideas of the Italian Marinists, when Góngora arose, and brought them into full fashion. His mind was shrewd and powerful; yet it was perverted by pursuing the most absurd critical reveries. His early satirical sonnets, romances, and songs, have seldom been exceeded in bitterness. In language and versification they are elegant and correct; and from the piquant simplicity of the style it could never have been anticipated that the ambition of introducing something new in literature would have betrayed the author into the affectation which afterwards distinguished him. It was, no doubt, in some of his fits of vexation that Góngora conceived the idea of distinguishing himself by the invention of a peculiar poetic phraseology which he called *estilo culto,* "polished style." In order to accomplish this, he formed with great labour and research an affected, obscure, and ridiculously allegorical language, totally at variance with all the ordinary modes of speaking or writing. Not only did he seek the most uncommon words, but attached to common ones a new signification, and laid mythology under contribution for fresh ornaments. He used in Spanish the boldest inversions of Greek and Latin, and invented a new system of punctuation to determine the sense. The most obvious feature of his style, however, is, that it consists almost entirely of metaphors heaped upon each other in so grotesque a mass that it is often difficult to discover the real meaning. In this manner Góngora wrote his *Soledades,* his *Polyphemus,* and several other pieces. In the former he speaks of a maiden so beautiful that she might parch up Norway with her two suns, and bleach Ethiopia with her two hands. In translation, it is impossible to do justice to this style, for we cannot display in our own language those labyrinths of phrases which make the original so obscure. None of the imitators of Góngora had his native talent; and soon they divided into the two sects—the "Cultoristos," retaining only the pedantry of their founder; and the "Conceptistos," aspiring to his genius by revelling in the wildest regions of fancy, and searching after strange ideas as well as eccentric language.

There are various compositions of Góngora still unpublished, but a *romancero,* under the title of *Delicias del Parnaso,* contains all his *romances* and *letrillas.* The Cultoristo Alonso Castillo Solorzano extended Gongorism even to America, where he published his own works in Mexico in 1625; and the earliest German romances were imitations of Góngora by Gleim.

GONIOMETER, an instrument principally used for measuring solid angles, such as those presented by the faces of crystals. The goniometer in general use is one invented by Dr Wollaston on optical principles.

GONONG APEE, one of the Banda Islands, which see.

GOOD FRIDAY, the name given in England to the Friday of passion week, which is observed as a fast day, as being the anniversary of our Saviour's crucifixion. Among the Saxons it was called Long Friday, probably from the length of the religious services observed. In Germany it is called *Stiller Freitag,* from the reverential silence maintained in the churches, but more commonly *Char Freitag,* from an obsolete word signifying penitence. In the Greek and Latin Churches many of the ceremonies still practised on this day remount in antiquity to the days of Constantine the Great.

CAPE OF GOOD HOPE,

Strictly speaking, a small promontory, nearly the most southern point of Africa, but it gives its name to the large tract of country which forms the most southern part of that continent, and is now a colony of Great Britain. It lies for the most part between S. Lat. 29 and 34½., and E. Long. 18. and 28. It is bounded on the N. by the Orange and the Gariep rivers, on the E. by the river Keiskamma and Kafraria, on the S. by the Southern Ocean, and on the W. by the Atlantic. Its extreme breadth is from N. to S. about 450 miles, and its length from E. to W. about 600 miles, its area containing about 250,000 square miles. The country rises from the sea by a series of terraces, of which the supporting walls are nearly parallel chains of rugged and barren mountains intersected by deep ravines, the beds of streams, feeble or dry in the summer, but rushing down in torrents in the winter. The first of these mountain ranges of which Drackenstein, Hottentots' Holland, and Lange Kloof form a part, runs from the N.W. round the colony towards the E., where it terminates in the promontory of Cape St Francis. Between it and the sea, on the W. coast, the country is sandy and sterile, but on the S. and E. coast it possesses some good soil, and is clothed with vegetation. The second great chain, containing the Karroo Berg, Oliphant's River, Cold Bokkeveld, and Zuurbergen mountains, runs parallel to the first and terminates near the mouth of the Great Fish River. Its average height is about 4000 feet, and its greatest about 6500. Between this chain and the first the surface is varied, some parts consisting of arid plains and hills, others of good arable soil with a large portion of excellent grazing land. The third great range also runs nearly parallel to the others, and includes the Kammies Bergen, Roggeveld Bergen, Nieuwveld, and Sneeuw-Bergen mountains. This is the highest part of the colony, and from it the land gradually descends to the Orange River. Between this range and the second is the vast desolate plain called the Great Karroo, nearly 300 miles in length E. and W., and about 90 in breadth N. and S. Its soil is a sand mixed with clay, and particles of iron: all soil of a similar character in other parts of the colony is called karroo ground. These mountain chains are mostly composed of sandstone resting upon a base of granite, which are the prevailing rocks, the next in abundance being clay slate, grauwacke, quartz rock, and dolerite. In some parts the ironstone is traversed by veins of red iron ore. Deposits of coal are said to have been discovered in Kafirland and Victoria division, and copper ore has been found in some abundance in Namaqualand.

The Rivers, with exception of the Orange River, are small; they all more or less partake of the character of mountain streams, having numerous falls, and being low and feeble in the dry season, but swollen and rapid in the rainy weather. They are of course not navigable, and their mouths are mostly barred with sand. The Knysna, the Cowie, and the Briede are however accessible for a short distance from their entrance to small vessels.

The chief rivers are, on the W. coast, the Orange, the Elephant, and Great Berg rivers; on the S. coast, the Briede Knysna, Sunday, Cantoos, Great Fish, and Keiskamma. The only one of them deserving special notice is the Orange River, which rises in Kathlamba or Drackenberg Mountains, flows for nearly 1200 miles generally in a westerly direction, and discharges itself into the Atlantic, forming the northern boundary of the colony. It is on the whole a noble stream, and in some parts its banks are shaded by huge willows.

The Soil.—It is considered that about two-fifths of the colony consist of arid mountain ridges and sandy plains, unfit either for agriculture or pasture. The remainder is not generally fit for agricultural purposes, although it contains some very fertile spots; a large portion of it, however, especially in the eastern part, affords excellent pasture for cattle and sheep.

The coast is indented by various bays and inlets; few of them, however, afford convenient harbours. Saldanha Bay, on the west coast, is one of the most extensive and secure havens in this part of the world, but it is rendered comparatively useless by the want of a sufficient quantity of fresh water near it for the supply of shipping. Simon's Bay, near the bottom of False Bay, is a good harbour, and is used as a station for the royal navy. Table Bay, though somewhat protected by Robben Island, is little better than an open roadstead. It affords shelter, however, to ships during the summer months, but in the winter from May to September it is very unsafe. Algoa Bay is an open roadstead, but it is the chief port of the eastern province, and is much frequented by ships, which in certain winds can lie in it safely. Mossel Bay and the Cowie are also resorted to by small vessels, but they are little better than open roadsteads.

The climate is generally milder and drier than that of England. December, January, and February are the summer months; June, July, and August the winter. In the western part the summer is dry and clear, but in the east it is wet and stormy. In the vicinity of Cape Town, the highest temperature is about 84°, the lowest about 40°, and the mean of the year about 65°. In the mountainous districts and elevated plains, the heat of summer and the cold of winter are greater.

The vegetation of the colony is remarkably rich and varied. Some of the finest botanical specimens that now adorn the gardens of Europe have been derived from this region. In no other place do bulbous plants and heaths exhibit so many beautiful varieties. Besides a number of other ornamental tribes, there are some plants which might be used in medicine and dyeing. The aloe, however, is the only one which has been made an article of export. The most remarkable trees are, the silver tree, which only grows in the vicinity of Table Mountain; the Protea; and in the eastern province, the Euphorbia. There is on the whole a scarcity of indigenous timber, though there are in some parts extensive forests. Some of the native woods furnish materials for furniture and the wood-work of houses. The oak, fir, and other European forest trees, have, however, been long since introduced, and thriven very well; some of them have attained a great size, and their wood is extensively used. There are few indigenous fruits, but most of the fruits both of the north and south of Europe, such as grapes, figs, oranges, mulberries, apples, pears, peaches, nectarines, and others, are grown in abundance; but strawberries rarely come to perfection, and the gooseberry cannot be raised.

In regard to the zoology of the Cape, there is little to distinguish it from the rest of Africa, under the head of which will be found sufficient information on this subject; we may, however, notice the domestic animals of the colony. Sheep, cattle, and dogs, of an inferior breed, were all possessed by the natives on the discovery of the country. Horses, asses, mules, goats, and inferior breeds of cattle and sheep, have been introduced, and thrive well. The Merino sheep, in particular, has proved a valuable acquisition to the colony. Among the game birds are the bustard, called by the Dutch the pouw, and a smaller kind called the coran, wild duck, teal, snipe, and partridge.

History.—This Cape was discovered by Bartholomew Diaz, the Portuguese navigator, in 1493, who first landed at Algoa Bay, having, after exploring the west coast, been driven out to sea by a storm, and thus accidentally doubling the Cape which he saw on his way back, giving it the name of the Cape of Storms (Cabo Tormentoso).

The king of Portugal, however, gave it the more auspicious name it still bears, as its discovery afforded a hope of a new and easier way of reaching India, the great object of all the maritime expeditions of that age.

The great navigator Vasco de Gama doubled the Cape in 1497, and carried the Portuguese flag into the Indian seas. His countrymen, however, attracted by the riches of the East, made no permanent settlement at the Cape, although they frequently touched there on the voyage to India. But the Dutch, who, on the decline of the Portuguese power, established themselves in the East, early saw the importance of the place as a station where their vessels might take in water and provisions. They did not, however, colonize it till 1650, when the Dutch East India Company directed Jan Van Riebeeck, with a small party of colonists, to form a settlement there. The country was at that time inhabited by a people called Quaiquæ, but to whom the Dutch seem to have given the name of Hottentots. The Riebeeck settlers had at first great difficulties and hardship to endure, and their territory did not extend beyond a few miles round the site of the present Cape Town, where they first fixed their abode. They gradually, however, extended their limits, by driving the natives back or reducing them to serfdom. These colonists, although under Dutch authority, were not wholly of that nation, but consisted partly of persons of various nations, especially Germans and Flemings, with a few Poles and Portuguese. They were for the most part people of low station or indifferent character; there was, however, a small number of a higher class, from whom was selected a council to assist the governor. About the year 1686 the European population was increased by a number of the French refugees who left their country on the revocation of the edict of Nantes. Our limits forbid our attempting to trace the history of the Cape Colony during the lengthened period it remained under the Dutch government. We may, however, mention some of its prominent incidents, the effects of which are visible in the colony to this hour.

1*st.* The Dutch, partly by so-called contracts, partly by force, gradually deprived the Hottentots of their country. 2*d.* They reduced to slavery a large part of that unfortunate people whom they did not destroy. 3*d.* They introduced a number of Malays and negroes as slaves. 4*th.* They established that narrow and tyrannical system of policy which they have adopted in other colonies, prescribing to the farmers the nature of the crops they were to grow, demanding from them a large part of their produce, and harassing them with other exactions tending to discourage industry and enterprise. We are of opinion that to this mischievous policy is due the origin of those unsettled habits, that dislike to orderly government, and that desire to escape from its control, which characterize a considerable part of the so-called Dutch boers of the present day, qualities so utterly at variance with the character of the Dutch in their native country, but which were strongly manifested at the Cape long before they came under British rule, and under those influences to which some exclusively attribute the insubordination of those men. The attempts of the boers to escape from the Dutch power, and so form an independent government beyond the borders of the colony, especially in the district since called Graaff-Reinet, are strikingly similar to their proceedings at a later date under the British government. 5*th.* The Gamtoos River formed the boundary between the Hottentot and Kafir races, and was early adopted by the Dutch as their eastern limit; but about the year 1740 they began to pass this river, and came into collision with the Kafirs, and in 1780 extended their frontier to the Great Fish River.

In 1795 the colonists, having imbibed the revolutionary principles then prevailing in Europe, attempted to throw off the yoke of the Dutch, upon which the British sent a fleet to support the authority of the Prince of Orange, and took possession of the country in his name. As, however, it was evident that Holland would not be able to hold it, and that at a general peace it would be made over to England, it was ruled by British governors till the year 1802, when, at the peace of Amiens, it was again restored to Holland. In 1806, on renewal of the war, it was again taken by the British under Sir David Baird, and has since remained in their possession, having been finally ceded by the king of the Netherlands at the peace of 1815.

A summary of the chief events which have taken place since 1806 may be given under the following heads:—

1*st. The Kafir Wars.*—The first of these wars took place in 1811–12; the second in 1819, when the boundary of the colony was extended to the Keiskamma. The third occurred in 1835, under Sir Benjamin D'Urban, when the boundary was advanced to the Kei; but on the recall of that officer, the country between the Kei and Keiskamma rivers was restored to the Kafirs. The fourth Kafir war took place in 1846, and, after being conducted by governors Maitland and Pottinger, it was terminated by Sir Harry Smith in 1848. The fifth war broke out at the end of 1850, and after being for some time carried on by Governor Sir H. Smith, it was conducted in 1852 by Governor Cathcart. A somewhat more detailed account of these wars will be found under the head of KAFRARIA.

2*d.* In 1820, Scottish emigrants, to the number of 5000, arrived at Algoa Bay, and laid the foundation of the settlements on the eastern frontier which have since become the most thriving part of the colony, and includes the important town of Graham's Town and Port Elizabeth.

3*d.* In 1834 the great measure of slave emancipation took effect in the Cape Colony, and has been of immense service in raising the character and condition of the Hottentots and other races before held in bondage. These people keep the anniversary of this great event as a holiday, which they enjoy in pleasure parties and innocent amusements. We have more than once been present on these occasions, and have had pleasure to observe, by their sober and orderly conduct, that they knew how to enjoy without abusing the blessings of freedom.

4*th.* The disaffection of the Dutch boers. In 1835-6 a large number of these people resolved to free themselves from the British government by removing with their families beyond the limits of the colony. With this object they sold their farms, mostly at a great sacrifice, and crossed the Orange River into the territories chiefly inhabited by tribes of the Kafir race. After meeting with great hardships and varied success in their contests with the natives, a part of their number, under one Peter Retief, crossed the Drackenberg Mountains and took possession of the district of Natal, where they established a republican government, and maintained their ground against powerful nations of Zulu Kafirs till 1842, when they were forced to yield to the authority of the British government, which took possession of Natal.

The boers beyond the Orange River and west of the Drackenbergs still, however, retained a sort of independence till 1848, when, in consequence of the lawless state of the country, and the solicitation of part of the inhabitants, the governor, Sir Harry Smith, declared the supremacy of the crown over the territory, which was thenceforth called the Orange River Sovereignty. Shortly after this, in consesequence, as it is alleged, of certain acts of the British government in Natal, Andrew Pretorius, an intelligent boer of that district, crossed the Drackensberg Mountains with his followers, and after being joined on the western side by large numbers of disaffected boers, he raised the standard of rebellion. Upon this the governor, Sir H. Smith, crossed the Orange River at the head of a detachment of troops, and encountered and defeated the rebels in a short but brilliant skirmish at Boem Plaats. After this Pretorius and the most disaffected part of the boers retreated to beyond the Vaal River (the northern limit of the sovereignty), where they established a government of their own. They were subsequently, in 1852, absolved from their allegiance to the British crown by treaty with the governors and her Majesty's commissioners for settling frontier affairs.

In 1853–54, in consequence of the troubled state of the Orange River Sovereignty, and the difficulty of maintaining with becoming dignity the authority of her Majesty there, it was resolved to abandon the country to the settlers, mostly Dutch boers. This was carried into effect by a special commissioner, Sir George Clerk, K.C.B., sent from England for the purpose; and the country, under the name of the Orange Free State, is constituted a republic, with a president at its head, assisted or controlled by an assembly called the Volksraad (people's councils), elected by nearly universal suffrage.

The chief causes of the disaffection of the boers, and their emigration from the colony, are supposed to have been, 1*st*, the emancipation of their slaves in 1834; 2*d*, the supposed too lenient policy adopted by the British government towards the Kafirs, and more especially the reversal of Sir Benjamin D'Urban's policy by Lord Glenelg in 1837. Without at all denying that these and other measures of the government were the immediate moving causes of the migration, there is little doubt that the germ of the disposition to remove out of the colonial boundary, and shake off government control, was engendered in the boers by the policy of the government of our predecessors the Dutch.

5*th*. *The Convict Agitation.*—After the government had felt itself compelled to discontinue the sending of convicts to New South Wales and Van Diemen's Land, the subject of transportation became one of great difficulty, more especially at a time when an unusually large number of prisoners was on its hands in consequence of the prosecution arising out of the disturbed state of Ireland. Under these circumstances an order in council was passed in 1848, under authority of the Act 5th Geo. IV., authorizing the secretary of state to send certain convicts to such colonies as he might think proper. A circular was sent by Earl Grey, then colonial secretary, to the governor of the Cape (among other colonial governors), requesting him to ascertain the feelings of the colonists regarding the reception of a certain class of convicts. It should be borne in mind, 1*st*, that the proposal to send convicts to the Cape did not originate with Lord Grey—the same project had been entertained by several of his predecessors in office; 2*d*, that some of the most influential popular leaders at the Cape had, some years before, suggested the employment of British convicts in the building of a breakwater at Table Bay; 3*d*, that it is shown, by the correspondence which has been published, that Lord Grey was influenced in this proceeding by a desire to benefit both the convicts and the colony to which they were to be sent. For he informed the governor that the wives and children of the convicts, and also free emigrants, in proportion to the number of convicts, would be sent out at the expense of the mother country; and further, that to guard the convicts, military pensioners would be sent out, who, with their families, would settle in the colony, whereby the supply of labour and the security of the country would be increased. It should further be remembered, that the convicts proposed to be sent were not of the worst class, but men convicted of crimes to which they had been incited by famine or wrong-headed political opinion, or men who had undergone some probationary imprisonment, and were supposed to be in some degree reformed. Unfortunately, owing to some misunderstanding, a vessel, the Neptune, was despatched to the Cape before the opinion of the colonists had been received, having on board 289 convicts, among whom were John Mitchell, the Irish rebel, and his colleagues. When the news reached the Cape that this vessel was on her way, the people of the colony became violently excited; and, goaded to fury by the inflammatory articles in the local newspapers, and guided by a few demagogues, they established what was called the *Anti-Convict Association*, by which they bound themselves by a pledge to cease from all intercourse of every kind with persons in any way connected "with the landing, supplying, or employing convicts." People who refused to take this pledge were also subjected to great annoyance and petty persecution. The banks, the government contractors, and a large number of the farmers and dealers about Cape Town were thus pledged. On the 19th of September 1849, the Neptune arrived in Simon's Bay; and when the intelligence reached Cape Town, the people assembled in vast masses, and their behaviour was violent and outrageous in the extreme. The governor, after adopting several resolutions, and again abandoning them under the pressure of popular agitation, agreed not to land the convicts, but to keep them on board ship in Simon's Bay till he received orders to send them elsewhere. Even this concession did not satisfy any but a small number of more moderate men. The mass of the population, under the guidance or domination of a few agitators, continued to do all in their power to prevent the convicts and all the officers of the government from obtaining supplies. Tradesmen and others were prohibited from selling to the proscribed class even the commonest necessaries of life. When the home government became aware of the state of affairs it immediately sent orders directing the Neptune to proceed to Van Diemen's Land, and the agitation ceased.

Upon an impartial review of these proceedings, the conduct of the people of the Cape appears utterly indefensible. Granting, what, however, may be open to discussion, that the project of sending convicts to the Cape was wrong, it was evidently formed with no disregard to the interests of that colony; and it is also clear that a temperate statement of their views on the part of the colonists would have secured its instant abandonment.

This agitation did not, however, pass away without important results, since it led to another agitation, the object of which was to obtain a free representative government for the colony. This concession, which had been previously promised by Lord Grey, has been granted by her Majesty's government; and, in 1853, a constitution was established of almost unexampled liberality. Whether this constitution, in its present form, is suited to the colony, time alone can determine; but the free expression of the opinions of the colonists through their representatives will, it is to be hoped, prevent the repetition of such disgraceful proceedings as marked the convict agitation.

Divisions, Towns, and Villages.—The colony is divided at present into two provinces, which are further divided into divisions. The western province comprises the divisions of Cape Malmesbury, Stellenbosch, Paarl, Worcester, Swellendam, Caledon, Clanwilliam, George Beaufort. The eastern province includes the divisions of Albany, Fort Beaufort, Graaff-Reinet, Somerset, Colesberg, Cradock, Witenhage, Port Elizabeth, Albert and Victoria. We have not space for description of each of these divisions. We shall therefore give a brief account of such of them as merit particular attention.

The Cape division, the oldest and most important, includes Cape Town, Wynberg, Constantia, and Simon's Town. It is remarkable for the beauty of its scenery. Its most prominent features are the Cape Peninsula and Table Mountain. The former is a narrow neck of land about 32 miles long by 6 to 8 broad, formed by a series of rugged, broken mountains. Its extreme point is the celebrated Cape of Good Hope. The Table Mountain, with its branches, the Devil's Mountain and the Lion's Rump, rises immediately at the back of Cape Town. Its greatest height is 3582 feet. During the prevalence of certain winds it is covered by a dense whitish cloud, partially overlapping its sides like a table-cloth. Along the base of this mountain, where lie the villages of Rondebosch, Wynberg, and Constantia, the land is covered with luxuriant vegetation, including oaks and firs of great size, and is studded with villas, the abodes of official persons and others engaged in business in Cape Town. The neighbourhood is remarkable for the abundance and variety of its flowers and shrubs, especially of heaths, of which there is great variety. The division produces corn of good quality, and a considerable quantity of wine, including the famous Constantia, made at the village of that name.

Cape Town lies at the bottom of Table Bay, and at the foot of Table Mountain, and about 32 miles N. of the Cape of Good Hope. The streets are laid out at right angles; some of them are adorned with trees. The houses are generally built of brick, faced with stucco. Some of them in the older parts of the town are decorated with cornices and architectural devices, and have in front raised platforms of stone or brick called stoeps, about six to eight feet wide, and two or three feet above the level of the street. Here the inhabitants used to sit and enjoy the air and converse with their friends. The interior of the house is generally spacious and commodious. There is a castle and several batteries for the defence of the town and harbour, and jetties are erected for landing goods. There are various public buildings, the chief of which are the Government House, the Colonial Office, the Post-office, the Barracks, the Commercial Exchange, and the Public Library. There is a broad public walk, shaded by large oak trees, on one side of which are the gardens of Government House, and on the other the botanical garden, stocked with a great variety of valuable plants. There are churches and chapels belonging to the Church of England, the Dutch Reformed, the Scotch, Roman Catholic, Lutheran, Wesleyan churches, and other denominations. The Dutch Reformed church is capable of holding 2000 persons, and the English cathedral upwards of 1000. The Roman Catholic church is also a handsome and spacious building. The population is about 25,000.

The division of Stellenbosch contains a very pretty village of the same name, a favourite resort of strangers and invalids. It is only a few hours' drive from Cape Town, with which it is connected by an excellent road. The division of Caledon has some warm mineral springs containing muriate of soda and iron. Their heat is 98° and 117° of Fahrenheit, and their waters are used both internally and as baths. They are very beneficial for rheumatism, and diseases of the skin. In the division of Swellendam is Cape Agulhas, the most southern point of Africa. In this division there are two warm mineral springs.

The Eastern Province.—The greater part of this district of country was, at the beginning of this century, in the possession of the Kafirs, and it can hardly be said to have been settled before 1820, when a large number of emigrants arrived chiefly from Scotland. It is now the most prosperous part of the colony. The most important places in it are Graham's Town and Port Elizabeth.

The former is situated on a plain surrounded by low sandstone hills covered with grass, but bare of trees except in the ravines or foldings of the hills. The town is large and straggling; its streets are laid out at right angles. In some of them are rows of oak trees. There are many handsome shops, numerous churches and chapels, but no public buildings worthy of special notice. The town is the head-quarters of the military stationed in the colony. It is now also the see of a bishop, whose authority extends over the Eastern Province and Kafirland.

The town of Port Elizabeth on Algoa Bay is built along the base and up the sides of the low hills which overlook the bay. Viewed from the sea, owing to the newness and uniformity of its houses, it reminds one of the mimic towns built by children with toy houses. The houses, however, are substantially built in the English style, and the streets contain good shops. There are Church of England, Roman Catholic, Wesleyan, and Independent churches, some of them handsome edifices. The town possesses banks and three newspapers. Its population is about 6000.

Population.—The total population of the colony is stated in the returns as 217,921, of which 118,088 are persons of colour. The latter consist of Hottentots (so called), Malays, Negroes, and Kafirs. The white population is chiefly composed of colonial Dutch and British.

The aborigines of the country had originally the generic name of Quæquæ, and received the name of Hottentots from the Dutch. Owing to intermarriages with Malays, negroes, and others, and illicit intercourse with whites, the race has lost much of its distinctive character. Indeed, a pure Hottentot is scarcely to be found in the colony, although the people, in whom the blood of that race preponderates, are still known by that name. There is no return of their number, but we do not think it can exceed 25,000.

The Malays were introduced by the Dutch as slaves; their descendants still retain the Mohammedan religion, and most of the distinctive habits and customs of their race. We have no means of ascertaining their number, but it cannot be large. They reside for the most part in the Cape division. The negroes are mostly from the eastern coasts of Africa.

The Kafirs residing within the colony are chiefly composed of the section of them called Fingoes, who originally came from Natal and its vicinity, whence they were driven by Chaka, king of the Zulus, and took refuge with Kafirs on the frontier of the Cape Colony, by whom they were reduced to serfdom, from which they were liberated by Sir Benjamin D'Urban, and have, up to this time, remained faithful allies of the British. Their number may be about 25,000.

The exact proportion which the white population of Dutch descent bears to the British is not known; but there is no doubt that it still greatly preponderates. We have called these people Dutch for sake of convenience, as they speak that language, but many of them are descended from Europeans of other countries—a considerable number from the French refugees. The latter have lost the language, but still retain the names of their forefathers, such as Du Plessis, De Villiers, Marais, and others. The British and their descendants require no special remark.

Government, local and general.—Prior to 1827, there existed in the several districts or divisions of the colony, an institution established by the Dutch, called the Board of Landrost and Heemraaden. The former was the chief magistrate of the district, appointed and paid by the government. The latter was a council to assist him, composed of respectable inhabitants appointed by the governor, on the recommendation of the Landrost. These boards not only had the administration of the local affairs usually entrusted to municipal bodies, but they also possessed extensive judicial authority. In consequence of abuses, more especially in the exercise of the latter functions, these institutions were in 1827 abolished, and the present system established. By this, every division is presided over by a civil commissioner, whose duties as such are chiefly of a financial nature, such as collecting the inland revenue, paying salaries, and other disbursements of the government in the division. For judicial purposes many of the divisions are subdivided into two or more districts, each with an officer called the resident magistrate, possessing a limited civil and criminal jurisdiction. The civil commissioner is always the resident magistrate of the division; or, if that be divided into districts, of the district in which he resides. The districts are again subdivided into a number of smaller divisions called Feld cornetcies, over each of which is an officer called Feld cornet, whose duties nearly resemble that of a high bailiff or chief constable.

Prior to 1835 the whole authority of the general government was vested in the governor, assisted by a small council of officials. In that year a legislative council was established, consisting of certain government officials, and six persons nominated by the crown. An executive council was also established to assist the governor in executive matters, consisting of certain high officers of government,—such was the form of government till 1853, when the legislative council as thus established was abolished, and a new constitution introduced. Under this, the legislature consists of the governor and two chambers, called the legislative council and the house of assembly, both elected by the people. The former body is composed of eight members for the western, and seven for the eastern province, chosen by the whole body of electors of those provinces. To qualify a man to be elected for this chamber, he must possess property in land worth L.1000 clear of charges, or L.2000 in landed and personal property together; he must be thirty years of age, and must have been invited to become a candidate by written requisition, signed by not less than twenty-five electors. Another peculiarity in this election is, that any elector may give all his votes (that is, as many as there are members to be chosen) to one candidate, or he may distribute them among two or more candidates as he pleases. The object of this provision is believed to be to permit the minority to be represented. The council is elected for ten years, but so that half its number, as near as may be, go out every five years.

The legislative assembly is chosen by the electors of the town, and electoral districts into which the colony is divided. The candidates have to be proposed and seconded at the hustings as in England. There is no property qualification required of the candidates. The assembly consists of forty-six members, and is elected for five years.

The qualification of electors of both houses is the same, namely, the occupation of fixed property worth L.25.

The colonial secretary, the attorney-general, the treasurer, and the auditor, may sit and take part in the discussions in both houses, but they are not entitled to vote in either.

The governor may dissolve both houses, or he may dissolve the house of assembly without dissolving the council. He may give or refuse his assent to bills in the Queen's name, or he may reserve them for the decision of her Majesty. The Queen may disallow any bill assented to by the governor at any time within two years of its receipt.

It is further provided, that all bills appropriating any part of the revenues must be recommended to the house of assembly by the governor.

Religion.—The chief religious bodies in the colony are, —1*st*, The Dutch Reformed Church, which comprises the entire Dutch population, including a large number of Hottentots and other persons of colour, has about 60,000 adherents. In form of church government and in devotion it closely resembles the Church of Scotland, to which country a considerable number of its ministers belong. 2*d*, The Church of England. In 1847 a bishop of Cape Town was appointed to preside over the church, whose diocese extended not only over the Cape Colony and Natal, but also over the Island of St Helena. Recently, however, separate bishops have been appointed for Eastern Province and Natal. The members of this church in the colony are stated to be about 12,000. 3*d*, The Scotch Presbyterians are a comparatively small body, and in the rural districts especially, its members are absorbed in the Dutch Reformed Church. 4*th*, The Wesleyans are a large and very respectable body, especially in the Eastern Province. Their number is stated to be about 10,000. 5*th*, The Roman Catholics number about 3500 adherents. Their church is ruled by two bishops; one living at Cape Town, the other at Graham's Town. 6*th*, The Independents number about 7000; and the Lutherans about 1500.

Besides these bodies there are several foreign missions in the colony having numerous followers: the most important are the Moravians, who have been established there since 1732, and have laboured hard to convert the coloured races. The government recognizes no particular body as the established church, but it contributes to the support of the clergy of most of the denominations of Christians.

Education.—A good system of education has been established by the government, and there is a free school in every district. Two colleges have also been established, one called the South African College, the other, an excellent institution, called the Bishop's College, was founded by Bishop Gray.

Trade.—The following table, giving the amount of imports and exports in several years, taken at intervals, exhibits the progress of the commerce of the colony:—

Year.	Imports.	Exports.	Shipping.
			Tons.
1836	L.541,038	L.362,280	134,875
1840	732,494	775,060	184,442
1849	944,535	594,920	204,049
1850	1,277,101	637,252	224,126
1853	1,651,597	1,064,884	323,884
1854	985,266	691,352	

These exports do not entirely consist of colonial produce, but partly of goods re-exported. The value of colonial produce alone exported during 1853 was L.732,245, of which L.297,346 was from Cape Town, and L.435,899 from Port Elizabeth. The amount of tonnage, however, of vessels entering Table Bay is much greater than that entering Port Elizabeth, on account of the large number of Indiamen and other vessels calling at the former for provisions; but the actual trade of the latter is much greater, as shown by the exports.

The following is a table of the chief articles of colonial produce and manufactures exported during 1853, from Cape Town and Port Elizabeth respectively:—

	Port Elizabeth.	Cape Town.		Port Elizabeth.	Cape Town.
Aloes	L.1,250	L.1,546	Hides	L.9,136	L.7,304
Argol	—	1,161	Horns	1,022	1,383
Beef and pork	2,309	3,709	Horses	—	8,414
Butter	1,360	642	Ivory	12,143	75
Copper ore	—	3,463	Mules	—	894
Corn and meal	—		Oil	—	566
Barley	—	1,061	Goat skins	8,426	12,626
Beans & pease	79	1,577	Seal skins	—	69
Bran.	—	2,865	Sheep skins	2,327	11,959
Flour	—	29,783	Spirits, Brandy	—	3,352
Oats	5	18,709	Tallow	1,387	494
Wheat	—	250			
Feathers	1,519	3,309	Wine, Constantia	—	66
Fish (cured)	398	9,876	Ordinary	—	26,799
Fruits (dried)	—	20,274	Wool	390,637	110,498

The most important export is wool, and the following table shows the progress of the export of this article:—

	Port Elizabeth.	Cape Town.
1833	39,753 lbs.	73,324 lbs.
1843	1,220,380	534,377
1853	6,160,916	1,703,692

There were imported into London from the Cape territories 22,706 bales of wool in 1853; 22,602 in 1854; and 28,087 in 1855.

By the summary of an official table in the *Cape Government Gazette*, the Custom-house returns of goods imported for the first six months of 1854 and 1855 give the following results:—For the first six months of 1854, goods imported, L.879,788; for the same months of 1855, L.622,218—making for those twelve months, L.1,502,006. Goods entered for consumption for the first six months of 1854, L.827,702; for the same months of 1855, L.643,485—for those twelve months, L.1,471,187. The exports of articles the produce of the colony for the first six months of 1854 were valued at L.315,579; for the same months of 1855, at L.440,816—for those twelve months, L.756,395. The excess of imports for consumption over the estimated value of colonial produce exported during the twelve months referred to is thus shown to be L.714,792.

In these returns we have the amount of customs-duties collected only for the first six months of 1855. They amount to L.31,770 for the first quarter; and to L.35,106 for the second—total for six months, L.66,876. The two chief articles of export are wool and wine. On both the increase has been very great. The wool exported during the first six months of 1854 was valued at L.221,865. In the same months in 1855, at L.297,885. The wine for the same months respectively was valued at L.13,425 and L.33,169. Wine was once the staple export, amounting in seven years to between L.80,000 and L.100,000. The quantity produced is supposed to be as great as ever it was, but it has found a more profitable market within the colony. The wool of the eastern and middle districts is indirectly exchanged for the wines, dried fruits, and flour of the western division.

Copper ore is a new article of export. For the first six months of 1854 this export was valued at L.4720; in 1855, at L.14,179.

The revenue of the colony is derived chiefly from customs-duties, stamp and auction duties, and a direct tax called transfer dues, at the rate of 4 per cent. on the purchase money of all landed property sold, whether by auction or privately. The expenditure is for payment of salaries of the officials and other disbursements incidental to the support of the civil government. The military expenditure is at present borne by the imperial treasury. The subjoined table shows the progress of the revenue and expenditure :—

	Revenue.	Expenditure.
1832	L.130,808	L.126,889
1842	226,261	226,025
1852	289,482	252,495
1853	308,472	268,111

The construction of good roads of late years, by the judicious employment of the convicts, the establishment of road boards, and other measures for the same object by the late able colonial secretary, Mr Montagu, have tended greatly to develop the resources of the colony, and to increase its commerce and revenue. (B. C. P.)

GOODWIN SANDS, a range of sandbanks lying about 4 or 5 miles off the east coast of Kent, between the North and South Forelands. They are about 10 miles in length from N. to S. and vary in breadth from 1½ to 3 miles. They are divided into two portions by a narrow channel, navigable by small boats. They are in many places dry at low water, and from their shifting and loose nature are very dangerous for shipping. Between them and the mainland is the roadstead termed the Downs. These sands are said to have at one time formed part of the Kentish land, and to have been submerged about the end of the reign of William Rufus, or the beginning of that of Henry I. Several light-vessels are fixed here as beacons; and during foggy weather gongs are sounded every ten minutes.

GOOLE, a market-town and river-port of England, west-riding of Yorkshire, on the right bank of the Ouse, 22 miles W. of Hull. Not many years ago, Goole was an obscure hamlet. Its situation on a navigable river, the opening of the Aire and Calder Canal to Ferrybridge, its being made a bonding port in 1829, the erection of its docks, and the completion of the Goole, Pontefract, and Wakefield Railway, have all contributed to its rapid rise. The docks of Goole constitute its most important feature. The ship-dock is 600 feet long and 200 wide, with a depth of 18 feet water; the barge-dock is 900 feet long by 150 wide, and could contain 200 vessels, averaging 50 or 60 tons each. There is a commodious dock for large steam-vessels, a large dry dock, and a patent slip for repairing vessels. The basin or entrance harbour is 250 feet long by 200 wide, with a depth of 9 feet water. There are extensive bonding warehouses for grain and other goods. The town itself is well built; a handsome church with a lofty tower, and a neat custom-house, are its chief public buildings. Market-day, Wednesday. On 31st December 1853, 512 sailing vessels of 33,865 tons, and 9 steamers of 707 tons, were registered at the port; and during that year, 2091 sailing vessels of 129,006 tons, and 115 steam-vessels of 20,316 tons entered, and 1993 sailing vessels of 111,428 tons, and 165 steam-vessels of 27,386 tons, cleared at the port. Pop. (1851) 4722.

GOOMSUR, a town of Hindustan, at the N.W. extremity of the Northern Circars, 43 miles N.W. from Ganjam. The town and neighbouring country formerly belonged to a native chief tributary to the British, who, failing in his feudal obligations, and rising in rebellion, was deprived of his possessions by the paramount power. This event occurred in 1835. The place had acquired an infamous celebrity from the encouragement afforded by its native rulers to the perpetration of human sacrifices; and upon its transfer to its new masters, measures were adopted for the suppression of the horrible practice. Several chiefs of the adjacent frontier tracts have entered into formal engagements to abandon the inhuman practice on condition of British protection; and the barbarous rite may now be regarded as effectually suppressed. The town of Goomsur is in N. Lat. 19. 50., E. Long. 84. 40.

GOOMTY, a river of Hindustan, so named from its winding course, having its source in the British district of Shahjehanpore, whence it flows in a S.E. direction through the province of Oude, and passes by the city of Lucknow, where it is navigable, and crossed by a bridge of stone. From Lucknow the river continues in a south-easterly direction, passing the towns of Sultanpore and Jounpore, and after a total course of 480 miles, during which it receives the waters of several tributary streams, it falls into the Ganges in N. Lat. 25. 29., E. Long. 83. 15.

GOORGAON, a town of Hindustan, giving name to one of the districts subject to the jurisdiction of the lieutenant-governor of the N.W. provinces. The district is bounded on the N. by the Jaghire or feudal possession of Jujhur, and the British district of Delhi, on the E. by the River Jumna, on the S. by the native state of Bhurtpore, and on the W. by the territory of Tijarra. It lies between N. Lat. 27. 40. to 28. 30., E. Long. 76. 21. to 77. 35., and contains an area of 1939 sq. miles. The population, according to the census of 1853, amounts to 662,486, of whom 460,774 are Hindus, and 201,712 Mohammedans. The greater part of the district of Goorgaon passed to the British by the treaty of Serjee Anjengum, dated 30th December 1803, by which Doulut Rao Scindia ceded to the East India Company his territories northward of those of the rajahs of Jeypore and Joudpore, and of the Ranah of Gohud. Part of it, containing about 180 square miles, was held in Jaghire by the Kashmirian adventurer, Zebal Nissa, more generally known under the name of the Beegum Sumroo, and lapsed to the British on her death in 1836. Another portion of about 200 square miles, termed the Jaghire of Ferozepore, from its principal place, was held with Loharoo, by Shumsuddeen Khan, who took it by descent from Ahmad Buksh Khan, to whom it had been granted by the British government early in the present century, on account of services rendered against the Mahrattas. Shumsuddeen Khan having, with the view of defeating certain contemplated measures, which would have affected his Jaghire, caused the murder of Mr William Fraser, the British political agent at Delhi, he was hanged at that city in October 1835, and his Jaghire forfeited. Loharoo was, by the British government, bestowed on the offender's half-brothers, but the territory of Ferozepore was incorporated with the district of Goorgaon. The town of Goorgaon is in N. Lat. 28. 28., E. Long. 77. 5.

GOOSE. See index to ORNITHOLOGY.

GOOSEBERRY. See HORTICULTURE.

GOPPINGEN, a town of Würtemberg, circle of the Danube, on the right bank of the Fils, 22 miles E.S.E. of Stuttgart. It has an old castle, a town-hall, a handsome church, and mineral baths; also manufactures of woollen and linen cloth, and an active trade in wool. Pop. 5035.

GORCAH, or Ghoorcah. See Nepaul.

GORCUM, or Gorkum (Dutch, *Gorinchem*), a town of Holland, province of South Holland, on the right bank of the Meuse, at the influx of the Linge, by which it is intersected, 22 miles E.S.E. of Rotterdam. It is surrounded by walls, and has an old town-house, prison, custom-house, barrack, arsenal, and military hospital. The charitable and benevolent institutions are numerous. There is also a library and several learned associations. Gorcum possesses a good harbour, and carries on a considerable trade in grain, hemp, cheese, potatoes, and other agricultural produce. Pop. (1850) 8780.

GORDIAN KNOT See Gordium.

GORDIANUS, Marcus Antonius Africanus, was a member of one of the noblest and wealthiest families of Rome, and gained unbounded popularity by the magnificence, games, and shows, with which he amused the people during his quæstorship. He was proconsul of Africa in A.D. 237, when that province rebelled against Maximin; and so popular had been his rule, that he was then saluted emperor. After much reluctance, he accepted the proffered dignity, though upwards of eighty years old, insisting only that his son should be conjoined with him in office. The two had barely been installed as emperors at Carthage, when Capellianus, a general of Maximin, hastily collecting troops, marched against them, defeating and slaying the younger in battle. His father, hearing the news of his death, strangled himself. They had scarcely enjoyed their imperial honours two months. Both the Gordians were fond of literature, and were themselves the authors of several books. They were both men of considerable accomplishments; but rather intellectual voluptuaries than able statesmen or powerful rulers.

Gordianus, M. Antonius, surnamed Pius, was grandson of the elder Gordian, and raised to the empire at thirteen years of age; and when Maximus and Balbinus fell in an insurrection of the soldiers, he was left sole emperor. Having married Fabia Sabina Tranquillina, the daughter of his master of rhetoric, he appointed his father-in-law, Misitheus, prefect of the prætorian guards, and through his assistance emancipated himself from the hands of his mother's eunuchs. Misitheus proved himself an able minister, and discharged the military duties of his office with vigour and ability. He induced the young emperor to proceed against the Persians, who had invaded Mesopotamia; and during the whole of the expedition Misitheus watched over the safety and discipline of the army. He was suddenly cut off, however, and the suspicion was general that he had been poisoned by Philip, his successor in the prefecture. A short time afterwards a sedition broke out among the soldiers, which was fomented by this same Philip, and Gordian was killed, A.D. 244, near the conflux of the Euphrates with the little river Aboras. (See *L'Histoire des quatre Gordiens*, par Abbé Dubois; also Caspar, *Historia trium Gordianorum*, Deventer, 1697.)

GORDIUM, in *Ancient Geography*, a once large and important city of Asia Minor, on the confines of Bithynia and Galatia, a few miles north from the right bank of the Sangarius. It was at one time the residence of the old kings of Phrygia, and a place of considerable note, but it dwindled down into a mere village, and was at length rebuilt by Augustus, who called it Juliopolis. Its name has been preserved by the story of the Gordian knot, which it was foretold that he who should first untie should receive the empire of Asia. Alexander the Great, in the course of his eastern conquests, arriving at Gordium, cut the knot with his sword, and applied the oracle to himself.

GORDON, Robert (1786–1853), an eminent Scottish preacher and theologian, was a native of Glencairn in Dumfriesshire. At the early age of sixteen he succeeded his father as schoolmaster of the parish, and held this office till he removed to Edinburgh, to carry out his plan of studying for the church. Difficulties and hardships almost incredible impeded and embittered the years of his student life; but he overcame them all, and after being ordained was appointed one of the masters in the Perth Academy. He now devoted peculiar attention to the exact sciences, and contributed largely to many of the scientific periodicals of the day. In 1816 he became minister of Kinfauns in Perthshire, whence he removed in 1820 to Edinburgh, in which city he held some minor charges, till he was translated in 1830 to the High Church. He joined the Free Church at the time of the Disruption, and, indeed, contributed not a little to accelerate that movement. He died in 1853. As a preacher Dr Gordon was surpassed by few pulpit orators of his day in Scotland. His chief contribution to theology is a posthumous collection of discourses, entitled, *Christ as made known to the Ancient Church*.

Gordon, *Thomas*, a political and miscellaneous writer of democratic principles, was born in 1684, at Kirkcudbright in Galloway. At an early age he removed to London, where he maintained himself by teaching languages. Some of his political writings attracted the notice of the Earl of Oxford, who is said to have employed his pen. His death took place in 1750. It was almost simultaneous with that of Conyers Middleton; and when both were announced together to Lord Bolingbroke, he is said to have observed, "Well, then, we have lost the best and the worst writers in England." Gordon's political writings, it is true, were often coarse and needlessly violent; but his name bids fair to be kept alive by his translation of Tacitus in two vols. fol., 1728–31.

GORE, in *Heraldry*, one of the abatements, which, according to Guillim, denotes a coward. See Heraldry.

GOREE, a small island on the W. coast of Africa, belonging to the French, immediately S. of Cape-de-Verd, in N. Lat. 14. 39., W. Long. 17. 26. It is about three miles in circumference, and has a small sandy bay on the N.E. side. On an elevated plateau in the centre is Fort St Michael, which commands the town. The town occupies more than two-thirds of the island. The island is deficient in water, but is said to be healthy. It is an entrepôt for Senegal gum, ivory, gold dust, and other productions of the coast. Pop. nearly 5000, comprising a few Europeans.

GORGE, in *Architecture*, the narrowest part of the Tuscan and Doric capitals, between the astragal, above the shaft of the pillar and the annulets.

Gorge, in *Fortification*, the entrance into any piece of fortification, consisting of the distance or space between the extremities of the two faces; as between the faces of a half-moon, redoubt, or bastion.

GORGED, in *Heraldry*, bearing a crown, coronet, or the like, about the neck.

GORGET, a piece of armour for defending the neck. Also a small ornament shaped somewhat like a half-moon, formerly worn by officers on the breast.

Gorget, in *Surgery*, a cutting instrument used in lithotomy. Also a cannulated conductor, called a *blunt-gorget*.

GORGONS, in *Grecian Mythology*, three sisters of terrible aspect and fierce disposition, but who do not seem to have had any special function. Homer makes mention of only one, who is described as dwelling in Hades. Hesiod, however, extends the list to three, calling them daughters of Phorcys and Ceto, and naming them Stheino, or Stheno, Euryale, and Medusa. Of these the last alone was mortal. They dwelt in the Western Ocean, according to Hesiod, but most writers place them in Libya. They are described as monsters with immense claws and teeth, sometimes with wings, and coiled round with snakes, hissing and quivering their forky tongues. Medusa is generally represented as a woman with snakes wreathed round her temples instead of hair, and presenting so fearful an appearance, that the sight of her turned into stone every living being that looked upon her. After Perseus had slain her, he cut off her head, which Minerva fastened in the centre of her ægis. The origin of the idea of the Gorgons has never been satisfactorily explained.

GORITZ (German *Görz*, Italian *Gorizia*), a town of Illyria, capital of a cognominal circle in the government of Triest, on the Isonzo, 22 miles N.N.W. of Triest. It consists of an upper and a lower town; the upper town is the more ancient, is surrounded by walls, and contains the old castle of the counts of Görz, now partly in ruins and partly used as a prison. The lower town is generally neat and well built. Goritz is the seat of an archbishop, and has a fine cathedral, several churches and monasteries, episcopal palace, court-house, town-house, and an elegant theatre. An old Jesuit college has been converted into a barrack. There are several literary and benevolent institutions, and an episcopal seminary for the government of Triest. The chief manufactures are leather, sugar, and silk. Pop. (1851) 10,851.

GORLITZ, a walled town in the Prussian province of Silesia, government of Liegnitz, capital of a cognominal circle on the left bank of the Neisse, 52 miles W. of Liegnitz, and 56 miles E. of Dresden, on the railway between these two towns. It is pleasantly situated, and is generally well and regularly built, and has three suburbs. It has eight churches, that of St Peter being a very fine edifice, a town-house, a house of correction, orphan asylum, three hospitals, a public library of 9000 volumes, a gymnasium, Moravian training institution, and several literary and scientific associations. It has also manufactures of linen and woollen cloths, and a considerable trade in grain and other agricultural produce. Pop. (1849) including the military and the suburbs, 19,032.

GORT (literally *garden*), a market-town of Ireland, county of Galway, 18 miles S.E. of the town of that name. The town is generally neat and regular, and the three principal streets diverge from a square which forms the market-place. The chief public buildings are the parish church, a Roman Catholic chapel, a district bridewell, and an infantry barrack. Market-day, Saturday. Pop. (1851) 5145, including 2637 in workhouse.

GORTHO, the modern name of the ancient city of Corinth, of which word it is a corruption. See Corinth.

GORTYNA or Gortyn, in *Ancient Geography*, a large and important city on the southern side of the island of Crete. It stood on the banks of the small river Lethæus at a short distance from the sea, with which it communicated by means of its two harbours, Metallum and Lebena. Near the town was the famous fountain of Sauros, inclosed by fruit-bearing poplars; not far from which was another spring, overhung by an evergreen plane-tree which marked the scene of the amours of Jupiter and Europa. Gortyna was, after Cnossus, the largest and most powerful city of Crete. The two cities combined to subdue the rest of the island; but when they had gained their object they quarrelled with each other; and the history of both towns is from this time little more than a record of their feuds. Neither plays a conspicuous part in the history of Greece.

GORUCKPORE, a town of Hindustan, and chief place of the British district of the same name, lying within the limits of the lieutenant-governorship of the north-western provinces. It is situated on the eastern bank of the Raptee River, which is navigable for boats at all seasons of the year. A few of the houses are of brick, but the larger portion, though tiled, have mud walls. On the east side of the town, and on the highest ground that could be appropriated for the purpose, is the cantonment of the British troops. Pop. (by census of 1853) 54,529. The district, of which this place is the principal town, is bounded on the N. by the kingdom of Nepaul, on the E. and S.E. by the British district of Sarun, on the S. by that of Azimghur; and on the W. by the native state of Oude. It lies between N. Lat. 26. 7., 27. 30., E. Long. 82. 12., 84. 30., and includes an area of 7340 square miles. The population amounts to 3,087,874; of these, 2,716,775 are Hindus, and 371,099 Mohammedans. The tract constituting this district was formerly part of the territory of Oude, and was transferred by the vizier to the East India Company in 1801 in commutation of subsidy. The town of Goruckpore is in Lat. 26. 42., Long. 83. 23.

GOSHEN, a province or district of Egypt, in which Jacob and his family settled through the instrumentality of his son Joseph, and in which they and their descendants remained for a period of 430 years. That Goshen lay on the eastern side of the Nile may be justifiably inferred from the fact that Jacob is not reported to have crossed that river; nor does it appear that the Israelites did so in their flight out of Egypt. By comparing Exod. xiii. 17, and 1 Chron. vii. 21, it appears that Goshen bordered on Arabia as well as on Palestine; and the passage of the Israelites out of Egypt shows that the land was not far from the Red Sea. The locality of Goshen was probably in Lower Egypt, on the east side of the Pelusiac branch of the Nile, in the district around Heroöpolis.

GOSLAR, a walled town of Hanover, district of Hildesheim on the Gose, an affluent of the Ocker, at the N.E. foot of the Harz, 24 miles S.E. of Hildesheim. It is said to have been founded by Henry, surnamed the Fowler, in A.D. 922; and was frequently the seat of the German diets and the residence of the emperor. Previous to 1803 it was an imperial city, but it then lost its independence and became subject to Hanover. In 1807 it was annexed to the kingdom of Westphalia, and included in the department of Ocker; but in 1813 it again reverted to Hanover. The town has a very antique appearance, and contains some interesting fragments of ancient buildings. The streets are generally narrow, crooked, and dirty. Goslar is the seat of a mining board; and most of the ore extracted from the mines in the neighbourhood is here purified, and much of it converted into various utensils. It is also celebrated for its beer, of which it brews a large quantity. Pop. (1849) 7741.

GOSPEL (Sax. *God*, and *spel*, "good news"), equivalent to the Greek *ευαγγελιον*. See Bible. For the spurious gospels, see Apocrypha.

GOSPORT, a fortified seaport and market town of England, county of Hants, on the western side of Portsmouth harbour, near its mouth, directly opposite and about a mile from Portsmouth, with which it is connected by a floating bridge moved by a steam-engine working on two fixed chains. It forms no part of the borough of Portsmouth, but is governed by trustees under an old act of parliament. It is fortified on the land side by a line of bastions extending from Weovil to Alverstoke, and having the appearance of being a segment of the fortifications of Portsmouth. Within the fortifications is the royal St Clarence victualling yard, with brewery, cooperage, powder-magazines, biscuit-baking establishment, and storehouses for various kinds of provisions for the royal navy. To the south is the magnificent Haslar naval hospital, capable of containing 2000 patients. Gosport has also an extensive establishment for the manufacture of anchors and chain cables. It communicates with London by the South-Western Railway. The coasting trade is considerable. Pop. (1851) 7414.

GOSSAMER, a fine filmy substance like a cobweb, observed floating in the air, especially in autumn. It is often seen in stubble-fields, and upon furze and other low bushes, and is probably produced by a species of spider.

GOSSIP (Sax. *God*, and *syb*, kindred), a term originally applied to sponsors at baptism on account of their relationship to the child. It is now only used in a secondary sense to denote a tattler or busybody.

Gotama Buddha.

GOTAMA BUDDHA. In our article Buddha we have given the opinions that have been most generally current among orientalists on the Buddhistical system; and we now propose under this biographical notice of Gotama to give, from other sources of information more recently opened up, some further details, and a more complete analysis of that system, as far as it can be gathered from the most authoritative or the most popular of its own writers.

No religious teacher, apart from the sages who have had access to the revelations of Israel, has left more important traces of an existence in the world than the Hindu Gotama. It is supposed that at the present moment there are upwards of 300,000,000 who regard him as the Supreme Intelligence, "wiser than the wisest, and higher than the highest," though acknowledging at the same time that he was "of man conceived, of woman born." With the single exception of the most lofty of the pyramids, there is no structure upon earth of vaster dimensions than the mounds that have been raised over his own relics, or those of his disciples; and the cave temples that have been excavated in his honour are equally without a parallel in the labour that has been bestowed upon their preparation. In the system that bears his name there is the germ of nearly all the teachings that are now the most rife among the speculative philosophers of Europe; and in the discipline of his adherents there are resemblances without number to the most striking usages of the monastic orders of Christendom. Yet this ancient reformer is hitherto without a niche in our great temple of the world's biography; and his existence is regarded as a myth or mystery, without any warrant for its reality beyond the vivid imagination of the myriads who place in him their trust.

It is now most generally admitted that Gotama was born in the year 623–4 B.C., at Kapila-wastu, on the borders of Nepaul. The name of his father was Sudhodana, a monarch of the Sakya race. As other kings are said to have reigned within a few miles of his metropolis, his dominions can have been of no great extent, though his race is represented as having sprung from that of the sun. His mother, Maya, died seven days after his birth. When he had attained his sixteenth year, he was married to the princess Yasodhara. The inoffensiveness of his disposition made the relatives of his bride suppose that he was unworthy to receive her hand; but by bending a bow of mighty strength, and other deeds of prowess, he convinced them, in the presence of multitudes, that they had entirely mistaken his character. Nevertheless, it was rather in obedience to the command of his parents than from personal inclination that he entered into the marriage state. Other thoughts were already brooding in his reflective mind, by which he was led to resolve upon renouncing the world and becoming an ascetic. The fulfilment of this resolution was hastened by four sights that he witnessed—an aged pilgrim leaning upon a staff; a loathsome leper full of sores; a dead body fed upon by worms; and a grave recluse passing modestly through the crowd without noticing its gaiety or grandeur. The day on which he fled from the palace was spent in unwonted revelry, perhaps to deceive the more readily those who might otherwise have detained him by force. Upon the same day the princess was delivered of a son, Rahula; but after taking a furtive glance at his wife and child, he succeeded in escaping to the forest on horseback with only one attendant. When at some distance he dismissed the attendant, with a charge to his relatives that they were not to sorrow for him under the supposition that he was lost, as he was about to become an ascetic. This occurrence took place when he was twenty-nine years of age. After seven days he entered the city of Rajagaha as a mendicant, but the gracefulness of his manner attracted the attention of the citizens, who informed the king, Bimsara, that some superior being must have become their visitant. On receiving this intelligence the king sought an interview with him, and entreated him, when he became acquainted with his rank, to renounce the low mode of life he had chosen, and return to the splendour of the palace. But Gotama was unmoved by these solicitations. Having seated himself upon a rock outside the city, he ate the food given him in alms, though it was not of the most inviting description. For the space of six years he practised the most severe austerities, which reduced him to a state of extreme weakness; but as he did not thereby obtain the object of his search, he commenced a less rigid course of abstinence, until his strength was restored. In a forest, on the banks of the Niranjara river, at the spot where the city of Buddha Gaya was afterwards built, he is said to have sustained a severe conflict with the powers of darkness; and after he had gained the victory by repelling the wiles of the tempter, he is represented as attaining an intuitive illumination of the most powerful kind, by which he became a Buddha. The joy of his triumph was expressed in a well-known stanza, in which he declared that he should now be free for ever from the trammels of existence, as he had attained to the extinction of desire.

Gotama Buddha.

About two months after this period, being thirty-five years of age, he began to proclaim the tenets of his religion, at a temple near Benares; and when his converts were sixty in number, he sent them forth to declare that a supreme Buddha had appeared in the world. Bimsara, at this time lord paramount of India, declared himself a convert to the teachings of the sage. His principal disciples were Seriyut and Mugalan. The former was convinced of the truthfulness of his doctrines by hearing one of his followers repeat the stanza that is found engraven in Pali upon many existing monuments: "All things proceed from some cause; this cause has been declared by Buddha; all things will cease to exist; this is that which is declared by the great ascetic." Soon afterwards, Gotama delivered another stanza of equal celebrity: "This is the advice of the Buddhas; avoid all demerit; obtain all merit; let the mind be cleansed from all evil desire." In process of time, his wife, his royal father, and his son, acknowledged the validity of his claims to the Buddhaship; and in all the regions that he visited he made numerous converts. The manner in which he taught the people maybe inferred from the following narrative:—There was a ploughing festival near Rajagaha, held by a wealthy Brahman, at which were a thousand oxen profusely ornamented; five hundred ploughs tipped with gold; five hundred ploughmen in gay attire, and many thousands of spectators. Thither the sage repaired, and seated himself in a conspicuous part of the field. When perceived, he was upbraided by the Brahman, and reproached with idleness, for attending festivals and other places, that he might receive something to eat instead of working like the rest of men. "I plough and sow," said he, "and from my ploughing and sowing I receive grain and enjoy the produce; priest, it would be better if you, in like manner, were to plough and sow, and then you would have food to eat." "Brahman," was the reply, "I do plough and sow, and from my ploughing and sowing I reap immortal fruit." But the Brahman thought thus: "The ascetic says that he ploughs and sows, but he has neither plough nor any other implement; he must have spoken falsely;" then addressing Buddha, he said, "I see no plough; no goad; no oxen; if you perform the work of the husbandman, where are the necessary implements?" In reply to this question, he was informed that the field of Gotama was the truth; the weeds that he plucked up, the cleaving to existence; the plough that he used, wisdom; the seed that he sowed, purity; the work that he performed, obedience to the precepts; the harvest that he reaped, the cessation of the evils of existence; and when he had explained these matters at great length, he exhorted the Brahman to sow in the same field, that he might reap its unrivalled fruit. The Brahman was thereby caught in the net of wisdom, and immediately prepared a repast for Buddha of the most excellent food. The teacher however refused to partake of it, telling him that it was not the custom of the Buddhas to receive offerings after they had been setting forth the excellence of the truth, or they would be like musicians and dancers, who make a collection after they have amused the people.

The principal opponents of Gotama were the fire-worshippers; but it was an age of religious excitement, and many sects are presented in the story of his life, all claiming to have the power to overcome evil desire, and free man from its presence and consequences. It was not unopposed that he was allowed to maintain his opinions, and extend his system. At one time he was accused of incontinence by a female unbeliever, Chinchi; but the charge resulted only in the greater confusion of his adversaries. His bitterest foe was his own brother-in-law, Dewadatta, who made several attempts to take his life: once, by the arrow of an assassin; at another time by hurling a stone from a machine constructed for the purpose; and again, by letting loose against him an intoxicated elephant. After wandering from place to place, confounding the sceptics who opposed him, and everywhere teaching the emptiness and vanity of all sensuous pursuits, in his old age he was entertained at the house of a smith, Chunda, who prepared for him a repast of pork; but by partaking of this gross food he became disordered, and soon afterwards died, at Kusinara, having attained his eightieth year. His body was burnt with many honours; after which his relics were collected and divided among his disciples. All the accounts that are given of him represent him as being extremely beautiful in person; graceful in deportment as became a prince, and gentle in disposition as became one who professed to be a divine teacher. It is said that he never addressed to any one a ruder epithet than to call him "vain."

We must now leave entirely the meagre thread of reality, almost imperceptible amidst the vast tissue into which it has been woven; in which exaggerations carried out until they become monstrous, and errors the most destructive to the best interests of man, are strangely blended with gorgeous imaginings, or the dim shadows of great and important truths. The legends of the far east are too improbable to be in themselves an object of interest; but the extent to which the system has been received, the massiness of the lore that its votaries regard as inspired, the wildness of some of its speculations, and the near approach to revelation in some branches of its ethics, entitle it to more regard than it has yet received from the learned men of our own country; and as no system can be properly comprehended unless taken in its entirety, we shall present, in order that it may be the more perfectly understood, its romance as well as its reality. The people of Ceylon, Burmah, Siam, China, and Tibet, are equally agreed in the extravagance of the character they ascribe to Gotama; and we may here remark, that in all the more popular of their legends, as well as in all the more important of their tenets, a uniformity may be traced, which proves an identity of origin; and even those customs that at first sight appear to be the most anomalous may be reconciled with the records that profess to introduce us to the doctrines of primitive Buddhism. In the present article we shall confine ourselves almost exclusively to the principles upon which nearly all the Buddhist nations are agreed; leaving the exceptions and discrepancies to be noticed under the head of the people among whom they take place.

In order to separate Gotama from the numerous other teachers, all claiming the same powers, who existed in the same age, his followers have ascribed to him perfect intelligence. The others saw truth, but it was partially; they could only reason imperfectly from the premises that were within their reach. The wisdom of Buddha did not arise from any process of reasoning, nor was it imparted unto him from any outward source whatever, either immediately or as an instrumentality. It came to him as the result of his own efforts and aspirations, carried on through myriads of ages; and was "an intuitive underived power, or self-generated effulgence." By the energy of his own mind, the whole field of truth was presented to his vision; and he could see it at once, and with the utmost clearness. The literal meaning of the word Buddha, according to Professor Wilson, is "he by whom truth is known," which answers exactly to the idea formed of him by his disciples. There have ever been Buddhas, and there ever will be; but they appear after intervals of time inconceivably vast. There is a period (asankya) so immense, that it requires a unit with 140 cyphers to express it. By Klaproth, a still vaster period is mentioned, which he says is "indiciblement indicible," and is expressed by a unit followed by 4,456,448 zeros, and would present, in ordinary type, an array of figures nearly 44,000 feet long. As many of these periods intervene between the appearance of one Buddha and that of another, it is only the cycles of geology that can approach them in immensity. The history of some of these Buddhas is known; but for all the intelligence we receive of their acts we are indebted to Gotama, as he is made to declare, repeatedly, that all knowledge of these distant ages is derived solely from his own intuition. There were, therefore, no traditions of the previous Buddhas until Gotama made known their existence. In the present cycle four Buddhas have appeared, Kakusanda, Konagamana, Kasyapa, and Gotama, and another is yet to appear, Maitree. Attempts have been made to ascertain the era in which they existed; and though, upon the acknowledged principles of the system, this may not be possible, further researches may enable us to reduce these limitless periods to some standard nearer the truth. It is somewhat remarkable, when these mighty numbers are looked at, that Gotama should have predicted, as he is said to have done, the decline of his religion, after the comparatively limited period of 5000 years.

The period at which existence commences is unknown to all but the Buddhas, so that we cannot tell when Gotama began to be; but we can trace his actions in some of these remote ages by the aid of his own revelations. The Buddhas, previous to their last appearance, as the deliverers of sentient being from the sequence of existence, are called Bodhisats. The story of the previous births of Gotama is contained in the *Pali Commentary* on one section of the discourses of Buddha, called *Jataka Gat'ha*, or *Birth Stanzas*. In this work we have the history of the Bodhisat, who afterwards became Gotama Buddha, in 550 different births. These narratives occupy about 2000 pages of the palm-leaf on which they are usually written, and are of unequal length. In some of them we have the fables we have been accustomed to ascribe to Æsop, with scarcely a single variation of circumstance. Each story begins with the well known formula "in days of yore;" and the foxes and monkeys, whose wit and cunning amused us in childhood, little as we suspected it, became afterwards "the all-wise teacher of the three worlds." In all these births he did, or said, or suffered something that further fitted him for the high office he was afterwards to assume. The sufferings he voluntarily endured no one can compute; but we may give one example out of many that are named. Were all the blood shed from his person, in the instances in which he suffered it to be poured out for the good of others (as when he threw himself before a hungry tiger, that he might save its life by his own death), to be collected together, it would form a greater mass than all the water of the four oceans. Myriads of years before his last birth he lamented the misery that prevailed. He might then have ceased to be, and thus have escaped finally from the unquiet of existence; but as he foresaw that by becoming a Buddha he might impart the same privilege to numberless other beings, he voluntarily threw himself into the stream of continued existence, in all the births he afterwards received making some progress towards the accomplishment of his great design. It was from a residence in one of the heavens that he entered into the womb of Maya, and was born as man.

At the moment of his conception thirty-two wonders were presented: the sky was covered as by a canopy of flowers; the waters of the sea became sweet; and the torments of the lapsed intelligences had a temporary cessation. The body of his mother was transparent, so that in the months of gestation he appeared like an image of gold in a vase of crystal. The queen one day set out to visit her native city in a golden litter, but on arriving at the garden of Lumbini she alighted, that she might enjoy its prospects and perfumes. As she held the branch of a tree the other branches bent around her of their own accord, and whilst in this seclusion her wondrous boy was born. At once he asserted his supremacy, and stepping forth he looked round in all directions that he might search through all worlds; but as he saw no one greater than himself, in any place, he exclaimed, as with the voice of a fearless lion, "I am the most excellent and the most exalted of beings." Five months after his birth there was a ploughing festival, attended by the king, at which he sat in the air without any support, and received the homage of his father and his nurses. But we pass by the accounts that are given of his marriage, his escape from the palace, his wanderings in the wilderness, and his contest with Mara and an innumerable host of demons and sprites; all of which abound with the most incredible accompaniments. The day on which he gained the victory over Mara was the most memorable in his whole career, including his previous births as well as the present. In the first watch he was able to remember all the circumstances of all the births he had previously received; in the second watch he saw the varied miseries to which sentient beings are exposed in the repetition of existence; and in the third watch he acquired the knowledge that unfolds the causes of the repetition of existence, and sets forth the means by which the stream of existence can be arrested for ever.

The last attainment is regarded as the essentiality of the Buddhaship, and its most exalted privilege. When the incipient Buddha awakes to a realization of the misery attendant upon sentient existence, he looks into all worlds to try if he can discover any state that is entirely free from its evils. For this purpose he looks to the insect in the sunbeam, the worm in the clod of earth, the fish as it glides through the waters, the fowl as it darts through the air, and the beast as it browses on the tender grass, or roams through the forest in terrible majesty; to man in all positions, from the monarch to the outcast: then, not finding one species of being with whom there is the home of absolute peace, he passes in thought to the other systems, the worlds beneath and the worlds above; but among all the varied intelligences that inhabit these innumerable worlds he finds no one that is not subject, either at the present moment or in some future state, to the three evils of existence, impermanency (anitya), sorrow (dukha), and unreality (anatma). In all beings there is a cleaving to sensuous objects, and so long as this remains there will be the continuance of existence. The agent that carries on the continuance of existence, and that, as to any given individual, is the cause of existence, is karma. This karma is the aggregate of all the actions ever done by the individual in whatever birth. Though a mere abstraction, it controls his destiny; it shapes out his weal or woe; it is fate not acting blindly, but under the guidance of moral influences. The Buddhist carries out the principle, "whatsoever a man soweth that shall he also reap" to its utmost extent, not restricting it to the present life alone, so that man is now as much under the influence of acts he did a myriad ages ago, as if they were done in his infancy or youth, or in the moment just passed away. On these accounts, as there is sorrow wherever there is existence, it is man's great object to free himself from the sequence of existence; and as this sequence can only be overcome by the destruction of all cleaving to sensuous objects, the wise man seeks the utter annihilation of the passions, which may be accomplished by an attention to the course of ascetic discipline set forth by the Buddhas. The cessation of existence is called nirwana in Sanscrit; in Pali, nibbanna or nibbuti. Though expressions are sometimes used relative to it which would seem to indicate that it is a state, it cannot mean anything more or less than non-entity. Were it otherwise, Buddhism would fail to accomplish the very sequence which it regards as its greatest triumph—its own peculiar and exclusive heritage, constituting its great claim upon man's regard. It was this discovery that gave to Gotama his supremacy as a teacher, and entitled him to receive the homage of all intelligences in the three worlds. The four great truths, as they are called, are thus expressed: 1. Where there is existence there is sorrow; 2. Sorrow arises from an attachment to existing objects; 3. There is no escape from sorrow but by the destruction of this attachment; 4. This attachment will be destroyed by an entrance into the paths that lead to nirwana."

Accompanied by his disciples, the sage is represented as going about from place to place to teach men the way to "the city of peace," as nirwana is figuratively called. But we wonder, as we proceed, how even the most credulous can be brought to receive the legends of his life as a truthful narrative. It has ever been with the nations of India as it is now; they cannot be content with the simple truth, but must add some accompaniment to make it appear the more truthful, robbing it of its credibility by the mode in which they try to place its reality on a firmer basis. The wildest tale of the nursery is soberness itself when compared with the fictions of the Hindu religionist. Of this we have ample evidence in the deeds that are recorded of Buddha. When he put his foot on the ground there sprang forth a lotus on which for him to step; he could pass through the earth or the sky; he could hear all sounds, and tell the thoughts of all intelligences; at the doing of his more important acts, deities innumerable were present, and the rays proceeding from his person penetrated to all worlds. His stature is represented as being twelve cubits; but it is said to be difficult to describe his appearance, and for this a cogent reason is given. He could walk in a space not larger than a mustard-seed, and in an instant he could scale the heavens. If there were any substances that might hinder or obstruct his walking, they moved out of his path of their own accord, and the ground became level as the head of a drum; the air appeared as if sweetened by perfumes; and if he passed any being that was in pain it ceased in an instant.

With such advantages as a teacher we wonder not when we are told that he soon numbered among his converts more than a hundred nobles and princes; and that a thousand fire-worshippers were convinced of his superiority to their own teachers by the displays of his power. A visit to his native city resulted in the conversion of nearly all his relatives. In the ninth month of his Buddhaship he visited Ceylon, which he found to be inhabited exclusively by demons, and he afterwards paid two other visits to the same island. As no other place in Southern India is mentioned as having received a similar honour, we may suppose that this legend, which is by no means confined to the Singhalese, was invented that he might not appear to be inferior to Rama, the conqueror of the giants of Lanka in an earlier age. When the city of Wisala was becoming desolate from the ravages made by pestilence, famine, and sprites, he commanded his attendant to go round the city sprinkling water from his alms-bowl, by which the city was freed at once from its deadly plagues. There was an assassin, in a forest, who had put many hundreds of travellers to death, but he followed him to his retreat, and succeeded in persuading him to renounce his cruelties and become a recluse. This led the convert to say, "The hook of the driver subdues the elephant and other animals, but Buddha subdues by kindness." It was the custom in that age for companies, both of men and women, to visit different places, and hold public disputations. But whenever any of them encountered Buddha they were obliged to confess the superiority of his wisdom in every instance, and they generally became his adherents at the conclusion of the contest. One of the greatest of his encounters was with a demon, Alawaka, who every day demanded the sacrifice of a human being from the king of Alow; but even this monster was overcome by the simple weapons of gentleness and equanimity. The ruler of one of the celestial worlds, Sekra, having paid him a visit, was enabled to gain a prolongation of his present state of existence, extending to many myriads of years, from the mere circumstance that Buddha, on his entrance, saluted him with these words, "May your age be multiplied." Subsequently the sage visited Sekra in his own dominion, and passed from earth to the celestial city at three steps. Here he remained three months preaching the word to the deities and their queens. On his departure, Sekra caused a ladder to descend to the earth, with another on each side, upon which were choristers and musicians, and the residents in many worlds assembled to do him honour. We are informed by Fa Hian, the Chinese traveller, that the three ladders disappeared under the earth; but that the monarch Asoka built a monument over the ladder by which Buddha descended, which was still in existence in the fourth century.

We have no contemporary account of Gotama, nor any writings of his immediate disciples. The sacred books of the Buddhists are written in Pali, the vernacular language of Magadha, of which Rajagaha was then the capital. It is allied to the Sanscrit, and is regarded as the language of the celestial regions. "There is a language," says the grammarian Kachayana, "which is the root [of all languages]; men and Brahmas, at the commencement of the cycle, who never before heard or uttered a human accent, and even the supreme Buddhas, spoke it; it is Magadhi." The discourses of Buddha are said to have been preserved in the memory of his followers during the space of 450 years, after which they were reduced to writing in the island of Ceylon. The volumes in which they are contained are called the Three Caskets, or Receptacles (Pitakattayan). 1. Winaya, or Discipline; 2. Sutra, or Discourses; 3. Abhidharmma, or Pre-eminent Truths. At a convocation held in the same year in which Gotama died, the discourses were orally repeated, and the text accurately defined; and at two subsequent convocations, held B.C. 443 and 309, they were again repeated, together with the Atakat'ha or commentaries; but as the native authorities, both Singhalese and Burman, affirm that the commentaries, as we now possess them, were translated from Singhalese into Pali, by Budhagosha, between A.D. 410 and 432, we may conclude that they had not previously been known in their collected form. Both the text and commentary are regarded as having been compiled by men who, from their purity, were incapable of falling into error; but the sages who thus claimed the intuitive possession of divine knowledge ceased to appear about 100 years B.C. The sacred books are worshipped with the same reverence that is paid to the images of Buddha. The scriptures of the Chinese are contained in 800 large volumes, known under the general name of Gandjour or Kan-gyur. The best edition, issued at Pekin from the imperial press, is in four languages—Tibetan, Mongol, Mantchou, and Chinese. An analysis of the contents of this great compilation was published by Csoma Körösi in the Asiatic Researches and the Journal of the Bengal Asiatic Society.

One of the most striking features of the system when seen in actual working is the monasticism of its priests. They sometimes live singly; whilst in some of the temples of Tartary there are several thousands of residents. The priesthood does not belong to them by primitive institution; but as their time is now principally occupied in receiving the offerings of the people and presenting them to the idols, with the recitation of a set form of words, they may be regarded as priests in a modified sense. The rules by which they are bound are most stringent. They are required, at their investiture, to take upon themselves ten obligations: not to take life; not to take that which has not been given; not to have sexual intercourse; not to say that which is not true; not to use intoxicating drinks; not to eat solid food after mid-day; not to attend places of amusement; not to use garlands, perfumes, or unguents; not to use seats or couches above the prescribed elevation; and not to receive gold or silver. The novice must be at least eight years of age; and he cannot receive investiture until he is twenty. From the time of his entrance upon the noviciate his head is shaven and he wears the yellow robe. The form of investiture is extremely simple. A chapter having been called, the candidate is asked if he is free from certain diseases that are named; if he is a human being, a male, and a freeman; if he is out of debt, and free from the king's service; if he has the consent of his parents; if he has attained the prescribed age; and if he is provided with the eight priestly requisites. These include—1, 2, 3. Three robes of different descriptions; 4. A girdle for the loins; 5. An alms-bowl; 6. A razor; 7. A needle; 8. A piece of rag for a water-strainer. When the answer is in the affirmative, his admission is proposed to the assembled priests; and if they agree to receive him, the more important of the rules by which he will have to abide are repeated to him, to which he makes known his assent. The precepts and prohibitions contained in the first and second of the five sections into which the Winaya is divided, are to be recited fortnightly in a chapter consisting of not fewer than four persons. When one class of precepts has been recited, the inquiry is made three times if all present have observed them; and if no answer is given it is supposed that no one is in fault; but if any one has broken the precept and does not confess it, he is regarded as being guilty of a wilful lie, and as subjecting himself to penance. The exercise of discipline includes reprimand, forfeiture, labour (such as carrying sand, and sweeping the sacred places), suspension, and exclusion. In certain cases that are named, the priest may ask permission of the chapter to lay aside his robe for a season; and if leave be granted, he may live as a laic, in all respects, and afterwards return to the position of a recluse without receiving any stain upon his character by this temporary breaking away from restraint. The present monarch of Siam, previous to his accession, was a high priest. The power of conferring investiture is confined within certain limits. It cannot be exercised but by a legally-constituted chapter, and must have been transmitted, in regular succession, from chapter to chapter, from the time of primitive Buddhism; and no investiture is regarded as valid, if the link required to bind the postulant of our own day to Buddha be broken. In some instances the succession has been lost from persecution or other causes; and in others particular castes have been wrongfully excluded from the privilege; but in both cases those who have assumed the yellow robe have regarded themselves as in the noviciate only, and they have patiently waited until the power could be received from some orthodox community without attempting to introduce an unauthorized order or a spurious succession.

The conduct of the priest who would live according to the strict rules of his order, is to be free from all suspicion of evil. He may not sit upon the same seat as a female, or ever be with one alone, even to teach her the precepts. The temples are sometimes rich in lands; but the individual priest is not permitted to have any property beyond the eight "requisites." He is not allowed to eat, in ordinary circumstances, any food that has not been presented to him in alms. Every morning he leaves his monastery, with a bowl slung across his shoulder, and visits a prescribed round. Every house is to be visited, in regular order, unless there be moral reasons for the omission, none being passed by on account of the low position of its inmates. Nothing is to be done to attract attention; there must not even be the lifting of a finger, a raising of the head, a movement of the jaw, or a hem of the throat. If nothing be given, after remaining a certain time, he is quietly to pass onward; and when his bowl is sufficiently full, he is to return home. He is not to eat any solid food before sunrise, or after the sun has passed the meridian; but in the lawful hours the use of animal food is not prohibited. He is not to carry a burden, dig the ground, cut down trees, or light a fire. During the months of the rainy season he may reside in a substantial dwelling; and at this period he is to read and expound the discourses of Buddha to the people; but at other times, according to the institute, he is to have no settled dwelling; like the beast of the forest, in whatever place he may happen to be, he is to lie down to sleep. One part of his daily service is, to introduce the people into the presence of the image of Buddha, when they come to worship; and to assist them in repeating the formulary of protection,—"I take refuge in Buddha, the Truth, and the Associated Priesthood;" or in repeating as many of the precepts as their circumstances will allow them to observe. The Buddhists are taught that their sage has become entirely extinct; that he has passed away like the light of the lamp when the flame is extinguished. Yet they worship him upon this principle: They believe that the act is in itself an *opus operatum;* that as the seed germinates when it is put into the earth, without any consciousness upon the part of the elements relative to the vivifying influence they exercise, so does merit arise from the worship of the images of Buddha, though the being they represent is unconscious of the deed; and this merit is, in like manner, spontaneously, without the intervention of any intelligent agent, productive of prosperity and peace. For the same reason they worship the bo, or *Ficus religiosa*, the tree under which the Buddhaship was attained. Equal honours are paid to the relics of the sage, and to those of his disciples, which are usually enshrined under a dagoba or tope. The Swadagon pagoda, at Rangoon, 338 feet high, is a receptacle of this kind; and at Anuradhapura, in Ceylon, there are the remains of a tope which was originally 405 feet high. The images of Buddha are in several postures —recumbent, sitting, and standing—and of all sizes, from an inch to 50 feet.

The exercise of meditation is enjoined upon the priest who would enjoy the fullest privileges of his order. It is to be carried on far away from the haunts of men, and will be most efficient when conducted amidst the offensiveness of a cemetery. There are various modes, all intended to free the mind from earthly agitation, and prepare it for an abstraction the most intense. He is to take a circle, about the making of which directions the most minute are given, and to contemplate it, in various ways that are named, until he attains to an illumination that will enable him to exercise miraculous power. He may then pass through the air, or walk on the water, or penetrate the earth; shake the foundations of the world, and cause a light to be enkindled that will enable him to see in any place, as by divine eyes. By another process, a joy so great may be made to arise, that it will overcome the grossness of the body and enable the ascetic to rise into the air; and by the recitation of acts of merit done by the individual in this or some former birth, he may produce any effect he wills to be, however wonderful its character. By this means a courtezan turned the stream of the Ganges backward. But it is wisely said, that out of a hundred thousand persons who practise these rites, scarcely one attains to the full reception of the power.

At the commencement of the system there were female recluses, or nuns, who were subject to the same rules, and appointed to the same offices as the men. But the practice was not encouraged by Gotama, who speaks most disrespectfully of the sex. "That which is named woman," he says, "is sin;" that is, as the meaning has been interpreted, she is not vicious, but vice. There are no nuns in Ceylon, but they are met with in Burmah, Arracan, China, and Nepaul. They make a vow to remain chaste so long as they continue in the order, but they may leave it at any time. Though Buddha has spoken in such rude terms of woman, in some of the countries where his system is professed she enjoys considerable influence. This may arise, however, from the facility of divorce, which allows the wife to leave her husband for reasons so trifling that the bond of marriage has little power.

It is probable that the ethics of Gotama have come down to us in the form in which they were originally taught, as to the more important of the rules; but so many glosses have been added, and exceptions made, that their purity is vitiated, and their power weakened. It is difficult to speak of this part of the system correctly, without great circumlocution. The moral observances can neither be called laws, precepts, nor commands. They are self-imposed restraints, taken by the postulant for a set purpose, the acquirement of merit. They have not proceeded from an authoritative power or supreme judge. The Buddhas have made known to the universe, that particular courses of action will lead to certain results, pleasant or painful, as the case may be; and that, therefore, the wise man will choose the course that ensures prosperity, and avoid the practice that leads to pain. No contrition is required from the transgressor; and if he expresses sorrow, as he knows nothing of condemnation or guilt, it will merely be because he has acted contrary to his own interests, and not because he has grieved any Intelligence whose will he is bound to obey, or insulted any authoritative Legislator. The practice of the right, and the avoiding of the wrong, become, under these circumstances, little more than mercenary acts; and man is robbed thereby of his dignity as a moral agent. Beyond the offering of the flower or the first-fruits, and the giving of alms, the idea of atonement, or vicarious sacrifice, never enters into the mind of the Buddhist. In the *Discourses* of Gotama there are insulated sentiments of the purest order of morality, but they mingle with others that are imperfect, confused, or contradictory, and all are without authority. A single excerpt from a comparatively modern work, on the taking of life, will illustrate the nature of the glosses to which we have alluded. "There are five things," it is said, "necessary to the crime of taking life:—1. There must be the knowledge that there is life. 2. There must be the actual presence of a living being. 3. There must be the intention to take life. 4. With this intention, there must be something done, as the placing of a bow, or the setting of a snare; and there must be some movement towards it, as walking or running. 5. The life must be actually taken." The laics are aware of the subtle distinctions made by their priestly casuists, and use them in defence of their conduct when accused of having acted wrong.

On the essentialities of being, the doctrines of Gotama are imperfect and unsatisfactory; but possess an interest from their originality. There are five classes of constituents that enter into the composition of a sentient being, each of which is divided into a number of elements, defined by the Buddhist authors with great precision; but the insertion of their names, amounting to 184, would be useless, without extended explanations. In this enumeration, which is said to include every essentiality pertaining to that which we call man, we can discover nothing that answers to the soul or self. It was expressly declared by Gotama, that "supremely happy is the state in which the pride of *I am* is subdued." The aggregate of a number of things, such as wood, leather, brass, is called a chariot; but apart from these things, there is no chariot, it is but a name; so also, the aggregate of a number of things, such as blood, hair, sensation, is called a man; but apart from these things, there is no man; it is but a name. There is, therefore, no individuality, no *ego*. When a sentient being dies, all the elements of his existence are broken up, and pass away; they exist no more. But though the being dies, his actions (karma) still live, and possess potentiality. This power it is that causes the existence of another being, into which being it enters, with all its virtues and energies, causing a virtuous and prosperous being to exist, if it be good; but if bad, a wicked and unfortunate being. This process must necessarily go on until the attainment of nirwana. The manner in which it commences, the first causes of being, no one can learn unless he become a Buddha. The causes of the continuance of being are thus enumerated, in what is called the sequence of existence. On account of ignorance, merit and demerit are produced; then, in regular succession, the first-named educt producing the next constituent, consciousness; body and mind; the six organs of sense; touch, or contact; desire; sensation; cleaving to that which causes sensation; renewed existence; birth; decay and death. Inversely: when ignorance ceases, merit and demerit are not produced; and so on, through every link of the chain of existence. This normal arrangement is common to all Buddhists. The Singhalese, Burmese, and Siamese have it in Pali, of which the above is a literal translation. Hodgson gives it from the Nepaulese; Csoma Körösi, from the Tibetan; Klaproth, from the Chinese; and Colebrooke, from the Sanscrit.

The cosmical speculations of Buddhism, though retaining, in some respects, a character of their own, are more nearly allied to the theory of the Brahmans than some other parts of the system. In the centre of the earth is a huge mountain, Maha Meru, around which are four continents, surrounded by seven concentric circles of rock, separated from each other by vast seas. We live in the southern continent, Jambudwipa, and cannot reach the others but by supernatural aids. The earth rests upon a world of waters, and the waters upon a world of wind. There are twenty-two superior worlds, divided into dewa and brahma, in the highest of which "the inhabitants are not fully conscious, and yet not altogether unconscious;" and there are eight infernal worlds. The systems of worlds are infinite in number, but homogeneous in their character. They are all subject to destruction, at periods regularly recurring, by fire, water, or wind. The first inhabitants of the earth came from a brahma world, and for a time retained their celestial splendour and purity; but by degrees these advantages were lost, and the brahmas degenerated into men. It is from them that the human race has sprung. All men are of one origin and one caste; and the only caste recognised by Buddha was that of the wise and the unwise. No distinction was made among his disciples on account of their former position; the prince and the barber were of equal rank.

The Buddhists of Nepaul suppose that there is a Supreme Creator, whom they call Adi Buddha; but in Ceylon this word would be interpreted as meaning ancient, or former—one who existed prior to Gotama, but of the same order and attributes. In Tartary and Tibet there are living Buddhas, one of whom is to be found in every monastery of the first class. The principal Buddha is the Grand Lama of Lassa, a living idol, who is daily worshipped by the devout. At his death, his spirit is supposed to enter into some child, who is recognised by certain tokens, and succeeds to the same office. But in these regions the monks have departed greatly from the rules of Gotama. One single sentence spoken by certain novices to the missionaries Huc and Gabet will be sufficient to confirm this statement. "The prayers are known best," said they, "that one has gotten with the most blows. The lamas who cannot recite prayers, or cure maladies, or tell fortunes, or predict the future, are those who have not been beaten well by their masters." Among the Buddhist nations visited by M. Huc, those who appeared to him to be most attached to their religion were, first, the Mongols, then came the Tibetans, in the third place the Singhalese, and lowest in the scale stood the Chinese, whom he regards as having fallen into complete scepticism.

The age in which Gotama appeared has been disputed, there being different eras in use among the nations that profess his faith. The other records, so far as we can learn, speak doubtfully upon the subject, or their discrepancies can be accounted for; but in the Pali *Commentary* on the sacred books a series of epochs is given, by which the date of his appearance may be calculated with precision; and with regard to several of these periods we have collateral evidence of their general correctness. In the ritual of the novice, one duty that he is required to attend to daily is, to reflect on the number of years that have elapsed since the death of Buddha, as they appear in his lita, or calendar. The very existence of Gotama has been called in question by one of the most eminent of living orientalists; who, however, acknowledges it to be certain that "a change in the religious organization of the Brahmanical system did take place about the time attributed to Sakya's death."

From the traditions of the Buddhists, and the monuments, inscriptions, images, and coins, that have been discovered in almost every part of India, it is evident that at one time the religion of Gotama was generally received among the nations of the Peninsula; but if we may judge from the prevalence of nat worship in Burmah, of demon worship in Ceylon, and of the unauthorized usages of other countries among the Buddhists of the present day, we may infer that it was never the exclusive religion of the people. After the sixth century, we can discover few traces of its existence; but whether it was put down forcibly by the terrible arm of power, or by the slow progress of events, we are yet unable to determine. The deciphering of the ancient alphabets of India by the lamented James Prinsep, and the explanation thereby of the inscriptions upon monuments now known to be Buddhist, will enable the future historian of India to investigate this subject with greater precision than has hitherto been possible, from the want of authoritative data. The vexed question of the relative antiquity of Buddhism and Brahmanism presents no difficulty to the followers of Gotama. The existence of the Vedas, and the proud pretensions of the Brahmans, are frequently referred to in the legends of his life; but we conclude, from the same premises, that the social position of the "twice-born" must have been greatly changed since that period, and that nearly all the more popular usages of the present race of Hindus are of more recent origin.

If we except Nepaul, it is probable that there is not now a single Buddhist in the whole continent of India; but the system still lives among the lovely groves and flower-clad mountains of Ceylon; the voices of its priests mingle with the murmur of the Irrawaddy, the Meinam, and the Cambodia; it droops and dotes among the forlorn masses of China; it flourishes under the protective exclusiveness of Japan; and exercises kingly authority amidst the snows of Tibet and the vast steppes of Tartary. It is the most rigidly atheistic system ever invented, reducing man to a temporary organization, and referring all events, as well as the mightiest creations, to the exercise of a non-intelligent power. It does not say, in so many words, that there is no God; but it shuts out the necessity of his existence, by accounting for all things without the intervention of any power beyond that which we, in our own human wilfulness, call nature. But, notwithstanding the witheringness of its revelations, it must have some sources of attraction, or it would not have spread so extensively, or retained its hold upon the nations with so much tenacity. Among these we may include its disavowal of the Brahmanical opinions upon the subject of caste; the admission of men of all classes into the priesthood; the strictness of its monastic discipline; the moral grandeur of the character ascribed to Gotama; the presentation of its religious requisitions in aphoristic sentences that the conscience at once approves and the mind readily understands, and that can be retained in the memory without effort; the daily sight of the priests, from their custom of seeking alms; the simplicity of the rites of worship; the recurrence of festivals in which there is public teaching upon subjects full of interest to the thoughtful mind; the possession of a record supposed to be inspired, more popular and practical in its teachings than the Vedas, read and explained to the people; the great results to be obtained from acts comparatively trifling; an equal participation in all the rewards to be acquired by its votaries; and the miraculous powers within reach of its more rigid ascetics. It has been no greater bar to progress than the other systems of eastern heathendom. Though undeserving of the high encomiums that have been paid to it by some European writers; by the comparative purity of its moral code, its abhorrence of all cruelty, even as an act of penance, and its constant inculcation of the gentler virtues, it has thrown a spirit of mildness into the whole of the social polity, ameliorated the condition of the unprotected classes, and acted as a restraint upon the passions of the master and the monarch. It has had a theatre of action without a parallel in extent, as it has exercised an influence during one-half of the whole period in which man has existed under his present economy, and throughout nearly one-half of the varied populations of the world. (In addition to the authorities enumerated under the head Buddha, see *Journal of the American Oriental Society*, *Journal of the Bengal Asiatic Society*, and *Essays* and *Translations* by Gogerly, Turnour, Hodgson, Sangermano, Klaproth, Remusat, Landresse, Burnouf, and Lassen.) (R. S. H.)

GOTHA, a town of Central Germany, on the Leine, an affluent of the Nesse, and on the Thuringian railway, by which it is 13 miles W. of Erfurt, and about the same distance E. of Eisenach. This was the residence of the dukes of Saxe-Gotha previous to 1825, when the direct line became extinct, and the duchy passed to the Duke of Saxe-Coburg. It is now the usual winter residence of the Duke of Saxe-Coburg-Gotha. Gotha is well and regularly built, and is surrounded by beautiful pleasure grounds and public walks, and altogether is one of the finest towns of Germany. The ducal palace of Friedenstein was founded by Ernest the Pious in 1643. It is a large and imposing building, occupying the summit of a high hill, and surrounded by a terrace, gardens, and pleasure grounds. It contains a valuable library of about 150,000 volumes and 5000 MSS., a famous collection of coins, with a numismatic library of 6000 volumes, a picture gallery, and collections of antiquities, engravings, objects of natural history, &c. Among the educational institutions are the gymnasium, founded in 1524, and considered one of the best in Germany, a training school for teachers, a trade school, midwifery institute, and an anatomical theatre. South-east of the town is the well known observatory of Seeberg. The manufactures and trade of Gotha are considerable, the former comprising cotton and woollen goods, porcelain, paper, leather, musical and scientific instruments, sausages, &c., for the manufacture of which last article it is celebrated. The *Almanach de Gotha* is published here; and the large geographical establishment of Justus Perthes employs several hundred printers, engravers, map-colourers, &c. Pop. 14,280.

GOTHAM, a town in Nottinghamshire, celebrated for the Theban rusticity of its inhabitants. Hence the usual proverb, "One of the wise men of Gotham."

GOTHARD, St. See Alps.

GOTHENBURG (Swedish *Götheborg*), a maritime city of Sweden, capital of a cognominal län or province, on the left bank of the Götha, about 5 miles above its mouth in the Cattegat. In point of importance Gothenburg ranks next to Stockholm. It consists of a lower and an upper town, the former being in a marshy plain, and intersected by several canals, which give it somewhat of the appearance of a Dutch town—the latter on the adjacent rocky heights. The canals are crossed by numerous and frequently handsome bridges, while rows of trees line their banks. The streets are generally spacious and well paved, and the houses, which are mostly built of stone or of bricks well stuccoed, have always a substantial and often an elegant appearance. Of the walls which formerly surrounded the town only a few fragments now remain, but the harbour is defended by three forts. The suburbs are larger than the town itself, and extend for a considerable distance along the river. The principal public buildings are the new exchange a large and splendid edifice, three churches of which the cathedral is a simple but elegant cruciform edifice surmounted by a tower, town-hall, bishop's palace, governor's residence, arsenal, theatre, &c. It has a gymnasium with a library attached, a society of arts, 2 free schools, 2 orphan asylums, an infirmary, and many benevolent institutions. The manufactures are various and extensive. Among its industrial products may be mentioned sailcloth, linen, plain and printed cottons, woollen cloth, tobacco, snuff, leather, paper, sugar, and porter. Shipbuilding is also extensively carried on. Vessels do not come close to the town, but lie in the river at a short distance from the shore, goods being conveyed to and from them by means of lighters that navigate the canals of the lower town. The depth of water in the port is 17 feet; and there is no tide, bar, or shallow. Iron and steel, the former excellent, the latter inferior to that made in England, form the principal articles of export. The next great article of export is timber, particularly deals. The others are tar, pitch, copper, bark, sailcloth, linen, cobalt, manganese, bones, linseed, &c. The principal articles of import are colonial produce, cotton-yarn and twist, salt, wine, rice, fish, &c. The opening of the Götha canal has greatly benefited its commerce by bringing it into communication with a large portion of the interior of Sweden. In 1849, 718 vessels entered, and 1462 cleared in the coasting trade; and 1018 vessels entered, and 1011 left for foreign ports, exclusive of steamers, of which the number that entered and cleared out at the port were 88. Gothenburg was built on its present site by Gustavus Adolphus in 1611. Pop. about 30,000.

The län of Gothenburg is bounded on the N. by Norway, E. by the län of Wenersborg, S. by that of Halmstad, and W. by the Skager-Rack and Cattegat. The surface is mountainous and well wooded. Agriculture has recently made considerable progress, but the quantity of grain produced is not equal to the wants of the inhabitants. The streams are very numerous, but generally small, the principal being the Götha, which connects Lake Wener with the sea. The coast is much indented by bays and arms of the sea, and is lined by numerous islands. Area 1884 square miles. Pop. (1850) 187,583.

GOTHIC LANGUAGE. The peoples known in history under the names of Mœsogoths, Ostrogoths, and Visigoths, were all of the same race, and spoke different but closely similar idioms of the same language. This language differed very little from the ancient dialects of Germany; and during successive ages it spread with the Goths over all southern Europe, and occupied for a considerable time Spain and Italy, where but feeble effects have been left in the vernaculars of these countries. The case has been very different, however, in the northern countries of Europe, where the Goths firmly and permanently established themselves, and have perpetuated their race with their language. From the Gothic has sprung the Scandinavian, which is found in its greatest purity in Iceland; and, in more modified forms, in the Danish, Swedish, and Norwegian. The similarity between the remains of the ancient relics of Gothic and Sanscrit is very striking.

Example of Declension in Sanscrit and Gothic.

SINGULAR.

Sanscrit.	Gothic.
Nom. *Sūnus*, son	Nom. *Sunus*, son
Acc. *Sūnum*	Acc. *Sunu*
Instr. *Sūnunā*	Instr. *Sunau*
Genit. *Sūnōs*	Genit. *Sunaus*
Voc. *Sūnō*	Voc. *Sunau*

PLURAL.

Nom. *Sūnavas*	Nom. *Sunjus*
Acc. *Sūnūn*	Acc. *Sununs*
Instr. *Sūnubis*	Instr. *Sunum*
Genit. *Sūnūnām*	Genit. *Sunivē*

The affinity between the Sanscrit and the Gothic appears equally striking in conjugation as well as in declension. The terminations which in the verbs designate the same persons, are the same in both languages. The Gothic has even preserved in conjugation the dual which has been lost in declension, and like the Sanscrit, the Greek and the Latin, it has a particular form to express the passive.

Example of Conjugation in Sanscrit and Gothic.

SINGULAR.

Sanscrit.	Gothic.
1. *Barāmi*	1. *Baira*
2. *Barasi*	2. *Bairis*
3. *Barati*	3. *Bairith*

DUAL.

1. *Barāias*	1. *Bairōs*
2. *Baratas*	2. *Bairats*
3. *Barētām*	

PLURAL.

1. *Barāvas*	1. *Bairam*
2. *Barata*	2. *Bairith*
3. *Baranti*	3. *Bairand*

As to the variety of grammatical forms the Gothic holds a middle place between Sanscrit and Latin; and without possessing the richness of the former or the conciseness of the latter, it rivals both in precision and energy of expression. See GOTHS. (A. F. F.)

GOTHOFRED, or GODEFROY, DENIS or DIONYSIUS, the most celebrated jurisconsult of his age, was born at Paris in 1549. After having completed his classical studies he applied himself to that of law, which he prosecuted at the universities of Louvain, Cologne, and Heidelberg. On his return to France, in consequence of his profession of the Reformed faith, he found himself obliged to retire to Geneva, where, in 1580, he was nominated to a chair of law. Henri IV. appointed him magistrate of Gex in 1589; but this city having the year after been taken by the Duke of Savoy, his house was pillaged, and no resource remained for him but to pass into Germany. He, however, proceeded no farther than Strasbourg, where he taught the Pandects from 1591 till 1600, when the elector palatine called him to Heidelberg. But the proceedings of his colleagues forced him six months afterwards to return to Strasbourg, where he remained three years more; at the end of which time he consented to resume his functions at Heidelberg, upon an assurance which was given him that he should have nothing to apprehend from the jealousy of the other professors. It was only then that his countrymen became sensible of the fault which had been committed in not endeavouring to retain in France a man of such distinguished merit, and he was offered the chair which Cujas had just left vacant at Bourges; but he declined the offer upon the ground of his age, and alleged the same excuse in opposition to all the instances which were made to draw him to Angers, to Valence, and to other universities of France and Germany. In 1618 he was sent as deputy by the elector palatine to Louis XIII., who received him well, and solicited him to remain in Paris; but Godefroy had become attached to Heidelberg, where he enjoyed all the consideration due to his talents, and where he desired to end his days. In this expectation, however, he was disappointed. The war, which extended to the palatinate, forced him to return a third time to Strasbourg, where, oppressed with grief and infirmities, he expired on the 7th of September 1622, in the seventy-third year of his age. His friend Bernegger pronounced his funeral oration, which is printed in the *Opuscula* of Loisel. Of all the works of Godefroy, that which does him the greatest honour, and ensures him a permanent rank amongst jurisconsults, is his edition of the *Corpus Juris Civilis*, the publication of which forms an epoch in the history of the science. His text is that which has been adopted for ordinary reading in the universities and at the bar, and his notes are much esteemed. The *Corpus* of Godefroy has passed through a number of editions, but the most valuable are those of Paris, Vitré, 1628, in two vols. folio, and Amsterdam, Elzevir, 1663, also in two vols. folio. Among the other works of Godefroy may be mentioned, *Notæ in Ciceronem*, Lyons, 1588 and 1591, in 4to; *Antiquæ Historiæ ex xxvii. auctoribus contextæ libri sex*, Basil, 1590, in 8vo; *Conjecturæ, variæ lectiones, et loci communes in Seneca*, printed at the end of the works of Seneca; *Auctores Latinæ linguæ in unum redacti corpus, adjectis notis*, Geneva, 1595 and 1602, in 4to; *Maintenue et Défense des Princes souverains et Eglises Chrétiennes contre les attentats et excommunications des Papes de Rome*, 1594, in 8vo; *Dissertatio de Nobilitate*, Spires, 1611, in 4to; *Statuta Galliæ juxta Francorum, Burgundiorum, Gothorum, et Anglorum in ea dominantium Consuetudines*, Frankfort, 1611, in folio. Gothofred was the author of a very large number of works besides those here mentioned. A complete list of them will be found in Sénébier's *Histoire Littéraire de Génève*, which also gives a biographical memoir of Gothofred himself and of his son James, who, as a jurist and general scholar, was hardly, if at all, inferior to his father. The son's name will be long remembered by his edition of the *Theodosian Code*, which Gibbon pronounced "a full and capacious repository of the political state of the empire during the 4th and 5th centuries." (J. B—E.)

GOTHS (in Latin *Goti*, *Gothi*, *Gothones*, or *Guttones*), a great branch of the Germanic family of nations, who, on their first appearance in history, are described as occupying the country about the mouth of the Vistula, north of the Lygii. They are spoken of under the name of Guttones, and as inhabiting the coast of the Baltic as early as the time of Pytheas, the Massilian navigator, who seems to have been a contemporary of Alexander the Great. After this, several centuries pass away, during which we hear nothing of the Goths, until we find them mentioned in the *Germania* of Tacitus, under the name of Gothones, and as still inhabiting the coast of the Baltic. After the time of Tacitus they are not mentioned again until the reign of Caracalla, when Spartianus speaks of them under the name of Gothi, from which our Goth is formed, and which is evidently a more correct form of the name, as we know from the Gothic bishop, Ulphilas, who lived in the fourth century of the Christian era, that the Goths called themselves by the name of Gutthiuda. But what is more interesting and important than all this, is the fact, that under Caracalla we find them no longer on the Baltic but on the coast of the Black Sea, about the mouths of the Danube, in a country which many centuries before had been occupied by the Getæ, a Thracian people. This circumstance has given rise to much confusion both with ancient and modern writers, who, identifying the Goths with the Getæ, or at least calling the former by the name of the latter, led many to the belief that the Goths were a Thracian or even a Sarmatian tribe. But all we know of the history and the language of the Goths does not leave a shadow of a doubt as to their Germanic character; they had no connection whatever with the Getæ, whether we regard these latter as Thracians or as Sarmatians. Some again have identified them with the Gothini, and believed them to be Celts, because Tacitus describes the Gothini as speaking a Celtic dialect. But Tacitus is innocent of this confusion, as he speaks of the Gothini and Gothones in the same chapter as two distinct tribes, calling the former Celts and the latter Germans. We must therefore assume that during the period between Tacitus and Caracalla the Goths had migrated from the coasts of the Baltic southwards to those of the Black Sea. Caracalla, during an expedition to the east, is said to have defeated them several times. For some time after this they appear to have remained quiet, but the Emperor Alexander Severus (A.D. 222–235) found them to be very troublesome neighbours, and endangering the safety of the province of Dacia, for they were animated by the same hostile feelings towards the empire as the more western German tribes on the Upper Danube and the Rhine. In the reign of the Emperor Philippus (A.D. 244–249) they not only succeeded in conquering the province of Dacia, but even penetrated into Mœsia, where they laid siege to the city of Marcianopolis, and compelled it to pay a large sum of money for their departure. Not long after this they invaded Mœsia a second time, and although they were at first (B.C. 250) obliged to retreat before the legions of Decius, they soon after returned and destroyed the whole Roman army, and sacked the town of Nicopolis at the foot of Mount Hæmus (Balkan). Without thinking of the possibility of their return being cut off, the Goths pushed forward into Macedonia, and advanced as far as the pass of Thermopylæ in Greece; but here they met a most determined resistance, and were forced to return to the north. Near the town of Abrutum in Mœsia, they met Decius with a fresh army; but the emperor was slain and his army annihilated, A.D. 251. Meanwhile the Goths extended their dominion on the coasts of the Black Sea, and having made themselves masters of the Crimea, they formed a formidable navy consisting of numerous flat boats. With this they boldly sailed to all parts of the Euxine and took possession of the towns of Pityus and Trapezus, in the harbour of which latter city they captured many vessels, with which they sailed to the sea of Azow, A.D. 258. In the following year they directed their attacks against the wealthy cities on the Thracian Bosporus, and conquered Chalcedon, Nicomedia, Nicæa, Prusa, Apamea, and Cius. A third expedition which they undertook with 500 ships was still more disastrous to the empire; they attacked and destroyed Cyzicus, crossed the Ægean Sea, and landed at the port of Athens; all the country from the south of Peloponnesus as far as Thessaly and Epirus was fearfully ravaged, and the whole of the Illyrian peninsula was devastated. At length, wearied of their long toils and dangers, a portion of them returned by land through Mœsia to their own country; the remainder returned by sea along the coast of Asia Minor, spreading devastation wherever they appeared. But they found it impossible to remain inactive for any length of time, and, in A.D. 268, entered upon a still larger maritime enterprise, during which, although they made unsuccessful attacks on Tomi and Marcianopolis, and although they sustained great losses in the Thracian Bosporus and on the coasts of Asia Minor, they yet succeeded in devastating Crete and Cyprus, and produced great distress at Cassandria and Thessalonica, which were besieged by them. At length, however, the Emperor Claudius, in A.D. 269, gained a great victory over the Goths near the town of Naissus, whence he obtained the honourable surname of Gothicus. Few only returned to their country on the Black Sea, but under the two following emperors they nevertheless continued to harass the adjacent parts of the empire, and in A.D. 272 Aurelian thought it proper to give up to them the large province of Dacia. There now followed a period of nearly 50 years during which the Goths did not engage in any fresh undertaking against the empire, except that in the reign of Tacitus they undertook an unsuccessful expedition into Colchis and Asia Minor. About the time when Constantine had overcome all his opponents the Goths again took the field against the Romans; their king, Araric, in A.D. 331, crossed the Danube, and although he gained some advantages in the first engagement, he was worsted in a second; and, as at the same time the Goths had to quell an insurrection of their own subjects in the Crimea, Araric concluded peace with Constantine. This peace was faithfully kept, and as long as the family of Constantine occupied the imperial throne the Goths never molested the empire, and Hermanric, the successor of Araric, was never engaged in war against the Romans. It was not till the reign of Valens that both parties were again involved in a war, which lasted three years, from A.D. 367 to 369, and in which the Goths appear to have gained some advantages over their enemies. At the time when the Huns appeared, the south-western portion of the Goths, alarmed at the approach of the savage hordes, implored the emperor of the East to allow them to settle in the empire, and place themselves under his protection. The request was granted, and in A.D. 375 these Goths, commanded by two of their chiefs, crossed the Danube and entered the empire; the eastern portion of the Goths, who had made the same request, were refused admission into the empire. If the emperor had kept his promise, the western Goths (or, as they are more commonly called, the Visigoths) might have become useful subjects; but being provoked by the ill treatment they experienced at the hands of their pretended protectors, they took up arms, defeated the Roman legions, and, having formed connections with a division of Goths engaged in the service of the emperor, and with a portion of the eastern Goths or Ostrogoths, fought a great battle near Adrianople, in which the Emperor Valens lost his life. The Goths then marched upon Constantinople, which, however, was well defended; and then turning westwards, advanced as far as the Julian Alps. In the reign of Theodosius I. (A.D. 379–395) the Goths continued their ravaging expeditions both in the north and south; and although they sustained many a defeat, still they maintained themselves in Thrace as well as in Dacia, and their strength was repeatedly increased by the arrival of kindred tribes from the north. The court of Constantinople perceiving the impossibility of subduing these formidable barbarians, at last formed the plan of winning them over, and amalgamating them with the empire. Whole swarms of Goths now entered the armies of the empire; but after the death of Theodosius those who were stationed in Thrace, commanded by their bold chief, Alaric, broke up, and without meeting with any great obstacle, advanced through the pass of Thermopylæ towards Thebes and Athens, Corinth, Argos, and Sparta, all of which were plundered. When the work of destruction was complete they turned northward towards Epirus, where they remained. During this same period the Ostrogoths, under their chief, Gainas, made an attempt to seize Constantinople, and place their own leader upon the imperial throne, but they were forced to retreat across the Danube. Notwithstanding the acts of hostility committed by Alaric in Greece, he was invested by the emperor with the dignity of Duke of Illyricum, in which capacity he made his first invasions of Italy in the years A.D. 400–404. His example was followed by Radagaisus, who crossed the Alps with an immense host of Goths. Alaric even advanced as far as Rome, and penetrated into southern Italy, where his career terminated. The emperor of the West then purchased peace of the Visigoths by ceding to them, in B.C. 412, the southern part of Gaul. They accordingly evacuated Italy, and, after a short period of rest, Athaulf, the successor of Alaric, led his Goths across the Pyrenees into Spain; there he was assassinated. His successor, Wallia, assisted the Romans in their struggles against the Vandals and Alani in Spain, and was rewarded by the whole of Aquitania from Tolosa to the ocean being given up to him. The empire of the Visigoths now gained consistency on both sides of the Pyrenees during the reigns of their kings Theodoric I., Thorismund, and Theodoric II.; and in the second half of the fifth century king Euric raised it to its highest prosperity. The kings of the Visigoths, now ruling over Spain and a great portion of Gaul (France), resided sometimes at Toulouse, sometimes at Arles, and sometimes at Bordeaux; but, after the death of Euric, the Visigoths in Gaul were gradually driven across the Pyrenees by another set of German conquerors—the Franks—who ultimately succeeded in making themselves masters of the country, and giving it the name which it still bears. In Spain, however, the Visigoths maintained themselves for two centuries longer, until, in the end, the Moors overthrew their kingdom, and established Mohammedanism in the south of Spain. The institutions and language of the Goths in Spain have completely disappeared, and at the present moment there are scarcely any traces of the dominion of the Goths in Spain.

We have already observed that the Emperor Valens refused to allow the Ostrogoths to enter the empire in A.D. 375; but the terror of the Huns, and the desire to take revenge, soon after tempted the Ostrogoths to take by force of arms what had been denied to their request. Accordingly they crossed the Danube in defiance of the Romans, and many made of them common cause with the ill-treated Visigoths. But when the latter turned southward, the Ostrogoths marched into Pannonia. At the time when the Visigoths were establishing their power in Gaul and Spain, about A.D. 386, a new swarm of Ostrogoths under a chief, Œdotheus, was in commotion in the country about the Lower Danube, but while attempting to cross the river they were completely defeated. During the ascendancy of the Huns, the Ostrogoths, with the exception of some bands following Attila into Gaul, committed no act of hostility against Rome; but after the destruction of the power of the Huns, we find them, commanded by three brothers, Walamir, Theodemir, and Widimir, in Pannonia, which was ceded to them by the Romans. The Eastern empire was obliged several times to purchase peace of the barbarians; and in one of these transactions Theodoric, a son of Theodemir, then a boy of seven years old, was given up to the court of Constantinople as a pledge that the peace should not again be disturbed. After the death of Walamir, Widimir led his hosts into Italy, where he maintained himself a long time; his son, however, on succeeding his father, was induced by the Emperor Glycerius to quit Italy and join the Visigoths in the west. Theodemir and his son Theodoric, who had in the meantime returned from Constantinople, harassed the Eastern empire by repeated predatory incursions, after which the country between the Lower Danube and Mount Balkan—that is, Lower Mœsia—was given up to them. Theodoric was now the ruler of his nation, and his capital seems to have been the town of Nova. For a time things went on tolerably well; but when the western empire was overturned, and Odoacer had set himself up as the ruler of Italy, Theodoric was induced by Zeno, emperor of Constantinople, to invade Italy and expel the usurper. Accordingly, in A.D. 489, Theodoric led his hosts from Lower Mœsia to the west, and was successful in establishing an Ostrogothic kingdom on the ruins of that of Odoacer in Italy. The power thus formed and recognized by the court of Constantinople was irresistible, and the prestige of Theodoric's name secured his kingdom, as long as he lived, against all foreign aggression. But the approach of his death, A.D. 526, was the signal for the dissolution of his empire. His family was distracted by internal feuds; and being at the same time attacked from without, the kingdom, though bravely defended, in the end fell into the hands of the emperor of the East, and the Ostrogoths ceased to be an independent kingdom, A.D. 555. The Longobards and other German tribes, who had assisted in the destruction of the Ostrogothic kingdom, now established themselves in their turn in the north of Italy, and founded the Longobardic or Lombardic kingdom.

During the migrations of the Goths from north to south, and from east to west, some branches of the nation having during their residence in a country become aware of the advantages of a settled mode of life, remained behind, while their brethren went forth in search of new adventures. The most celebrated among the former were the Mœsogoths, a branch of the Visigoths, who remained behind in Mœsia at the time when the great body of their nation migrated westward; but they were by no means quiet neighbours of the empire; for under their king, Theodoric (not to be confounded with the Ostrogoth), they extorted money and honours from the Roman emperor. The Gothic Tetraxitæ were a branch of the Ostrogoths who remained behind about the Lower Danube, and preserved their national peculiarities for a long time. Besides these, however, there are several other tribes, such as the Gepidæ, Taifalæ, Guthrungi, Greutungi or Grutungi, and others, which, notwithstanding their distinctive names, must be regarded as belonging to the great nation of the Goths. In fact, the nation appears to have been divided into a great number of subdivisions with special names, each of which was at first governed by its own chief. Some of these smaller tribes forming a closer connection among themselves ultimately united into larger bodies under one common ruler. This gave rise to the two great divisions into which we afterwards find the nation divided—the western and the eastern Goths, the former occupying the fertile and woody districts of the west, and the latter the sandy steppes of the east. The western Goths are called by the ancient writers *Wisigothi*, *Vuisigothi*, *Wesegothæ*, or *Wesigothæ*, and the eastern *Austrogothi* or *Ostrogothi*. Zosimus and Ammianus Marcellinus apparently did not know these names and divisions of the Gothic people; Jornandes, on the other hand, goes too far in assuming that the distinction of Visigoths and Ostrogoths existed even at the time when the nation still dwelt on the Vistula. The complete separation of the two branches did not take place until the power of the Ostrogothic king, Hermanric, was crushed by the Huns who came from the distant east.

As the Goths were unquestionably Germans, their religion and language were in all points of importance the same as those of the other German tribes. Christianity was gradually introduced among them even before the time of Constantine the Great, for, at the council of Nicæa, A.D. 325, a Gothic bishop of the name of Theophilus was present. This fact would seem to suggest, that they belonged to the orthodox or Catholic Christians; but it is quite certain that, in the reign of the Emperor Valens, Arianism predominated among them. Attempts, however, to crush Christianity were still made from time to time by their rulers. Thus, Athanaric, the chief of the Thervingi, the principal tribe among the Visigoths, did all he could to exterminate the new religion, and cruelly persecuted those who disobeyed his commands. But no man did more firmly to establish Christianity among his countrymen than the Mœsogothic bishop Ulphilas, about the middle of the fourth century, who invented a Gothic alphabet, by a combination of those of the Greeks and Romans, adapting it to the Gothic language. When this was accomplished, he translated the Scriptures into the Mœsogothic, a translation which is still extant in part, and is the most ancient written specimen of any of the various German dialects. A somewhat incomplete MS. of this work, which was probably written about 150 years after the time of Ulphilas, and is known under the name of *Codex Argenteus*, exists in the library at Upsala in Sweden; another likewise imperfect MS. is preserved in the library of Wolfenbüttel, under the name of the *Codex Carolinus*. This translation and separate portions of it have often been printed, and are invaluable to the student of philology. The best edition is that of Gabelentz and Lœwe, bearing the title, *Ulfilæ Veteris et Novi Testamenti Vers. Goth. Fragmenta quæ supersunt cum Commentario et Glossario*, Altenburg, 1836, 4to. Besides this translation of the Bible, there are a few other literary productions, which show that the connection of the Goths with the Greeks and Romans was not without a considerable influence in inspiring the barbarians with a love of literature. It is owing to this influence that, independently of the radical identity between the classical and Gothic languages, a number of Greek and Latin words are found in the work of Ulphilas. Another Goth who distinguished himself as a writer, though he composed his work in Greek, was the priest Jornandes, who, according to some, was Bishop of Ravenna, and wrote a history of the Goths—*De Rebus Geticis*—from the earliest times, down to the year A.D. 552. This work is the most important we have on the history of the Goths. He regards the nation as having come from Scandinavia, which, he says, was their original home. The fact of there having been Goths in the country now called Sweden, is sufficiently well established, and is evident from several local names, as Gothland, Gothenburg, and others; but it is much more probable to suppose that Goths migrated or sailed to Scandinavia at the time when they still occupied the country about the Vistula, than that Scandinavia should have been their original home. The literary character, or rather their aptititude for literature, is further attested by the fact, that the Visigoths had written laws as early as the time of Euric, when no other German tribes can be supposed to have been even acquainted with the art of writing. It is probably this superiority of the Goths over all other German tribes, that has led some modern writers to apply the term Gothic to all things connected with the ancient Germans; and even to speak of Saxons and other tribes as members of the Gothic stock; but such a usage is not warranted by anything we know about the Goths. In order to give the reader some idea of the Gothic language in the fourth century of our era, we shall here quote the *Lord's Prayer* from Ulphilas' translation, with a literal translation, which cannot fail to show the relationship of the Gothic to other German dialects:—

Atta unsar thu in himinam weihnai namo thein. Quimai
Father our thou in heaven, hallowed name thine. Come
thiudinassus theins. Wairthai wilja theins, swe in himina jah ana
kingdom thine. Be done will thine, as in heaven as on
airthai. Hlaif unsarana thana sinteinan give uns
earth. Bread our the perpetual or daily give us
himmadaga. Jah aflet uns thatei skulans sijaima, swaswe jah
to-day. And forgive us what guilty we are, as also
weis afletam thaim skulam unsaraim. Jah ni briggais uns in
we forgive the trespasses ours. And not bring us into
fraistubnjai, ak lausei uns af thamma ubilin, unte theina ist
temptation, but deliver us of the evil, for thine is
thiudangardi jah maths jah wultus in aiwins. Amen.
kingdom and might and glory for ever. Amen.

There are also some documents belonging to the Ostrogoths of the time of their dominion in Italy, especially one which is preserved at Naples, and another at Arezzo; both were composed about the end of the fifth, and the beginning of the sixth century. Among the numerous modern works which the reader may consult are, Gibbon's *Decline and Fall of the Roman Empire;* Aschbach, *Geschichte der Westgothen;* Manso, *Geschichte der Ostgothen in Italien;* Zeuss, *Die Deutschen und die Nachbarstamme.* (L. S.)

GOTTENBURG. See GOTHENBURG.

GÖTTINGEN, a town of Hanover, province of Hildesheim, and capital of a cognominal principality, is situated in the fertile valley of the Leine, at the foot of the Hainberg, 60 miles south of Hanover. It consists of three parts, the Altstadt, Neustadt, and Masch, the first being separated from the two latter by the New Leine, an artificial arm of the Leine. The ramparts which surround the town have been planted and converted into agreeable promenades. The town itself is generally well built, and the streets are mostly wide and spacious. Neither the trade nor manufactures are important, the town being chiefly dependent on its famous university. This institution, entitled the "Georgia Augusta," was founded by George II. in 1734. Previous to 1831 it was among the first of German universities, and from 1822 to 1826 the average annual number of students was 1481. Since then, in consequence of political disturbances at Göttingen, in which the professors and students were implicated, the university has fallen into disrepute, and from 1831 to 1837 the average annual number of students was only 868. The dismissal of some of the ablest professors in 1837 by the king, for political reasons, reduced the number still lower, so that in 1845 it was only 633. The number now averages about 700. The faculties are theology, law, medicine, and philosophy. The library contains upwards of 400,000 volumes and 5000 MSS. The museum contains extensive and valuable specimens in zoology, geology, &c., with models, instruments, coins, &c. There is also a botanic garden, a chemical laboratory, anatomical theatre, observatory, lying-in-hospital, two infirmaries for medical and surgical cases. The *Spruch Kollegium* is a judicial society, for whose decision questions are brought from all parts of Germany. Pop. (1849) 10,174.

GOTTLAND, a large island in the Baltic belonging to Sweden, and lying about 55 miles E. of the nearest Swedish mainland, between N. Lat. 56. 55. and 58., and E. Long. 18. 10. and 19. 10. It is of an irregular form, tapering from the centre towards the N. and S. extremities. From N. to S. it is about 80 miles in length, and its greatest breadth is about 34 miles. Area 1227 square miles. It presents the appearance of a large plateau rising from 80 to 130 feet above the sea, and is traversed by ranges of rocky heights, which, however, nowhere rise to more than 200 feet above the sea. The coasts are for the most part rocky and precipitous, but in some parts they slope gradually to the sea. They are deeply indented by bays forming numerous excellent harbours, of which those of Kapelhamn on the N., and Slite on the N.E., are the best. The soil is fertile, but indifferently cultivated. A great part of it is wooded, and swamps occur in some places. The climate is comparatively temperate; the chief products are wheat, barley, oats, turnips, potatoes, and hops; and in favourable situations the walnut, mulberry, and grape, ripen in the open air. The chief articles of exportation are timber, marble, sandstone, and lime. Game is abundant; and the rearing of cattle receives a considerable degree of attention. Gottland was taken from the Swedes in 1361 by Vladimir III., king of Denmark. By the treaty of 1644 it was restored to the Swedes, and has since remained in their possession, with the exception of a short period in 1807, when it was occupied by the Russians. Its chief town, Wisby, was, in the middle ages, the seat of an extensive trade. It gives name to a læn of Sweden, comprising Gottland and several of the adjacent islets, and containing a population of (1850) 44,572. The town of Wisby contains about 4000 inhabitants.

GOUDA or TERGOUW, a town of Holland, province of South Holland, on the Yssel, at the influx of the Gouw, 11 miles N.E. of Rotterdam. It is generally well built, and has five churches, one of which, St John's, is celebrated for its organ and its splendid painted windows. The town-house is a spacious and substantial edifice, with a tower and spire. It has breweries, gin-distilleries, brickworks, and potteries; but the manufacture for which it is chiefly known is that of tobacco pipes, which affords employment to nearly one-half of the population. Gouda is also famous as a cheese market, the well-known Gouda cheese being brought here to the market and sold. Pop. (1850) 13,791.

GOUDOK, a rustic kind of violin with three strings, used by the Russian peasantry. Another name for it is Balalayka.

GOURDON, a town of France, department of Lot, and capital of an arrondissement of the same name, situated on the declivity of a hill, at the foot of which runs the Bleou, 20 miles N. of Cahors. It has manufactures of linens, woollens, and hats, and a considerable trade in wine and walnuts. Pop. (1851) 4990.

GOUROCK, a village of Scotland, county of Renfrew, on the left bank of the Firth of Clyde, three miles below Greenock. It is much frequented as a bathing-place in the summer season. Pop. of parish (1851) 3018.

GOUSLY, an ancient harp with four strings, employed by the Sclavonians to accompany the voice when singing their ballads or rhapsodies. Formerly every wealthy Sclave family had its bard, called a Gouslar; and the poetry, historical or religious, which he recited, was named Gouslo.

GOUT. This very peculiar modification of inflammatory action has been known since the days of Hippocrates, and is a disease of common occurrence among the higher classes of society, especially with those who indulge habitually in the luxuries of the table, and use little exercise, or who inherit a predisposition to its attacks. This hereditary tendency is often very strongly marked; sometimes indeed so much so as to prevail against every precaution of diet and bodily exercise. Gout is emphatically a disease of adults, and is for the most part confined to the male sex, females seldom being attacked; yet a few rare cases have occasionally occurred in boyhood, and in one well authenticated instance even so early as the eleventh year. That gout is a blood or humoral disease has long been the common opinion, and is the origin of its name, *gout* or *gutta*, or morbid matter passed, *drop by drop*, into the affected part.

An attack of the disease is generally preceded by heartburn and other dyspeptic affections. An acute seizure (and the first few are nearly uniformly acute) usually begins about an hour or so after midnight, when suddenly the patient is awakened by a severe pain in some part of the foot, most commonly in the great toe, though sometimes in the heel, instep, ankle, &c. With the commencement of the attack there is shivering, and very soon the pain becomes of an extremely acute character, and is attended by great general uneasiness. Commonly about the next midnight, the pain ceases, often almost in a moment, and the sufferer falls asleep and is soon in a gentle perspiration. Next morning when he awakes he finds the part that was affected red and swollen, and the skin over it tense and shining. The affected part, however, soon resumes its natural size, and the cuticle falls off—a process usually attended with much itching.

During the paroxysm the urine is almost invariably found to be loaded with urea and lithates. After the paroxysm is over, not only does the patient feel as well as he was before, but usually much better. "The fit," says Cullen, "leaves the person in very perfect health, enjoying greater ease and alacrity in the functions of both body and mind than he had for a long time before experienced." After a person has suffered from one attack, he may have no return of gout for some years, but it is very liable to revisit him again and again, the intervals between each attack becoming briefer and briefer, but the paroxysm being less painful, although there is more of stomachic disorder. Joints, too, that have been frequently affected seldom completely recover their pliancy, and in many instances are liable to have, what are popularly termed, chalk-stones (deposits of lithate of soda) formed immediately beneath the skin. These sometimes give rise to open sores, and then are very troublesome.

In the great majority of cases gout is an hereditary disease. Sir Charles Scudamore collected information regarding 522 gouty individuals, and found that 332 could trace the disease to their fathers, mothers, grandfathers, or other progenitors. Gout seldom makes its appearance until after the age of 35. Some time after its appearance the affection frequently becomes complicated with severe dyspepsia, including impaired appetite, heartburn, and gastrodynia, with irregular action of the bowels, hypochondriasis, and other disorders.

Sometimes during a paroxysm the gout suddenly disappears from the extremities, and violent pain is felt at the stomach, with great sinking of the pulse; or sudden inflammatory action may supervene, generally in the chest. The former of these affections is called *retrocedent*, and the latter *misplaced* gout.

The pathology of gout is now again generally believed to be humoral, and the essence of the disease to consist in a morbific matter or matters, which gradually accumulate in the system, producing general indisposition, until at length it is concentrated and expelled at the foot; after which "the bodily economy, like the atmosphere after a thunder storm, is for a while unusully pure and tranquil." That the poisonous matter should tend to one particular spot, usually the toes, is exactly analogous to what we know regarding other poisons. Thus, white arsenic tends to the stomach, cantharides to the bladder, and so in like manner does the morbid accumulation of lithic acid in the system tend to be deposited in the joints, particularly in those of the lower extremities. During the paroxysm it may be detected, says Berthollet, in the skin of the affected part, and, as before mentioned, in the urine, having doubtless been absorbed by the lymphatics.

As the paroxysm of the gout is the effort of nature to rid the system of a poison, many physicians have been unwilling to interfere with the progress of the disease, save by the antiphlogistic regimen, and some very slight antiphlogistic remedies. But it seems to be now quite confirmed by experience, that colchicum (meadow saffron) with antacids may be given during the paroxysm with the result of shortening it, and without producing any bad effects. If pushed too far, however, colchicum causes great sickness, purging, and faintness; and in such cases it is necessary to administer stimulants and opiates. Also by means of antacids and bitters administered during the intervals, the tendency to gouty paroxysms may be mitigated. But it is also quite certain, that if the latter be done without a change in the mode of life which produced or excited the gout, various internal diseases of a very serious nature, chiefly in the head and chest, are liable to be induced. The rational plan of treating gout, therefore, consists in relieving the attack, when it is fairly developed, by means of colchicum and antacids; and, in the intervals, to recommend a regimen calculated to diminish the tendency to it, such as food mainly vegetable, a small proportion of fermented drink, habitual exercise, and the general tonic mode of treating disease.

Cases of misplaced and retrocedent gout should be treated as in persons not gouty, and in the usual way; but great care should be taken to watch for and be prepared to treat the severe neuralgic attacks that are liable to supervene. (T. L. K.)

GOVERNMENT.

THE members of the human race are not isolated and independent individuals, each acting for himself without reference to his fellows. This is a fact borne out by all history and by all experience. Wherever a number of individuals have assembled on the face of the earth, it is found universally, that they have adopted certain regulations for their mutual guidance, thus proving that the association of men is not an accidental, but an inherent attribute of human nature. But as men, tribes, and nations, are placed in a variety of circumstances, this diversity of circumstances affects the arrangements by which societies are regulated.

Among these different circumstances, it is unnecessary to refer to the disputed question of variety of *species;* but it must be acknowledged that there are most extensive varieties in the moral, intellectual, and physical conditions of men. We may therefore be prepared to find a corresponding variety of systems of society, and of the institutions regulating them, according as these societies are distinguished by intellectual capacity, acquired knowledge, historic antecedents, and physical position on our globe.

In considering government therefore as a science which has rules, we must bear in mind that it involves two elements, the variable and the invariable, the abstract or ethical, and the economical. There is not only the intellectual perception of what the form of society ought to be, and of the principles on which it ought to be constructed; but there is the consideration of the peculiar circumstances in which the community is placed. The form of government that would suit Great Britain could not possibly be established among the Red Indians; yet those Indians might have their own rules for their own government, and as perfect a system of administration of them as the administration of the laws in Britain.

There is scarcely any truth more indubitably established by history, than that the form of government suitable at one period of a nation's history is not suitable, and could not be realized, at another and subsequent period.

SECTION I.—WHAT IS GOVERNMENT?

When it is admitted that man is by nature a social being, there can no longer be a question as to whether there ought or ought not to be rules by which he, in a collective capacity, should be governed. There can therefore be no question as to whether there ought or ought not to be a government, but only a determination of the proper nature of government, of its ends, objects, and purposes. We must accept government as a necessity, and inquire, not *whether* it should exist, but how and under what conditions it can exist profitably and beneficially. And, therefore, the first question is, What is government?

The system of rules regulating a society may be termed in general *law*, and the fact and form of administering the rules is *government*. Two countries might have exactly the same body of law, and yet have essentially different governments. On the other hand, two countries might have exactly the same form of government, and yet have laws radically dissimilar. We see this exemplified in several modern states.

Of the term government there are three distinct significations:—1. Government is, in general, the administration of rule, law, and direction. 2. Government is the form of the institutions by which the rules are administered. 3. Government is the body of administrators who rule.

SECTION II.—THE END OF GOVERNMENT.

Were we to ask from history what is the end of government, we should be compelled to affirm—"the interests and advantages of the governing classes." Reason replies differently, and assures us that there is another and more appropriate end which harmonizes with the higher and better instincts of our nature. From the days of Locke, or more properly speaking, from the days of Milton, this has been termed the "good of the public," the "good of the greatest number," the "good of the whole body of society," the "greatest good of the greatest number," with other equivalent expressions, which mean that the welfare of the whole mass of society is the true end of government. Nothing, of course, can be better than the greatest good; but there has been an obscure and indefinite enunciation of the principle which renders more minute examination desirable.

When we inquire into the character of the good that government ought to produce, we find two essential principles which have been more or less acknowledged in all societies, and which depend on the very nature of man himself. The first is the administration of *justice;* the second is the development of *social improvement and well-being.*

The first is the negative, or restrictive function of government, the second the expansive or positive function; the first lays upon society rules which deter all subjects or citizens from injuring their fellows by force or fraud; the second regulates those modes of action by which a much greater good can be achieved by combination, by distribution of labour, distribution of office, united effort and national action, than if each were to undertake for himself all the multifarious duties of life. On this distinction depends the division of government into its two great departments, *judicature*, or the judicial exercise of civil and criminal justice; and *administration*, including all fiscal arrangements, taxation, duties and customs upon home and foreign produce, municipal and electoral powers,—in fact, the whole organization of society, where crimes or civil suits are not involved. But as both of these divisions are presumed to be under the direction of law; and as laws must be made either by acknowledged custom, or by positive enactment, *legislation* is the department of government which dominates the other two.

But these are not the only ends of government, although the most important. Wherever there is a government, there is a geographical limit of space, or a numerical determination of persons to which the authority of government extends. Government is not merely an abstraction, but a concrete fact, and every government has its boundaries, either of geographical demarcation or of personal citizenship and accountability. The mariner on the high seas, although for the time located on a spot that is not claimed as the possession of any government, is yet amenable to the laws of his country, and is under the rule and sway of a special particular government which claims him as a subject.

This agglomeration of territory, with the sum-total of its people, is termed a *state*, a realm, kingdom, empire, republic, or some other term which expresses the *unity* of the whole. Where the persons only are united, and the territory is indefinite, or altogether undetermined, they form only a tribe, or it may be a small nation, which, however, may have a positive unity of its own, although fluctuating in its territorial residence.

This unity of the state involves another distinct end of government, namely, its defence against the aggression of other states. Hence the military establishments of countries. The third great end of government, therefore, is the defence of the national territory, and the defence or protection of every member of the state or nation. Every one who owes allegiance to a state is entitled to its protection;

hence, where there is a monarchy, the *subject* is sheltered by the whole military power of the monarch; and where there is a republic, the *citizen* is sheltered by the whole power of the republic.

But government has yet another end distinguished from the foregoing, namely, the distribution of *honours.* Whatever may be said regarding the futility of titular honours, it is a fact apparent from history, and from the practice of all civilized people, that honours form a very important ingredient in the composition of human society. To some men honours are more desirable than wealth; and if they were accorded only for distinguished services really performed, they would be just and reasonable rewards, marking out not the fallacious vanities which too often have been combined with an utter want of merit, but marking the national esteem and gratitude, which, if fairly earned, ought also to be publicly acknowledged.

To sum up concisely the ends for which government may be supposed to exist, we recapitulate as follows. The ends of government are—

1. The administration of justice, criminal and civil.
2. The development of the social improvement and wellbeing of society.
3. The military defence of the state.
4. The distribution of honours.

Under these four heads every operation of government may be ranged, with the exception of *legislation*, which overrides all the rest. Law is the rule, and the four operations are performed under the law and by authority of the law, so that legislation is the most general function of government. It might be said in still fewer words, that the end of government was "to enact good laws and to execute them with certainty and despatch," leaving it to be ascertained and determined what laws were or were not good.

But here it is necessary to point out the fact that history presents only an imperfect fulfilment of the ends of government, yet even in the imperfect fulfilment there is the similitude of the truth. We must regard government therefore as an imperfect art which historically grows and improves like other arts. Growth, development, the gradual perfection of systems, the decay of those systems, the recasting of materials, and the gradual issue of better systems, are the keys which enable us to read history—the history of government not less than the history of other arts. If we neglect this idea of growth we can never arrive at an intelligent understanding of history, nor of the changes which, as time rolls onwards, seem destined to invade the political constructions of mankind. Stability, in fact, seems only to be attainable by providing for perpetual change.

SECTION III.—THE ORIGIN OF GOVERNMENT.

We have already said that the origin of government is in the social nature of man. That is the æsthetic origin which renders government not only possible but necessary. Under the term *origin*, however, must also be included two circumstances of another character—the historical origin as matter of fact, and the logical origin as matter of political science. So far as history throws light on the chronological commencement of government, it points in the almost invariable direction of military leadership. The warrior or the representative of force and power was the original form of the governing man. The patriarchal system which accords the power of ruling to the father or elder of the family, and then by extension to the elder branch of a tribe, may perhaps claim priority; and this form, among the Arabs and other cognate tribes, has continued down to the present day. Nor is the patriarchal element obliterated even in the governments of the most civilized nations; for wherever there is a dynasty or reigning family, the eldest member of which assumes the throne, we recognise distinctly the remnant of the patriarchal system. It is one of the elements which are still woven into the constitution of European monarchies, and no doubt it was the earliest form of authority, the children being by nature placed under the authority of the father. But the patriarchal government, if it be taken to mean that all are subject to the will of the patriarchal ruler, can have no principles save the one principle of primogeniture, and, therefore, cannot be accepted as signifying what in modern times is meant by government; and if the ruler were to rule not merely by will, but by laws, customs, and equity, then he falls to be considered as the ordinary administrator of the law, and his patriarchal character may be viewed as a mere accident.

On the other hand, the military chief, who may be taken as the historic original of the true governor, is selected for the express purpose of directing the whole body of society; and the difference between the patriarchal ruler and the military ruler lies in the significant fact, that the authority of the former was based on the relationship of blood, whereas the latter occupies an *office.* His was the first creation of the *office of government, irrespective of the natural relationship of family;* and consequently the military leader may be considered as the original form, which, as circumstances change, and as the interests of society become more and more complex, undergoes change after change, till at last it may even lose its military character except in name.

The military leader or man of military ability and prowess would naturally become the director and ruler of his tribe. In some cases the hereditary element might be grafted on the system of military chieftainship; in others the office of ruler might be merely individual, and the most powerful general might seize the reins of government. Even in modern times, and among the most advanced nations, this military origin is not unknown. Washington the general was also the first president of the United States; Napoleon Bonaparte became emperor of France; the late king of Sweden, Bernadotte, was a general; and in the South American republics, the chief power appears to be considered the prize for which all military leaders may contend, seemingly as a matter of course.

The *logical* origin of government belongs to a different category from that of history. It belongs to political ethics, and should answer the question, What ought to be the origin, foundation, and basis of the governing power in its governing authority?

Here, of course, there is room for diversity of opinion. The democratic party of the world will point to the sovereign people, and proclaim it "universal monarch;" the autocratic party will point to the advantages of a strong executive, and will cite examples where democracy has failed and where despotism has succeeded—for a time. Others, like the British, will affirm that very much must depend on the circumstances of a people, and that no theoretic rule can be laid down which will apply to all cases. They will affirm that government, being a concrete fact, must be regulated by the necessities of time, place, circumstance, and habitual belief; that circumstances not only do, but *ought to* influence all deductions from abstract reason, and all inferences from historic teaching; that a republic may, theoretically, be the most correct, and a despotism (among semi-barbarous people) the most successful; but yet that there is another way of solving the difficulty, namely, by compensating advantages according to the actual conditions of the people who are to be ruled; that with a very free, enlightened, and well educated people there may be a tendency towards popular election becoming year by year more and more expansive, but that an ignorant and half-savage population must submit to the iron rod because they are unfit for governing themselves, and consequently must submit to those who will rule them ill.

There are then two poles to the theory of government, the one which points to democracy and the other to despotism; and in the midway between the two, there is a neutral point which equalizes powers and modifies extremes. The democrat derives the logical right to govern from the sovereign will of the people, his antagonist from the sovereign necessity of government, and from the ideal perfection of a single will. The British system, on the contrary—and the British system is absolutely unique in the world, having no counterpart or fellow—derives the right to govern from several distinct sources, mainly from the people, but only a small portion of the people; partly from the notion of hereditary right, which resides in the nobles; and to a great extent from the hereditary authority of the crown, which represents those ends of government that are independent of human will, namely, the ends of justice.

The logical origin of government, therefore, must be sought neither in the fury of the democrat nor the violence of the despot. It must be sought in the necessities of man, with an impartial consideration of circumstances and national peculiarities ever present before us. The circumstances of nations do, no doubt, allow a large limit of action intermediate between despotism and democracy, and according to those circumstances a people may be compelled to verge towards the one or the other. With a new, vigorous, expanding population, spreading itself out on new lands, occupying new territories, fighting its way, rifle in hand, against rugged nature and hostile Indians, there is necessarily produced a powerful tendency towards democracy. Democracy, in fact, grows of its own accord as the result of circumstances, and where not overstretched nor carried to unreasonable extremes, it answers perhaps better than a more rigid and stringent form of government. But it requires an intelligent and well-intentioned people who are in nearly uniform circumstances to conduct it. On the other hand, with a long settled and stationary population, accustomed to the ordinary administration of law, and where more especially each individual, instead of being called upon to do everything for himself, performs only a single part of the employments of life, where there is a division and subdivision of labour, and where each man desires to attend to his own particular business, there is quite as powerful a tendency to despotic rule, that is, to leave the government in the hands of some one or few whose especial occupation it is to govern and to administer justice and law. With good laws a despotic administrator acting with just impartiality may really rule well, but the danger is, that the possession of power may lead to its abuse, and therefore checks must be devised to secure the people from tyranny.

When, therefore, it is asked, "what is the logical origin of government, or what *ought* to be the *origin* of a government in any given country?" we should hesitate to lay down any absolute rule; but rather to regard government as an organic growth with which circumstances have much concern. Instead of saying "the will of the people," as Milton, Locke, De Foe, and the republicans would say; and instead of saying "the will of the prince," as Hobbes, Filmer, the Austrian catechism, the constitution of Denmark, and the despotic governments would say; we should rather reject both schemes, and affirm that government ought to originate "in the *intelligence* of the nation," without fixing, by any absolute dictum, where that intelligence is to be found, but leaving it to be determined by circumstances *what* classes have arrived at such a state of intelligence and stable good conduct, as to entitle them to become active members of the body politic, and to exercise political rights. All such dogmas as "the will of the people," or "the will of the prince," are hazardous and unreasonable propositions, which may have a show of logical completeness, but which are not suited to the circumstances of mankind. A good government is an organic growth, and it must originate in the *intelligence* of a nation.

SECTION IV.—OF THE KINDS OF GOVERNMENT.

It has been usual to classify the forms of government into the monarchical, or government by one person; the aristocratic, or government by a few privileged individuals; and the democratic, or government by all. This classification is a loose yet convenient mode of expressing certain facts and ideas; it answers a purpose, and may pass as the conventional mode of indicating that certain characteristics prevail more or less in certain political constitutions. But it would be difficult to point to any nation where there was really and truly a pure and simple monarchy, aristocracy, or democracy. Much, for instance, has been said and written on the advantages or disadvantages of republics, and the ancient republics have freely been cited as examples; overlooking the fact that there never *was* an ancient republic, and that the *name* alone has imposed on those who pretended to draw arguments from history. All the ancient republics contained *slaves*, persons who were excluded from political rights, and the so-called republics were only instances where a privileged class of citizens, or very numerous aristocracy, ruled the state or commonwealth. So also with monarchy. We can scarcely assign a time or place where all the members of a state have been subject to the will of one man. There has always been a council or divan which aided and controlled the monarch. The control may have been of the rudest kind, as in the Russian government, which has been termed "an aristocracy varied by an assassination;" but control has always been present. The great mass may have been subject to the monarch's will, but not the *whole* mass. The monarch has never stood alone as the one single dictator whom all others were willing to obey in all things. There may in Turkey, Russia, and other countries, have been a near approach to absolute domination and absolute submission; but the extreme point, if ever reached at all, has speedily been followed by circumstances which prove the existence of a counterbalance to the autocratic will. The feudal system was nominally a monarchy, but the barons had intelligible and acknowledged rights which limited the crown, and these rights were enforced against the king, as at Runymede, with the distinct understanding that the royal will was not and could not be paramount to the interests of all the subjects. The monarchical Pope of Rome has his college of cardinals, but the aristocracy of Venice had also their doge, the republican United Provinces had their stadtholder, the democratic United States have their president and their honourable senators, and France, under Louis XIV. (*l'état, c'est moi*), had her laws and her parliaments.[1] The logical division, therefore, into monarchy, aristocracy, and democracy, must be accepted as a species of general expression which indicates extreme forms, like the mathematical point that has no length, breadth, or thickness, or the line which is absolutely straight. In the real history of men and nations we find only approaches to these theoretic forms. They are mingled together in various proportions—here, monarchy is the predominant element—there, aristocracy—elsewhere, democracy. The *names* may be suitable, but the fact is found only in the conception of an ideal perfection that exists in the human understanding—not in the actualities of history. In actual fact the three elements, however disproportioned, will generally be found together;

---

[1] One of the five-franc pieces issued in the time of the first Napoleon affords a curious illustration of this mixture of political elements. On the reverse it bears "*Republique Francaise*," and on the obverse "*Napoleon Empereur*."

and in the form of government, as well as in its theoretic origin, the object of research must be, not any dogmatic determination of a perfect form, but a compensation of advantages accommodated to the actual circumstances of a people.

We may therefore ask what each element represents, for unquestionably there is some reality represented by the monarch, the aristocracy, and the popular will.

The monarch represents the unity of the nation and the stability of the government. He is the fountain of all executive power, and in his name justice is executed—he is the head of all military forces—he alone enters into relations with foreign countries—he makes peace or war; and he is the fountain of honour to grant titles and dignities. So plainly do these functions indicate unity, that where there is not a monarch there is commonly a single person chosen to perform them—a president, a stadtholder, a doge, or some single official who represents a monarch, though passing by a different name. In foreign relations the essential purpose of a monarch is to represent the whole nation, and in home relations to represent the administration of justice. We therefore see how *hereditary* monarchy may arise by an easy and natural process. Justice is supposed to be permanent and unvarying; it ought to be administered under all circumstances. Whatever fluctuations there may be in other political matters, whatever parties, doctrines, theories, or schemes, may be uppermost for the time being, the administration of justice is supposed to be a permanent duty, and, therefore, it is not unreasonable that there should be a permanent person in whose name justice is administered. The king is thus said "never to die:" "le roi est mort—vive le roi," is an expression that contains a profound political truth, namely, the permanency of the nation, and the permanency of the administration of justice. Where, on the contrary, a mere *military ruler* dies there is usually a contest among the survivors, and government is only re-established when one shall have made himself supreme.

This view of the monarch, however, entails the question of a monarch's powers. If the monarch be the permanent representative of justice, the monarch, as a person, must reign but not *govern,—le roi régne, et ne gouverne pas.* Where the monarch attempts to enforce his own will, or to take a positive activity in the government, he abdicates the position into which the feelings of men have installed him. "The king can do no wrong" is only the sequel to the idea that the kingly office is occupied not for the sake of the person but for the sake of the office itself; and the true meaning is that the office can do no wrong, because it is not endowed either with a legislative or a dictatorial power. It is the representative of the execution of the law; and so long as the monarch restricts himself to his proper official capacity he can no more do a legal wrong than the law itself can do a legal wrong.

If it be considered, then, that the monarch represents the unity of the nation, an aristocracy may be regarded as representing the distribution of its powers and dignities. The noble also, like the monarch, originated in war leadership. While the monarch was the supreme head of the whole military power, the noble was the divisional commander; and in the feudal system, which made the monarch lord or suzerain of the whole national territory, the noble was the lord of a portion, a province, a county, or a minor subdivision of the kingdom. It has been stated that one of the ends of government is "the defence of the kingdom," and under this idea the feudal system portioned out the kingdom into districts over which a noble was appointed to preside. At first the office was not hereditary, nor were the lands the property of the nobles, but nobility gradually became hereditary, and the right of the noble families to the soil came to be acknowledged, first by custom, then by positive grant, and, finally, as in England in the reign of Charles the Second, the nobles were relieved from military service, and retained their lands by the tenure called free and common soccage.

It will thus be seen what aristocracy in its true sense represents. It represents, first, the territorial soil of the kingdom; second, the divisional exercise of power under the monarch; and third, the military distribution of the national forces. This was the feudal idea of an aristocracy; and where the state was constructed on a military system, the lands being held on condition of performing military service, it is evident that aristocracy was the native growth of circumstances, and fulfilled the requirements of the times. In entering as an element into the government of a country, therefore, an aristocracy may fairly be regarded as the representative of the fixed property of the soil; and as territorial wealth will always exercise its influence, whether ostensibly or implicitly, the aristocratic element is only an open and avowed acknowledgment of an influence that is sure to exist, whether it does or does not assume a separate standing of its own.

Such may appear the reasonable origin and purpose of an aristocracy; and even where the titular nobility is rejected, and hereditary dignities are unknown, we see an approach to a similar system. We see in the United States the territorial division into *separate* states, each of which has its governor, and each of which has its senator—the one holding an executive and the other a legislative office. These offices may be regarded as aristocracy in the birth; and if the offices were made hereditary—an event, however, which none can anticipate—there would be a genuine foundation of aristocratic nobility, just as Washington would have become a monarch, had he been appointed perpetual president, with hereditary succession of the office secured to his family. An instance of this kind has been furnished in the recent history of France, where a president elected for a term of years was transformed into an hereditary emperor by the suffrages of the people.

Where an aristocracy, however, from an element of government produced by the circumstances and necessities of society, becomes changed to a governing *caste*—where one family endowed with the title of nobility is supposed to differ in kind as well as in office from another family perhaps of equal wealth and equal worth—and where, instead of a compensation of advantages, and a due representation of all the interests of society, the noble families assume the whole government of the community, and form what is termed an *aristocratic* government, the greatest evils have always been found to prevail, and the state has sunk inevitably into factions which sooner or later have ended in the ruin of the commonwealth. Nor is this surprising, for the determination that a certain number of families shall enjoy all powers and privileges is the very destruction of the organic growth of society; it is an attempt to fix in perpetuity what nature has made variable and expansive—an attempt to make the physical accident of birth take the place of the true intelligence of the nation. An aristocracy existing in a country where there is both a monarch and a popular assembly is a very different thing from a government by nobles alone. The first may give stability to the government, and may prevent sudden fluctuations by the people when roused into temporary excitement, and rashly urging their measures with undue and unreasoning vehemence. The landed or property interest may sometimes balance the state when other interests would act with less consideration; and, as an element of government, it can scarcely be denied that property should have its weight because it is immediately implicated in the decisions of the body politic. But where the nobles rule as nobles born to dominate; where the doge is a puppet, and the people are nothing; where *caste* is made the criterion for office or power; where an impassable or scarcely passable wall of separation is built up between the privileged and the unprivileged families; where the interests of the order are preferred to all other considerations; and where factious ambition is the chief characteristic of the governing class, aristocracy presents itself under the form of a hateful and tyrannical oligarchy which is certainly doomed to self-destruction or decay. Society falls into a condition which nature cannot tolerate; there are no means for renewing the strength and vigour of the commonwealth, growth is arrested, expansion is impossible, the green moss grows upon the edifice of the state, which sinks into a picturesque ruin that only indicates the presence of its former glories by ornaments that have no longer a meaning, and by dignities that have fallen out of use.

Having thus endeavoured to exhibit the fundamental elements of society, represented by monarchy and aristocracy, it remains for us to inquire into the nature and characteristics of democracy. The democratic element, like the monarchical and aristocratic, has its foundation in one of the ends of government, namely, "the development of social improvement and well-being." Why should the people attempt to govern themselves instead of allowing the whole power to pass into the hands of the monarch? is a question that meets with a ready and specific answer, when we reflect that the interests of the whole population are involved in the administration of government. Every man's interest being at stake, and every man's life, liberty, property, and reputation, being implicated in the success or non-success of the society to which he belongs, he has a direct motive to assert his own views of the national policy, and, in a modified sense, a right to influence that policy according to his own will. That the will of the people ought in all cases to be supreme, that the popular will ought in all cases to be obeyed, and that "*vox populi* is *vox dei*," is one of those gigantic fallacies which gain currency in expression but never in fact. Nothing can be more fallacious than the idea that the will of the people ought to be obeyed *because it is their will.* It may be more probable that the judgment or decision of a large body is more correct than the judgment of a single individual or small selection of interested persons. We do not affirm that it is so, but admit the possibility that it may be so. Yet that circumstance could never establish the principle of democratic supremacy, nor ever render it right that the will of the people should be assumed as the last final criterion of political rectitude. The laws of justice are independent of human will, though not independent of human intelligence, because it is the province of human intelligence to discover and apply them. Human will, therefore, cannot be accepted as a universal and infallible rule of duty, because man being subject to passion may be blinded to right, and a majority or the whole of an assembled multitude may commit a crime, even as an individual may commit a crime. The will of the multitude can no more change right into wrong, or wrong into right, than can the will of the monarch or the will of the aristocracy. It is not the multitude of *wills* that establishes the propriety of democratic influence, but the agglomeration of interests and the agglomeration of intelligences.

But although the will of the multitude must be rejected as an absolute criterion of right, there is nevertheless a vast department of the public business of society where the popular dictum comes into reasonable and appropriate action. The many have interests, and instincts, and intelligence. They bear burdens, pay taxes, and live by the sweat of their brow. They "know where the shoe pinches;" and often, by the instinct of their common interest, they arrive at truer and better conclusions regarding the economical influence of the laws, than others gifted with greater powers of speculation, yet who are not placed under the instructive agency of direct pressure. Pressure is the great instructor of the people. Many bad laws having been enacted in almost all countries, deeply injurious to the welfare of the people, and greatly detrimental to their interests, the operation of the popular will has been called into exercise to amend those laws, and to ameliorate the circumstances of social existence; and thus the democratic influence, directly or indirectly, has operated in the most beneficial of all directions, namely, towards the purification of the permanent laws that are habitually administered among civilized men. The code, or statute-book, whether in France, Britain, America, or Germany—meaning thereby the body of positive law actually enforced in the present day—owes its justice and impartiality in a very high degree to the democratic spirit generated in England during the time of the parliamentary struggles; carried out at a later period in the laws and constitutions of the United States; reproduced in the turmoil of the great French Revolution, and embodied in the spirit of French law even after the insurrectionary portion of the revolution had ceased, and now habitually acknowledged as a worthy and genuine contribution to the principles of law and government. Without that democratic element infused into the spirit of modern legislation, liberty would have been far less extensive and far less secure;—not that we are nearer to what is termed a democracy, but that numberless bad laws, customs, institutions, privileges, class exemptions, or class injustices, have been swept away, probably for ever; and that the body of modern law has been purified to an extent that can only be appreciated when we turn to the pages of past history, and inquire into the condition of society in England before the accession of William, and on the Continent before the French Revolution. This undeniable fact points out what may be the good influence of the democratic element even though we are left as far as ever from the establishment of a democracy. It works, when it works for good, as a principle infiltrating through the institutions of society, and amalgamating with the other principles—not overthrowing everything that stands in the way of the popular will, but gradually removing those things that stand in the way of the popular good. The true aim of democracy is not to war against thrones, but to war against unjust and injurious laws, and to obtain the enactment of good laws whose administration shall be secured by a powerful sceptre. Democracy in its best sense, in fact in its only good sense, means *impartiality;* and the great aim of modern society should be to infuse impartiality into the laws, and to have the laws executed by a strong government.

In thus viewing democracy, it need scarcely be added that we cannot regard it as solving the difficulties of government. As a principle or element capable of being wrought into the framework of society, democracy has a true and vital existence, which cannot be obliterated among freemen. But as a form of government in which all things and all measures come ultimately to depend on the popular will, it is a mere violent extreme, which may, like the highest despotism, exist for a period in extreme circumstances, but which time must modify as society grows into more and more complex conditions.

SECTION V.—OF CONSTITUTIONAL AND REPRESENTATIVE GOVERNMENT.

Admitting, then, that there are three essential ideas, or principles, involved in the fact of good government—first, the unity of the state and administration of justice; second, the fixed property of the realm; and, third, the rights and interests of the people,—it remains to be asked whether a system can be found that shall combine these in such due *proportion* that the welfare of all shall work together coincidently, so that a nation possessing a certain territory shall be organized in such a manner that it shall no longer be subject to the sudden and disastrous fluctuations of political revolution. Let it be granted that organized society is a growth—that it begins in simple forms and ends in more complex forms—that, like a tree, it has its roots, its stem, and its branches—that time, experience, amendment, and continual improvement, are necessary to bring it to perfection;—let this be granted, and we see at once that the simple forms of social organization are elementary, and, in one sense, barbarous. A monarchy can be manufactured at once by a strong-minded and strong-handed military chief, who assumes the supreme rule: a democracy can spring into existence wherever a multitude of human beings assemble: an aristocracy can be produced where the more knowing and the more wealthy agree to rule the multitude. Such systems of government are not organizations; and however long they may be perpetuated, they are only rude and elementary; because, let society be reduced into anarchy, and one of these forms can be reproduced at any given moment. This is not growth nor construction, but the mere spontaneous commencement of what ought to lead to construction. No length of time can make such forms other than elementary—no universality of practice, other than the mere beginnings of the complex machinery of civilization. A perfect government would be one that would produce the free, enlightened, and well-behaved citizen, who, conscious of his own duty and dignity, should walk with perfect freedom in obedience to perfect law. Such, indeed, is the great ultimate end of government,—not merely to *punish* crime, but to prevent it altogether; to lead the whole body of society to the intelligent conclusion that crimes and evil deeds are the worst possible investments; that good conduct shall be attended with perfect liberty, but that evil conduct shall be instantly followed by swift and certain retribution. It is true that man being endowed with passions and impulses cannot be manufactured like raw material; but all the *external motives* capable of being presented in one form rather than another should be so arranged as to be inducements to good and not evil; that is, that the machinery of government shall be as perfect as possible, whatever may be the nature of the material that is subjected to its operation.

Complexity is in reality no objection to a government, provided the ultimate operations are simple. The more complex the machine, the more perfectly it ought to do its work, and with the least cost and trouble to the proprietor—that is, the nation.

How then can the ends of government be efficiently carried out so as to preserve the rights and promote the interests of all parties?

The answer to this question must, we apprehend, be one derived from practice. Whatever conclusions may be derived from theory, or whatever logical deductions may be derived from the intuitional principles of the reason, it is plainly evident that the best form of government cannot be derived from abstract considerations alone, because there are, in the concrete nature of the individuals of the human race, certain circumstances and tendencies that can never be sufficiently accounted for in abstract reasonings. Politics may be a science, and may be studied in its universal doctrine of ethics; but government is an art, and as an art, must depend on experience. Trial, failure, trial again, and ultimate success, must precede the analysis which shows us the principles of government. Those principles are not *à priori* but inductive. They are drawn by careful study from the actual facts which history presents; and induction has this immense advantage over speculation, that the circumstances and peculiarities of men, which no sagacity could bring into calculation, are seen at work in the actual world exhibiting both the quality and the quantity of their real influence.

Let us, then, consider the three facts,—

1. The unity of the nation.
2. The fixed territorial property of the nation.
3. The rights and interests of the people.

The first is represented by a monarch who *reigns* but does not *govern*. The second is represented by an assembly of the great landlords. The third is represented by an assembly of notables chosen by the people.

No *à priori* scheme would ever have produced a combination of this kind, and arguments of the most conclusive character have been advanced to prove that it could never work. But it has worked and does work, not perfectly perhaps, but with such a manifest superiority over the other systems of Europe that no European nation can boast of the same security and liberty that have been developed under this complex system. In no other country has the utmost freedom been combined with the same regular administration of law; and this fact entitles the British, or limited constitutional system, to particular attention. It is not perfect, and never has been perfect, but it has shown such a real adaptation to the circumstances of man, that, under it, a small island kingdom of little geographical importance, has attained a strength and vigour that have not only carried the British name but the British power and influence into all quarters of the globe. This assertion cannot be construed into a boastful laudation of Britain; for it is a mere historical and political fact that Britain has gigantic colonies, and the territory of India subject to her crown; that her colonies exceed in wealth and importance those of any other nation, and even those of all other nations put together. To assert this fact is not to boast, but to point out one of the most remarkable phenomena that ever appeared in the world of politics—one that ought to convey instruction to all despotic governments, and that ought to inspire all nations with a love of sound and wholesome liberty, not run riot, but duly tempered and regulated by wise and reasonable institutions. The progress of Great Britain, since the establishment of her constitutional government, is a marvellous fact that has excited the astonishment and perhaps occasionally the envy of other countries. It depends upon two circumstances, on *liberty* and *security*. Britain was the first country that discovered the mode of combining the utmost amount of reasonable liberty with the utmost amount of legal security; and to this she owes her progress. It is, therefore, not merely a matter of opinion that the British constitutional government has worked well, but a great and instructive fact worthy of the best attention of all political students, and indeed of all nations that desire to improve their condition.

Let us then endeavour very briefly to extract the essential characteristics of the British constitutional government.

In the first place, the hereditary monarch reigns, and is the first magistrate of the kingdom, in whose name all justice is administered. The monarch is also the fountain of honour, and alone confers titular dignities. All naval and military commissions are held from the monarch, and the monarch alone enters into relation with foreign states. The crown, it is true, has an official veto on laws passed by the Lords and Commons; but this prerogative, where all parties are really bent on full and fair discussion—and the laws are the result of judgment, not of will—may be considered formal rather than practical. The great fact, however, is, that the monarch must govern *according to law*. This provision, introduced at the accession of William III., is the true hinge of the British monarchy, and it is the safeguard not only of the people, but of the monarchy itself, because it prevents those contests between crown and people which prevail elsewhere. Instead of a revolution, which perils or changes the monarch, the British system *changes the advisers of the crown*—that is, changes the ministry—and the monarch becomes practically as new as if a new personage had been promoted to the kingly office. This excellent provision, which keeps the monarch irresponsible, and devolves the responsibility on the advisers of the crown, combines constant opportunity for change with constant stability. The queen's *ministry* may be removed as often as occasion requires, but the queen's *government* never ceases. The parties, or factions, of the kingdom, instead of entering into contests with the crown as in former ages or in other countries, circulate round the crown as round a centre; and that party which for the time being can occupy the greatest portion of the circumference claims the sanction of the crown to its measures, the crown remaining always at the point of stability, and as regards the nation, of *impartiality*.

The despot, however, affirms that the monarch ought to govern, and the republican affirms that there ought to be no hereditary monarch. Both propositions are true in certain extreme circumstances, but only in the early growth of a constitution. When once a nation has settled down into form, and has recognized its laws, there is every disadvantage in allowing the monarch to become a partizan—which he must become if he assume one side or other of a national question, agitated perhaps with the rancour and vehemence which proverbially attach to questions of politics. In a country where many serious struggles have at last instituted a regular system of law which ought to be carried out and enforced under all circumstances of party, there is an immediate and evident advantage in having the highest official removed from taking a part in what are really the minor questions of a nation's existence.

But the republican says that there ought to be no hereditary monarch; yet it must be confessed that it would require a larger amount of experience than the world has hitherto accumulated to prove the advantage of abolishing all monarchies, or even of adopting an *elective* monarchy. To subject a nation to the perpetual play of faction, and to cast the first office of the state into the arena of political strife, to be contended for by the great or ambitious families, can be attended with a very small amount of good when the stability of the office and not the qualities of the person are the great requisites. Justice is not better administered in the name of a president than in the name of a king; and the very circumstances which have been adduced to prove the evils of monarchy are those in which the monarch has departed from the duties of his office and has become a politician, with personal opinions and predilections. Nor can the example of the United States be fairly cited in this case, for the states contain several millions of people who are deprived of all political rights, and the slave states are no more republics than Great Britain is a despotic monarchy. They are virtual *aristocracies*, and aristocracies of the worst kind, the aristocracy of a dominant race reducing another race to slavery. To call such a system a *republic* is to make a mockery of our mother tongue. The only instance of a true and genuine republic, where all men were presumed equal, and where universal suffrage was reduced to real practice by a great nation, is to be found in France in 1849; but the existence of that form of organization was too short to prove anything either on the one side or the other, except the instructive fact that anarchy is historically followed by a strict rule, which introduces the element that had been omitted in the republican calculation.

Next to the throne comes the House or Assembly of Peers, composed of the lords spiritual and temporal. When the church was a great landed proprietor, possessing from a third to two-fifths of the soil of the kingdom, and when the bishops were the nobles of the church and of the church lands, there was a *feudal* reason for admitting ecclesiastics into the councils of the state. But since the Church of England has been undergoing a modification, which may at some future time divest it of all *direct* proprietorship in the soil, the reason for the presence of bishops in the House of Peers becomes more and more attenuated.

The temporal peers may be supposed to represent the territorial soil and the dignities of the kingdom. A hereditary nobility, possessing the right of legislation in conjunction with the crown and the commons, is based on the idea of hereditary possession of the soil. In the feudal system, where the noble was, strictly speaking, a constituent portion of the military organization of the kingdom, the office of nobility is clearly intelligible. Nobility was as much an office as monarchy itself. The noble was bound to appear in the field (bishops not unusually handled the sword as well as the crozier) with so many knights, and each knight with so many followers or men-at-arms. The noble in fact was the divisional military commander; he was bound to serve, and for his service he received the use of the lands which belonged to the king, or rather to the nation, these being held by the crown for the purpose of the national defence. The office of nobility was then a distinct portion of the national organization. Since the introduction of a standing army, however, the feudal service has lapsed and ceased, and the nobles now form a separate assembly, apparently on account of their titular dignities alone. If the crown confer a peerage on an individual, he immediately takes his place as a legislator, whatever may have been the motive for conferring the dignity. The possession of the title gives the right to a seat in the chamber of the aristocracy; but so essential is wealth, that where the crown confers a peerage on an individual not endowed with broad acres or a large income, a provision is made out of the *national funds*, either in permanency or for a certain number of lives. This fact proves that nobility is mutually considered as a national office, and not merely a personal and inherent dignity. The doctrine of *caste* still remains to a small extent, but it must be remembered that British society has grown out of a strictly feudal system, which was essentially a system of caste, and the small remnants of the doctrine now extant are probably not more than coincide with the national feelings; for there can be no doubt that Britain is actually proud of her aristocracy; and not altogether without reason, as many a hard-fought field and gallant feat of arms can testify. With the exception of the Russian aristocracy, which has not yet begun to decline, the British aristocracy is the only one in Europe that has preserved the high mental and physical qualities necessary for the maintenance of its position. It can still stand before the world without shame, and before the nation without fear; and this it owes to the circumstance that the doctrine of caste has been practically abolished, and that the institution of nobility has been renovated from time to time by the introduction of the more successful and distinguished commoners.

But the office of the nobles is not confined to legislation alone. They form, when assembled, the ultimate *judicial court* of the kingdom. With them lies all final appeal in the administration of civil law; and as judges their very position is a sufficient safeguard against the intentional abuse of the judicial office. In ordinary cases they leave the decision to certain professional members termed law lords—men of distinguished acquirement who have attained a peerage; but the court is comprised of the whole of the peers, and on occasion the whole assembly may record its judgment.

Having thus considered the two hereditary branches of the legislature, we turn to the third branch—the House of Commons—constructed on quite a different plan, and representing a totally distinct series of principles. The British House of Commons may, without exaggeration, be termed the most important popular assembly that has ever been brought together. A larger amount of money is annually subject to its immediate control than ever was placed at the disposal of any other assembly, a population is affected by its decisions greater than any other assembly could ever directly reach by legislation, and a more extensive territory owns its legislative sway. In the direction of the affairs of the world, and in all quarters of the globe, the British House of Commons wields a more massive power and influence than ever fell to the lot of any similar assembly; and although it cannot in any particular interfere as a legislative assembly with the executive government of the empire, the principle seems to be established beyond question that no executive government can continue in office in Britain, unless it have a majority of the representatives of the people in its favour. The Commons also, having the exclusive command over the national purse, have the constitutional power of suspending the payment of the army, navy, and all government officials—in fact, of arresting the course of administrative government altogether. The real power of the Commons, therefore, has no assignable limit, and consequently all great questions of policy are virtually decided in the House of Representatives. What then is the House of Commons, and how do its members come to exercise their powers?

The House of Commons, as the representative of the people of Great Britain, is distinguished from the monarch and the House of Peers by the fact that its members are chosen by the votes or suffrages of the nation. The assembly is not democratic, but is supposed to represent the more intelligent portion of the population. How far the suffrage ought to be extended, that is, what number out of the whole population ought to exercise the right of election, is a matter of expediency which depends not on any abstract idea that all men are equal, but on the real progress of the people in those qualities which enable them to exercise the right for the benefit of themselves and their fellow-countrymen. De Lolme, in his *Constitution of England*, draws this distinction between *freedom*, which is every man's right, and *the franchise*, which is a political function. He says, "What is liberty? Liberty so far as it is possible for it to exist in a society of beings whose interests are almost perpetually opposed to each other, consists in this,—that every man, while he respects the persons of others, and allows them quietly to enjoy the produce of their industry, is himself secured in the enjoyment of the produce of his own industry, and the safety of his person. But to contribute by one's suffrage to procure these advantages to the community—to have a share in establishing that order of things by means of which an individual, lost as it were in the crowd, is effectually protected—to lay down the rules for those who, being invested with power, are charged with the defence of individuals, and to provide that they should never transgress them—these are *functions*, are acts of government, but not constituent parts of liberty." (P. 245.)

Here, as in all other departments of government, there must be a compensation of advantages, a contest with the democracy on the one hand, and with the aristocracy of land or wealth on the other. The great advantage of a wide constituency is, that it diminishes or prevents that undue influence over the popular elections which the aristocracy are certain to exercise over tenants, dependents, and those who hope to propitiate favour by the sacrifice of a vote which thus comes to represent not self-government but self-interest. The great disadvantage of a too widely-extended constituency is that electors are tempted to follow the demagogue, and to do his bidding in moments of excitement when there is some common object before them. Between these extremes there is a point which must be estimated by a rational consideration of the circumstances of the country; but as this point is unquestionably moveable, there ought to be some provision for the rearrangement of the national constituency, and for the revision of the electoral scheme so as to make it suitable to the circumstances of the time being.

The object of the Reform Act of 1832 was to place the franchise in the hands of the middle classes. It gave the preponderance, not to the populace or the working-men, but to persons in a rank of life below the aristocracy and gentry, but above that of the labouring poor. It embraced a large proportion of the intelligent, well-conducted, and, at least, moderately cultivated, and thus infused into the government an element of progressive improvement and stability.

In any new reform bill it is of essential importance that what has been stated as the end of government should be steadily kept in view—"the greatest good of the greatest number." No man, no class of men, have a right to exercise the franchise unless it can be shown that by so doing they conduce to this end. Our electoral system is but an instrument for working a great good; whoever adds or withdraws from the machinery so as to impair its efficiency inflicts an injury on the community. If it can be satisfactorily proved that any part of it prevents the proper working of the machine, it should be removed; if it can be proved that any addition would increase its efficiency, let it be added. There are those who base their arguments on abstract right, in whose estimation all men are entitled to a voice in the representation. If their theory were carried into practice, then all the other classes would be swamped by the overwhelming numbers of the operative classes, and the government would be handed over to the more excitable, more ignorant, and the more corruptible part of the community. The history of the past and the history of the present alike testify to the calamitous results of this course. An extension of the suffrage may not only be just but desirable and necessary, but that extension should be beneficial and safe. In the first place, the franchise should not be conceded on any ground that involves the principle of right, or on the notion that the mere lowering of the qualification is an extension of liberal government. Next, if we are asked, how then can the franchise be safely and beneficially extended, we answer in the words of an able article in the *Edinburgh Review* (No. 196):—"Our reply to this, if it is to be satisfactory, must be not evasive, but direct. That reply is briefly an appeal to the fundamental idea lying at the basis of our constitution, and at the very core of the national character, which is not that of democratic equality, but of distinct and privileged but open orders. We ground our polity upon, and owe our safety to, two great principles—*retaining the powers of the state in the hands of the less numerous, but more select, more cultivated, and more competent classes*, and, *making ingress into these classes accessible to all.* The union of these two principles is safety; their disjunction would be injustice and ruin. The old *régime* in France fell by denying the second; the new *régime* has never been able to maintain itself, from having negatived the first. Let it be our fixed resolution to avoid with equal care either error."

Theoretically, the crown and the peers ought to have no power to influence the election of popular representatives; but practically, it must always be expected that official authority and territorial wealth will *de facto* have a social power which, though not belonging to the office of the administration or of the peerage, operates on the conditions of human nature.

If, then, we ask what are the direct and indubitable advantages of a government composed of king, lords, and commons, with a king who cannot initiate legislation, with a responsible ministry, with a house of representatives that cannot interfere in the executive administration of the national affairs, and yet that has the exclusive power of the purse, the answer is precise and definite. Such a government possesses stability on the one hand, the power of change and of adaptation to circumstances on the other; and also, it must be observed, that such a government can find a place for men of the most extreme views. The most

Gower.

antiquated conservator of old customs appears not ungracefully in an assembly that has feudal traditions, and when (as he must do on serious occasions) he stands almost alone, he represents the antiquarian spirit of government. The most extreme democrat need not be denied a place in an assembly where all the social influences are in favour of a reasonable preservation of order. He represents the opposite pole of political theory, and with much talk is in reality only the solitary speculator, who, perhaps, may point out a new course, but cannot move society in that direction until the whole field has been minutely surveyed and explored, and its advantages tested by experience. Under a constitutional government, therefore, there is really no serious danger in the presence of the most violent extremes. The extremes only point out the utmost limits of discussion, they are the outposts of the army, the sentries and pickets, who are removed from the main body to give warning of danger. But between these must be found the common sense of the nation, embodied not in this or that erratic individual, but in the agglomeration of interests, that neither desire to adhere to useless forms nor to rush into untried regions of probable disaster. Such are the advantages of a limited and constitutional monarchy; and such advantages, combining, as they do, stability with the power of change, have afforded the most successful example of government that has ever appeared in Europe, if we take into consideration the liberties of the people combined with the impartial administration of law. The radical virtue of a constitutional government is, that it affords a power of fluctuation, and can adapt itself in its ordinary course to the varying circumstances of the governed people, without revolutions, insurrectionary bloodshed, or civil war.

But in a constitutional government like that of Britain, it must not be supposed that the whole idea of government is summed up and exhausted when we have mentioned king, lords, and commons. These, it is true, constitute the political government, they frame the laws, and in their name the nation is supposed to act. But before the laws can be brought into contact with the individual, and carried into real operation, there is another institution of not less importance to the community, namely, the *jury*. It may be supposed that the jury does not form a constituent portion of the government of a country, but if we suppose the governing body to be *all those on whom the life, liberty, and property of the population depend*, we must necessarily include the jury, because the jury stands between the crown and the people; and no man can be punished, except with the minor inflictions of the law, unless a jury of his equals shall decide that he is legally worthy of punishment.

But even the king, the lords, the commons, and the jury, do not constitute the whole of constitutional government. To these must be added as another guarantee for the well ordering of the national affairs, *local self-government*, which is found in the municipal institutions of the towns, and in the local arrangements for the management of county business. Municipal government is in fact the real basis of popular liberty; and no circumstance is so well calculated to maintain the self-governing spirit of a people as the constant and habitual practice of managing their own local affairs through persons of their own selection. The process may be troublesome, and, perhaps, even cumbrous, but it keeps alive a vigorous and wholesome spirit of social independence, which makes a manly nation that cannot be oppressed. Local self-government is the very root of liberty, out of which the excellences of the higher government grow naturally, because in local self-government there is the constant preparation for the exercise of political functions, and it may be said that the citizen finds his political education in the school of the municipality, while many of the representatives of the people in the House of Commons have become skilled in the transaction of public business by passing through municipal offices, and conducting the affairs of a town or county.

These five institutions, the crown, the upper or aristocratic house of legislators, the lower or commons' house of representatives, the jury, and the municipalities, are the organs of constitutional government. Despotism is tyranny, and democracy is anarchy and confusion. But constitutional government is the organization of society for the administration of law and the security of freedom. Society is no longer in a state of slavery ruled by a despot, nor in a state of dissolution, without rule or order. It is in a state of *organization*, and, properly speaking, it ought to be organized from the meanest individual up to the monarch. We might thus say that the idea of a perfect government could be reduced to very simple terms, and that the institutions of a country should strictly correspond with its local divisions, those divisions being made on a principle of convenient adaptation to the local circumstances of the population. It might be said that the parish should govern the parish in all matters that are purely parochial; that the union, district, or division, should govern itself in all matters that belong to it; that the county should govern the county, the province the province, and the kingdom the kingdom; that the imperial government should regulate only imperial affairs, the provincial government only provincial affairs, the county only county affairs, the parish parish affairs, and the town town affairs. Such a system would afford a practical realization of self-government, organized from the top to the bottom of society; and the more nearly it is approached the more nearly do all parties in the nation understand their political right, and perform their political duties. (P. E. D.)

GOWER, John, one of the best of the English minor poets, was born probably in or about the year 1320; but the date is not exactly known. The place of his birth is equally uncertain. Weever makes him a native of Kent; in Caxton's edition of the *Confessio Amantis* he is mentioned as a Welshman. Popular tradition, however, has always pointed to Stitenham in Yorkshire as the place of the poet's birth; and the Rev. H. J. Todd, in his *Illustrations of the Lives and Writings of Gower and Chaucer*, publishes a deed from the charter-chest of the Duke of Sutherland (the present head of the family of which the poet was a scion), in which the signature of "Johannes Gower" stands first among those of the subscribing witnesses. On the back of this document is a note to the effect that the Gower is "Sir John Gower, the poet." The handwriting of the note is believed to be about a century posterior to that of the deed itself.

Possessing considerable means, Gower studied law, at that time a very expensive accomplishment, at the Inns of Court, and there contracted a friendship with Chaucer and Hoccleve. It is even said, though it has never been proved, that he attained the dignity of Chief Justice of the Common Pleas. It is known with certainty that he attached himself to Thomas of Woodstock, Duke of Gloucester, just as Chaucer had done to John of Gaunt. Like Chaucer also, he seems to have taken especial pleasure in railing at the weeknesses and vices of the churchmen of those times. It has been common among the recent biographers of Chaucer to maintain that a coolness sprung up between him and Gower in their old age. No direct proof of this has yet been brought forward. Tyrwhit suspects it from some expressions of Chaucer (which, however, might easily be explained away), and is confirmed in his suspicion by finding that Gower, in the second edition of his poems, omits some eulogistic verses upon Chaucer, which had appeared in the first edition. Their friendship, however, was certainly still unbroken in the year 1393, for near the close of the *Confessio Amantis*, finished in that year, Gower puts the following compliment to Chaucer into the mouth of Venus:—

> "And greet weel Chaucer when ye meet,
> As my disciple and my poet;
> For in the floures of his youth,
> In sundry wise, as he well couth,
> Of ditties and of songes glade,
> The which he for my sake made,
> The land fulfilled is over all; &c."

The second edition of Gower's poems was published only a year before Chaucer's death; and if their author intended a slight upon his old friend, it is most probable that that friend died without knowing it. The attachment between them, so long as it lasted, seems to have been very sincere on both sides; for Gower, in the above quoted lines, was merely requiting a compliment that had been paid him some years before by his brother-poet, who, in dedicating to him his *Troilus and Cressida*, addressed him as "O moral Gower." This epithet, though not remarkably happy, has stuck to Gower, just as that of "judicious" is always associated with the name of Hooker. Of Gower's personal history little more is known, except that in his old age he became blind, and at his death, in 1402, was buried in the church of St Mary Overie, or, as it is now called, St Saviours, in Southwark, where his monument is still to be seen. The beautiful church in which he lies was rebuilt in great part at his expense, and proves among other things that Gower must have been exempt from one of the usual misfortunes of poets—poverty.

Gower's poetical works are three in number—the *Speculum Meditantis*, a treatise on the duties of married life, written in French verse, and divided into ten books; *Vox Clamantis*, a narrative in Latin elegiacs, of the insurrection of the Commons in the reign of Richard II.; and the *Confessio Amantis*, of which a specimen has already been given. The first of these works is believed to have perished; manuscript copies of the second exist in the Cottonian and Bodleian libraries; the third had gone through four editions before the year 1560. The *Confessio Amantis*, or Lover's Confession, is a huge miscellaneous collection of physical, metaphysical, and moral reflections, and of stories culled from the common repertories of the middle age.

A kind of unity is given to these apparently incongruous materials by the form of the poem, which is a dialogue between a lover and his confessor, who is a priest of Venus, and is called Genius. In the moral part of his theme, Gower is confessedly wise, impressive, and sometimes almost sublime. But as Ellis, in his *Specimens of the Early English Poets*, observes, "His narrative is often quite petrifying; and when we read in his works the tales with which we have been familiarized in the poems of Ovid, we feel a mixture of surprise and despair at the perverse industry employed in removing every detail on which the imagination had been accustomed to fasten. The author of the *Metamorphoses* was a poet, and at least sufficiently fond of ornament. Gower considers him as a mere annalist, scrupulously preserves his facts, relates them with great perspicuity, and is fully satisfied when he has extracted from them as much morality as they can reasonably be expected to furnish." Though Gower's descriptions are often extremely agreeable, and his diction easy and smooth, the general tediousness of the narrative, and the prosaic feebleness of the conceptions, will prevent the *Lover's Confession* from ever rivalling or even approximating in popularity the works of the author of the *Canterbury Tales*. (Todd's *Illustrations of the Lives and Writings of Gower and Chaucer*; Ellis's *Specimens of the Early English Poets*; Craik's *Hist. Lit.*; Spalding's *Hist. Eng. Lit.*; Warton's *Hist. Eng. Poetry*; Godwin's *Life of Chaucer*; Gower's Works, &c., &c.)

GOWER or Gwyr, a peninsula of South Wales, projecting into the Bristol Channel, and forming the most western portion of Glamorganshire. It is 15 miles in length from N.E. to S.W., and has an average breadth of 5 miles. A colony of Flemings settled here in the time of Henry I., and their descendants still retain much of their national characteristics, and rarely intermarry with the Welsh.

GOYANNA, a town of Brazil, province of Pernambuco, on the right bank of the Goyanna river, 15 miles from the sea, and 40 miles N.W. of Pernambuco. It is the seat of civil and criminal courts, has several factories, and an active trade. Pop. about 6000.

GOYAZ (formerly *Villa Boa*), a town of Brazil, capital of a cognominal province, and situated on the Vermelho, an affluent of the Araguay, 680 miles N.W. of Rio de Janeiro, being almost in the very centre of the empire. It contains the governor's palace, seven churches, and some other public buildings. Pop. about 7000. The province of Goyaz has an estimated area of 320,000 square miles, and a population of 100,000.

GOYT, a romantic river on the borders of Cheshire, Derbyshire, and Staffordshire, about four miles S.W. of Buxton. From its source to the junction with Etherow it forms a boundary between Cheshire and Derbyshire. At Newmills it receives the brook Kinder, from the west side of Kinderscout, and flows through a romantic dale. Below this village and dale the Goyt passes through some beautiful meadows bounded by hills and woods, after which it enters a narrow vale replete with beautiful scenery. After its passage through Marple Bridge, the scenery becomes strikingly beautiful, the river impetuous and broad, and its banks are lofty and precipitous. Its junction with the Etherow is further down, where the scenery becomes still more imposing and picturesque; and hence the river flows westward a few miles through part of Cheshire, passing Marple Hall and Woodbank, to Stockport, where it unites with the Tame, and thus forms the Mersey.

GOZO, an island in the Mediterranean. See Malta.

GOZZI, the name of two brothers, natives of Venice, who, each in his own sphere, attained considerable distinction in Italian literature. Gasparo, the elder, and, as he is often called, the "Addison" of Italy, was born in 1715. He inherited a large fortune, which, as he was careless and indifferent in money matters, soon melted away, and he was compelled to write for a livelihood. Such means as he had been able to save from the wreck of his fortunes were swamped by an unsuccessful speculation of his wife (a woman of considerable literary powers and accomplishments), who undertook the management of the theatre of San Angelo at Venice, and failed utterly. Till the age of sixty Gozzi supported himself by his pen. His most valuable contributions to literature are his *Osservatore Veneto*, on the model of the English Spectator, distinguished by a high moral spirit, a fine play of fancy, and a pleasant glancing satire, couched in the choicest diction; his *Lettere Famigliari*, a delightful collection of short racy pieces in prose and verse on every subject, and generally pointing some useful moral; and his *Opere in versi e in prosa*, consisting chiefly of dramatic pieces, translated for the most part from the French, and displaying, like all Gozzi's works, great elegance of style. Not the least valuable of his works is his defence of Dante (whom he enthusiastically admired), against the attack of Bettinelli. Much of the work which passed through his hands in the course of his long literary career was merely done to meet the exigencies of the hour. Such were his translations of Fleury's *Ecclesiastical History*, Marmontel's *Tales*, Pope's *Essay on Criticism*, &c. He is also said to have written the greater part of Foscarini's *History of Venetian Literature*, the so-called author having only contributed the plan and an unfinished sketch of the work. Gozzi's life closed in peace and happiness. On the suppression of the Order of Jesus in 1774 he was commissioned to organize a new school system for the north of Italy. He executed his commission with such ability that he was appointed to do the same good office to the university of Padua. In this city he died in 1786, in the seventy-third year of his age.

Carlo Gozzi, his younger brother, was born in 1722. He was a man of greater vigour of mind and general force of character than his brother Gaspard. Before his sixteenth year he had written four poems of great length, besides a vast number of smaller pieces. His literary career, however, like that of his brother, though always congenial enough, became at length, through that brother's mismanagement of the common inheritance, a necessity. In 1761 he produced his comedy of *The Three Oranges*, which had an immense run from its successful revival of the masks and impromptu dialogues so long popular in Italy, but which Goldoni had recently banished from the stage. (See Goldoni.) He followed up his success with a series of similar pieces, and was able to make head for a time against Goldoni. Like Goldoni, Gozzi enjoys the somewhat strange privilege of being a greater favourite abroad than at home. Native critics, indeed, deny him altogether the praises liberally bestowed on him by Ginguené, Madame de Staël, and other French writers. His *Useless Memoirs of his own Life* were discontinued in 1798; at least no part of them was published after that date. Gozzi died in 1806 at the advanced age of eighty-four. (See Ginguené's articles on the Gozzi in the *Biog. Univ.*, where a complete list of the works of the two brothers will also be found.)

GRABE, John Ernest, a learned theologian, was born at Königsberg in 1666. The perusal of the works of the fathers having inspired him with doubts as to some points of his creed, he explained them in a memoir addressed to the consistory of Sambia. The elector of Brandenburg ordered three theologians to examine the memoir of Grabe, who afterwards proceeded to Berlin to confer with Spener, one of his adversaries. Upon some of the points in dispute they came to agree; but Grabe persisting in maintaining the necessity of the apostolical succession in the ministry, Spener, having despaired of overcoming his conviction of this doctrine, counselled him to proceed to England, where he would find it established. Grabe followed this advice, and, having reached London, got himself ordained priest according to the English ritual; but he always preserved his private opinions touching the eucharist and consecration. Nevertheless, the regularity of his conduct, and his useful labours, recommended him to notice; he obtained some benefices; and Queen Anne granted him a pension, which he enjoyed till his death, which took place at London on the 13th of September 1711, in the forty-fifth year of his age.

His works, which have obtained him the reputation of a learned and laborious man, but indifferent critic, are—*Specilegium SS. Patrum et Hæreticorum sæculi post Christi natum primi, secundi, tertii*, Oxford, 1698 and 1699, in 8vo; *S. Irenæi episcopi Lugdunensis adversus hæreses libri quinque*, Oxford, 1702, in folio; *Vetus Testamentum juxta Septuaginta Interpretes*, Oxford, 1707, 1719, 1720, and 1729, in folio: *Liturgia Græca*, Hague, 1715, in 8vo; *De forma consecrationis Eucharistiæ, hoc est, Defensio Ecclesiæ Græcæ contra Romanam*, London, 1721, in 8vo; Editions of the First Apology of St Justin Martyr, of the works of George Bull, and of the treatise of Daubuz *pro Testimonio Flavii Josephus de Jesu Christo; Doubts presented to the Consistory of Sambia*, in German, two writings in English against Whiston, and some polemical pieces of little importance. (J. B—E.)

GRABOW, a town of Germany, Mecklenburg-Schwerin, on the Elde, 24 miles S.S.E. of Schwerin. It is a station on the Hamburg and Berlin railway, and has a handsome church, manufactures of woollen cloth and tobacco, and a considerable trade in butter. Pop. 5300.

GRACCHUS, Tiberius and Caius, celebrated Roman tribunes and popular leaders, were the sons of the famous Cornelia, and thus grandsons of the elder Scipio Africanus. Tiberius, the elder and greater of the two, was born about 163 B.C., and was killed in 133 B.C.; Caius was born in 154 B.C., and was killed in 121. The personal history of both these men is only important in so far as it is connected with the general history of Rome. See Roman History.

GRACE, Days of, in commercial law, certain days allowed to be added to the time after which a bill falls due. See Exchange, vol. ix., p. 428.

GRACES (in Latin *Gratiæ*, in Greek Χάριτες), the goddesses of grace, are described in ancient mythology as three sisters of surpassing beauty, the attendants of Venus. Their names were Aglaia, Euphrosyne, and Thalia. Various accounts of their parentage are given. By some they are made the daughters of Jupiter and Eurynome, by others of Apollo and Ægle, by others of Bacchus and Venus or Coronis. The Spartans, however, had only two Graces, Kleta and Phaënne, whose temple was still extant in the days of Pausanias. The Athenians, also, had only two, Auxo and Hegemone, whom they seem to have worshipped from a very early period. Originally there seems to have been only one Grace, in whom the pure idea of beauty was typified. By and bye, when the principles of æsthetics came to be more deeply investigated by the Greeks, their number was increased to three, to each of whom a special function was assigned. Thus Aglaia symbolized generally the beauty and splendour of the forms of nature, Euphrosyne mirth and happiness, and Thalia social festivity. Hence they were invoked to preside at marriages, births, and festivals of every kind. On these last-named occasions they were believed to interpose in preventing the evil consequences apt to result from excessive indulgence in wine.

The worship of the graces is said to have originated in Bœotia; and they are always represented as innocent maidens in the full bloom of youth and beauty, carrying either lyres, or myrtle branches, or roses. In early statues and carvings they are always found dressed; but in later times it became the fashion to represent them naked. As might have been expected, they form a favourite subject with modern as well as ancient sculptors and painters. Raphael and Canova have both reproduced the idea; and the marble of the one is as widely known as the painting of the other.

GRACIOSA, one of the Azores. See Azores. Also one of the Canary Islands. See Canary Islands.

GRADISKA or Berbir, a strongly-fortified town of European Turkey, province of Bosnia, on the right bank of the Save, 28 miles N. by E. of Banyaluka. Immediately opposite to it stands the Austrian fortress of Alt-Gradiska.

GRADUATION, among mathematical instrument-makers, is the process of dividing the arcs of quadrants, theodolites, circular instruments, measures, &c., into degrees, fractions of a degree, &c. Accuracy in this operation is of the utmost importance in practical astronomy and surveying, and no small amount of practical skill is requisite to insure its successful execution. There are two methods employed in the dividing of instruments—the ordinary one consisting in making a copy of a system of divisions already existing; the other and more delicate process is that of *original dividing*. Straight scales and rules, such as are used in drawing, are divided by placing the particular instrument and the original pattern side by side, then passing a straight edge (with a shoulder fixed at right angles to serve as a guide) along the original, and pausing at each division, when a corresponding line is made on the copy by the dividing knife. Segments of circles may be graduated by making the straight edge revolve on the centre of a divided circle, and marking off the divisions as in the straight scale. This method, which in skilful hands admits of considerable accuracy, was applied to the dvision of theodolites and common circular instruments until superseded by Ramsden's *Dividing Engine.* For the invention of this ingenious machine the author received from the Board of Longitude a premium of L.300, and L.315 for the machine itself, which he was permitted during pleasure to retain in his own possession, on condition of his dividing sextants and octants for other instrument-makers at fixed rates. A description of Ramsden's dividing engine would require a diagram to render it perfectly intelligible; but perhaps some general idea of its mode of action may be formed from the following brief explanation :—A horizontal circle, four feet in diameter, turns upon a vertical axis, and is moved by an endless screw, one revolution of which carries forward the circle ten minutes, or one sixth of a degree; the screw is moved forward by depressing a treadle, at each descent of which the screw, by a series of ingenious mechanical appliances, may be turned through any portion of its revolution; and when the pressure is removed, the position of the several parts is restored without communicating any return motion to the screw. The circle to be graduated is fixed upon the dividing-plate of the machine, and concentric with it, and the lines are cut after each depression of the treadle.

Some idea of the extreme delicacy required for original dividing may be derived from the fact that Ramsden, in laying down the original divisions on his dividing engine, divided his circle first into five parts, and each of these into three; these parts were then bisected four times, but being apprehensive lest some error might arise from quinquisection and trisection, in order to test the accuracy of the divisions he described another circle $\frac{1}{10}$th inch within the former by continual bisections, when the two sets of divisions were found to exhibit no sensible difference. It was by means of this machine that Ramsden graduated his great theodolite, constructed under the inspection of General Roy for the trigonometrical survey of Great Britain. A description of this fine theodolite, with illustrative plates, may be found in the *Philosophical Transactions*, Lond., vol. lxxx.

Ramsden's dividing machine is the prototype after which various similar ones (with some alterations and improvements) have been constructed by Troughton, Adie of Edinburgh, and various other artists. The dividing machines of Reichenbach, Gambey, and other continental inventors, differ somewhat from those above mentioned. The German method of division, which admits of the greatest accuracy under skilful management, is performed by copying from a large circle originally divided with extreme precision. Upon this the copy is fixed concentrically; and by the aid of the micrometer-microscope fixed independently over the divided circle, the degrees and their fractional parts are cut in the copy.

Ample details of the different methods employed for graduation are to be found in various published works which treat of this particular subject, such as those of Bird, Ramsden, Troughton, de Chaulnes, &c., &c.

Graduation, in the arts, the process of accelerating evaporation by exposing a large surface of the liquid operated on to a current of air.

GRÆCIA MAGNA (ἡ μεγάλη Ἑλλάς), in *Ancient Geography*, a collective name for the numerous Greek colonies which at an early age were established along the southern, south-eastern, and south-western shores of Italy. The term, however, is never used in a territorial sense to signify the southern half of the Italian peninsula, but is restricted entirely to the Greek cities on coasts.

GRÆVIUS, the Latinized form of GRÆFE, John, George, one of the most learned and laborious writers of his time, was born at Naumburg, in Saxony, Jan. 29, 1632. He began his studies in the gymnasium of Pforta, and completed them at the university of Leipzig, under Rivinus and Strauch. Grævius was led to the study of letters by his natural inclination, and every day he became more and more devoted to this pursuit. But his father wished that he should study the law; Strauch seconded this view, and Grævius obeyed, though with repugnance. He had the curiosity to visit Holland, while Salmasius, Heinsius, and Frederic Gronovius, were in the zenith of their reputation. The conversation of Gronovius revealed to him the painful truth that his studies had been almost entirely unavailing, that he had been taught according to the principles of a bad school, and that he had no time to lose if he desired to correct the vices of its method of instruction. He entreated Gronovius to become thenceforth his guide; nor could he have chosen one more able; so, having abandoned jurisprudence, he passed two years at Deventer, attending assiduously the lessons of his new master. He then proceeded to Amsterdam to hear Alexander Morus and David Blondel, whose counsels decided him to quit Lutheranism for the sect of Calvin. Peter Burmann, his panegyrist, anxious that this change of religion should not be misrepresented, declares that the new convert listened only to the voice of conscience. Grævius, whose reputation had now begun to be extended, was, in 1656, called to the university of Duisburg; and he had been there two years, surpassing all the hopes which had been conceived of his talents, when Gronovius, who had entered the university of Leyden, solicited the magistrates of Deventer to appoint Grævius his successor. They agreed to this application, and Grævius, notwithstanding the efforts of the elector of Brandenburg, who, in order to retain him, offered an augmentation of fees, quitted a university for a simple gymnasium, influenced probably by the desire of living under a free government. After a stay of three years at Deventer, he yielded to the solicitations of the university of Utrecht, which offered him the chair of history, then vacant by the death of Æmilius. This satisfied all his ambition, and, content with his situation, he declined the invitations of the magistrates of Amsterdam and Leyden, who twice attempted, by brilliant offers, to attach him to the schools in those cities. The elector-palatine, who wished to draw him to Heidelberg, was also refused; the king of Prussia was not more fortunate; and the republic of Venice, which offered him a chair in the university of Padua, had as little success, although, in the hope of inducing him to accept, it had promised him, besides considerable appointments, full liberty on the score of religion, and complete protection against the inquisitors. But none of these offers could overcome his resolution. The eager desire of foreigners to obtain his services was justified by the great reputation which he had attained as professor. Pupils crowded to his lectures, not only from all Holland, but from all Europe. In Germany, particularly, almost all the great lords sent their sons to be educated by him; and he reckoned amongst his auditors sons of princes, and even of kings; for William III., who made him his historiographer, had confided to his care the young Prince of Nassau. Paquot, and before him G. Burmann, in the *Trajectum Eruditum*, have given a complete list of his works. He died suddenly Jan. 11, 1703.

The following are his principal works—An edition of the Letters of Casaubon, Brunswick, 1655; The Solecist of Lucian, Amsterdam, 1668, in 8vo, with notes rich in grammatical erudition; Hesiod, with a collection of excellent observations under the title of *Lectiones Hesiodeæ;* Justin, 1669, *cum Notis Variorum;* Catullus, Tibullus, and Propertius, Utrecht, 1680, *cum Notis Variorum;* Suetonius, 1672; Florus, 1680; The Commentaries of Cæsar; The miscellaneous Letters of Cicero, his Letters to Atticus, his Treatise of Offices, and his Discourses, *cum Notis Variorum.* But his masterpiece is his *Thesaurus Antiquitatum Romanarum*, in 12 vols. folio, a work of incredible labour and research, to which he afterwards added *Thesaurus Antiq. et Hist. Italiæ*, printed the year after his death, 1704, in 3 vols. folio, and continued by his successor Peter Burmann. Besides all these works, which are more than sufficient to have exhausted the industry of ten ordinary men, Grævius edited the Philological Lexicon of Martinus, the treatise of Junius *De Pictura Veterum*, the Greek and Latin Poetry of Huet, and several works of Meursius; and, in concert with Peter Burmann and Holthen, he had commenced a reimpression of the Inscriptions of Gruter. Fabricius has published a collection of his Prefaces and Letters, and Burmann a collection of his Discourses.

GRAFTING, in *Horticulture*. See BOTANY, vol. v., p. 167–8; and HORTICULTURE, § *Fruit-Garden*.

GRAHAM, GEORGE, a distinguished mechanician and clockmaker, was born in 1675 at Horsgills, in the parish of Kirklinton, and county of Cumberland. His inventions in science are numerous and valuable. He invented and constructed with his own hands the sector with which Bradley discovered two new movements in the so-called fixed stars. He also executed the superb mural arch in the observatory of Greenwich, on the pattern of which the best instruments of this kind are still made. The French Academy selected him to make the necessary instruments for their expedition to the north, undertaken for the purpose of determining the figure of the earth. Some of Graham's horological inventions are no less remarkable than those already alluded to. It is to him that we owe the mercurial compensation pendulum, the dead escapement for clocks, and the horizontal or cylinder escapement for watches, which are all detailed under CLOCK AND WATCH WORK. Graham was a Quaker, and a man of almost proverbial probity and veracity. His published works are limited to his contributions to the Royal Society, of which he was a member. He died in 1751, and was buried in Westminster Abbey.

GRAHAM, *James*, the celebrated Marquis of Montrose, born 1612, beheaded at Edinburgh, May 21, 1650. His history will be found under SCOTLAND. His character is familiar to all through Sir W. Scott's *Legend of Montrose*.

GRAHAM, *John*, Viscount of Dundee, better known as Claverhouse, from the name of his estate, born about 1650, killed at Killiecrankie in 1689. The details of his life are given in the article SCOTLAND. The recent attempts of party writers to whitewash the character of Claverhouse have been all signal failures. It would be hardly fair to except from that catalogue even Sir W. Scott, whose political sympathies lay altogether in favour of those views for which Graham fought and finally died. The sketch of Claverhouse in *Old Mortality* is in the highest degree vigorous and graphic, but a very different and far truer estimate of the arch-persecutor is that in the episode entitled "Wandering Willie's Tale," in the story of *Redgauntlet* by the same author.

GRAHAM, *Thomas*, Lord Lynedoch, the hero of Barossa, was a cadet of a very ancient and honourable Scottish family. The date and place of his birth are alike unknown with certainty, as no register of the event is known to exist. He was born, however, either in 1750, or (as is more likely) in 1748. The place of his birth was either the family estate of Balgowan, or his father's property of Blairgowrie, near the town of that name, both in the county of Perth. On his father's side he claimed kindred with the dukes of Montrose; his mother was a daughter of the first Earl of Hopetoun. He was the third son, but as both his brothers died young he inherited the family estates. His education was carried on at home, and his tutor was the celebrated James Macpherson, whose name is identified with the poems of Ossian. On reaching manhood, young Graham did very much as was and is the custom of his class—he travelled a good deal on the Continent; farmed a little; distinguished himself as a most daring rider and sportsman, and dipped a good deal into general, but more especially classical literature, for which he had a decided taste. In this way he spent his life till the year 1792, when he had the misfortune, while travelling on the Continent, to lose his wife (the second daughter of Charles, ninth Earl of Cathcart), to whom he was most devotedly attached. This loss preyed deeply and long upon his mind; and the means that he took to drown the memory of his affliction imparted a romantic interest to the whole tenor of his future life. He entered the army as a volunteer; in 1793 took part in the campaign of the south of France, and distinguished himself by the devoted gallantry with which he always marched at the head of his column into the thickest of the fight. On returning home he was made colonel of the 90th regiment, of which the first battalion had been raised by himself. In 1795 he was stationed at Gibraltar, but becoming tired of the dull monotony of garrison routine, he left it, and attached himself to the Austrian headquarters as British commissioner. In this capacity he assisted Wurmser in the defence of Mantua, when it was blockaded by the French under General Bonaparte.

On returning home he was again employed on foreign service, and attracted especial notice at the reduction of Minorca and the subsequent blockade and capture of Malta. In 1808 he accompanied Sir John Moore to Spain, and took part in the campaign that ended in the disastrous retreat to Corunna. In the hardships, almost unparalleled, then undergone by the British soldiers, Graham (to quote the words of Sheridan) was in the hour of peril their best adviser, in the hour of disaster their surest consolation. In 1811 he fought and won the memorable battle of Barossa, notable among other reasons as the first fight in which the English captured a French eagle. Hastening to join Wellington, he arrived in time to be present at the siege of Ciudad Rodrigo. At Vitoria he led the English left wing, and after taking St Sebastian, crossed the Bidassoa, and was the first to take seisin of the soil of France with British troops. He received the thanks of parliament for his numerous services, and in 1814 was made a baron of the empire with the title of Lord Lynedoch. In 1826 he was appointed governor of Dumbarton Castle, and before his death had received as many orders and decorations as any general in the British service, Wellington alone excepted. Sir Walter Scott pays him a touching tribute at the close of the Vision of Don Roderick:—

> "Nor be his praise o'erpast, who strove to hide
> Beneath the warrior's vest affection's wound,
> Whose wish heaven for his country's weal denied;
> Danger and fate he sought, but glory found.
> From clime to clime, where'er was trumpet's sound
> The wanderer went; yet, Caledonia, still
> Thine was his thought in march and tented ground;
> He dreamed 'mid Alpine cliffs of Athole's hill,
> And heard in Ebro's roar his Lynedoch's lovely rill."

"Never," said Sheridan, "was there seated a loftier spirit in a braver heart." Lord Lynedoch died at London, Dec. 18, 1843, in the 94th (or if we assign his birth to 1748, in the 96th) year of his age. He died without issue, and his title is consequently extinct.

GRAHAME, JAMES, author of *The Sabbath* and other poems, was a native of Glasgow, where he was born April 22, 1765. His father was a successful and prosperous legal practitioner, and, by a very common error, he conceived that no other profession could be so suitable or so advantageous for his son. James, dutiful, and shrinking from opposition, as he did all through life, obeyed the parental wish and studied law, first to qualify himself for the business of writer to the signet, and subsequently for the Scottish bar. His inclinations, however, were all for retirement and literature; and finally, when he had reached the mature age of forty-four, he took orders in the English Church, and was contented with an humble curacy in the north of England. He did not long enjoy an office which he adorned by his pious and eloquent ministrations. Ill health compelled him to try the renovating effects of his native air and landscape ever dear to his imagination, but he died shortly after his return, September 14, 1811. The works of Grahame consist of a dramatic poem, *Mary Queen of Scots*, *The Sabbath*, *British Georgics*, *The Birds of Scotland*, and several smaller poems. His principal work is *The Sabbath*—a sacred and descriptive poem in blank verse, characterized by a fine vein of tender and devotional feeling, and by the happy delineation of Scottish scenery. He is the Cowper of Scotland, but wanting Cowper's mastery of versification and easy idiomatic vigour of style. The blank verse of Grahame is often hard and constrained, though at times it swells out into periods of striking imagery and prophet-like earnestness. His description of the solemn stillness and unbroken calm of "the hallowed day" in the rural districts of Scotland, and of the Scottish Sabbath preachings among the hills in times of persecution, when

> "The scattered few would meet in some deep dell
> By rocks o'er-canopied,"

are finished pictures that will never fade from our poetry. In his *Georgics* he tried the wider field of rural occupations and manners, and produced some pleasing daguerreotypes of nature—for he was a careful as well as loving student—but he descends into minute and undignified detail. Cowper ventured upon the subject of manure, and his failure as to the "stercoraceous heap" should have warned Grahame from the "compost pile." Such rules of husbandry are unfitted for poetry—or at least it was given to Virgil only to render them pleasing in verse. He, indeed, as Dryden happily says, "delivers the meanest of his precepts with a kind of grandeur: he breaks the clods and tosses the dung about with an air of gracefulness." No other poet, however, has succeeded in the perilous employment. In the notes to Grahame's poems the author expresses manly and enlightened views on the subject of slavery, on popular education, the criminal law, and other public questions. He was emphatically a friend of humanity—a philanthropist as well as a poet. (R. C—S.)

GRAHAM'S TOWN. See Good Hope, *Cape of.*

GRAINGER, James, author of an *Ode on Solitude*, and other poems, and the translator of *Tibullus*, was born about the year 1721 of "a gentleman's family in Cumberland" (his own statement); but Dunse in Berwickshire is said to have been the place of his birth. In 1759 he accompanied a rich West India proprietor to St Christopher's, where he resided about five years. He there wrote a poem on the "Sugar Cane," in which he dignified the poor negroes with the name of *swains*. He died in London in 1766. Johnson considered the opening lines of his Ode a "noble" passage, and many parts of the poem are highly picturesque. Grainger was a learned and worthy man, much esteemed by the Johnson circle of wits.

GRAIN, the name of the smallest weight in common use. It is the 24th part of a pennyweight troy, and the 20th part of the scruple in apothecaries' weight.

GRAINS OF PARADISE, hot, acrid, aromatic seeds, produced on the coast of Guinea, and supposed to be derived from two distinct species of plants, viz., the *Amomum Grana-paradisi* of Linnæus, and the *A. Meleguetta* of Roscoe; perhaps also from others. They are of a glossy dark brown colour, are longer and rounder than the seeds of the true cardamom, and have a slight flavour of camphor. These seeds are much esteemed as a spice among the Africans, but are chiefly employed to give a fictitious strength to beer and spirits. (Archer's *Economic Botany.*)

GRAMMAR.

Grammar is the art of speaking or writing any language with correctness and propriety; and the purpose of language is to communicate thought.

Grammar, considered as an art, necessarily supposes the previous existence of language; and as its design is to teach any language to those who are ignorant of it, it must be adapted to the genius of that particular language of which it treats. A just method of grammar, therefore, without attempting any alterations in a language already introduced, furnishes certain observations called rules, to which the methods of speaking used in that language may be reduced; and this collection of rules is called the *grammar* of that particular language. For the greater distinctness with regard to these rules, grammarians have usually divided this subject into four distinct heads: *Orthography*, or the art of combining letters into syllables, and syllables into words; *Etymology*, or the art of deducing one word from another, and the various modifications by which the sense of any one word can be diversified consistently with its original meaning or its relation to the theme whence it is derived; *Syntax*, or what relates to the construction or due disposition of the words of a language into sentences or phrases; and *Prosody*, or that which treats of the quantities and accents of syllables, and the art of making verses.

But grammar, considered as a science, views language only as significant of thought. Neglecting particular and arbitrary modifications introduced for the sake of beauty or otherwise, it examines the analogy and relation between words and ideas; distinguishes between those particulars which are essential to language and those which are only accidental; and thus furnishes a certain standard, by which different languages may be compared, and their several excellencies or defects pointed out. This is what is called Philosophical or

UNIVERSAL GRAMMAR.

The origin of language is a subject which has employed much learned investigation, and about which there is still a diversity of opinion. The design of speech is to communicate to others the thoughts and perceptions of the mind of the speaker; but it is obvious, that between an internal idea and any external sound there is no natural relation; that the word *fire*, for instance, might have denominated the substance which we call *ice*, and that the word *ice* might have signified *fire*. Some of the most acute feelings of man, as well as of every other animal, are indeed expressed by simple inarticulate sounds, which, as they tend to the preservation of the individual, or the continuance of the species, and invariably indicate either pain or pleasure, are universally understood; but these inarticulate and significant sounds are very few in number; and if they can with any propriety be said to constitute a natural and universal language, it is a language of which man as a mere sensitive being partakes in common with the other animals.

Man is endowed not only with sensation, but also with the faculty of reasoning; and simple inarticulate sounds are insufficient for expressing all the various modifications of thought, for communicating to others a chain of argumentation, or even for distinguishing between the different sensations either of pain or of pleasure; a man scorched with fire or unexpectedly plunged amongst ice, might utter the cry naturally indicative of sudden and violent pain; the cry would be the same, or nearly the same, but the sensations of cold and heat are widely different. Articulation, by which those simple sounds are modified, and a particular meaning fixed to each modification, is therefore absolutely necessary to such a being as man, and forms the language which distinguishes him from all other animals, and enables him to communicate with facility all that diversity of ideas with which his mind is stored, to make known his particular wants, and to distinguish with accuracy all his various sensations. Those sounds thus modified are called *words;* and as words have confessedly no natural relation to the ideas and perceptions of which they are significant, the use of them must either have been the result of human sagacity, or have been suggested to the first man by the author of nature.

Whether language be of divine or human origin, is a question upon which, though it might perhaps be soon resolved, it is not necessary to enter here. Upon either supposition, the first language, compared with those which succeeded it, or even with itself as afterwards enlarged, must have been extremely narrow and rude. If it was of human contrivance, this will be readily granted; for what art was ever invented and brought to a state of perfection by illiterate savages? If it was taught by God, which is at least the more probable supposition, we cannot imagine that it would be more comprehensive than the ideas of those for whose immediate use it was intended; that the first men should have been taught to express pains or pleasures which they never felt, or to utter sounds that should afterwards be significant of ideas which at the time of utterance had not occurred to the mind of the speaker. Man once taught the elements of language would be able of himself to improve and enlarge it as his future occasions required.

As all language is composed of significant words variously combined, a knowledge of them is necessary previous to our acquiring an adequate idea of language as constructed into sentences and phrases. But as it is by words that we express the various ideas which occur to the mind, it is necessary to examine how ideas themselves are suggested, before we can ascertain the various classes into which words may be distributed. It is the province of *logic* to trace our ideas from their origin, as well as to unfold the process of reasoning; but it is necessary at present to observe, that our earliest ideas are all ideas of sensation, excited by the impressions that are made upon our organs of sense by the various objects with which we are surrounded. Let us therefore suppose a reasonable being, devoid of every possible prepossession, placed upon this globe; and it is obvious that his attention would in the first place be directed to the various objects which he saw existing around him. These he would naturally endeavour to distinguish from one another; and if he were either learning or inventing a language, his first effort would be to give them *names*, by means of which the ideas of them might be recalled when the objects themselves should be absent. This is one copious source of words, and forms a natural class which must be common to every language, and which is distinguished by the name of *nouns;* and as these nouns are the names of the several substances which exist, they have likewise been called *substantives.*

It would likewise be early discovered that every one of these substances was endowed with certain qualities or attributes, to express which another class of words would be requisite, since it is only by their qualities that substances themselves can attract our attention. Thus, to be weighty, is a quality of matter; to think, is an attribute of man. Therefore in every language words have been invented to express the known qualities or attributes of the several objects which exist. These may all be comprehended under the general denomination of *attributives.*

Nouns and attributives must comprehend all that is essential to language;[1] for every thing which exists, or of which we can form an idea, must be either a substance or the attribute of some substance; and therefore the two classes which we denominate substances and attributes must comprehend all the words that are necessary to communicate to the hearer the ideas which are present to the mind of the speaker. If any other words occur, they can only have been invented for the sake of dispatch, or introduced for the purposes of ease and ornament, to avoid tedious circumlocutions or disagreeable tautologies. There are indeed grammarians of great name, who have considered as essential to language an order of words, of which the use is to connect the nouns and attributes, and which are said to have no signification of themselves, but to become significant by relation. Hence all words which can possibly be invented are by these men divided into two general classes; those which are *significant of themselves*, and those which are *not.* Words significant of themselves are either expressive of the names of substances, and therefore called *substantives;* or of attributes, and therefore called *attributives.* Words which are not significant of themselves must acquire a meaning either as defining or connecting others, and are therefore arranged under the two classes of *definitives* and *connectives.*

That in any language there can be words which of themselves have no signification, is a supposition which a man free from prejudice will not readily admit. For to what purpose, we ask, should they have been invented? As they are significant of no ideas, they cannot facilitate the communication of thought, and must therefore be only an incumbrance to the language in which they are found. But in answer to this it has been said, that these words, though devoid of signification themselves, acquire a sort of meaning when joined with others, and that they are as necessary to the structure of a sentence as mortar is to the structure of an edifice; for as stones cannot be arranged into a regular building without a cement to bind and connect them, so the original words significant of substances and attributes cannot be made to express all the variety of our ideas without being defined and connected by those words which of themselves signify nothing. It is wonderful that he who first suggested this simile did not perceive that it tends to overthrow the doctrine which it is meant to illustrate. For surely the cement is as much the matter of the building as the stones themselves are; it is equally solid and equally extended. By being united with the stones, it neither acquires nor loses any one of the qualities essential to matter; it neither communicates its own softness nor acquires their hardness. By this mode of reasoning, therefore, it would appear that the words called definitives and connectives, so far from having of themselves no signification, are equally essential to language, and equally significant with those which are denominated substantives and attributives; and upon investigation it will be found that this is the truth. For whatever is meant by the definition or connection of the words which all men confess to be significant, that meaning must be the sense of the words of which the purpose is to define and connect; and as there can be no meaning where there are no ideas, every one of these definitives and connectives must be significant of some idea, although it may not always be easy or even possible to express that idea by another word.

---

[1] This is the doctrine of many writers on the theory of language; yet it is not easy to conceive mankind so far advanced in the art of abstraction as to view *attributes* by themselves independently of particular *substances*, and to give one general name to each attribute wheresoever it may be found, without having at the same time words expressive of affirmation. We never talk of any attribute, a colour for instance, without affirming something concerning it; as, either that it is bright or faint, or that it is the colour of some substance. It will be seen afterwards, that to denote affirmation is the proper office of what is called the substantive verb; as, "Milk is white." That verb therefore appears to be as necessary to the communication of thought as any species of words whatsoever; and if we must range words under a few general classes, we should be inclined to say that nouns, attributes, and affirmatives, comprehend all that is really essential to language.

These different modes of dividing the parts of speech we have just mentioned because they have been largely treated of by grammarians of high fame. But it does not appear to us that any man can feel himself much the wiser for having learned that all words are either substantives or attributives, definitives or connectives. The division of words into those which are *significant of themselves*, and those which are *significant by relation*, is absolute nonsense, and has been productive of much error and much mystery in some of the most celebrated treatises on grammar. It is indeed probable that any attempt to establish a different classification of the parts of speech from that which is commonly received, will be found of little utility either in practice or in speculation. As far as the former is concerned, the vulgar division seems sufficiently commodious; for every man who knows any thing, knows when he uses a noun and when a verb. With respect to the latter, not to mention that all the grammarians from Aristotle to Horne Tooke have differed on the subject, it should seem to be of more importance, after having ascertained with precision the nature of each species of words, to determine in what circumstances they differ than in what they agree.

In most languages, probably in all cultivated languages, grammarians distinguish the following parts of speech, viz. noun, pronoun, verb, participle, adverb, preposition, conjunction. The Latin and English grammarians admit the interjection among the parts of speech, although it is confessedly not necessary to the construction of the sentence, being only thrown in to express the affection of the speaker; and in the Greek and English tongues there is the article prefixed to nouns when they signify the common names of things, to point them out, and to show how far their signification extends. In the method of arrangement commonly followed in grammars, adjectives are classed with substantives, and both are denominated nouns. But it is certain that, when examined philosophically, an essential difference is discovered between the substantive and the adjective; and therefore some philologists of eminence, when treating of this subject, have given the following classification of words, which we shall adopt: The ARTICLE, NOUN, PRONOUN, VERB, PARTICIPLE, ADJECTIVE, ADVERB, PREPOSITION, CONJUNCTION, INTERJECTION. All these words are to be found in the English language, and therefore we shall examine each class, endeavour to ascertain its precise import, and show in what respects it differs from every other class. It is impossible to investigate the principles of grammar without confining the investigation in a great measure to some particular language from which the illustrations must be produced; and that we should prefer the English language for this purpose can excite no wonder, as it is a preference which is due to every tongue from those by whom it is spoken. The principles, however, which we shall here expound and elucidate, being in substance the same with those so clearly and ingeniously established by Dr John Hunter of St Andrews, in his oral prelections on philology, will be found to apply universally; and our inquiry, though principally illustrated from the English language, will be an inquiry into Philosophical and Universal Grammar.

I. *Of the Noun or Substantive.*

Nouns are all those words by which objects or substances are denominated, and which distinguish them from one another, without marking either quantity, quality, action, or relation. The substantive or noun is the name of the thing spoken of, and in Greek and Latin is called *name;* for it is ονομα in the one, and *nomen* in the other; and if in English we had called it the *name* rather than the *noun*, the appellation would perhaps have been more proper, as this last word, being used only in grammar, is more liable to be misunderstood than the other, which is in constant and familiar use. That nouns or the names of things must make a part of every language, and that they must have been the words first suggested to the human mind, will not be disputed. Men could not speak of themselves, or of any thing else, without having names for themselves and the various objects with which they are surrounded. Now, as all the objects which exist must be either in the same state in which they were produced by nature, or changed from their original state by art, or abstracted from substances by the powers of imagination, and conceived by the mind as having at least the capacity of being characterised by qualities; this naturally suggests a division of nouns into *natural*, as man, vegetable, tree; *artificial*, as house, ship, watch; and *abstract*, as whiteness, motion, temperance.

But the diversity of objects is so great, that had each individual a distinct and proper name, it would be impossible for the most tenacious memory, during the course of the longest life, to retain even the nouns of the narrowest language. It has therefore been found expedient, when a number of things resemble each other in some important particulars, to arrange them all under one *species;* to which is given a name that belongs equally to the whole species, and to each individual comprehended under it. Thus the word *man* denotes a *species* of animals, and is equally applicable to every human being; the word *horse* denotes another species of animals, and is equally applicable to every individual of that species of *quadrupeds;* but it cannot be applied to the species of men, or to any individual comprehended under that species. We find, however, that there are some qualities in which several species resemble each other; and therefore we refer them to a higher order called a *genus*, to which we give a name that is equally applicable to every species and every individual comprehended under it. Thus, men and horses and all living things on earth resemble each other in this respect, that they have *life.* We refer them therefore to the genus called *animal;* and this word belongs to every species of animals, and to each individual animal. The same classification is made both of artificial and abstract substances; of each of which there are genera, species, and individuals. Thus, in natural substances, animal, vegetable, and fossil, denote *genera;* man, horse, tree, metal, *species;* and Alexander, Bucephalus, oak, gold, *individuals.* In artificial substances, again, edifice is a *genus;* house, church, tower, are *species;* and the Vatican, St Paul's, and the Tower of London, are *individuals.* Lastly, in abstract substances, motion and virtue are *genera;* flight and temperance are *species;* the flight of Mahommed, and temperance in wine, are *individuals.* By arranging substances in this manner, and giving a name to each genus and species, the nouns necessary to any language are comparatively few and easily acquired; and when we meet with an object unknown to us, we have only to examine it with attention, and, comparing it with other objects, to refer it to the genus or species which it most nearly resembles. By this contrivance we supply the want of a proper name for the individual; and, as far as the resemblance is complete between it and the species to which it is referred, and of which we have given it the name, we may converse and reason about it without danger of error;

whereas had each individual in nature a distinct and proper name, words would be innumerable and incomprehensible; and to employ our labours in language would be as idle as that study of numberless written symbols which has been attributed to the Chinese.

Although nouns are thus adapted to express, not the individuals, but the genera or species into which substances are classed; yet, in speaking of these substances, whether natural, artificial, or abstract, all men must have occasion to mention sometimes one of a kind, and sometimes more than one. In every language, therefore, nouns must admit of some variation in their form, to denote *unity* and *plurality;* and this variation is called *number.* Thus in the English language, when we speak of a single place of habitation, we call it a house; but if of more, we call them houses. In the first of these cases the noun is said to be in the *singular,* in the last case it is in the *plural* number. Greek nouns have also a *dual* number to express two individuals, as have likewise some Hebrew nouns; but this variation is evidently not essential to language; and it is perhaps doubtful whether it ought to be considered as an elegance or as a deformity.

But although number be a natural accident of nouns, it can only be considered as essential to those which denote genera or species. Thus we may have occasion to speak of one animal or of many animals, of one man or of many men; and therefore the nouns *animal* and *man* must be capable of expressing *plurality* as well as *unity.* But this is not the case with respect to the proper names of individuals; for we can only say *Xenophon, Aristotle, Plato,* in the *singular;* as, were any one of these names to assume a plural form, it would cease to be the proper name of an individual, and become the common name of a species. Of this, indeed, we have some examples in every language. When a proper name is considered as a general appellative under which many others are arranged, it is then no longer the name of an individual, but of a species, and as such admits of a plural; as the *Cæsars,* the *Howards,* the *Pelhams,* the *Montagues;* but *Socrates* can never become plural, as long as we know of no more than one man of that name. The reason of all this will be obvious, if we consider that every genus may be found whole and entire in each of its species; for *man, horse,* and *dog,* are each of them an entire and complete animal; and every species may be found whole and entire in each of its individuals, Socrates, Plato, and Xenophon, being each of them completely and entirely a *man.* Hence it is, that every genus, though *one,* is multiplied into *many;* and every species, though *one,* is also multiplied into *many,* by reference to those beings which are their subordinates; but as no individual has any such subordinates, it can never in strictness be considered as *many;* and so, as well in nature as in name, is truly an *individual* which cannot admit of number.

Besides number, another characteristic, visible in substances, is that of *sex.* Every substance is either male or female, or both male and female, or neither the one nor the other. So that with respect to sexes and their negation, all substances conceivable are comprehended under this fourfold consideration, which language would be very imperfect if it could not express. Now the existence of hermaphrodites being rare, if not doubtful, and language being framed to answer the ordinary occasions of life, no provision is made, in any of the tongues with which we are acquainted, for expressing, otherwise than by a name made on purpose, or by a periphrasis, duplicity of sex. With regard to this great natural characteristic, grammarians have made only a threefold distinction of nouns: those which denote *males* are said to be of the *masculine gender;* those which denote *females,* of the *feminine;* and those which denote substances that admit not of *sex,* are said to be *neuter,* or of *neither gender.* All animals have sex, and therefore the names of all animals should have gender. But the sex of all is not equally obvious, nor equally worthy of attention. In those species which are most common, or of which the male and female are, by their size, form, colour, or other outward circumstances, eminently distinguished, the male is sometimes called by one name, which is masculine, and the female by a different name, which is feminine. Thus in English we say, *husband, wife; king, queen; father, mother; son, daughter,* and so on. In others of similar distinction, the name of the male is applied to the female only by prefixing a syllable or by altering the termination; as *man, woman; lion, lioness; emperor, empress,* anciently *emperess; master, mistress,* anciently *masteress;* and so in other similar instances. When the sex of any animal is not obvious, or not material to be known, the same name, in some languages, is applied, without variation, to *all* the species, and that name is said to be of the *common gender.* Thus in Latin *bos albus* is a white ox, and *bos alba* a white cow. Diminutive insects, though they are doubtless male and female, seem to be considered in the English language as if they were really sexless things. No man, speaking of a worm, would say *he* creeps, but *it* creeps upon the ground. But although the origin of genders is thus clear and obvious, yet the English is the only language with which we are acquainted that deviates not, except in a very few instances, from the order of nature. Greek and Latin, and many of the modern tongues, have nouns, some masculine, some feminine, which denote substances where sex never had existence. Nay, some languages are so particularly defective in this respect, as to class every object, inanimate as well as animate, under either the masculine or the feminine gender, as they have no neuter gender for those which are of neither sex. This is the case with the Hebrew, French, Italian, and Spanish. But the English, strictly following the order of nature, puts every noun which denotes a male animal, and no other, in the masculine gender; every name of a female animal, in the feminine; and every animal whose sex is not obvious, or known, as well as every inanimate object whatsoever, in the neuter gender. And this gives our language an advantage above most others in the poetical and rhetorical style; for when nouns naturally neuter are converted into masculine and feminine, the personification is more distinctly and more forcibly marked. Some very learned and ingenious men have endeavoured, by what they call a more subtile kind of reasoning, to discern even in things without a sex a distant analogy to that *natural distinction,* and to account for the names of inanimate substances being, in Greek and Latin, masculine and feminine. But such speculations are wholly fanciful, and the principles upon which they proceed are overturned by an appeal to facts. Many of the substances that, in one language, have masculine names, have in others names that are feminine; which could not be the case were this matter regulated by reason or nature. Indeed, for this, as well as many other anomalies in language, no other reason can be assigned than that custom,

> Quem penes arbitrium est, et jus, et norma, loquendi.

It has been already observed that most nouns are the names, not of individuals, but of whole classes of objects termed genera and species.[1] In classing a number of individuals under one species, we contemplate only those qualities which appear to be important, and in which the several individuals are found to agree, abstracting the mind from the consideration of all those which appear to be less essential, and which in one individual may be such as have nothing exactly similar in any other individual upon earth. Thus, in classing the individuals which are comprehended under the species denominated horse, we pay no regard to their colour or their size; because experience teaches us that no particular colour or size is essential to that individual living creature, and that there are not perhaps upon earth two horses whose colour and size are exactly alike. But the qualities which in this process we take into view, are the general shape, the symmetry, and proportion of the parts; and in short, every thing which appears evidently essential to the life of the individual and the propagation of the race. All these qualities are strikingly similar in all the individuals which we call *horses*, and as strikingly dissimilar from the corresponding qualities of every other individual animal. The colour of a horse is often the same with that of an ox; but the shape of the one animal, the symmetry and proportion of his parts, are totally different from those of the other; nor could any man be led to class the two individuals under the same species. It is by a similar process that we ascend from one species to another, and through all the species to the highest genus. In each species or genus in the ascending series fewer particular qualities are attended to than were considered as essential to the genus or species immediately below it; and our conceptions become more and more general as the particular qualities which are the objects of them become fewer in number. The use of a general term, therefore, can recal to the mind only the common qualities of the class, the genus, or species, which it represents. But we have frequent occasion to speak of individual objects. In doing this, we annex to the general term certain words significant of particular qualities, which discriminate the object of which we speak from every other individual of the class to which it belongs, and of which the general term is the common name. For instance, in advertising a *thief*, we are obliged to mention his height, complexion, gait, and whatever may serve to distinguish him from all other men.

---

[1] It is almost unnecessary to observe, that the words *genus* and *species,* and the phrases *higher genus* and *lower species,* are taken here in the logical sense; and not as the words *genus, species, order, class,* are often employed by naturalists.

The process of the mind in rendering its conceptions particular, is indeed exactly the reverse of that by which it generalizes them. For, as in the process of generalization, it abstracts from the ideas of any number of species certain qualities in which they differ from each other, and of the remaining qualities in which they agree constitutes the first genus in the ascending series; so, when it wishes to make its conceptions more particular, it annexes to the idea of any genus those qualities or circumstances which were before abstracted from it; and the genus, with this annexation, constitutes the first species in the descending series. In like manner, when it wishes to descend from any species to an individual, it has only to annex to the idea of the species those particular qualities which discriminate the individual intended from the other individuals of the same kind.

This particularizing operation of the mind points out the manner of applying the general terms of language for the purpose of expressing particular ideas. For, as the mind, to limit a general idea, connects that idea with the idea of some particular circumstance, so language, as we have already observed, in order to limit a general term, connects that term with the word denoting the particular circumstance. Thus, in order to particularize the idea of horse, the mind connects that general idea with the circumstance, suppose, of whiteness; and in order to particularize the word horse, language connects that word with the term white; and so in other instances. Annexation, therefore, or the connecting of general words or terms in language, fits it for expressing particular conceptions; and this must hold good alike in all languages. But the methods of denoting this annexation are various in various tongues. In English and most modern languages we commonly use for this purpose little words, which we have chosen to style *particles*; and in the Greek and Latin languages, the *cases of nouns* answer the same end.

Cases, therefore, though they are accidents of nouns not absolutely necessary, have been often considered as such; and they are certainly worthy of our examination, since there is perhaps no language in which some cases are not to be found, as indeed without them or their various powers no language could readily answer the purposes for which it was formed.

All the oblique cases of nouns, if we except the vocative, are merely marks of annexation; but as the connections or relations subsisting among objects are very various, some cases denote one kind of relation, and some another. We shall endeavour to investigate the connection which each case denotes, beginning with the *genitive*.

This is the most general of all the cases, and gives notice that *some* connection indeed subsists between two objects, but does not point out the particular kind of connection. That we must infer, not from our nature or termination of the genitive itself, but from our previous knowledge of the objects connected. That the genitive denotes merely relation in general, might be proved by adducing innumerable examples, in which the relations expressed by this case are different; but we shall content ourselves with one observation, from which the truth of our opinion will appear beyond dispute. If an expression be used in which are connected by the genitive case, two words significant of objects between which a twofold relation may subsist, it will be found impossible, from the expression, to determine which of these two relations is the true one, which must be gathered wholly from the context. Thus, for example, from the phrase *injuria regis*, no man can know whether the injury mentioned be an injury *suffered* or an injury *inflicted* by the king; but if the genitive case notified any particular relation, no such ambiguity could exist. This case therefore gives notice, that two objects are somehow connected,[1] but it marks not the particular sort of connection. Hence it may be translated by our particle *of*, which will be seen afterwards to be of a signification equally general.

The dative and accusative cases appear to have nearly the same meaning; each of them denoting apposition, or the junction of one object with another. Thus, when any one says, *Comparo Virgilium Homero*, Homer and Virgil are conceived to be placed beside one another, in order to their being compared; and this sort of connection is denoted by the dative case. In like manner, when it is said *latus humeros*, breadth is conceived as joined to or connected in apposition with shoulders; and the expression may be translated " broad *at* the shoulders."

This apposition of two objects may happen either without previous motion, or in consequence of it. In the foregoing instances no motion is presupposed; but if one say, *Misit aliquos subsidio eorum*, the apposition is there in consequence of motion. In like manner, when it is said *Profectus est Romam*, his apposition with Rome is conceived as the effect of his motion thither. From this idea of the accusative, the reason is obvious why the object after the active verb is often put in that case; it is because the action is supposed to proceed *from* the agent *to* the patient. But the same thing happens with respect to the dative case, and for the same reason. Thus, *Antonius læsit Ciceronem*, and *Antonius nocuit Ciceroni*, are expressions of the same import; in each the action of hurting is conceived as proceeding *from* Antony *to* Cicero; and this is finely illustrated by the passive form of such expressions, where the procedure above mentioned is expressly marked by the preposition *ab*, as *Cicero nocetur, Cicero læditur* AB *Antonio*. It is therefore not true that the accusative is that case, at least the only case, which to an efficient nominative and a verb of action subjoins either the effect or the passive subject; nor is the dative the only case which is formed to express relations tending to itself. The only thing *essential* to these two cases is to denote the apposition or junction of one object with another; and this they do nearly, if not altogether, in the same manner, although from the custom of language they may not be indifferently subjoined to the same verb.

---

[1] The Greek grammarians seem to have been aware of the nature of this case when they called it *πτωσις γενικη*, or the general case; a name of which the Latin grammarians evidently mistook the meaning when they translated it *casus genitivus*, or the generative case, which is a name totally foreign to its nature.

The Greek language has no *ablative* case; but in the Latin, where it is used, it denotes concomitancy, or that one thing accompanies another. From this concomitancy we sometimes draw an inference, and sometimes not. For example, when it is said, *Templum clamore petebant*, clamour is represented as concomitant of their going to the temple; but here no inference is drawn. From the phrase *palleo metu*, although nothing more is expressed than that paleness is a concomitant of the fear, yet we instantly infer that it is also the effect of the fear. In most instances where the ablative is used, an inference is drawn, of which the foundation is some natural connection observed to subsist between the objects thus connected in language. When this inference is not meant to be drawn, the *preposition* is commonly added; as, *interfectus est* CUM *gladio*, he was slain with a sword *about* him; *interfectus est gladio*, he was slain with a sword as the *instrument* of his death.

The remaining cases, which have not been noticed, are the nominative and the vocative. These are in most instances alike in termination, which makes it probable that they were originally one and the same case. The foundation of this conjecture will appear from considering the use to which each of these cases is applied. The nominative is employed to call up the idea of any object in the mind of the hearer. But when a man hears his own name mentioned, his attention is instantly roused, and he is naturally led to listen to what is to be said. Hence, when one man meant particularly to solicit the attention of another, he would naturally pronounce that other person's name; and thus the nominative case would pass into a vocative, of which the use is always to solicit attention.[1]

The Greek and Latin among the ancient, and the German among the modern languages, express different connections or relations of one thing with another by cases. In English this is done for the most part by prepositions; but the English being derived from the same origin as the German, that is, from the Teutonic, has at least one variation of the substantive to answer the same purpose. For instance, the relation of possession, or belonging, is often expressed by a different ending of the substantive, which may be well called a case. This case answers nearly to the genitive case in Latin; but as that is not a denomination significant of the nature of the case in any language, it may perhaps in English be more properly called the possessive case. Thus, *God's grace*, anciently *Godis grace*, is the grace belonging to or in the possession of God; and may be likewise expressed by means of the preposition, as, *the grace of God*.

Although the word *Godis* is as evidently an inflexion of the noun *God* as the word *Dei* is an inflexion of *Deus*, there are grammarians who have denied that in English there is any true inflexion of the original noun, and who have said that the noun with the addition of that syllable which we consider as the sign of a case, ceases to be a noun, and becomes a definitive; a word which with them is devoid of signification. Thus, in the expression *Alexander's house*, the word *Alexander's* stands not as a *noun*, but as an article or definitive, serving to ascertain or point out the individuality of the house. But this is a palpable mistake. The word *Alexander's* serves not to point out the individuality of the house, but to show to whom the house belongs; and is therefore beyond dispute not an article, but a noun in the possessive case. Again, when we say *St Peter's* at Rome and *St Paul's* at London, the words *St Peter's* and *St Paul's* are neither articles, nor, as has been absurdly imagined, the proper names of edifices, like the Rotunda or the Circus, but they are, in the possessive case, the names of the two apostles to whom the churches were dedicated, and to whom they are supposed to belong.

But that this, which we have called the possessive case, is really not so, must be evident, it is said, because there are certain circumstances in which it cannot be substituted for the noun with the preposition prefixed. Thus, though a man may say, I speak *of* Alexander, I write *of* Cæsar, I think *of* Pompey, he cannot say, I speak Alexander's, I write Cæsar's, or I think Pompey's. This is indeed true, but it is nothing to the purpose. For though I may say *Loquor* DE *Alexandro, Scribo* DE *Cæsare, Cogito* DE *Pompeio*, I cannot say, *Loquor Alexandri, Scribo Cæsaris*, or *Cogito Pompeii*; and therefore all that can be inferred from this argument is, that as the Latin genitive is not always of the same import with the preposition *de*, so the English possessive is not always of the same import with the preposition *of*. Upon the whole, then, we may conclude that English nouns admit of one inflexion; and that though cases are not so essential to nouns as gender and number, no language can be wholly without them or their various powers.

II. *Of Articles or Definitives.*

The intention of language is to communicate thought, or to express those ideas which are suggested to us by our senses external and internal. The ideas first suggested to us are those of pain and pleasure, and of the objects with which we are surrounded; and therefore the words first learned must be nouns, or the names of objects natural, artificial, and abstract. Every object about which the human mind can be conversant is strictly and properly speaking particular; for all things in nature differ from one another in numberless respects, which, not to mention the idea of separate existence, so circumstance and individualize them, that no one thing can be said to be another. Now the use of language being to express our ideas or conceptions of these objects, it might naturally be expected that every object should be distinguished by a proper name. This would indeed be agreeable to the truth of things, but we have already seen that it is altogether impracticable. Objects have therefore been classed into genera and species; and names given, not to each individual, but to each genus and species. By this contrivance of language, we are enabled to ascertain in some measure any individual that may occur, and of which we know not the proper name, only by referring it to the genus or species to which it belongs, and calling it by the general or specific name; but as there is frequent occasion to distinguish individuals of the same species from one another, it became necessary to fall upon some expedient to mark this distinction. In many languages general and specific terms are modified and restricted by three orders of words; the *article*, the *adjective*, and the *oblique cases of nouns.* The cases of nouns we have already considered; the adjective will employ our attention afterwards; at present our observations are confined to the *article*, a word so very necessary, that without it, or at least some equivalent invention, men could not employ nouns to any of the purposes of life, or indeed communicate their thoughts at all. As the business of articles is to enable us, upon occasion, to employ general terms to denote particular objects, they must be considered in combination with the general terms as merely substitutes for proper names. They have, however, been commonly called definitives; because they serve to define and ascertain any particular object so as to distinguish it from the other objects of the general class to which it belongs, and, of course, to denote its individuality. Of words framed for this purpose, whether they have by grammarians been termed articles or not, we know of no language that is wholly destitute. The nature of them may be explained as follows.

---

[1] The chief objection to this conjecture, that the nominative and vocative were originally the same case, is taken from the Latin tongue, in which the nouns of the second declension ending in *us* terminate their vocative in *e*. But this is easily accounted for. The *s* in such words was often dropped, as appears from the scanning of old Latin poetry; when this was done, the *u* being short, would naturally in pronunciation pass into *e*, a like short vowel; and thus, in the vocative case, *e* would in time be written instead of *u*.

An object occurs with which, as an individual, we are totally unacquainted; it has a head and limbs, and appears to possess the powers of self-motion and sensation; we therefore refer it to its proper species, and call it a dog, a horse, a lion, or the like. If it belongs to none of the species with which we are acquainted, it cannot be called by any of their names; we then refer it to the genus, and call it an animal.

But this is not enough. The object at which we are looking, and which we want to distinguish, is not a species or a genus, but an individual. Of what kind? Known or unknown? Seen now for the first time, or seen before and now remembered? This is one of the instances in which we shall discover the use of the two articles A and THE; for, in the case supposed, the article A respects our primary perception, and denotes an individual as unknown; whereas THE respects our secondary perception, and denotes individuals as known. To explain this by an example: I see an object pass by which I never saw till now: What do I say? There goes *a* beggar with *a* long beard. The man departs and returns a week after: What do I then say? There goes *the* beggar with *the* long beard. Here the article only is changed; the rest remains unaltered. Yet mark the force of this apparently minute change. The individual once vague is now recognised as something known; and that merely by the efficacy of this latter article, which tacitly insinuates a kind of previous acquaintance, by referring a present perception to a like perception already past.

This is the explanation of the articles A and THE as given by the learned Mr Harris, and thus far what he says on the subject is certainly just; but it is not true that the article THE always insinuates a previous acquaintance, or refers a present perception to a like perception already past. I am in a room crowded with company, of which the greater part is to me totally unknown; I feel it difficult to breathe from the grossness of the enclosed atmosphere; and, looking towards the window, I see in it a person whom I never saw before. I instantly send my compliments to *the* gentleman in the window, and request that, if it be not inconvenient, he will have the goodness to let a little fresh air into the room. Of this gentleman I have no previous acquaintance; my present perception of him is my primary perception, and yet it would have been extremely improper to send my compliments to *a* gentleman in the window. Again, there would be no impropriety in saying, "*A* man whom I saw yesterday exhibiting a show to the rabble was this morning committed to jail charged with the crime of housebreaking." Notwithstanding the authority, therefore, of Mr Harris, and his master Apollonius, we may venture to affirm, that it is not essential to the article A to respect a primary perception, or to the article THE to indicate a pre-established acquaintance. Such may indeed be the manner in which these words are most frequently used; but we see that there are instances in which they may be used differently. What, then, it may be asked, is the import of each article, and in what respects do they differ?

We answer, that the articles A and THE are both of them definitives, as, by being prefixed to the names of genera and species, they so circumscribe the latitude of those names as to make them for the most part denote individuals. A noun or substantive, without any article to limit it, is taken in its widest sense. Thus the word man means all mankind;

> The proper study of mankind is man;

where *mankind* and *man* may change places without making any alteration in the sense. But let either of the articles of which we are treating be prefixed to the word *man*, and that word is immediately reduced from the name of a whole genus to denote only a single individual; and instead of the noble truth which this line asserts, the poet will be made to say, that the proper study of mankind is not the common nature which is diffused through the whole human race, but the manners and caprices of one individual. Thus far therefore the two articles agree; but they differ in this, that though they both limit the specific name to some individual, the article A leaves the individual itself unascertained; whereas the article THE ascertains the individual also, and can be prefixed to the specific name only when an individual is intended of which something may be predicated that distinguishes it from the other individuals of the species. Thus, if I say, *a* man is fit for treasons, my assertion may appear strange and vague; the sentence, however, is complete, and wants nothing to make it intelligible; but if I say, *the* man is fit for treasons, I speak nonsense; for as the article THE shows that I mean some particular man, it will be impossible to discover my meaning till I complete the sentence, and predicate something of the individual intended to distinguish him from other individuals.

> The man that hath not music in himself....
> Is fit for treasons.

A man, therefore, means some one or other of the human race indefinitely; *the* man means, definitely, that particular man who is spoken of. The former is called the indefinite, the latter the definite, article.

The two articles differ likewise in this respect, that as the article A serves only to separate one individual object from the general class to which it belongs, it cannot be applied to plurals. It has indeed the same signification nearly with the numerical word *one;* and in French and Italian the same word that denotes unity is also the article of which we now treat. But the essence of the article THE being to define objects, by pointing them out as those of which something is affirmed or denied which is not affirmed or denied of the other objects of the same class, it is equally applicable to both numbers; for things may be predicated of one set of men, as well as of a single man, which cannot be predicated of other men. The use and import of each article will appear from the following example: "*Man* was made for society, and ought to extend his good will to *all men;* but *a man* will naturally entertain a more particular regard for *the men* with whom he has the most frequent intercourse, and enter into a still closer union with *the man* whose temper and disposition suit best with his own."

We have said that the article A cannot be applied to plurals, because it denotes unity. But to this rule there is apparently a remarkable exception in the use of the adjectives *few* and *many* (the latter chiefly with the word *great* before it), which, though joined with plural substantives, yet admit of the singular article A: as, *a few men, a great many men.* The reason of this is manifest from the effect which the article has in these phrases. It means a small or a great number collectively taken, to which it gives the idea of a whole, that is, of unity. Thus likewise *a hundred, a thousand*, is one whole number, an aggregate of many collectively taken, and therefore still retains the article A, though joined as an adjective to a plural substantive; as, *a hundred years.* The exception therefore is only apparent; and we may affirm that the article A universally denotes unity.

The indefinite article is much less useful than the other; and therefore the Greek and Hebrew languages have it not, though they have both a definite article. In languages of which the nouns, adjectives, and verbs, have inflexion, no mistake can arise from the want of the indefinite article; because it can always be known by the terminations of the noun and the verb, and by the circumstances predicated of the noun, whether a whole species or one individual be intended. But this is not the case in English. In that language, the adjectives having no variation with respect to gender or number, and the tenses of the verbs being for the most part the same in both numbers, it might be often doubtful, had we not the indefinite article, whether the specific name was intended to express the whole species or only one individual. Thus, if we say in English, *man was born sent from God*, we must be understood to mean that the birth of *every* man is from God, because to the specific term the indefinite article is not prefixed. Yet the words, Εγενετο ἀνθρωπος ἀπεσταλμενος παρα Θεου, convey no such meaning to any person acquainted with the Greek language; as the word ἀνθρωπος, without any article, is restricted to an individual by its concord with the verb and the participle; and the sense of the passage is, A *man was born, or existed, sent from God.* But though the *Greeks* have no article corresponding to the article A, yet nothing can be more nearly related than their ‘O to our THE; ‘O *βασιλευς*, THE *king*, TO δωρον, THE *gift*. In one respect, indeed, the Greek and English articles differ. The former is varied according to the gender and number of the noun with which it is associated, being ὁ, *masculine*, ἡ, *feminine*, το, *neuter*, and οἱ, αἱ, τα, in the *plural number;* whereas the English article suffers no change, being invariably THE before nouns of every gender and in both numbers. There are, however, some modern languages which, in imitation of the Greek, admit of a variation of their article which relates to gender; but this cannot be considered as essential to this species of words, and it may be questioned whether it be an improvement to the language. In tongues of which the nouns have no inflexion, it can only serve to perplex and confuse, as it always presents a particular idea of sex where in many cases it is not necessary.

The articles already mentioned are allowed to be strictly and properly such by every grammarian; but there are some words, such as *this, that, any, some, all, other*, &c. which are generally said to be sometimes articles and sometimes pronouns, according to the different modes of using them. That words should change their nature in this manner, so as to belong sometimes to one part of speech and sometimes to another, must appear very extraordinary; and if it were a fact, language would be a thing so equivocal, that all inquiries into its nature, upon principles of science and reason, would be vain. But we cannot perceive any such fluctuation in any word whatever; though we know it to be a general charge brought against words of almost every denomination, of which we have already seen one instance in the possessive case of nouns, and shall now see another in those words which are commonly called pronominal articles.

If it be true, as we acknowledge it to be, that the genuine *pronoun* always stands by itself, assuming the power of a noun, and supplying its place, then is it certain that the words *this, that, any, some*, &c. can never be *pronouns.* We are indeed told, that when we say *this* is virtue, give me *that*, the words *this* and *that* are pronouns; but that when we say, *this habit* is virtue, *that man* defrauded me, then are they articles or definitives. This, however, is evidently a mistake occasioned by overlooking those abbreviations in construction which are frequent in every language, and which, on account of that very frequency, have perhaps escaped the attention of grammarians whose sagacity has been successfully employed on matters less obvious. When we say *this* is virtue, it is evident that we communicate no intelligence till we add a substantive to the word *this*, and declare what is virtue. The word *this* can therefore in no instance assume the power of a noun, since the noun to which it relates, though for the sake of dispatch it may be omitted in writing or conversation, must always be supplied by the mind of the reader or hearer, to make the sentence intelligible, or *this* itself of any importance. "When we have viewed speech analysed, we may then consider it as compounded. And here, in the first place, we may contemplate that synthesis which by combining simple terms produces a truth; then by combining two truths produces a third; and thus others and others in continued demonstration, till we are led, as by a road, to the regions of science. Now *this* is that superior and most excellent synthesis which alone applies itself to our intellect or reason, and which to conduct according to rule constitutes the art of logic. After *this* we may turn to those inferior compositions which are productive of the pathetic," &c. Here, if any where, the word *this* may be thought to stand by itself, and to assume the power of a noun; but let any man complete the construction of each sentence, and he will perceive that *this* is no more than a definite article. Thus "We may contemplate that synthesis which by combining simple terms produces a truth; then by combining two truths produces a third truth; and thus other truths and other truths in continued demonstration, till we are led, as by a road, into the regions of science. Now *this* combination of truths is that superior and most excellent synthesis which alone applies itself to our intellect or reason, and which to conduct according to rule constitutes the art of logic. After we have contemplated *this* art, we may turn," &c.

The word *that* is generally considered as still more equivocal than *this;* for it is said to be sometimes an article, sometimes a pronoun, and sometimes a conjunction. In the following extract it appears in all these capacities; and yet, upon resolving the passage into parts, and completing the construction, it will be found to be invariably a definite article. "It is necessary to *that* perfection, of which our present state is capable, *that* the mind and body should both be kept in action; *that* neither the faculties of the one nor of the other be suffered to grow lax or torpid for want of use; but neither should health be purchased by voluntary submission to ignorance, nor should knowledge be cultivated at the expense of health;

for *that* must enable it either to give pleasure to its possessor, or assistance to others." If this long sentence be resolved into its constituent parts, and the words be supplied which complete the construction, we shall see the import of the word THAT to be precisely the same in each clause. "The mind and body should both be kept in action; *that* action is necessary to *that* perfection of which our present state is capable; neither the faculties of the one nor of the other should be suffered to grow lax or torpid for want of use; the degree of action proper to prevent *that* laxness is necessary; but neither should health be purchased by voluntary submission to ignorance, nor should knowledge be cultivated at the expense of health; for *that* health must enable it either to give pleasure to its possessor, or assistance to others." Again:

He that's unskilful will not toss a ball.

A man unskilful (he is *that*) will not toss a ball. Here the word *that,* though substituted for what is called the relative pronoun, still preserves unchanged its definitive import; and in every instance, except where it may be used very improperly, it will be found to be neither more nor less than a definitive article.

It appears, then, that if the essence of an article be to define and ascertain, the words *this* and *that,* as well as *any, some, all,* &c. which are commonly called pronominal articles, are much more properly articles than any thing else, and as such should be considered in universal grammar. Thus, when we say, *this* picture I approve, but *that* I dislike, what do we perform by the help of the words *this* and *that,* but bring down the common appellative to denote two individuals, the one as the more near, the other as the more distant? So when we say, SOME men are virtuous, but ALL men are mortal; what is the natural effect of this *all* and *some,* but to define that universality and that particularity which would remain indefinite were we to take them away? The same thing is evident in such sentences as, "SOME substances have sensation, OTHERS want it; choose ANY way of acting, and SOME men will find fault," &c. For here *some, other,* and *any* serve all of them to define different parts of a given whole; *some,* to denote any indeterminate part; *any,* to denote any indefinite mode of action, no matter what; and *other,* to denote the remaining part, when a part has been assumed already.

We have said that the article is a part of speech so very necessary, that without it, or some equivalent invention,[1] mankind could not communicate their thoughts; and that of words falling under this description we know of no language which is wholly destitute. We are aware that these positions may be controverted; and that the Latin may be instanced as a language which, without articles, is not only capable of communicating the ordinary thoughts of the speaker to the mind of the hearer, but which, in the hands of Cicero, Virgil, and Lucretius, was made to serve all the purposes of the most profound philosopher, the most impassioned orator, and the most sublime poet. That the Latin has been made to serve all these purposes cannot be denied, although Lucretius and Cicero both complain, that on the subject of philosophy, where the use of articles is most conspicuous, it is a deficient language. But should we grant what cannot be demanded, that these two great men were unacquainted with the powers of their native tongue, our positions would still remain unshaken; for we deny that the Latin is wholly without articles. It has indeed no word of precisely the same import with our *the* or the Greek ὁ; but the place of the indefinite article A might be always supplied, if necessary, with the numerical word *unus.* It may be so even in English; for we believe there is not a single instance where the words *one man, one horse, one virtue,* might not be substituted for the words *a man, a horse, a virtue,* without in the slightest degree altering the sense of the passage where such words occur. This substitution, however, can be but seldom or never necessary in the Latin tongue, of which the precision is much greater than that of the English would be without articles, because the oblique cases of the Latin nouns, and the inflexion of its verbs, will almost always enable the reader to determine whether an appellative represents a whole species or a single individual. The want of the definite article *the* seems to be a greater defect; yet there are few instances in which its place might not be supplied by *this* or by *that* without obscuring the sense; and the Latin tongue is by no means deficient of articles corresponding to these two. Let us substitute the words *one* and *that* for *a* and *the* in some of the foregoing examples, and we shall find, though the sound may be uncouth, the sense will remain. Thus,

THAT man who hath not music in himself....
Is fit for treasons,

conveys to the mind of the reader the very same sentiment which the poet expresses by the words *the* man that hath not music, &c. Again, *Man* was made for society, and ought to extend his good will to *all men*; but *one* man will naturally entertain a more particular regard for *those men* with whom he has the most frequent intercourse, and enter into a closer union with *that man* whose temper and disposition suit best with his own. Now the words *hic* and *ille* being exactly of the same import with the words *this* and *that,* it follows, that wherever the place of the article *the* may in English be supplied by *this* or by *that,* it may in Latin be supplied by *hic* or by *ille.* This is the case with respect to Nathan's reproof of David, where the definite article is indeed most emphatical. The original words might have been translated into English, "thou art *that* man," as well as "thou art *the* man;" and in Latin they may with the utmost propriety be rendered, "Tu es *ille* homo." Indeed the words *hic* and *ille,* and we might instance many more, though they are commonly called pronouns, are in truth nothing but definite articles. *Hic* is evidently ὁκε; and *ille* is most probably derived from the Hebrew word *al,* in the plural *ale,* which may be translated indifferently, either *the* or *that.* But, what proves beyond dispute that these words are not pronouns, but articles, is, that in no single instance will they be found to stand by themselves and assume the power of nouns. For the sake of dispatch, or to avoid disagreeable repetitions, the noun may indeed be often omitted; but it is always supplied by the reader or hearer, when *hic* and *ille* appear in their proper place, and are seen to be invariably definitive articles. We shall give an example of the use of each word, and dismiss the subject.

In the first oration against Catiline, Cicero begins with addressing himself in a very impassioned style to the traitor, who was present in the senate-house. He then exclaims pathetically against the manners of the age, and proceeds in these words: *Senatus hæc intelligit, consul videt,* HIC *tamen vivit. Vivit? immo vero etiam in senatum venit; fit publici consilii particeps.* In this passage *hic* cannot be a pronoun; for from the beginning of the oration there occurs not a single noun of which it can possibly supply the place. When the orator uttered it, he was probably pointing with his finger at Catiline, and every one of his audience would supply the noun in his own mind, as we do when we translate it, "*yet* this traitor lives." When Virgil says,

---

[1] As in the Persian and other eastern languages, in which the place of our indefinite article is supplied by a termination to those nouns which are meant to be particularized.

> *Ille* ego, qui quondam gracili modulatus avena
> Carmen,

it is obvious that he means, I am *that man*, or *that poet*, who sung, &c.; and though we may translate the words "I am *he* who tuned his song," yet when we construe the passage we are under the necessity of supplying either *vates* or *vir*, which shows that *ille* is nothing more than a definite article signifying *that* or *the*. It appears, then, that the Latin tongue is not wholly destitute of articles, as few cases can occur where the Greek ὁ and our *the* may not be supplied by the words *hic* and *ille*, which have in our opinion been very improperly termed pronouns. If there be any such cases, we can only confess that the Latin language is defective; whereas, had it no articles, it is not easy to conceive how it could answer, to a cultivated people, the ordinary purposes of speech.

The articles *this* and *that*, unlike *a* and *the*, are varied according as the noun, with which they are associated, is in the singular or in the plural number. Thus we say, *this* and *that man* in the singular, and *these* and *those men* in the plural. The Latin articles *hic* and *ille*, for such we will call them, are varied, like the Greek ὁ, not only with the number, but also with the gender of their nouns. In languages where the structure of a sentence may be so changed from the order of nature, as it commonly is in Greek and Latin, and where the reader is guided, not by the position, but by the terminations of the words, to those which are in concord and those which are not, these variations of the articles have their use; but in English they are of no importance. Were it not that the custom of the language, the *norma loquendi* as Horace calls it, has determined otherwise, there would be no more impropriety in saying *this* or *that men*, than in saying *some men* or *the men*.

As articles are by their nature definitives, it follows of course that they cannot be united with such words as are in their own nature as definite as they may be, nor with such words as, being undefinable, cannot properly be made otherwise; but only with those words which, though indefinite, are yet capable through the article of becoming definite. Hence the reason why it is absurd to say, *the I* or *the thou*, because nothing, as will be seen afterwards, can make these pronouns more definite than they are of themselves; and the same may be said of proper names. Neither can we say, *the both*, because the word *both* is in its own nature perfectly defined. Thus if it be said, "I have read both poets," this plainly indicates a definite pair, of whom some mention has been made already. On the contrary, if it be said, "I have read two poets," this may mean any pair out of all that ever existed. And hence the numeral, being in this sense indefinite, as indeed are all others as well as itself, is forced to assume the article whenever it would become definite. Hence also it is that as *two*, when taken alone, has reference to some primary and indefinite perception, whilst the article *the* has reference to some perception secondary and definite, it is bad language to say *two the men*, as this would be blending of incompatibles, that is, it would be representing two men as defined and undefined at the same time. On the contrary, to say, *both the men*, is good language; because the substantive cannot possibly be less apt, by being defined, to coalesce with a numeral adjective which is defined as well as itself. So likewise it is correct to say, *the two men*, *these two men*, or *those two men*; because here the article, being placed at the beginning, extends its power as well through the numeral adjective as the substantive, and tends equally to define them both.

As some of the above words admit of no article because they are by nature as definite as may be, so there are others which admit it not because they are not to be defined at all. Of this sort are all *interrogatives*. If we question about substances, we cannot say, *the who is this*, but *who is this?* And the same both as to qualities and quantities; for we say, without an article, *what sort of*, *how many*, *how great?* The reason is, the article *the* respects beings of which we can predicate something; but interrogatives respect beings about which we are ignorant, and of which we can therefore predicate nothing; for as to what we know, interrogation is superfluous. In a word, the natural associates of articles are *all those common appellatives which denote the several genera and species of beings:* and it may be questioned whether in strictness of speech they are ever associated with any other words.

We have said that proper names admit not of the article, being in their own nature definite. This is true, whilst each name is confined to one individual; but as different persons often go by the same name, it is necessary to distinguish these from one another, to prevent the ambiguity which this identity of name would otherwise occasion. For this purpose we are obliged to have recourse to adjectives or epithets. For example, there were two Grecian chiefs who bore the name of Ajax; and it was not without reason that Mnestheus used epithets when his intention was to distinguish the one from the other. "If both *Ajaxes* cannot be spared," said he, "at least let mighty Telamonian Ajax come." But as epithets are diffused through various subjects, in as much as the same adjective may be referred to many substantives, it has been said to be necessary, in order to render both parts of speech equally definite, that the adjective itself assume an article before it, which may indicate a reference to some single person only. It is thus we say, Trypho *the* Grammarian, Apollodorus *the* Cyrenian, &c. This is the doctrine of Mr Harris, from which, with the highest respect for the learning of the author, we feel ourselves obliged to dissent. In the examples given, the article THE is certainly not associated with the words Grammarian and Cyrenian, in the same manner in which it is associated with the word *man* in the sentence, "The man that hath not music in himself." When we say Apollodorus THE Cyrenian, we may, without folly or impertinence, be asked, the Cyrenian *what?* And the moment this question is answered, it will be seen that the article defines, not an adjective, but a substantive. If the answer be, the Cyrenian philosopher, the article *the* is associated with the word philosopher, and the phrase Apollodorus THE Cyrenian is an abbreviation of Apollodorus THE philosopher of Cyrene. In like manner, Trypho THE grammarian, is Trypho THE grammarian writer, or Trypho THE writer of grammar. Such abbreviations are very common. We say familiarly *the Speaker*, and are understood to mean a high officer in the British parliament; yet as speaker is a name common to many men, we may without impropriety be asked, *what* speaker we mean; and if so, we must reply, *the Speaker of the House of Commons*. But that which is eminent is supposed to be generally known; and therefore, in common language, *the speaker* is deemed a sufficient designation of him who presides over the lower house of parliament. Hence, by an easy transition, the definite article, from denoting reference, comes to denote eminence also; that is to say, from implying an ordinary preacquaintance, to presume a kind of general and universal notoriety. Thus *a king* is any king, but *the king* is that person whom we acknowledge as our sovereign, the king of Great Britain. In Greek, too, as in English, the article is often a mark of eminence; for *the Poet* meant Homer, and *the Stagirite* meant Aristotle; not but that there were many poets besides Homer, and many Stagirites besides Aristotle, but none equally illustrious.

Before we dismiss the *Article*, we shall produce one example to show the utility of this species of words; which, although they may seem to be of small importance, yet, when properly applied, serve to make a few general terms sufficient for expressing with accuracy all the various objects about which mankind can have occasion to converse. Let *man* be the general term, which I have occasion to employ for the purpose of denoting some particular. Let it be required to express this particular as unknown, I say *a* man; known, I say *the* man; definite, *a certain* man; indefinite, *any* man; present and near, *this* man; present and at some distance, *that* man; like to some other, *such* a man; different from some other, *another* man; an indefinite multitude, *many* men; a definite multitude, *a thousand* men; the ones of a multitude taken throughout, *every* man; the same ones taken with distinction, *each* man; taken in order, *first* man, *second* man, &c.; the whole multitude of particulars taken collectively, *all* men; the negation of that multitude, *no* man; a number of particulars present and near, *these* men; at some distance, or opposed to others, *those* men; a number of individuals separated from another number, *other* men; a small indefinite number, *few* men; a proportionally greater number, *more* men; a smaller number, *fewer* men. And so we might proceed on almost to infinitude. But not to dwell longer upon this subject, we shall only remark, that minute changes in principles lead to mighty changes in effects; so that principles are well entitled to regard, however trivial they may appear.

III.—*Of Pronouns, or Substantives of the second order.*

To men who are neither intoxicated with their own abilities, nor ambitious of the honour of building new systems, little pleasure can accrue from differing upon points of science from writers of great and deserved reputation. In such circumstances a man of modesty, although he will not upon the authority of a celebrated name adopt an opinion of which he perceives not the truth, must always advance his own notions with some degree of diffidence, as being conscious that the truth which he cannot perceive, may be visible to a keener and more perspicacious eye. In these circumstances we feel ourselves with regard to some of the most celebrated writers on grammar, from whom, concerning one or two points, comparatively indeed of but little importance, we have already been compelled reluctantly to differ. In treating of pronouns we are likely to deviate still farther from the beaten track; but that we may not be accused of acting the part of dogmatists in literature, and of claiming from others that implicit confidence which we refuse to give, we shall state with fairness the commonly received opinions, point out in what respects we think them erroneous, assign our reasons for calling them in question, and leave our readers to judge for themselves. The most celebrated writer in English who has treated of pronouns, and whom, since the publication of his *Hermes*, most other writers have implicitly followed, is Mr Harris, who, after a short introduction, proceeds thus:—

" All conversation passes between individuals, who will often happen to be till that instant unacquainted with each other. What, then, is to be done? How shall the speaker address the other, when he knows not his name? or how explain himself by his own name, of which the other is wholly ignorant? Nouns, as they have been described, cannot answer this purpose. The first expedient upon this occasion seems to have been pointing, or indicating by the finger or hand; some traces of which are still to be observed, as a part of that action which naturally attends our speaking. But the authors of language were not content with this. They invented a race of words to supply this pointing; which words, as they always stood for substantives or nouns, were characterized by the name of *pronouns*. These also they distinguished into three several sorts, calling them pronouns of the first, the second, and the third person, with a view to certain distinctions, which may be explained as follows:—

" Suppose the parties conversing to be wholly unacquainted, neither name nor countenance on either side known, and the subject of the conversation to be the speaker himself. Here, to supply the place of pointing by a word of equal power, the inventors of language furnished the speaker with the pronoun I; *I* write, *I* say, *I* desire, &c.; and as the speaker is always principal with respect to his own discourse, this they called, for that reason, the pronoun of the first person.

" Again, suppose the subject of the conversation to be the party addressed. Here, for similar reasons, they invented the pronoun *thou; thou* writest, *thou* walkest, &c. And as the party addressed is next in dignity to the speaker, or at least comes next with reference to the discourse, this pronoun they therefore called the pronoun of the second person.

" Lastly, suppose the subject of conversation neither the speaker nor the party addressed, but some third object different from both. Here they provided another pronoun, *he, she*, or *it*; which, in distinction to the two former, was called the pronoun of the third person. And thus it was that pronouns came to be distinguished by their respective *persons*."

The description of the different *persons* here given is taken, we are told, from Priscian, who took it from Apollonius. But whatever be the deference due to these ancient masters, their learned pupil, though guided by them, seems not to have hit upon the true and distinguishing characteristic of the personal pronouns. He supposes, that when the names of two persons conversing together are known to each other, they may, by the use of these names, express all that the personal pronouns express; but this is certainly not true. To us, at least, there appears to be a very material difference between saying " George did this," and " I did this;" nor do we think that the power of the pronoun would be completely supplied by the name, even with the additional aid of indication by the hand. So, when one man says to another with whom he is conversing, " James did so and so;" it is surely not equivalent to his saying " You did so and so." If such were the case, one might pertinently ask, when both persons are known to each other, Why do they use the personal pronouns? Mr Harris tells us, that " when the subject of conversation is the speaker himself, he uses I; and when it is the party addressed, he uses *thou*." But, in fact, the nature of the personal pronouns has no sort of connection with the subject of conversation, whether that conversation relate to the speaker, the party addressed, or a Greek book. In this sentence, " I say that the three angles of every triangle are equal to two right angles," the speaker is surely not the subject of the discourse; nor is the party addressed, but the truth of his assertion, the subject of discourse in the following sentence: " *You* say, that Horne Tooke's Diversions of Purley is the most masterly treatise on grammar, as far as it goes, that you have ever seen." Mr Harris uses the phrase " becoming the subject of conversation," in no other sense than that when the speaker has occasion to mention *himself*, he uses I; when the party addressed, *thou*; and when some other person or thing, *he, she*, or *it*. But we know that he may use other words by no means equivalent to the two first of these pronouns, which will sufficiently mark himself, and the party addressed; and that he may use indifferently, and without the smallest injury to the sense, either the third pronoun, or the word for which it is merely a substitute. A man who sustains various characters may design himself by any one of them. Thus Mr Pitt might have spoken of himself as the first lord of the treasury, chancellor of the exchequer, or member for the university of Cambridge; and in each case he would have been what Mr Harris calls the subject of conversation; yet every one feels that none of these designations would have been equivalent to I. What, then, is the force of the personal pronouns?

It appears to be simply this: The first denotes the speaker, *as characterised by the present act of speaking*, in contradistinction to every other character which he may bear. The second denotes the party addressed, *as characterised by the present circumstance of being addressed*, in contradistinction to every other character. And what is called the pronoun of the third person is merely a *negation of the other two*, as the neuter gender is a negation of the masculine and feminine. If this account of the personal pronouns be true, and we flatter ourselves that its truth will be obvious to every body, there is but one way of expressing by other words the force of the pronouns of the first and second person. Thus, " The person who now speaks to you did so and so," is equivalent to " *I* did so and so;" and " The person to whom I now address myself did so and so," is equivalent to " *You* did so and so."

Hence we see why it is improper to say the *I* or the *thou*; for each of these pronouns has of itself the force of a noun with the definite article prefixed, and denotes a person of whom something is predicted, which distinguishes him from all other persons. *I* is the person who now speaks, *thou* is the person who is now addressed by the speaker. Hence too we see the reason why the pronoun *I* is said to be of the first, and the pronoun *thou* of the second person. These pronouns can have place only in conversation, or when a man, in the character of a public speaker, addresses himself to an audience; but it is obvious that there must be a speaker before there can be a hearer; and therefore, that the pronouns may follow the order of nature, *I*, which denotes the person of the speaker, must take place of *thou*, which denotes the person of the hearer. Now the speaker and the hearer being the only persons engaged in conversation or declamation, *I* is with great propriety called the pronoun of the first, and *thou* the pronoun of the second person. We have said, that with respect to pronouns, the third person, as it is called, is merely a negative of the other two. This is evident from the slightest attention to the import of those words which are called pronouns of the third person. *He*, *she*, or *it*, denotes not the person either of the speaker or of the hearer; and, as we have just observed, no other person can have a share in conversation or declamation. An absent person or an absent thing may be the subject of conversation, but cannot be the speaker or the person addressed. *He*, *she*, and *it*, however, as they stand by themselves, and assume the power of nouns, are very properly denominated pronouns; but they are not personal pronouns in any other sense than as the negation of sex is the neuter gender.

We have already seen that nouns admit of number; pronouns, which are their substitutes, likewise admit of number. There may be *many* speakers at once of the same sentiment, as well as one, who, including himself, speaks the sentiment of *many*; speech may likewise be addressed to *many* at a time, as well as to *one*; and the subject of the discourse may likewise be *many*. The pronoun, therefore, of every one of the persons must admit of number to express this singularity or plurality. Hence the pronoun of the first person *I*, has the plural *we*; that of the second person *thou*, has the plural *ye* or *you*; and that of the third person *he*, *she*, or *it*, has the plural *they*, which is equally applied to all the three genders.

The Greeks and Romans, when addressing one person, used the pronoun in the singular number *thou*; whereas in the polite, and even in the familiar style, we, and many other modern nations, use the plural *you*. Although in this case we apply *you* to a single person, yet the verb must agree with it in the plural number; it must necessarily be, *you have*, not *you hast*. *You was*, the second person plural of the pronoun placed in agreement with the first or third person singular of the verb, is an enormous, though common solecism, which ought to be carefully avoided. In very solemn style, as when we address the Supreme Being, we use *thou*, perhaps to indicate that he is God alone, and that there is none like unto him; and we sometimes use the same form of the pronoun in contemptuous or very familiar language, to intimate that the person to whom we speak is the meanest of human beings, or the dearest and most familiar of our friends. A king, exerting his authority on a solemn occasion, adopts the plural of the first person, " *we* strictly command and charge;" meaning, that he acts by the advice of counsellors, or rather as the representative of a whole people. But in all cases in which the use of the pronoun deviates from the nature of things, the verb in concord deviates with it; for, as will be seen afterwards, these two words universally agree in number and person.

But though all these pronouns have number, neither in Greek, Latin, or any modern language, do those of the first and second person carry the distinctions of sex. The reason is obvious,[1] namely, that sex, and all other properties and attributes whatever, except those mentioned above as descriptive of the nature of these pronouns, are foreign from the intention of the speaker, who, when he uses the pronoun *I*, means *the person who now speaks*, no matter whether man or woman; and when the pronoun *thou*, *the person*, no matter whether man or woman, *to whom he now addresses himself*, and nothing more. But the pronoun of the third person denoting neither the speaker nor the hearer, but the subject of the discourse, and being merely the substitute of a noun which may be either masculine, feminine, or neuter, must of necessity agree with the noun which it represents, and admit of a triple distinction significant of gender. In English, which allows its adjectives no genders, this pronoun is *he* in the masculine, *she* in the feminine, and *it* in the neuter; the utility of which distinction may be better found in supposing it away. Suppose, for example, that we should in history read these words, *He caused him to destroy him*, and were informed that the pronoun, which is here thrice repeated, stood each time for something different; that is to say, for a man, for a woman, and for a city, whose names were Alexander, Thais, and Persepolis. Taking the pronoun in this manner, divested of its gender, how would it appear which was destroyed, which the destroyer, and which the cause that moved to the destruction? But there is no ambiguity, when we hear the genders distinguished: when we are told with the proper distinctions, that *she* caused *him* to destroy *it*, we know with certainty that the prompter was the woman; that her instrument was the hero; and that the subject of their cruelty was the unfortunate city. From this example we would be surprised how the Italians, French, and Spaniards could express themselves with precision or elegance with no more than two variations of this pronoun.

---

[1] The reason assigned by Mr Harris and his followers is, that " the speaker and hearer being generally present to each other, it would have been superfluous to have marked a distinction by art, which from nature and even dress was commonly apparent on both sides." This is perhaps the best reason which their description of the personal pronouns admits, but it is not satisfactory; for the speaker and hearer may meet in the dark, when different dresses cannot be distinguished.

Although in every language with which we are acquainted, there is but one pronoun for each of the first and second persons; and although it is obvious, from the nature and import of those words, that no more can be necessary; yet the mere English reader may perhaps be puzzled with finding three distinct words applied to each; *I*, *mine*, and *me*, for the first person; *thou*, *thine*, and *thee*, for the second. The learned reader will see at once that the words *mine* and *me*, *thine* and *thee*, are equivalent to the genitive and accusative cases of the Latin pronouns of the first and second persons. That *mine* is a pronoun in the possessive case is obvious; for if I were asked "whose book is that before me?" I should reply, "It is *mine*,"[1] meaning that it belongs to me. That the word *me* is the same pronoun in the case which the Latin grammarians call the accusative, is evident from the import of that word in the sentence *he admires me*, where the admiration is supposed to proceed from the person spoken of to the person who speaks. It appears, therefore, that though English nouns have only two cases, the nominative and possessive, the pronouns of that language have three, as, *I, mine, me; thou, thine, thee; he, his, him*, &c.; and that these are cases, can be questioned by no man who admits that *mei, mihi, me*, are cases of the Latin pronoun *ego*. Both pronouns, the Latin and the English, are irregularly inflected; and perhaps those words which are called the oblique cases of each may have originally been derived from nominatives different from *ego* and *I*; but these nominatives are now lost, and *mei* and *mine* have, beyond all dispute, the effect of the genitives of the Latin and English pronouns of the first person. These variations, however, cannot be looked upon as an essential part of language, but only as a particular refinement, invented to prevent the disagreeable repetition of the pronoun, which must frequently have happened without such a contrivance. This seems to have been the only reason why pronouns have been endowed with a greater variety of cases than nouns. Nouns are in themselves greatly diversified. Every genus and every species of objects has a distinct name, and therefore the sameness of sound does not so often occur among them as it would among the pronouns, without cases, where the same *I, thou, he, she*, or *it*, answers for every object which occurs in nature; but by this diversity in the form of the words, the *cacophonia*, which would be otherwise disgusting, is in a great measure avoided. It is, probably, for the same reason that the plural of each of these pronouns is so very different from the singular. Thus from *I, mine, me*, in the singular, is formed, in the plural, *we, ours, us*; from *thou, thine*, and *thee*, *ye* or *you, yours, you*; and from *he, she, it, his, hers, its, him, her, it*, in the singular, *they, theirs, them*, in the plural. In all of which there is not the least resemblance between the singular and plural of any one word; and except in *he, his, him; it, its; they, theirs, them*; there is not any similarity between the different cases of the same word in the same number.

From the account here given of the personal pronouns, it appears that the first or second will, either of them, coalesce with the third, but not with each other. For example, it is good sense, as well as good grammar, to say in any language, *I am he, thou art he, we were they, you were they*; but we cannot say, *I am thou*, nor *thou art I*, nor *we are you*, &c. The reason is, there is no absurdity for the speaker to be also the subject of the discourse, as when it is said, I am he; or for the person addressed, as when we say, thou art he. But for the same person, in the same circumstances, to be at once the speaker and the party addressed, is impossible; for which reason the coalescence of the pronouns of the first and second persons is likewise impossible.

I, thou, he, she, and *it*, are all that are usually called personal pronouns. There is another class of words, which are called sometimes pronominal adjectives, sometimes adjective pronouns, sometimes possessive pronouns; and by one writer of grammar they have been most absurdly termed pronominal articles. It is not worth while to dispute about a name; but the words in question are *my, thy, her, our, your, their*. These words are evidently in the form of adjectives; for, like other English adjectives, they have no variation to indicate either gender, number, or case; and yet they are put in concord with nouns of every gender and both numbers, as, *my wife, my son, my book; her husband, her sons, her daughters*, &c. But though in the form of adjectives, they have the power of personal pronouns in the possessive case: *my book* is the book of *me*, or the book of *him who now speaks; our house* is the house of *us*, or the house occupied by the *persons who now speak; her husband*, is the husband of a woman who can be known only from something preceding in the discourse; and *their property* is the property of them, of any persons, whether men or women, or both, who have been previously mentioned. Words which have the form of adjectives, with the power of pronouns, may, without impropriety, be called pronominal adjectives; and such is the name by which we shall henceforth distinguish them. To these pronominal adjectives, as well as to the personal pronouns, are subjoined the words own and self, and in the plural selves; in which case they are emphatical, and imply a silent contrariety or opposition. Thus, *I live in my own house*; that is, not in a hired house. *This I did with my own hand*; that is, not by proxy. *This was done by myself*; that is, not by another. The word self subjoined to a personal pronoun forms also the reciprocal pronoun; as, *we hurt ourselves by vain rage; he blamed himself for his misfortune. Himself, itself, themselves*, are supposed by Wallis to be put, by corruption, for *his self, its self, their selves*; so that *self* is always a substantive or noun, and not a pronoun. This seems to be a just observation; for we say, *the man came himself, they went themselves*; where the words *himself* and *themselves* cannot be accusatives, but nominatives, and were anciently written *his self, their selves*.

There are other words which are usually ranked under the class of pronouns; as *who, which, what*. These, when employed in asking questions, are called interrogative pronouns; though a name more characteristic might surely be found for them. Their import, however, will be more easily ascertained after we have considered another species of pronouns, which have been denominated relatives, and with which they are intimately connected.

The pronouns already mentioned may be called prepositive, as may indeed all substantives, because they are capable of introducing or leading a sentence: but there is another pronoun which has a character peculiar to itself, and which, as it is never employed but to connect sentences, and must therefore have always a reference to something preceding, is called the subjunctive or relative pronoun. This pronoun is in Greek, ὁς, ἡ, ὁ; in Latin, *qui*, *quæ*, *quod*; and in English, *who, which, what.*

---

[1] If we mistake not, Dr Johnson has somewhere affected to ridicule Bishop Lowth for considering the word *mine* as the possessive case of the pronoun of the first person. According to the doctor, *mine* is the same word with the pronominal adjective *my;* and was anciently used before a vowel, as *my* was before a consonant. This is not said with the lexicographer's usual precision. That *mine* was anciently used before a vowel is certain; but it does not therefore follow that it is the same word with *my*. If it were, we might on every occasion substitute either of these for the other, without offending against grammar, however we might injure the sound; but we apprehend that this is not the case. "That book is *mine*," is good English; but "that book is *my*" would be a gross solecism. The reason is, that *mine* is a genuine pronoun, and stands by itself with the power of a noun; but *my*, being an adjective, cannot stand by itself.

In order to determine with precision the nature and import of the *relative pronoun*, it will be necessary to ascertain the powers which it contains, or the parts of speech into which it is capable of being resolved. Now, it is obvious that there is not a single noun, or prepositive pronoun, which the relative is not capable of representing; for we say, I WHO *saw him yesterday cannot be mistaken;* YOU WHO *did not see him may have been misinformed;* THEY WHO *neither saw nor heard can know nothing of the matter;* THE THINGS WHICH *he exhibited were wonderful.* From these examples, it is apparent, in the first place, that the relative contains in itself the force of any other pronoun; but it contains something more.

If from any sentence in which there is a relative, that relative be taken away, and the prepositive pronoun which it represents be substituted in its stead, the sentence will lose its bond of union, and stand quite loose and unconnected. Thus, if instead of saying *the man is wise* WHO *speaks little*, we should say *the man is wise* HE *speaks little*, the sentence would be resolved into two; and what is affirmed of the man's wisdom, would have no connection with the circumstance of his speaking little. Hence it is evident, in the second place, that the relative contains the force of a connective as well as of the prepositive pronoun. What kind of connection it denotes is next to be ascertained.

It may be laid down as a general principle, that, by means of a relative pronoun, a clause of a sentence, in which there is a verb, is converted into the nature of an adjective, and made to denote some attribute of a substance, or some property or circumstance belonging to the antecedent noun. Thus, when it is said, *homo qui prudentia præditus est*, the relative clause, *qui prudentia præditus est*, expresses nothing more than the quality of prudence in concrete with the subject *homo*, which might have been equally well expressed by the adjective *prudens*. In like manner, when we say, *vir sapit qui pauca loquitur*, the relative fact expresses the property of speaking little as belonging to the man, and as being that quality which constitutes, or from which we infer, his wisdom; but if there were such a word as *pauciloquens*, that quality might very properly be expressed by it, and the phrase *vir sapit pauciloquens* would express the same assertion with *vir sapit qui pauca loquitur.*

Now if a relative clause expresses that which might be expressed by an adjective, the presumption is, that it may be resolved into the same constituent parts. But every adjective contains the powers of an abstract substantive, together with an expression of connection; and may be resolved into the genitive case of that substantive, or into the nominative with the particle *of* prefixed, which, in English, corresponds to the termination of the genitive in the ancient languages. That the member of a sentence in which there is a relative, may, in every instance, be analysed in the same manner, will be apparent from the following examples. *Vir qui sapit*, *vir sapiens*, and *vir sapientiæ*, "a man who is wise, a wise man, and a man of wisdom," are certainly phrases of the same import. Again, *homo, cui ingratus est animus*, *malus fit amicus*, may be translated into Greek, ἀνθρωπος ἀχαριστιας κακος γινεται φιλος; and into English, "the man of ingratitude is a bad friend."

Thus then it appears, that the relative pronoun contains in itself the force of the prepositive pronoun, together with that connection implied in English by the preposition *of*, and in the ancient languages by the genitive case. When one says, *vir sapit qui pauca loquitur*, the relative clause *qui pauca loquitur* expresses that attribute of the man from which his wisdom is inferred. It is conceived by the mind, as stripped of its propositional form, and standing in the place of a substantive noun governed in the genitive case by *vir*. The whole sentence might be thus translated, "the man *of little speaking* is wise;" or, did the use of the English language admit of it, "the man *of he speaks little* is wise." In like manner, when it is said, "Man, who is born of woman, is of few days and full of trouble," the relative clause is equivalent to an abstract noun in the genitive case, and the whole might be expressed in the following manner: "Man *of he is born of woman* is of few days and full of trouble."

It is obvious that these expressions into which, in the instances adduced, the relative clauses have been resolved, will appear extremely uncouth and offensive; but it is not meant to recommend them as common modes of phraseology. Against their being employed as such, present use loudly remonstrates.[1] They are introduced only with a view to show the true import of the relative pronoun; and for that purpose they are well adapted. That pronoun seems to be of use only when there is a deficiency of adjectives or substantives to denote some complex attribute by which we want to limit a general term or expression. Where such adjectives or substantives exist in language, we may indeed use the relative or not at pleasure. Thus we may say, *homo qui grandia loquitur*, or *homo grandiloquus;* because the adjective and the relative clause are precisely of the same meaning. But if the Latins were called upon to translate *ανθρωπος αυτοδιδακτος*, we believe they must have made use of the relative pronoun, as we know not any corresponding adjective in their language

---

[1] It is worthy of observation, however, that, repugnant as such expressions are to the present idiom of the English language, there is nothing in the nature of the thing that could render the use of them improper. All prepositions, as will be seen afterwards, are expressive of relations subsisting between those objects of which they connect the signs in discourse. Those objects may be denoted, either by single words, and then the preposition will govern a noun; or by assertions, and then it will govern a nominative and a verb. Thus, when it is said, "I came after his departure," the preposition *after* expresses the relation between two events, *my coming* and *his departure*, and governs a substantive noun; but if it is said, "I came after he departed," the preposition in this case (for, as shall be shown afterwards, it is absurd to call it in the one instance a preposition, and in the other a conjunction) expresses the same relation as before, but governs a nominative and a verb.

This last expression is exactly similar to those employed above. When one says, for example, "the man *of he speaks little* is wise," however uncouth the expression may appear from its not being supported by the authority of custom, the preposition *of* is used precisely in the same manner, and serves the very same purpose, as when it is said, "the man *of little speaking* is wise." In both cases it denotes the relation between the two objects, *man* and *little speaking;* only in the one it is prefixed to a noun, in the other to an assertive clause of a sentence, the import of which is to be taken as a noun. Custom has indeed determined that prepositions shall more frequently govern a noun than a nominative and a verb; but they are, in their own nature, equally well adapted to answer both purposes.

But as the pronoun of the third person is merely the substitute of some noun, an objector may ask, What noun is here represented by *he?* "The man *of he speaks little* is wise." Who is meant by the pronoun *he?* We answer, *the man* who is declared to be *wise.* The objection proceeds from inattention to the radical signification of the word *of*, which a late ingenious writer has shown to be the fragment of a Gothic or Anglo-Saxon word, signifying *consequence* or *offspring*. If this be admitted, and, after the proofs which he has given, we think it cannot be denied, the uncouth phrase, "The man *of he speaks little* is wise," may be thus resolved, "The man, *a consequence* (of his mind is) *he speaks little*, is wise;" or, in other words. "The man, *in consequence* of his speaking little, is wise." The same acute writer, Mr Horne Tooke, has shown that *of* and *for*, though of different radical meanings, may often be substituted the one for the other without injury to the sense. Let this substitution be made in the present instance, and the propriety of the phrase will be apparent: "The man is wise *for* he speaks little." It must be remembered, however, that such a substitution cannot be made in every instance, because *for* signifies *cause*, and *of* signifies *consequence.*

The learned and ingenious Mr Harris, in his Treatise on Universal Grammar, has given an analysis of the relative pronoun very different from that which has been given by us. The result of his inquiry is, that the relative is equivalent to another pronoun, together with an expression of connection of that kind which is denoted by the particle *and*. This analysis he exemplifies, and endeavours to confirm, by the sentence, " Light is a body which moves with great celerity." Now, says he, instead of *which* substitute the word *and it*, and in their united powers you see the force and character of the pronoun here treated. But let any one attentively consider these two expressions, " Light is a body *which* moves with great celerity," and " Light is a body *and it* moves with great celerity;" and he will find that they are not precisely equivalent. For, to speak in the language of logic, there is in the first but one proposition, of which the subject is light, and the predicate a complex term expressed by the words, *body which moves with great celerity*. In the second there are two propositions, or two predications, concerning light; first, that it is a body; and, secondly, that it moves with great celerity. The relative clause, in the first case, expresses a property of the antecedent body, which, with that property, is predicated of the subject light; in the second case, this property is removed from the predicate of which it was an essential part, and is improperly converted into a new predication of the subject. The sentence may be resolved upon our principles, and its precise import preserved; as " Light is a body *of it moves with great celerity;*" the clause " it moves with great celerity," is conceived by the mind as having the force of an abstract substantive, and is connected with the antecedent body by the preposition *of*, answering to the termination of the genitive case. This abstract substantive thus connected expresses a quality of the body light. But by this example Mr Harris's doctrine is not exhibited in all its absurdity; it may be proper to try it by another.

Let us suppose that the following assertion is true; " Charles XII. was the only monarch who conquered kingdoms to bestow them on his friends." Here it is evident there is but one proposition, of which the predicate is expressed by the words, " only monarch who conquered kingdoms to bestow them on his friends;" so that the relative clause is a necessary part of the predicate, and has, like an abstract noun in the genitive case, the effect of modifying the general term monarch. Resolve this sentence on Mr Harris's principles, and you have two propositions of which the first is a notorious falsehood: " Charles XII. was the *only monarch, and he* conquered kingdoms to bestow them on his friends." But instead of *and* substitute *of*, thus, " Charles XII. was the only monarch *of he conquered kingdoms to bestow them on his friends*," and you preserve the true import of the expression.[1]

Are there no cases, then, in which the relative may be resolved into the connective *and* with a prepositive pronoun? Undoubtedly there are, and we shall now endeavour to ascertain them.

Adjectives in language have two different effects upon the substantives to which they belong, according to the nature of the attribute which they express. If the attribute expressed by the adjective be competent to all the species of which the substantive is the specific name, it is plain that the adjective does not modify or limit the substantive, for this obvious reason, that nothing can modify which is not discriminative. Thus, when Horace says, *Prata canis albicant pruinis*, the adjective *canis* denotes a quality common to all hoarfrost; and therefore cannot modify the substantive, because it adds nothing to the conception of which that substantive is the name. But when the attribute expressed by the adjective is competent to some individuals only of the species of which the substantive is the name, the adjective has then the effect of modifying or limiting the substantive. Thus when one says *vir bonus*, he makes use of an adjective which modifies the substantive, *vir*, because it expresses a quality or attribute which does not belong to all men.

The clause of a sentence, in which there is a relative, as it is in every other respect, so is it in this, equivalent to an adjective; it either modifies, or does not modify, the antecedent, according as the attribute which it expresses is or is not characteristic of the *species* to which the antecedent belongs. Thus, when it is said, " Man, who is born of woman, is of few days and full of trouble," the relative clause " who is born of woman," expresses an attribute common to all men, and therefore cannot modify. In like manner, when we say, " SOCRATES, who taught moral philosophy, was virtuous," the clause, " who taught moral philosophy," does not modify. In both these instances the relative clause might be omitted; and it might be said with equal truth, " Man is of few days and full of trouble," and " SOCRATES was virtuous."

But if it be said, *vir sapit qui pauca loquitur*, the relative clause, *qui pauca loquitur*, modifies the antecedent *vir*; for it is not affirmed of every man that he is wise, but only of such men as speak little. So " Charles XII. was the only monarch who conquered kingdoms to bestow them on his friends;" and, " the man that endureth to the end shall be saved;" with many more examples that will occur to every reader.

Now it will be found that it is only when the relative clause expresses such a property or circumstance of the antecedent as does not limit its signification, that the relative pronoun can be resolved into a prepositive pronoun with the conjunction *and*, and that in these cases the relative clause itself is of very little importance. Thus in the assertion, " Charles XII. was the only monarch who conquered kingdoms to bestow them on his friends," where the relative clause is restrictive, the *who* cannot be resolved into *and he* consistently with truth or common sense. But in the expression, " Man, who is born of woman, is of few days and full of trouble," the relative *who* may be so resolved, at least without violating truth, thus, " man is of few days and full of trouble, and he is born of a woman." The only difference between the sentence with the relative *who*, and the same sentence thus resolved, is, that, in the former case, it contains but one predication; in the latter two, and these but loosely connected.

Thus, then, it appears that the general analysis of the relative pronoun is into the particle *of*, and a prepositive pronoun; but that there are also occasions on which it may be resolved into a prepositive pronoun and the particle *and*, without materially altering the sense. Now, what is the reason of this distinction?

---

[1] Mr Harris was probably led into his opinion, from considering the Latin *qui* or *quis* as compounded of *que* and *is* (See *Hermes*, p. 81, 82, third edit.). But the notion of *Perizonius* is perhaps better founded, who, in his notes to the *Minerva* of Sanctius, considers it as immediately taken from the Greek *τις*, which in the Doric is made *κις*, and in the Latin *quis*. For it seems highly probable, as some ingenious writers have endeavoured to show, that the Latin is a dialect of the Greek. Of this at least we may be certain, that many words in the former are immediately adopted from the latter.

If the relative clause be equivalent to an adjective, or to an abstract substantive in the genitive case, it is easy to see that the relative itself may, in every instance, be resolved into another pronoun and the particle *of*; but it will not perhaps be quite so evident how it should in any instance be resolved by *and*. This last analysis has its foundation in the nature of the particles *of* and *and*; or, to speak more properly, in the nature of the attribute which the relative clause expresses. Both the particles *of* and *and* are used to link or join conceptions together; but with this difference, that *of* has the effect of making the conceptions it connects figure in the mind as one object; whereas the conceptions connected by *and* are still conceived separately as before. To explain ourselves by an example: suppose we take two words, *man* and *virtue*, which denote two distinct ideas or conceptions, and join them together by the particle *of*, saying *man of virtue*; the mind no longer views them separately as significant of two conceptions, but of one. Take the same words, and join them together by the particle *and*, saying *man and virtue*; the conceptions denoted by *man* and *virtue* are still viewed separately as *two*, and notice is only given that they are collaterally connected.

This being the case, it follows, that when the relative modifies the antecedent, or, in other words, when the relative clause and the antecedent denote but one conception, the relative must then be resolved by *of*, in order to preserve this unity of conception. But when the relative does not modify the antecedent; that is, when its clause does not express any necessary part of a complex conception, then the conceptions or ideas denoted by the relative clause and the antecedent may be viewed separately as two; and therefore the relative may be resolved into the corresponding prepositive pronoun and the particle *and*.

To state this reasoning in a light somewhat different. As every relative clause, which expresses an attribute that is not applicable to a whole genus or species, must necessarily modify some general term, that is, restrict its signification; and as that general term must belong either to the subject or to the predicate of a proposition; it is evident, that every such relative clause is a necessary part of that subject or predicate in which its antecedent stands. If therefore a relative clause, which modifies, be taken away either from the subject or the predicate of a proposition; or if that connection, in consequence of which it modifies, be dissolved, which is always done when the relative is resolved by *and*; then the proposition itself will not hold true. The reason is, that the subject or the predicate becomes then too general; for, in the one case, something is predicated of a whole genus or species, which can be predicated only of some individuals of that genus or species; and in the other, a general predication is made where only a particular one can be applied. Thus, if it be said, "all men who transgress the laws are deserving of punishment;" the subject of the proposition is expressed by the words, "all men who transgress the laws." Take away the clause of the relative "who transgress the laws," and say, "all men are deserving of punishment;" and you have a proposition which is not true, because that is affirmed of the whole species which can be affirmed only of some individuals. Retaining now the clause of the relative, but resolving it by *and*, you have the same proposition as before; and together with it, in this instance, another which is equally false, namely, "all men, *and they* transgress the laws, are deserving of punishment;" that is, "*all men* are deserving of punishment, and *all men* transgress the laws."

But when the attribute expressed by the clause of the relative is characteristic of the genus or species of the antecedent, and consequently applicable to every individual which that genus or species comprehends, the relative clause may be entirely omitted without affecting the truth of the proposition, which is already as general as it can be. As in this case the import of the relative clause is not restrictive of the signification of the antecedent, it is of little consequence whether the attribute be represented by the connective part of the relative, as *of* the antecedent, or be affirmed to belong to the antecedent in a separate assertion. Thus it matters not much, whether we say, "man, who is subject to death, ought not to be too much elated," that is, according to our analysis, "man *of he is subject to death*, ought not to be too much elated;" or whether, forming the relative clause into a separate assertion, and connecting the two by the particle *and*, we say "man, and he is subject to death, ought not to be too much elated." In the one sentence, indeed, the reason is implied why man should not be too much elated, his being subject to death; and in the other, no reason is assigned for this; we only affirm that man is subject to death, and likewise that he should not be too much elated; but as both affirmations are equally true and evident, it is of little consequence, in such a case as this, whether the reason upon which either is founded be implied or not.

From the whole of this investigation, the following conclusions may be deduced as sufficiently established: 1*st*, That the relative pronoun contains in itself the united powers of a connective and another pronoun. 2*dly*, That *of* is the connective of which, together with another pronoun, it contains the powers, as in every possible instance it may be resolved into these constituent parts, and the import of the sentence in which it has place remain unaltered. 3*dly*, That in the ancient languages the relative clause of a sentence has the import of an abstract substantive in the *genitive case*; in English, with the particle *of* prefixed. 4*thly*, That the relative pronoun is of necessary use only where there is a deficiency of adjectives or substantives to denote some complex attribute, by which we want to limit a general term or expression; but that where such adjectives or substantives exist in language, we may use the *relative* or not at pleasure. And, 5*thly*, That though, in cases where the relative clause does not limit a general term, the relative pronoun may, without violating truth, be analysed by *and*; yet such analysis is never proper, as it gives two predicates to the same subject, which, in the original proposition, had but one predicate.

If the clause of the relative be equivalent to an adjective, as in every instance it seems to be, it will naturally occur, that in the ancient languages, the relative should agree with its antecedent in gender, number, and case. They do agree for the most part in gender and number; in case they cannot often, because the very intention of introducing a relative into language is to represent the antecedent in a different case. Whenever we have occasion to use a substantive or noun in a clause of a sentence, and afterwards to express by another clause, in which there is a verb, an attribute of the object denoted by that substantive, we then employ the relative pronoun. Now it seldom happens that the two clauses admit of the same regimen; and hence the case of the relative is often necessarily different from that of the antecedent, as the case of each must be accommodated to the clause in which it is found. Thus we cannot say, "Deus *qui* colimus bonus est;" but, "Deus *quem* colimus bonus est;" because the regimen of the verb *colo* is always the accusative.

This shows the necessity of introducing a relative into those languages which give inflexions to their nouns. Were all the nouns of a language indeclinable, there would be little occasion for a relative; and accordingly in English it is often omitted. Examples are frequent in our best authors. Suffice it to quote the following.

> For I have *business would employ* an age.—*Rowe.*
> I had several *men died* in my ship of calentures.—*Swift.*
> They affect to guess at the *object they* cannot see.—*Bolingbroke.*

We are not ignorant that our most eminent grammarians consider such expressions as chargeable with impropriety; and we are far from recommending them in any dignified or solemn composition. But in the instances adduced there is not the smallest degree of obscurity; at least there is none occasioned by the omission of the relative. The reason seems to be, that the mind can easily, by an effort of its own, make the antecedent unite, first with the one clause, and then with the other. Thus, when it is said, "I have business would employ an age," the mind can, without any difficulty, as the word business has no inflexions, consider it first as the objective case after *have*, and then as the nominative to *would employ*; but this cannot be so easily done in the ancient languages, where the termination of the noun is changed by the variation of its cases.

Both in the learned and in the living languages the relative has different forms, corresponding to the different genders of nouns; and by these it gives notice whether it is applied to persons, or to things without life. Thus in the English language we say, The man or the woman *who* went to Rome; The tree *which* stands on yonder plain. It admits likewise, when applied to males or females, a variation of cases similar to that of the personal pronouns. Thus we say, The man *whose* book is now before me; The man or woman *whom* I saw yesterday; but the neuter admits of no such distinction,[1] as we say, The tree *which* I saw, as well as The tree *which* stands on yonder plain. In modern languages the relative admits not of any distinction to denote number; for we say, The *man* or the *men* who came yesterday; The *man* or the *men* of whom I speak.

In English, the word *that*, which by some has been called a demonstrative pronoun, by others a pronominal article, and by us a definite article, is often used instead of the relative, as in the following examples: "He is the same man *that* I saw yesterday; he was the ablest prince *that* ever filled a throne." With regard to the principle upon which this acceptation of the word *that* depends, we beg to offer the following conjecture.

In English, from the phlegmatic arrangement of the language, occasioned by the want of inflexions and conjugations, the place of every part of a sentence is almost uniformly determined, and very little variety is allowed in the collocation of the words. The adjective is almost always placed in apposition with its substantive, and the nominative with its verb. In consequence of this uniformity in the collocation of the words, the mind acquires a habit of connecting in idea any kind of word with the place in which it is used to stand; and is naturally led to consider every word which stands in such a place as belonging to such a class. Hence it is, we imagine, that the definitive *that* passes into the nature of the relative pronoun; as in those instances in which it occupies the place of the relative, it was natural to consider it as having the same import. Yet the word *that* has undoubtedly in itself no more the force of the relative pronoun than *the* or *this*, or any other definitive whatever. In such expressions as the foregoing, it is not improbable that originally the clause of the definitive *that*, which we now call the *relative* clause, was thrown in as a kind of modifying circumstance, thus, "The book (I read that) is elegant," where the speaker, finding the word book too general for his purpose, throws in a clause to qualify and restrict it, or to confine his affirmation to that particular book which he is then reading. We can easily suppose that through time the definitive *that* in such an expression might be transposed or removed from its own place to that of the relative; so that the expression would run thus, "The book *that* I read is elegant;" which would be considered as precisely equivalent to "The book *which* I read is elegant." This opinion is not a little confirmed by a similar use of the article in Greek, which, though undoubtedly a definitive like the English *the*, is often used instead of the relative pronoun. Numberless examples may be found in Homer and Herodotus, especially in the latter, who seldom uses what is properly called the relative. We shall produce one instance from each.

> Εισεαι Ατρειδην Αγαμεμνονα, ΤΟΝ περι παντων
> Ζευς ενηκε πόνοισι διαμπερὲς.—*Homer.*
>
> Ορκιοισι γαρ μεγαλοισι κατειχοντο (*scil.* Αθηναιοι) δεκα
> ετεα χρησεσθαι νομοισι ΤΟΥΣ αν σφισι Σολων θηται.—*Herodot.*

We have said that the interrogative pronouns, as they are called, *who*, *which*, *what*, are intimately connected with relatives; we now affirm, that the two first of these words are nothing but relatives, and that the last contains in itself the united powers of a relative and a definitive. With respect to cases, number, and gender, the words *who* and *which*, when employed as interrogatives, differ not from the same words when employed as relatives; and we hold it as a maxim, without which science could not be applied to the subject of language, that the same word has always the same radical import, in whatever different situations it may be placed. To understand this, it is necessary to observe, that all men have a natural propensity to communicate their thoughts in the fewest words possible: hence it follows, that words are often omitted which are necessary to complete the construction of the sentence; and this nowhere happens more frequently than in the use of *who* and *which*. In sentences where these words are confessedly relatives, we often find them without an antecedent; as,

> *Who* steals my purse steals trash.—*Shakspeare.*
> Which *who* would learn, as soon may tell, &c.—*Dryden.*
> Qui *Bavium non odit, amet tua carmina, Mævi.*—*Virg.*

That is, "*He* who steals my purse;" "Which *he* who would learn, as soon may tell;" and "Ille *qui Bavium non odit*," &c. Such abbreviations occasion no obscurity, because from previous circumstances the hearer knows the mind of the speaker and the persons to whom he refers. But it is not with respect to the relative and antecedent only that such abbreviations have place; in sentences of a different form, whole clauses are sometimes omitted, whilst the meaning of the speaker is made sufficiently plain. Thus, when King Richard III. having lost his horse in battle, exclaims,

> A horse! a horse! my kingdom for a horse!

there is no complete thought expressed; but the circumstances in which the king then was, enabled those about him to understand that he *wanted a horse*. Accordingly Catesby answers him,

> Withdraw, my lord; I'll help you to a horse.

In like manner, when a person asks a question, his expression is frequently incomplete; but the tone of his voice, or some other circumstance, enables us to ascertain his meaning, and to supply, if we please, the words that are omitted. Thus when it is said, *An fecisti?* nothing more is expressed than *If you did it*, the Latin *an* being nothing else but the Greek αν, *si*; but some circumstance enables the person who hears it to know that the meaning is, "Say

---

[1] "*Whose* is by some authors made the possessive case of *which*, and applied to things as well as persons; I think, improperly.—*Lowth.*

"if you did it." Let us apply these observations to the words *who* and *which*. If these words be relatives, and if our analysis of the relative be just, it is obvious, that no complete meaning can be contained in the clause, "Who is your principal friend?" for that clause contains nothing more than the circumstance of being your principal friend predicated of some unknown person; "of he is your principal friend." That this is indeed the case, every man may be convinced, by asking himself what he means by the interrogative *who* in such a sentence; for he will find it impossible to affix to it any meaning without supplying an antecedent clause, by which that which is called an interrogative will be immediately converted into the relative pronoun. The custom, however, of language, and the tone of voice with which the relative clause is uttered, intimates, without the help of the antecedent, the wish of the speaker to be informed by the person addressed of the name and designation of his principal friend; and we know that the sentence when completed is, "Tell me the name and designation of the person who is your principal friend." Again, when the prophet says, "Who is this that cometh from Edom, with dyed garments from Bozrah?" he utters but part of a sentence, which when completed will run thus: "*Describe the person* who cometh from Edom (this is that *person*), with dyed garments from Bozrah." He sees a person coming from Edom, of whose name and designation he is ignorant; he calls upon some one for information concerning these particulars; and that there may be no mistake, he describes the unknown person as having "dyed garments from Bozrah;" but lest even that description should not be sufficiently accurate, he throws in the definitive clause, "this is that person," pointing at him, we may suppose, with his finger. *Which*, used as an interrogative, indicates a wish of knowing a particular person or thing out of more than one mentioned; as, "Which of the two did it?" that is, "*Tell me the one* of the two which did it?" for, in old English, *which* as a relative is often used, where in modern English we should say *who*; and that mode of speech is still retained when the antecedent is omitted, and the relative clause employed to indicate such a wish as that before us. *What* includes in itself the signification of a definitive and a relative pronoun; as, "from *what* has gone before, *what* follows may easily be guessed;" where the word *what* is equivalent to *that which*. When therefore we say, "What rude fellow is that?" our meaning is, "*Describe* that *person* who is that rude fellow." Upon the whole, then, it is evident, that the words called interrogatives are merely relative pronouns; and that interrogative sentences are relative clauses uttered in such circumstances as to enable the hearer to supply the antecedents necessary to complete the meaning.

In fine, we have seen that substantives are either primary or secondary; or, in other words, nouns or pronouns. Nouns denote substances, and those either natural, artificial, or abstract. They moreover denote things either general, or special, or particular; and a general or specific name is made to denote an individual by means of words called articles or definitives. Pronouns are the substitutes of nouns, and are either prepositive or subjunctive. The prepositive is distinguished into three orders, called the first, the second, and the third person. The subjunctive, otherwise called the relative, includes the powers of all those three, having superadded as of its own the peculiar force of a connective.

IV. *Of Verbs.*

The words which we have hitherto considered are commonly called substantives primary or secondary, and definitives; because nouns are significant of substances; pronouns are the substitutes of nouns; and the article serves to ascertain the extent of the noun, and to determine whether on any occasion it be significant of a whole class of substances, or only of one individual. But substances are of importance to mankind only on account of their various qualities or attributes; for their internal texture is a thing of which we are profoundly ignorant, and with which we have no manner of concern. Thus, experience teaches us that certain vegetables are pleasant to the taste, and wholesome food; whilst others are unpleasant and poisonous. The former kinds are valuable only for their qualities or attributes; and they are the qualities or attributes of the latter that make them worthless or hurtful. A horse is strong, and swift, and docile, and may be trained to carry a man on a journey, or to drag a plough. It is for his strength, swiftness, and docility, that he is the most valuable of all quadrupeds. One man is brave, another learned, and another eloquent; and by possessing these different qualities or attributes, each is fitted for a different station in society. It is plain, therefore, that in contemplating substances, our attention must be principally bestowed upon their qualities, and that the words which serve to denote these qualities must be an essential part of language. Such words are in general called attributives, and are of three sorts, verbs, participles, and adjectives.

Of all the constituent parts of speech, none has given the grammarians greater trouble than the verb. The vast variety of circumstances which it blends together in one word throws very considerable difficulties in the way of him who attempts to analyse it and ascertain its nature; at the same time that, by its eminent use in language, it is entitled to all the attention which can be bestowed upon it. To the discussion of the verb, Mr Harris, whose notions of this as of the other parts of speech have been generally adopted by the subsequent writers on grammar, has dedicated a large proportion of his book, in which he has thrown out many excellent observations, mixed, as it appears to us, with several errors. We have already observed, that no man is ignorant when he uses what is called a *verb* and when a *noun*. Every schoolboy knows that the words *is*, *loveth*, *walketh*, *standeth*, in English, and *est*, *amat*, *amatur*, *ambulat*, *stat*, in Latin, are verbs; he knows likewise that they are of different kinds, that some of them are said to be active, some passive, and some neuter. But it should seem that the first object of our investigation ought to be the characteristic of the verb, or that which all these words have in common, and which constitutes them *verbs*, distinguishing them from every other species of words. Now it is obvious to the slightest attention, that every verb, whether active, passive, or neuter, may be resolved into the substantive verb IS, and another *attributive*; for *loveth* is of the same import with IS *loving*; *walketh*, with IS *walking*; and *amat*, with *amans est*. But *loving*, *walking*, and *amans*, are not verbs; and hence it follows, that the characteristic of the verb, that which constitutes it what it is, and cannot be expressed by other words, must be that which is signified by the word IS; and to us that appears to be neither more nor less than assertion.

Assertion, therefore, or predication, is certainly the very essence of the verb, as being that part of its office, and that part only, which cannot be discharged by other kinds of words.[1] Every other circumstance which the verb includes, such as attribute, mode, time, it may be possible to express by adjectives, participles, and adverbs;

---

[1] Hence a common noun, or even a proper name, may be converted into a verb by being rendered assertive or predicative. Thus, in the indignant rebuke addressed by Rob Roy to Rashleigh Osbaldistone, "Don't Mr or *Campbell* me, sir; my foot is on my native heath, and my name is Macgregor;" the proper name "*Campbell*," being that which Rob usually assumed in his lowland and southern expeditions, is converted into a verb, and great force thereby given to the exclamation. (*Dr Hunter.*)

but without a verb it is impossible to predicate, to affirm or deny, any one thing of any other thing. The office of the verb, then, when stript of all accidental circumstances, seems to be merely this: "To join together the subject and predicate of a proposition." Its powers are analogous to those of the sign + in algebra, which does not affect the separate value of the quantities between which it is placed, but only indicates their union or coalescence. To explain by an example: When we say, *Cicero eloquens, Cicero wise:* these are imperfect sentences, though they denote a substance and an attribute. The reason is, that they want an assertion, to show that such an attribute appertains to such a substance. But when we insert the word *was*, we join the substance and attribute together; we give notice that the *wisdom* and *eloquence* are applied to *Cicero*, and we do nothing more; we neither increase the wisdom nor diminish it, we neither make it real nor imaginary; for it was supposed in all its extent when the words *Cicero* and *wise* stood independent of each other. We may indeed use the verb in a form which implies not an assertion only, but likewise an attribute; as when we say, *George writeth*, or *George walketh*. But as whiteness or any other particular colour is not of the essence of a horse, an animal which is found of all colours; so, in the phrases quoted, the attribute, though implied, is not of the essence of the verb; for it may be equally well expressed by other words, as *George* IS *writing*, and *George* IS *walking*, which are phrases of the very same import with *George writeth* and *George walketh.*

In resolving every verb, whether active, passive, or neuter, into the substantive verb IS and another attributive, we have the honour to agree with all the grammarians; but to the word IS itself the learned author of *Hermes* has given a meaning which, as a verb, it does not admit. He observes, that before any thing can be the subject of a proposition, it must exist; that all existence is either absolute or qualified, mutable or immutable; that the verb IS can by itself express absolute existence, but never the qualified, without subjoining the particular form; and that it signifies both mutable and immutable existence, having in these cases different meanings, although the sentences which he gives as examples are evidently constructed in the same manner, and consist of the same parts of speech. His examples are: Of absolute existence, B IS: of qualified, B IS *an animal*; of mutable, *This orange* IS *ripe*; of immutable, *The diagonal of the square* IS *incommensurable with its sides.* But if predication be the essence of verb, all this is nothing to the purpose, and part of it is not true. It is not true that the verb IS ever varies its signification; for it has as verb no connection with existence of any kind. All such circumstances are superadded to its verbal nature; or, to speak more accurately, we infer such circumstances from our previous knowledge of the objects concerning which the predication is made. When we say, "*This* orange IS ripe," we do indeed mean, as Mr Harris observes, that it *is* so now at this *present* in opposition to past and future time; but it is not the verb IS, but the definitive *this*, which fixes the time of maturity, as well as the place, of the orange. If we had said, Oranges ARE ripe, we might have been properly asked, When and where are they ripe? although the same verb is used in both sentences. Even in the sentence B IS, absolute existence, the most simple of all, is inferred, and not expressed, by the verb; and the inference is made from this obvious principle, that when one utters a mark of predication, we naturally conclude that he means to predicate something of the subject. If he adds no specific predication, as B IS ROUND, we apply to B the most general that we can; and what other species is so general as existence?

That the idea of existence, considered as mutable or immutable, is not contained in the verb IS itself, but is derived from our knowledge of the objects concerning which the predication is made, appears manifestly from this, that if a person be supposed ignorant of the meaning of the words GOD and MAN, whilst he knows that of IS, the uttering of the two propositions, *God is happy*, and *This man is happy*, will give him no notice of existence considered as mutable or immutable, temporary or eternal.[1] His conclusion with respect to these modes of existence, if any such conclusion be drawn at all, must be derived entirely from his previous knowledge of the nature of God and the nature of man.

Some of our readers may possibly think this notion of verb too abstract and metaphysical; yet what other circumstance than mere predication is essential to that species of words? We say *essential*; for we are inquiring, not what is expressed by each individual verb, but what it is which is equally expressed by all verbs, and which distinguishes them from the other parts of speech. And if it be true, that every thing which the verb implies, predication alone excepted, may be expressed by other parts of speech, and that no other parts of speech can predicate, then we think ourselves warranted to affirm, that simple predication is the essential characteristic of *verb*; that every word which predicates is a VERB; and that nothing is so which does not predicate.

It must not, however, be concealed, that a doctrine very different from this has been maintained by a writer of distinguished abilities. "We have *energy* expressed," says Dr Gregory,[2] "and of course a verb constituted without affirmation, when we wish or command; without command, when we affirm or wish; without wish, when we command or affirm; yet in all these cases we have equally and indisputably a verb."

That in all these cases we have a verb, is indeed indisputable; but we hold it to be equally indisputable, that in all these cases we have affirmation. The ingenious author has given no direct example of a wish or command uttered without affirmation; and a feeling or sentiment which is not uttered has nothing to do with language; but he has given a sentence in which there are three verbs, that in his opinion denote no affirmation, but a very plain supposition. If a supposition can be expressed without affirmation, we shall very readily allow that a wish or command may be so expressed likewise. The doctor's supposition is thus expressed: "*Had* any punishment ever overtaken you for your broken vows; *were* but one of your teeth growing black, or even *were* but one of your nails growing less beautiful, I should believe you." It is almost superfluous to observe, that to every verb not in the infinitive mode there must be a nominative, and to every active verb an object, whatever be the arrangement of the sentence in which such verbs are found. These are truths known to every schoolboy; the reasons of them shall be afterwards given. It is likewise undeniable, that in the sentence before us the nominative to "had" is "any punishment;" to the first "were," "one of your teeth;" and to the second, "one of your nails." But the sentence arranged in grammatical order, with the several nominatives before their respective verbs, is evidently elliptical; and the conjunction *if* must be supplied as well to complete the construction as to make sense of the passage. "*If* any punishment had ever overtaken you; *if* but one of your teeth were growing black, or even *if* but one of your nails were growing less beautiful, I should believe you." Now it has been proved, by such evidence as leaves no room for doubt, that *if*, though called a conjunction, is in fact a verb in the imperative mode, of the same import with *give;* so that we may substitute the one for the other without in the smallest degree altering the sense. The sentence will then run thus: "*Give* any punishment had ever overtaken you; *give* but one of your teeth were growing black, &c. I should believe you." It is therefore so far from being true, that *had* and *were*, when the sentence is completed, express no affirmation; that it is only upon granting the truth of the affirmation which they denote that the speaker says, "I should believe you." "Any punishment had ever overtaken you," is plainly an affirmation; *if, give* that affirmation, *admit its truth*, "I should believe you." But it cannot be supposed that *had* and *were* change their significations by a mere change of place, or that by being removed from the middle to the beginning of a clause they lose their original import, and come to denote something entirely different. Were this the case, every attempt to ascertain and fix the general principles of grammar would be as ridiculous as an attempt to arrest the course of time. For what purpose, then, it may be asked, if the verb always denotes affirmation, is it removed from the middle to the beginning of the clause, when supposition is implied, as in the present instance? We answer, that supposition is neither more nor less than conditional affirmation; that when such affirmation is completely expressed, the verb is not removed to the beginning of the clause; and that such removal takes place only when the clause is elliptical, being merely an artificial contrivance in language, to show the reader or hearer that some such word as *if*, demanding the truth of the affirmation, is omitted for the sake of dispatch. This is evident; for when the word requiring the affirmation to be granted is supplied, the verb must be restored to its place in the middle of the clause. Such abbreviations, and such contrivances to mark them, are frequent in all languages, as will be seen more clearly when we come to treat of modes or moods. Upon the whole, then, we are compelled reluctantly to differ from this writer, and still to think that simple predication is the essence of the verb.

---

[1] The truth of this observation may be proved by experiment, as, for instance, by uttering to a man of good common sense these two propositions, taking care to express the words *God* and *man* in a language which he does not understand. Thus, *Deus* is *happy*, and *hic homo* is *happy*, uttered to a man totally unacquainted with the Latin tongue, will contain no notice of existence considered as mutable or immutable.

[2] *Theory of the Moods of Verbs*, published in vol. ii. of the Transactions of the Royal Society of Edinburgh.

Should we be required to exemplify our theory by language, and to produce instances of this simplified verb in practice, we might answer, that the not being able to produce such instances would be no good argument against the truth of our principles. It is the nature of language to express many circumstances by the same word, all of which, however, are not essential to distinguish the species to which that word belongs from the other species of words; and it is the nature of man to infer from discourse many things which are not actually expressed. Perhaps, however, something very nearly approaching to an exemplification of our idea of a simple verb will be found in the proposition, "The three angles of every plane triangle *are* equal to two right angles." What other office the verb *are* here performs than simply to join the subject and predicate, it is difficult to perceive. It does not give notice of time; or such notice, if given, is an imperfection; for the truth of the proposition is independent of time. Neither ought it to imply existence; for the proposition would be true were there neither a triangle nor a right angle in nature.

This idea of verb, when well considered, will be found just; but should any of our readers suspect it of novelty, and on that account be disposed to condemn it, we have only to request that he will restrain his censure till he has examined the writings of others, and nicely observed the several states of his own mind in discourse; for meditation may perhaps show him that our theory is not false, and inquiry will satisfy him that it is not novel.[1]

But although it is certain that assertion, and assertion only, is essential to the verb, yet the greater part of that species of words which grammarians call *verbs* are used to denote an attribute as well as an assertion; or, in the language of logic, they express both the copula and the predicate of a proposition; thus, *he liveth, he writeth, he walketh*, are phrases equivalent in all respects to *he is living, he is writing, he is walking.* Now, of attributes, some have their essence in motion, as *walking;* some in the privation of motion, as *resting;* and *others* have nothing to do with either motion or its privation, as *white* and *black.* But all motion and all privation of motion imply *time* as their concomitant; and a substance may have an attribute to-day which it had not yesterday, and will not have to-morrow. This is self-evident; for a man may be at rest to-day who yesterday was walking, and to-morrow will be on horseback; and a sheet of paper may have been white yesterday which to-day is black, and at some future time will be of a different colour. As, therefore, all motions and their privations imply time; and as a proposition may be true at one time which is not true at another, all *verbs*, as well those which denote both an attribute and an assertion, as those which denote an assertion only, come to denote *time* also. Hence the origin and use of *tenses*, which are so many different forms assigned to each verb, to show, without altering its principal signification, the various *times* in which the assertion expressed by it may be true. Whether these various forms of the verb be essential to language, it is vain to dispute. They have place in every language with which we are acquainted; and as the use of the verb is to affirm one thing of another, it is absolutely necessary that the *time* when such or such an affirmation is true be marked by *tenses*, or some other contrivance. Concerning tenses, therefore, we shall throw together some observations, which, *mutatis mutandis*, are applicable to every language, premising only a general remark or two which seem necessary in order to proceed with precision.

Time, although its essence consists in succession continued and unbroken, may yet be considered by the mind as divided into an infinite number of parts. There is, however, one grand division which necessarily occurs, and to which the different *tenses* of verbs are in all languages adapted. Computing from some portion conceived to be

---

[1] "Besides words, which are names of ideas in the mind, there are a great many others that are made use of to signify the connection that the mind gives to ideas or propositions one with another. The mind, in communicating its thoughts to others, does not only need signs of the ideas it has then before it, but others also to show or intimate some particular action of its own at that time relating to those ideas. This it does several ways; as IS and IS NOT are the general marks of the mind affirming or denying." (Locke on *Human Understanding.*) "Verbum est pars orationis variabilis, aliquid de re aliqua dici seu affirmari significans. Vulgaris verbi definitio est, quod, sit pars orationis, quæ agere, pati, aut esse significet. Sed nostra accuratior, magisque ex ipsa verbi cujusvis natura petita videtur. Cæterum *το affirmari* laxiore hic sensu accipimus, pro eo quod prædicari dialectici appellent, quo non modo affirmationes strictius sic dictæ, sed negationes etiam interrogationesque includuntur." (Ruddiman, *Grammaticæ Institutiones;* see also Beattie's *Theory of Language.*)

present, all time is either *past* or to *come*. Hence the tenses of verbs are threefold; some denoting time *present*, some time *past*, and others time *future*.

Again, from the very nature of time, it must be obvious that all its parts are relative; or, in other words, that no portion of it can be ascertained by any thing *inherent in itself*, but only by referring it to some other portion, with respect to which it is past, present, or to come. In this respect time is perfectly analogous to space; for as the space in which any object exists cannot be described but by stating its relation to some other space, so neither can the time of any attribute or action be determined, but by stating its relation to some other time. When, therefore, we would mark the time of any action or event, we must previously fix upon some point to which we may refer it. If this point be known, the time referred to it will also be known; but if the former be not known, neither will the latter.

Lastly, in contemplating an *action*, we may have occasion to consider it as *going on*, or as *finished*. This distinction is likewise denoted by the different tenses of verbs. In treating, therefore, of the tenses, there are two things to which attention ought principally to be turned;—the *relation* which the several tenses have to one another in respect of time; and the notice which they give of an action's being *completed* or *not completed*.

Having premised these remarks, we proceed now to the tenses themselves; of which Mr Harris has enumerated no fewer than twelve. Of this enumeration we can by no means approve; for, without entering into a minute examination of it, nothing can be more obvious, than that his inceptive present, *I am going to write*, is a *future* tense; and his completive present, *I have written*, a *past* tense. But, as was before observed of the classification of words, we cannot help being of opinion, that to take the tenses as they are commonly received, and endeavour to ascertain their nature and their differences, is a much more useful exercise, as well as more proper for a work of this kind, than to raise, as might easily be done, new and hypothetical theories on the subject.

It has already been observed that all the tenses must necessarily mark *relative time*. In one sense this is extremely obvious. The present tense is used in contradistinction to both the past and future, and marks an attribute or action as existing in neither. The past and the future are in like manner used in contradistinction to the present, and mark an attribute or action which exists not now, but which in the one case has existed formerly, and in the other will exist at some time coming. But besides this relation of contradistinction subsisting among the tenses, there is another of co-existence, as we may call it, to which it is of great consequence to attend, especially in examining the nature of the present.

The present tense refers not only to something which is past or future, but also to something with which the attribute or action of the verb is contemporary. This reference is necessarily implied in its very name; for we cannot say of any thing that it is present, without implying at the same time that there is something else with which it is present. Hence it appears with how little reason Mr Harris and others have given us an aorist of the present, as marking present time indefinitely in contradistinction to *other* presents, which have been called *inceptive, extended*, and *completive presents*. For from what has been said, it follows, that the present tense is necessarily and from its very nature perfectly indefinite, and can of itself give notice of no precise or determinate portion or point of time whatever. A thing may have been present fifty years ago, may be present now, or at any future period. This tense implies the relation of co-existence between two or more things; but without some auxiliary circumstance, it cannot in any language mark the particular portion of time in which those things exist. The indefinite nature of this tense is indeed most clearly seen in that use of it in which Mr Harris has styled it the aorist of the present; that is, in cases where it is employed to denote the repetition of an action which the agent is accustomed frequently to perform, or to express propositions of which the truth is evinced by general experience; as in the following examples:—

> Hypocrisy......the only evil that *walks*
> Invisible, except to God alone.
>
> *Ad pœnitendum* properat *qui cito judicat.*

In these instances it is plain that there is no particular time pointed out; the propositions are *true*, or apprehended as true, at all times. Although the actions, therefore, of "walking" and "hastening" are expressed as present, it is impossible from the expressions to determine any precise point of time when they are present.

But if the *present tense* be thus indefinite, how, it may be asked, are we to ascertain the particular time which is intended? We answer, it is to be ascertained, either by stating the action of the verb as existing in some time already known, or by inference. If, for example, we say, "Millions of spiritual creatures *walk* the earth unseen," the proposition is general, and the time of walking undetermined. But if we add, "both *when* we *wake* and *when* we *sleep*," the *time* is by this addition ascertained and specified; for if the time when men wake and sleep be known, the time when these spirits walk the earth is also known. When no specifying clause is given by which to determine the time of the present tense, it is very commonly determined by inference. Thus, if one use such an expression as "He *sleeps* while I am *speaking to him*," the time of his sleeping is ascertained by the subsequent clause of the sentence; but if it be said simply, "he sleeps," without assigning any data from which it may be concluded when his sleeping is present, we very naturally infer that it is at the instant when we receive the information of his sleeping. Such inferences as this are common in language. The mind is desirous to obtain complete information on every subject, and therefore frequently supplies to itself what is not expressed in the speech of others.

Both these ways of ascertaining the precise time of the present tense are excellently illustrated by the use of the word present as applied to space. Take a familiar example: "His brother and he were *present* when I read the letter." It is at first sight evident that this expression is perfectly indefinite. But if it be said, "His brother and he were *present at your house* when I read the letter," the place of action is then determined by being referred to a portion of space which is known. If no such reference be made, the person who hears the speech uttered must either remain ignorant of the place intended, or he must ascertain it to himself by inference; and he will probably infer it to be that in which the speaker is at the time of his uttering the indefinite sentence. This leads us to observe, that such inferences are not often made without sufficient foundation. Various circumstances may assist the reader or hearer in making them, and prevent all danger of mistake. He may have the evidence of sense, or of something preceding in the discourse, and a number of other particulars, to warrant his conclusion. Thus, if, when sitting by a large fire, any one pronounce the words "I am too warm," those to whom he addresses his speech are authorized to conclude that he is too warm at the time of speaking, unless he expressly prevent the drawing of that conclusion by adding some such clause as "when I wear a great coat."

It is strictly demonstrable, and has been in fact demonstrated by Mr Harris, that there is no such thing as present time. Yet do we not only conceive time as present and existing, but frequently as extended to a very great degree. We speak not only of the present instant, or the present day, but also of the present year, and even of the present century. This manner of conceiving time is indeed loose and unphilosophical, but it is sufficient for the ordinary purposes of language. To express time as it really is, we ought to say, the passing day, the passing year, and the passing century; but in common discourse we denominate any portion of time present, in which the present now or instant is included, although it is obvious that part of that portion is past, and the remainder of it future. From the very nature of time thus conceived to be present, the tense now under consideration must represent the action of the verb as commenced, and not finished; for as time is in continued succession, and accompanies every action, when any action is *not* commenced, it exists not in any time, although it may exist hereafter in time which is now future; and when it is finished, it exists no longer in time present, but in *time past.* Hence the absurdity of introducing into a theory of the tenses an inceptive present and a completive present; for these terms imply each a direct contradiction.

After having said so much respecting the present tense, we shall have but little to say of the *præter-imperfect.* It states an action in regard to time as *past;* and in respect of progress, as *unfinished. Legebam*, I was reading at some time, but my reading was then incomplete; I had not finished the book or the letter. We must here observe, however, as we did with respect to the present tense, that although the præter-imperfect represents the action as past, it does not inform us in what precise portion of past time the unfinished action was going on; this circumstance must either be given in separate words, or be inferred by the hearer. If one say simply, *Legebam*, the person to whom he addresses his speech will conclude that the time of his reading is past with respect to the present time of his speaking. But if he say *Legebam antequam venisti*, he expressly states the action of reading as past with respect to the time in which his hearer came to the place where they both are at the time of speaking. The time of the præter-imperfect is always past with respect to the present instant when the imperfect is used, and of this the tense itself gives notice; but it may also be past with respect to some other time, and of this it conveys no information.

If we join two præter-imperfects together, the expression will state the co-existence of two progressive actions, both of which were going on at a time *past* in respect of some determinate time given or supposed. *Cum tu scribebas ego legebam;* "when you were writing I was reading." Hence the præter-imperfect has by some grammarians been called the relative present; a name which, however, is by no means exclusively applicable to this tense. When the præter-imperfect is by the conjunction *and* joined in the same sentence with a plusquam-perfect, the two tenses express two actions, both prior to the time of speaking; but the one as having continued after the other was finished. Thus Æneas, speaking of the destruction of Troy, says, that after having escaped with his father and followers, he returned to the city in quest of his wife, and went directly to his own house; but there, continues he, *Irruerant* Danai, et tectum omne *tenebant*, "the Greeks *had rushed in*," that action was over and completed *before his arrival*; but the act of "possessing the whole house," *tenebant*, was not over, but still continuing.

But it is necessary that the verb should denote actions which were complete or perfect in past time, as well as those which were incomplete or imperfect. For this purpose Greek and English verbs have an aorist, a præter-perfect, and a plusquam-perfect. Of these the Latin has only the two last. The præter-perfect in that language sustains a twofold character; it performs the office of the Greek and English aorist, as well as that of the præter-perfect properly so called; that is, it denotes a finished action at some indefinite past time. as well as at some time which is both past and definite.

In attempting to analyse the signification of complex terms, by which we here mean words that include in their signification a variety of particulars, it is of great advantage to have these particulars separately expressed by different words in another language. Now the English has resolved the tenses, which in the Greek and Latin languages are denominated the aorist and the præter-perfect, by means of what are commonly called auxiliary verbs, expressing the former by the verb *did*, and the latter by the verb *have.* In examining therefore the aorist and præter-perfect, it will be of use to inquire into the import of these verbs.

Did is evidently the aorist of the verb *to do;* a verb of the most general signification, as it denotes action of every kind. It expresses the finished performance of some action, the completion of which must of course have taken place in some portion of *past time:* "*I* DID *write*, or *I wrote* (these expressions being equivalent) yesterday, a month, a year ago." But the import of *did* being so very general, it can convey no determinate meaning without being limited by the addition of some particular action; and this addition, however expressed, is to be considered in the same light as an accusative case, governed by the active verb *did;* for it produces exactly the same effect. 'Εγραψα, *scripsi*, I *did* WRITE; that is, "at some past time I performed the *action* of *writing*, and *finished it.*"

The verb *have*, which is included in the præter-perfect, is plainly a verb of the present tense denoting possession, But a man may possess one thing as well as another; and therefore *have* requires limitation, for the very same reason that *did* requires it, namely, because its signification is perfectly general. Now this limitation, whatever it is, must be conceived as the thing possessed; and in instances where *have* is limited by a noun, this is obvious, and universally acknowledged. "I *have* a gold watch," means "I *possess* a gold watch." But to annex the same meaning to the word *have*, when used as an auxiliary verb, is an idea we believe not common, and which may perhaps be thought whimsical; yet what other meaning can be affixed to it? To suppose that words have not each a radical and determinate signification, is to suppose language a subject incapable of philosophical investigation; and to suppose, with Mr Harris, that there are words entirely devoid of signification, is at once to render all inquiries into the principles of grammar nugatory and ridiculous. We conceive, then, that each of the phrases, *γεγραφα ἐπιστολην, scripsi epistolam*, I HAVE *written a letter*, is equivalent to the phrase, "I *possess* at present the *finished action* of writing a letter." Such an expression may sound harsh to the ear, because it is not in use; but we often employ expressions, to the precise and proper meaning of which we do not attend; and if the above be attentively considered, however awkward it may at first appear, nothing will be found in it either improper or absurd.

The aorist, then, we conceive to state an action as performed and finished in some past portion of time; whilst the præter-perfect represents the past performance and completion of that action as *now* possessed. And here we may hazard a conjecture why *have*, when used as an auxiliary verb, is always joined with a past participle; whereas *did* is joined to a word expressing the simple action of the verb, or, as it is called, present infinitive. Of the expression, "I *have* WRITTEN a letter," *one* part, namely, the verb *have*, denotes *present time;* the other part, viz. *written*, must denote past time, to give notice that the action is performed and finished. *Did*, on the other hand, implying past time, has no occasion for the past part of another verb to give notice of this circumstance; for "I *did* WRITE a letter," is equivalent to, "at some past time I performed and finished the simple action of writing a letter."

The principal distinction in practice between the aorist and præter-perfect (for the difference seems little in their real import) consists in the time by which the performance of the action admits of being particularly specified. The præter-perfect is always joined with a portion of time which includes the present *now* or *instant;* for otherwise it could not signify, as it always does, the present possession of the finishing of an action. But the aorist, which signifies no such possession, is as constantly joined with a portion of past time which excludes the present *now* or *instant.* Thus we not only say, "I *have written* a letter *this* day, *this* week," but "I *wrote* a letter *yesterday*, last week;" and to interchange these expressions of time in Greek and English, where the aorist and præter-perfect have different forms, would be improper. In Latin, indeed, where they have but one form, the impropriety does not appear.

Besides the tenses already examined, which are expressive of past time, in most languages the verb has another tense called the *plusquam-perfect*, in which, however, no difficulty occurs to detain our attention. What the præter-imperfect is to the present tense, that the plusquam-perfect is to the præter-perfect. The verb *had*, by which it is resolved in English, being evidently the past time of *have*, sufficiently explains its meaning and relation to the other tenses. "I *had* written a letter," is equivalent to the phrase, "I *possessed* at some *past time* the finished action of writing a letter." It is justly observed by Dr Beattie, that the imperfect and plusquam-perfect are very useful, and may be the sources of much elegant expression; and that if one were not taught to distinguish, in respect of meaning as well as of form, these tenses from each other, and the præterite from both, one could not pretend to understand, far less to translate, any good classic author.

Having considered the tenses which imply present and past time, it now remains that we examine the import of those which are expressive of time *future.* In Latin and English there are two tenses for this purpose, of which the first represents an action in point of time as *not yet existing*, but as about to exist at some period to come; but it does not bring the completion of the action into view. The other asserts the *futurity* of an action together with its completion. *Scribam*, "I shall be writing," denotes *future* time and *incomplete action;* for it does not say whether I am to write for a long or for a short time, or whether I shall finish what I promise to begin. This part of the verb, therefore, to which the Greek γραψω corresponds, is an imperfect future, or, in other words, indefinite. The futurity of any action, it should seem, may always be computed from the time of speaking; for every action must be future with respect to the time at which its futurity is declared: but the time of its futurity may be more precisely specified by fixing upon some other future time to which to refer it: "I shall be writing after he shall have departed." *Shall* or *will* refers to future time indefinitely; and *write* or *writing* refers to an action which is indeed to *begin* and so far to proceed, but of which nothing is said concerning the completion.

On the other hand, *scripsero*, "I shall have written," is a perfect future denoting complete action; for *shall* denotes future time; *written*, finished action; and *have*, present possession. So that the meaning of the whole assertion is, that "at some future period of time I shall possess the finished action of writing." The completion of the action, together with the possession of it, is always future with respect to the time of assertion; but, with respect to some other time expressed or understood, the completion of the action is to be past: *Promittis te scripturum si rogavero*, "you promise to write if I shall have asked you." In this sentence the action of asking is future with relation to the time of promising, but it is past with relation to that of writing. This tense the Latin grammarians call the future of the subjunctive mode, but very improperly. The notice which it communicates respects not the power or liberty of acting, which, as will be seen by and by, is the characteristic of that mode; but only the action itself. It ought, therefore, to be ranked among the tenses of the indicative mode; for *scripsero* is, in every sense, as really indicative as *scribam* or *scripturus ero.*

These are all the tenses, essentially different from each other, which have place in the indicative mode (or mood) of any language with which we are acquainted;[1] but as there are tenses in the mode called *subjunctive*, which bear the same names with those already examined, and which have yet a different import, it will be necessary to consider them before we dismiss the subject of tenses. Of *modes* in general something will be said hereafter; at present we shall only observe, that the mode with which we are now concerned is not very properly distinguished by the name assigned to it by the Latin grammarians. They call it the *subjunctive*, because it is often subjoined to another verb, and forms the secondary clause of a sentence; but the mode called *indicative* frequently appears in the same circumstances. The difference between these two modes appears to us to consist in this, that the indicative asserts something directly concerning the action, and the subjunctive, something concerning the power or liberty of the agent to perform it; for that the latter asserts as well as the former, admits not of dispute.

The present tense of the *subjunctive mode*, in the learned languages, answers to the English auxiliaries *may* and *can.* Let us consider these a little. *May* is evidently a verb of the present tense denoting *liberty.* When I assert that I MAY *write*, I give notice that I am under no *compulsion* to *abstain* from writing; that there is no impediment from without by which I am restrained from writing. *Can* is also a verb of the present tense, expressive of internal power or skill. "I *can* write" is equivalent to such an expression as this: "There is nothing in myself which incapacitates me for performing the operation of writing." This verb seems originally to have denoted knowledge or skill, and to have been afterwards extended to signify power or ability of any kind. There is little doubt of its being the same with the old English verb *to con*, which signifies *to know*. The difference between the import of these two verbs, *may* and *can*, will be best perceived in a familiar example. Suppose we say to any one, "You *may* write a treatise on grammar," to which he returns for answer, "I *cannot;*" our assertion evidently supposes him at liberty to write the treatise; his answer implies that he is unable or unskilled to do it. We may conclude, then, that the present tense of this mode contains a declaration of present liberty, ability, or skill; and its other tenses will be found to have reference to the same capacities.

---

[1] "It will perhaps occur," says an elegant and ingenious writer, "that there are two Greek tenses of which I have given no account; namely, the *second aorist* and the *second future.* The truth is, that I consider them as unnecessary. Their place, for any thing I know to the contrary, might at all times be supplied by the *first aorist* and the *first future.* Some grammarians are of opinion that the first aorist signifies time past in general, and the second indefinite time past; and that the first future denotes a nearer, and the second a more remote, futurity. But this, I apprehend, is mere conjecture, unsupported by proof; and therefore I incline rather to the sentiments of those who teach that the second future and the second aorist have no meaning different from the first future and the first aorist; and that they are the present and imperfect of some obsolete theme of the verb: and when the other theme came into use, happened to be retained for the sake of variety perhaps, or by accident, with a preterite and future signification. Be this as it will, as these tenses are peculiar to the Greek, and have nothing corresponding to them in other tongues, we need not scruple to overlook them as superfluous." (Beattie on the *Theory of Language*, part ii. chap. 2.) To these judicious observations we have nothing to add, except that they acquire no small degree of confirmation from the circumstance that there are many Greek verbs which have no second future, and which are yet employed to denote every possible modification of future time. Of the *paulo-post-futurum* of the Greeks we have taken no notice, because it is found only in the passive voice; to which, if it were necessary, it is obvious that it would be necessary in *all* voices, as a man may be about to *act* as well as to *suffer* immediately.

The observation is here to be repeated which was enlarged upon when treating of the present of the indicative. The liberty or ability signified by this tense is always represented as present, but the time of this presence is indefinite. If no particular time be specified, we generally refer it to the time of speaking; but another point may be given from which we are to compute. "When he shall have finished, you *may* then proceed as you propose." Here the liberty of proceeding is stated as present, not at the time of speaking, but at the time of his finishing, which is future to the time of speaking. But though the liberty, ability, or skill, denoted by this tense, be represented as present, the action itself is stated as *contingent*; for it is not necessary that a man should perform an action because he has the capacity to perform it.

From this idea of the present of the subjunctive some of its most peculiar uses seem capable of being explained. And, in the first place, it appears to have a near affinity with the future of the indicative, insomuch that in many instances they may be used promiscuously. Without materially altering the effect of the expression, we may say, "Dico me facturum esse quæ *imperet*," or "quæ *imperabit*." The reason of this, perhaps, may be, that with respect to us, *futurity* and *contingency* are in most cases nearly the same, both being involved in equal obscurity; and therefore it is often of little consequence which mode of expression we employ.

Secondly, the present of the subjunctive is used to denote the right of which a person is possessed. "*I may*, or I *can*, sell this book." This application, which Dr Priestley considers as the primary signification of the tense, is easily deduced, or rather it follows immediately from the foregoing account of its import. For if one be under no restraint, either external or internal, to prevent him from performing an action, he has surely a right to perform it.

Thirdly, the present of the subjunctive is often used to signify command or request; as when one says, "You *may give* my compliments to such a person." This use of the tense under consideration seems to have arisen from a desire to soften the harshness of a command, by avoiding the appearance of claiming superiority. When a man utters the above sentence, he certainly utters no command, but only asserts that the person to whom he speaks has liberty or power to do him a favour. This assertion, however, may contain no new information; and therefore the person addressed, reflecting upon the intention of the speaker in making it, infers that it indicates a *wish* or *desire* that his compliments should be made to such a person.

Of the subjunctive as well as of the indicative, the præter-imperfect is evidently the past time of the present. As the latter asserts liberty or ability to perform some action, as existing at present, the former asserts the same liberty or ability to have existed in time past; but the precise portion of time past in which these capacities existed must be specified by other words, or it will remain unknown. Thus, in the following sentence, "Dixi me facturum esse quæ *imperaret*," the time of *imperaret* is referred to that of *dixi;* the person having the right to command is supposed to have had it at the time when the other said that he would obey. This tense, as well as the present, states the action as going on and incomplete; and also as future with respect to the liberty or ability to perform it. It is rendered into English by the verbs *could* or *might*, of which the first is the past time of *can*, and the second of *may*. From the near affinity which the present of the subjunctive has to the future of the indicative, the tense now under consideration appears in many instances as the past time of the latter as well as the former. Thus, *Dixi me facturum quæ imperaret*, may be rendered "I said that I would do whatever he might, or whatever he *should*, command."

Of the præter-perfect it is sufficient to observe, that as the present states the agent as at *liberty* to be performing an unfinished action, so this tense states him as at liberty to perform the action considered as finished. "I *may be writing* a letter when you come;" that is, "I *am at liberty to be writing* a letter when you come." "I *may have written* a letter when you come;" that is, "I *am at liberty to be in possession of the finished action* of writing a letter when you come." It is a common mode of expression to say, "I may have done such or such a thing in my time," when he who speaks can have little doubt whether he has done the thing or not. In that case, the words *may have done*, cannot be considered as the præter-perfect of the subjunctive of the verb *do;* for it is nonsense to talk of liberty with respect to the performance of an action, which at the time of speaking is supposed to be past and completed. What, then, is the import of the phrase? We are persuaded that it is elliptical, and that the word *say* or *affirm* is understood: "I may (say that I) have done such or such a thing in my time;" for liberty or contingency can relate to actions only as they are conceived to be present or future.

Of all the tenses, the most complex is the plusquamperfect of this mode. It combines a past and a future time with a finished action. It may be considered as the past time both of the perfect future and the præter-perfect of the *subjunctive;* for it represents an action, future and contingent at some *past time*, as *finished before* another *period specified;* which period, therefore, though past at the time of speaking, was itself future with respect to the time when the futurity or contingency of the action existed. "Promisisti te scripturum fuisse si *rogassem;*" "You promised that you would write, if I should have asked you." Here the futurity of the action of *asking*, which is represented as complete and finished, is stated as *co-existing* with the *past promise;* but the action itself must be *posterior* to that promise. It is however supposed to be past with respect to the action of writing, which is also posterior to the promise.

Before we dismiss the subject of tenses, it may not be improper just to mention number and person; for these have place in every tense of the verb in the learned languages, and in many tenses even of the English verb. They cannot, however, be deemed essential to the verb; for affirmation is the same, whether it be made by you, by me, or by a third person, or whether it be made by one man or by a thousand. The most that can be said is, that verbs in the more elegant languages are provided with a variety of terminations which respect the number and person of every substantive, that we may know with more precision, in a complex sentence, each particular substance, with its attendant verbal attributes. The same may be said of sex with respect to adjectives. They have terminations which vary as they respect beings male or female, though it is past dispute that substances alone are susceptible of sex. We therefore pass over these matters, and all of like kind, as being rather amongst the elegancies of particular languages, and therefore to be learned from the particular grammar of each tongue, than amongst the essentials of language; which essentials alone are the subject of inquiry in a treatise on universal grammar.

Besides tenses, number, and person, in every tongue with which we are acquainted, verbs are subject to another variation, which grammarians have agreed to call *modes* or *moods*. Of modes, as of tenses, it has been warmly disputed whether or not they be essential to language. The truth seems to be, that the only part of the verb absolutely necessary for the purpose of communicating thought is the indicative mode; for all the others, as has been well observed by Dr Gregory, are resolvable, by means of additional verbs and a word denoting the action of the primary verb, into circuitous expressions which fully convey their meaning.[1] But such expressions continually repeated would make language very prolix and wholly devoid of animation; and for this reason the import of each of the commonly received modes is a subject worthy of the philologist's investigation. About the number of modes, whether necessary or only expedient, as well as about the import of each, the writers on grammar have differed in opinion. Mr Harris, one of the most celebrated of those writers, has enumerated four modes of the verb, besides the infinitive: viz. the *indicative* or *declarative*, to assert what we think certain; the *potential* or *subjunctive*, for the purposes of whatever we think contingent; the *interrogative*, when we are doubtful, to procure us information; and the *requisitive*, to assist us in the gratification of our volitions. The requisitive, too, according to him, appears under two distinct species; either as it is *imperative* to inferiors, or *precative* to superiors. For establishing such a variety of modes as this, there appears to be no sort of foundation whatever. The same reasoning which induced the author to give us an interrogative and requisitive mode, might have made him give us a hortative, a dissuasive, a volitive, and innumerable other modes, with which no language is acquainted. But besides perplexing his reader with useless distinctions, we cannot help thinking that Mr Harris has fallen into some mistakes with regard to the import of those modes which are universally acknowledged. According to him, *assertion* is the characteristic of the indicative, and that which distinguishes it from the subjunctive or potential; but this is certainly not true, for, without an assertion, the verb cannot be used in any mode. Of this the learned author indeed seems to have been aware, when he observed respecting the subjunctive mode, that it is employed "when we do not *strictly* assert," and that "it implies but a *dubious* and *conjectural* assertion." The truth is, that the assertion implied in this mode, though it is not concerning the same thing, is equally positive and absolute with that conveyed by the indicative. An example quoted by himself should have set him right as to this matter:

> Sed tacitus pasci si posset corvus, *haberet*
> Plus dapis.

Who does not feel that the assertion contained in *haberet* is as absolute and positive as any assertion whatever?

Perhaps we may be asked to define what we mean by a mode. We know not that we can define it to the satisfaction of all. Thus much, however, seems to be obvious, that those variations which are called modes do not imply *different modifications* of the *action* of the verb. *Amo*, *Amem*, *Ama*, do not signify modes of *loving;* for modes of loving are, loving *much*, loving *little*, loving *long*, loving *short*, and the like. Shall we then get over the difficulty by saying, with Mr Harris, that "modes exhibit some way or other the *soul* and its *affections?*" This is certainly true, but it is nothing to the purpose; for it does not distinguish the meaning of mode from the object of language in general, all languages being intended to exhibit the soul and its affections.

Grammatical modes of verbs have been defined by Dr Gregory to be "concise modes of expressing some of those combinations of thoughts which occur most frequently, and are most important and striking." This is a just observation; but perhaps he would have given a more complete definition had he said, that grammatical modes of verbs are concise modes of expressing some of those combinations of thoughts which occur most frequently, and of which *assertion* is an essential part.[2] This indeed seems to be the real account of the matter, especially if our notion of the nature of verb be well founded, that its essence consists in affirmation. And in this opinion we are the more confirmed, from a conviction that no man ever employs language on any occasion but for the purpose of affirming something. The speaker may affirm something directly of the action itself, something of the agent's power or capacity to perform it, or something of his own desire that it should be performed, but still he must affirm. If this be so, then are all the modes equally indicative. Some may be indicative of perceptions, and others of volitions; but still they all contain *indications*. On this idea the three foregoing modes of *amo* will be thus distinguished: When a man indicates his present *feeling* of the passion of love, he uses the first; when he indicates his present *capacity* of feeling it, he uses the second; and when he indicates his present *desire* that the person to whom he is speaking would entertain that passion, he uses the third.

---

[1] The imperative, for instance, may be resolved into a verb of commanding in the first person of the present of the indicative, and a word denoting the action of the primary verb, commonly called the infinitive mode of that verb. Thus, *I nunc et versus tecum meditare canoros*, and *Jubeo te nunc ire et tecum meditari*, &c. are sentences of the very same import. The subjunctive may be resolved in the same manner by means of a verb denoting power or capacity; for *credam*, and *possum credere*, may often be used indifferently. The indicative mode, however, is not thus convertible with another verb of affirming in the first person of the present of the indicative, and a word denoting the action of the primary verb; for *Titius scribit*, "Titius writes," is not of the same import with *dico Titium scribere, quod Titius scribat*, "I say that Titius writes." The first of these sentences, as has already been shown, contains but one assertion; the second obviously contains two. *Titius writes*, is equivalent to *Titius* IS *writing; I say that Titius writes*, is equivalent to *I* AM *saying that Titius* IS *writing*. The reason why the imperative and subjunctive are resolvable into expressions into which the *indicative* cannot be resolved, will be seen when the import of each of those modes is ascertained.

[2] Every verb, except the simple verb *am*, *art*, *is*, &c. expresses without modes a combination of thoughts, namely, affirmation and an attribute. The affirmation, however, is alone essential to the verb, for the attribute may be expressed by other words. It is indeed extremely probable, that in the earliest ages of the world, the affirmation and attribute were always expressed by different words; and that afterwards, for the sake of conciseness, one word, compounded perhaps of these two, was made to express both the affirmation and the attribute; hence arose the various classes of verbs, *active*, *passive*, and *neuter*. Of a process of this kind there are evident signs in the Greek and some other tongues. But the improvers of language stopped not here. The same love of conciseness induced them to modify the compound verb itself, that it might express various combinations of thought still more complex; but in all these combinations *assertion* was of necessity included; for if the word had ceased to assert, it would have ceased to be a verb of any kind.

As to what Mr Harris calls the interrogative mode, he observes that it has a near affinity to the indicative. It has in fact not only a near affinity to it, but, as far as language is concerned, there is not between the one and the other the slightest difference. For, in written language, take away the mark of interrogation, and, in spoken language, the peculiar tone of voice, and the interrogative and indicative modes appear precisely the same. That such should be the case is extremely natural. To illustrate this, let us for once speak in the singular number, and conceive one of our readers to be present. "I assert a thing, taking the truth of it for granted; but if you know me to be wrong, I presume that you will set me right." In this case, assertion produces the same effect as interrogation. Instances of the same kind perpetually occur in common conversation. An acquaintance says to me, "You took a ride this morning." I answer yes or no, according to the case; and the same effect is produced as if he had said, "Did you take a ride this morning?" In this way simple assertions would at first be employed to procure information wanted. *Fecisti*, you *did* such a thing; *fecisti ne*, you did it *not;* either would produce the proper reply, and the information wanted would be gained.[1] This being observed as language improved, men would accompany such a sentence with a peculiar tone of voice, or other marks, to signify more unequivocally that they wanted information, or that such information was the only object of their speech. Further progress in refinement would lead them to alter the position of the words of a sentence when they meant to ask a question, as we do in English, saying, when we *assert*, "*You have* read Euripides," and when we *interrogate*, "*Have you* read Euripides?"

In Greek and Latin, questions are asked commonly enough by the particles ἐι and *an*. These particles we know to be exactly equivalent to the English particle *if*, at least to the sense in which that particle is commonly taken. *An fecisti*, is "*If* you did it;" and the sentence may either be an abbreviation for *dic an fecisti*, "tell me if you did it;" or *an* may perhaps be, as *if* certainly is, the imperative mode of some obsolete verb equivalent to *give;* and in that case, *an fecisti* will be a complete interrogative sentence, signifying, "you did it, *give that*." But of the interrogative mode of Mr Harris we have said enough; perhaps our readers will think too much, since it is a useless distinction not found in any language. It will, however, be proper to say something of his precative mode, as far as it is the same with the optative mode of the Greek grammarians.

And nothing, we think, can be clearer, than that the Greek optative constitutes no distinct mode of the verb, whatever meaning be annexed to the word mode. The different tenses of the optative are evidently nothing but the past tenses of the corresponding tenses of the subjunctive. Thus, pres. subj. τυπτω, I *may* strike; pres. optat. τυπτοιμι, I *might* strike, &c. This is proved to be indubitably the case by the uniform practice of the Greek writers. Examples might be found without number were one to read in search of them. The following sentence will illustrate our meaning: 'Ερχονται 'Αθηναιοι ἱνα βοηθωσι τοις Αργειοις, "The Athenians *come* that they *may assist* the Argives." Here the leading verb ἐρχονται being of the present tense, the dependent verb βοηθωσι is the present subjunctive. But change the former to the *past time*, and the latter must also be changed. 'Ηρχοντο 'Αθηναιοι ἱνα βοηθοιεν τοις 'Αργειοις, "The Athenians *came* that they *might assist* the Argives." Here it is plain that βοηθοιεν, the present of the optative, is the past time of βοηθωσι, the present of the subjunctive; and the same holds in other instances.

It is almost unnecessary to add, that when this mode is employed to denote a wish, the wish is not expressed by the verb, but is understood. Such abbreviated expressions to denote a wish are common in all languages. Thus, in Greek,

> 'Υμιν μεν θεοι δοιεν, ὀλυμπια δωματ' ἐχοντες
> 'Εκπερσαι Πριαμοιο πολιν, κ. τ. λ.

signifies, "The gods might give you (or, as we say in English, *changing* the position of the verb, *might the gods give you*) to destroy," &c. So in Latin, *Ut te omnes dii deæque perdant*, "That all the gods and goddesses may destroy you." Again, in English, "O that my head were waters, and my eyes a fountain of tears." In all these, and such like sentences, words equivalent to *I wish, I pray*, are understood. In Greek a wish is sometimes introduced by the particle ἐι or ἐιτε, *if;* as in Homer,

> 'Ειθ' ὀφελες τ' ἀγονος τ' ἐμεναι, ἀγαμος τ' ἀπολεσθαι.

"*If* it had been your fate not to be born, or to die unmarried." The supplement is, "It would have been fortunate for your country," or some such thing. In like manner, a poor person not uncommonly entreats a favour by saying, "Sir, *if* you would be so good." Here he stops; but the completion of his sentence is, "it would make me happy." In all these cases a wish is not formally expressed by the speaker, but inferred by the hearer. They are therefore instances of that tendency which mankind universally discover to abbreviate their language, especially in cases where the passions or feelings are interested.

The interrogative and optative modes being set aside as superfluous, it would appear from our investigation, that the real distinct modes of the verb, which are found in the most copious and varied language, are only three; the *indicative*, the *subjunctive*, and the *imperative:* And these are all that can be considered as *necessary;* the first to indicate the speaker's feeling or acting, the second to indicate his capacity of feeling or acting, and the third to indicate his desire that the person to whom he speaks should feel or act.

Here again we have the misfortune to differ in opinion from Dr Gregory, who seems to think that a greater number of modes, if not absolutely necessary, would, at any rate, be highly useful. His words are, "All languages, I believe, are defective in respect of that variety and accuracy of combination and of distinction, which we know with infallible certainty take place in thought. Nor do I know of any particular in which language is more deficient than in the expressing of those energies or modifications of thought; some of which always are, and all of which might be, expressed by the grammatical moods of verbs. Of this there cannot be a clearer proof than the well-known fact, that we are obliged to express by the same mood very different modifications or energies of thought. As, for instance, in the case of the grammatical mood called the imperative, by which we express occasionally prayer to God, command to a slave, request to a superior, advice to an equal or to any one, order as from an officer to his subaltern, supplication to one whom we cannot resist." If these be, as the author calls them, specific differences of thought, he will not surely object to their being all ranked under one genus, which may be called *desire.* That the internal feelings which prompt us to pray to God, to command a slave, to request a superior, to advise an equal, to give an order to an inferior, and to supplicate one whom we cannot resist, are all different in degree, cannot be denied. Each of them, however, is desire; and the predication by which the desire is made known to the person whom we address, is the same in all, when we utter a prayer as when we utter a command, when we request as when we supplicate. But predication alone is that which constitutes the verb; for desire by itself, however modified, can be expressed only by an abstract noun; and the mere energy of desire, when not applied to a particular agent, can be expressed only by a *participle,* or by what is commonly, though improperly, called the infinitive mode. Now it is certainly conceivable that a few shades of meaning, or a few degrees of one general energy, might be marked by corresponding variations of such verbs as combine energy with predication;[1] and there could be no great impropriety in calling those variations modes, or rather modes of modes; but that such a multiplication of modes would be an improvement in language, is by no means evident. The verb, with the modes and tenses which it has in all languages, is already a very complex part of speech, which few are able, and still fewer inclined, to analyse; and it would surely be of no advantage to make it more complex by the introduction of new modes, especially when those degrees of energy which could be marked by them are with equal and perhaps greater precision marked, in the living speech, by the different tones of voice adapted to them by nature; and, in written language, by the reader's general knowledge of the subject, and of the persons who may be occasionally introduced. If there be any particular delicacy of sentiment or energy which cannot thus be made known, it is better to express it by a name appropriated to itself, together with the simple and original verb of affirmation, than to clog the compound verb with such a multiplicity of variations as would render the acquisition of every language as difficult as is said to be that of the Chinese written characters. The indicative, subjunctive, and imperative, are therefore all the modes of the verb which to us appear to be in any degree necessary or expedient; and they are in fact all the modes that are really found in any language with which we are acquainted.

---

[1] Of a question put in the form of an assertion we have a remarkable instance in the gospel of St Matthew. When Christ stood before Pilate, the governor asked him, saying, Συ ἐι ὁ βασιλευς των Ιουδαιων, "Thou art the king of the Jews." That this sentence was pronounced with a view to obtain some answer, is evident from the context; yet it is as plainly *an affirmation*, though uttered probably in a scoffing tone, as the serious confession of Nathaniel, Συ ἐι ὁ βασιλευς του Ισραηλ, "Thou art the king of Israel." Had not the question been put in this form, which *asserts* Christ to be the king of the Jews, the reply could not have been Συ λεγεις, "Thou sayest;" for without an assertion the governor would have said nothing. (See Dr Campbell's *Translation of the Gospels*, where the form used in the original is with great propriety retained in the version.)

For the *infinitive,* as has already been observed, seems on every account to be improperly styled a mode. To that name it has no title which we can perceive, except that its termination sometimes (for even this is not universally true) differs in the learned languages from the terminations of the other parts of the verb. Nay, if affirmation be, as it has been proved to be, the very essence of verb, it will follow that the infinitive is no part of the verb at all; for it expresses no affirmation. It forms no complete sentence by itself, nor even when joined to a noun, unless it be aided by some real part of a verb either expressed or understood. *Scribo, scribebam, scripsi, scripseram, scribam, scripsero,* "I am writing, I was writing, I have written, I had written, I shall write, I shall have written," contain each of them an *affirmation,* and constitute a complete sentence; but *scribere* "to write," *scripsisse* "to have written," affirm nothing, and are not more applicable to any one person than to another. In a word, the *infinitive* is nothing more than an *abstract noun,*[2] denoting the simple

---

[1] Dr Gregory seems to think, that not merely a few, but a vast number, of these energies might be so marked. "*Affirming, denying, testifying,* foretelling, asking, answering, *wishing, hoping, expecting,* believing, knowing, doubting, supposing, stipulating, being able, commanding, *praying,* requesting, *supplicating,* loving, hating, fearing, despairing, being accustomed, wondering, admiring, wavering, swearing, *advising, refusing, exhorting, dissuading, encouraging,* promising, threatening, &c." says he, "all admit very readily of being combined with the general import of a verb." And he adds, that "if every one of them had been expressed in all languages by variations as striking as those of τυπτω, τυπτοιμι, and τυπτε, they must have been acknowledged as distinct moods of the verb."

If all these words denote different energies of thought, which, however, may be doubted, and if all those different energies, with many others for which, as the author justly observes, it is not easy to find names, could, like capacity and desire, be combined with the general action or energy of one verb; and if those combinations could be marked by corresponding variations of that verb; we should indeed acknowledge such variations to be distinct modes, or modes of modes, of the verb. But we doubt much if all this be possible. We are certain that it would be no improvement; for it seems to be evident, either that, in some of the modes, the radical letters of the original verb must be changed, and then it would cease to be the same verb; or that many of the modes must be expressed by words of very unmanageable length; not to mention, that the additional complication introduced by so many minute distinctions into a part of speech already exceedingly complex, would render the import of the verb absolutely unintelligible to nine tenths even of those who are justly styled the learned.

[2] In our idea of the infinitive, we have the good fortune to agree with the learned Ruddiman, whose words are, "Non inepte hic modus a veteribus quibusdam *verbi nomen* est appellatum. Est enim, si non vere ac semper, quod nonnulli volunt, nomen substantivum, significatione certe ei maxime affinis; ejusque vices sustinet per omnes casus. Et quidem manifeste substantivum videtur, cum adjectivum ei additur neutri generis; ut, Cic. *Att.* xiii. 28, *Cum vivere ipsum turpe sit nobis.* Pers. v. 53, *Velle suum cuique est.* Cic. *Fin.* i. 1, *Totum hoc displicet philosophari.* Petron. c. 52, *Meum intelligere nulla pecunia vendo.* Item, absque adjectivo, ut Ovid. *Met.* ii. 483, *Posse loqui eripitur,* id est, *potestas loquendi.* Plaut. *Bacch.* i. 2. 50, *Hic vereri perdidit,* id est, *verecundiam.* Cic. *Tusc.* v. 38, *Loquor de docto homine et erudito, cui vivere est cogitare,* id est, *cujus vita est cogitatio.*" See *Grammaticæ Latinæ Institutiones,* pars secunda, lib. i. cap. 2, where the reader will find examples of the infinitive used by the best Roman writers as a substantive noun in every case.

This opinion of Ruddiman and the ancient grammarians has been controverted with much ingenuity by Dr Gregory, who seems to think that in the infinitive alone we should look for the essence of the verb divested of every accidental circumstance, time only excepted. If this be indeed the case, almost every thing which we have said of the verb, its tenses, and its modes, is erroneous; and he who takes his principles of grammar from the Encyclopædia Britannica will fill his head with a farrago of absurdities. But it may without much difficulty be shown, that the error does not attach to the doctrine respecting the infinitive, which has been stated and illustrated in this article, but to the strange inversion of all recognised principle involved in the notion which Dr Gregory has espoused, apparently by reason of its novelty alone.

The Doctor acknowledges (*Transactions of the Royal Society of Edinburgh,* vol. ii. liter. class, p. 195), that the infinitive is most improperly called a mode, and on that account he thinks we ought to turn our thoughts exclusively to it, "when we endeavour to investigate the general import of the verb, with a view to ascertain the accident which it denotes, and be led, step by step, to form a distinct notion of what is common in the accidents of all verbs, and what is peculiar in the accidents of the several classes of them, and thereby be enabled to give good definitions, specifying the *essence* of the verb," &c. It may be true, that to the infinitive exclusively we should turn our attention when we wish to ascertain the accident denoted by a particular verb or class of verbs; that is, the kind of action, passion, or state of being, of which, superadded to affirmation, that verb or class of verbs is expressive; but in accidents of this kind it may be doubted if there be any thing that with propriety can be said to be common to all verbs. There seems indeed to be nothing common to all verbs but that which is essential to them, and by which they are distinguished from every other part of speech; but every kind of action, passion, and state of being, may be completely expressed by participles and abstract nouns, and therefore *energy* of the verb, in conjunction with time; and is not a mode as far as we can conceive of any thing. Thus, *Scire tuum nihil est*, is the same with *Scientia tua nihil est;* and "*Death* is certain," is identical with "*To die* is certain."

Before we dismiss the subject of modes, it may not be improper to take notice of the connection which Mr Harris, after Apollonius, has found between commanding and futurity. "Intreating and commanding," he says, "have a necessary respect to the future only. For what have they to do with the present and the past, the natures of which are immutable and necessary?" This is surely con-

---

in such accidents we cannot find the essence of the verb, because such accidents distinguish it not from other parts of speech. Were a man called upon to specify the essence of verse or metre, he would not say that it consists in the meaning of the words, or in the using of these words according to the rules of syntax. In every kind of verse where words are used, they have indeed a meaning, and in all good verses they are grammatically constructed; but this is likewise the case in prose, and therefore it cannot be the essence of verse. The essence of verse must consist in something which is not to be found in prose, namely, a certain harmonic succession of sounds and number of syllables; and the essence of the verb must likewise consist in something which is not to be found in any other part of speech, and that is nothing but affirmation. But if affirmation be the very essence of the verb, it would surely be improper, when we endeavour to ascertain the general import of that part of speech, to turn our thoughts exclusively to a word which implies no affirmation; for what does not affirm, cannot in strictness of truth be either a verb or the mode of a verb.

In the same page it is said that "the infinitive denotes that kind of thought or combination of thoughts which is common to all the other modes." In what sense this is true we are unable to conceive; it denotes indeed the same accident, but certainly not the same thought or combination of thoughts. In the examples quoted, *Non est* VIVERE, *sed* VALERE *vita*, the infinitives have evidently the effect of abstract nouns, and not of verbs; for though *vivere* and *valere* express the same states of being with *vivo* and *valeo*, they by no means express the same combination of thoughts. *Vivo* and *valeo* affirm that *I* AM *living*, and that *I* AM *well;* and he who utters these words must think not of life and health in the abstract, but of life and health as belonging to himself. *Vivere* and *valere*, on the other hand, affirm nothing; and he who utters them thinks only of the states of living and of being in health, without applying them to any particular person.

The learned author of *The Origin and Progress of Language* having said that the infinitive is used either as a noun, or that it serves to connect the verb with another verb or noun, and so is useful in syntax, the doctor combats this opinion, and infers that the infinitive is truly a *verb*, because "the thought expressed by means of it may be expressed in synonymous and convertible phrases, in different languages, by means of other parts or moods of the verb." Of these synonymous and convertible phrases he gives several examples, the first of which is taken from Hamlet's soliloquy. "*To be* or *not to be*, that is the question," he thinks equivalent in meaning to, "The question is, *whether we shall be or shall not be*." But we are persuaded he is mistaken. "Whether we shall be or shall not be," involves a question, whether we shall exist at some future and indefinite time; but the subject of Hamlet's debate with himself was not, whether, if his conscious existence should be interrupted, it would be afterwards at some future and indefinite time restored, but whether it was to continue uninterrupted by his exit from this world. This, we think, must be self-evident to every reader of the soliloquy. It is likewise obvious that the word "question" in this sentence does not signify interrogatory, but *subject of debate*, or *matter to be examined;* and that the word "that" serves no other purpose than to complete the verse, and give additional emphasis, perhaps, to an inquiry so important. "*To be* or *not to be*, that is the question," is therefore equivalent in all respects to "The continuance or non-continuance of my existence is the matter to be examined;" and the infinitive is here indisputably used as an abstract noun in the nominative case. Should it be said that the doctor may have taken the sentence by itself, unconnected with the subject of Hamlet's soliloquy, we reply, that the supposition is impossible; for, independently of the circumstances with which they are connected, the words "*To be* or *not to be*" have no perfect meaning. Were it not for the subject of the soliloquy, from which every reader supplies what is wanting to complete the sense, it might be asked, "*To be* or *not to be*"—*what?* A coward, a murderer, a king, or a corpse? Questions all equally reasonable, and which in that case could not be answered.

With the same view, to prove that the infinitive is truly a *verb*, the doctor proceeds to remark upon the following phrases, *Dico, credo, puto, Titium existere, valere, jacere, cecidisse, procubuisse, projecisse Mævium, projectum fuisse a Mævio;* which, he says, have the very same meaning with *dico, quod Titius existat, quod jaceat, quod ceciderit*, &c. He adds, that "the infinitives, as thus used, acquire not any further meaning, in addition to the radical import of the verb with tense, like the proper moods; but the subjunctives after *quod* lose their peculiar meaning as moods, and signify no more than bare infinitives." In the sense in which this observation is made by the author, the very reverse of it seems to be the truth. The infinitives, as thus used, acquire, at least in the mind of the reader, something like the power of affirmation, which they certainly have not when standing by themselves; whereas the subjunctives neither lose nor acquire any meaning by being placed after *quod. Dico, credo, puto, Titium existere, valere, jacere*, &c. when translated literally, signify, *I say, believe, think, Titius to exist, to be well, to lie along;* a mode of speaking which, though now not elegant, was common with the best writers in the days of Shakspeare, and is frequently to be found in the writings of Warburton at a much later period. *Dico, credo, puto, quod Titius existat, quod jaceat*, &c. signifies literally, *I say, believe, think, that Titius may exist, may lie along*, &c. Remove the verbs in the indicative mode from the former set of phrases, and it will be found that the infinitives had acquired a meaning, when conjoined with them, which they have not when left by themselves; for *Titium existere, jacere*, "Titius to exist, to lie along," have no complete meaning, because they affirm nothing. On the other hand, when the indicative verbs are removed, together with the wonder-working *quod*, from the latter set of phrases, the meaning of the subjunctives remains in all respects as it was before the removal; for *Titius existat, jaceat*, &c. signify, *Titius may exist, may lie along*, as well when they stand by themselves as when they form the final clauses of a compound sentence. Every one knows that *quod*, though often called a conjunction, is always in fact the relative pronoun. *Dico, credo, puto, quod Titius existat*, must therefore be construed thus: *Titius existat (est id) quod dico, credo*, &c. "Titius may exist—is that thing, that proposition, which I say, believe, think." In the former set of phrases, the infinitives are used as abstract nouns in the accusative case, denoting, in conjunction with *Titium*, one complex conception, the *existence*, &c. *of Titius: Dico, credo, puto*, "I say, believe, think;" and the object of my speech, belief, thought, is *Titium existere*, "the existence of Titus."

In confirmation of the same idea, that the infinitive is truly a *verb*, Dr Gregory quotes from Horace a passage, which, had we thought quotations necessary, we should have urged in support of our own opinion:

Nec quicquam tibi prodest
Aërias *tentasse* domos, animoque rotundum
Percurrisse polum, morituro.

To our apprehension, nothing can be clearer than that *tentasse* and *percurrisse* are here used as nouns; for if they be not, where shall we find a nominative to the verb *prodest?* It was certainly what was signified by TENTASSE *aërias domos, animoque rotundum* PERCURRISSE *polum*, that is said to have been no advantage to Archytas at his death. This, indeed, if there could be any doubt about it, would be made evident by the two prose versions which the professor subjoins to these beautiful lines. The first of them is as follows: *Nec quicquam tibi prodest quod aërias domos* TENTAVERIS, *et animo* PERCURRERIS *polum;* which must be thus constructed: TENTAVERIS *aërias domos, et* PERCURRERIS *animo polum (est id) quod nec quicquam tibi prodest.* This version, however, is not perfectly accurate; for it contains two propositions, whereas Horace's lines contain but one. The second, which, though it may be a crabbed and inelegant sentence, expresses the poet's sense with more precision, is in these words: *Nec quicquam tibi prodest morituro tua* TENTATIO *domuum aëriarum, et* CURSUS *tuus circa polum.* Having observed, with truth, that this sentence has the very same meaning with the lines of Horace, Dr Gregory asks, "why are not *tentatio* and *cursus* reckoned verbs as well as *tentasse* and *percurrisse?*" Let those answer this question who believe that any of these words are truly verbs; for they are surely, as he adds, all very near akin; indeed so near, that the mind, when contemplating the import of each, cannot perceive the difference. Meanwhile, we beg leave in founding commands with the execution of commands. But the learned writer proceeds to inform us, that "it is from the connection of futurity with commands that the future of the indicative is sometimes used for the imperative mode." The connection of which he speaks appears to us entirely imaginary; for futurity has nothing to do with commands, though it may with the execution of them. The present time is the time of commanding, the future of obeying. But supposing the connection real, it would not account for the future tenses being used imperatively. For although it were true, as it is evidently false, that commands are future, it would not follow that the relation is convertible, or that employing the future should imply a command. The principle upon which such expressions as, *Thou shalt not kill*, come to have the force of a command, seems to be this: When a person, especially one possessed of authority, asserts that an action depending on the will of a free agent, and therefore in its own nature contingent, shall or shall not actually take place; what are we to conclude from such an assertion? Why, surely it is natural to conclude that it is his will, his command, that his assertion be verified. The English word *shall*, if we be well informed, denoted originally obligation; a sense in which its past tense *should* is still commonly employed. In English, therefore, the foregoing process of inferring a command from an assertion of futurity seems to have been reversed; and the word *shall*, from denoting a command or obligation, has come to denote futurity simply.

Having considered the verb in its essence, its tenses, and its modes, we might seem to have exhausted the subject; but there is still something more to be done. Grammarians have distinguished verbs into several species; and it remains with us to inquire upon what principle in nature this distinction is made, and how far it proceeds. Now it must be obvious, that if predication be the essence of verbs, all verbs as such must be of the same species; for predication is the same in every proposition, under every possible circumstance, and by whomsoever it is made. But the greater part of verbs contain the predicate as well as the predication of a proposition; or, to speak in common language, they denote an attribute as well as an affirmation. Thus, *lego* is "I am *reading*," *ambulo*, "I am *walking*," *sto*, "I am *standing*," *verbero*, "I am *striking*," *verberor*, "I am *stricken*." But the attributes expressed by these verbs are evidently of different kinds; some consisting in action, some in suffering, and some in a state of being which is neither active nor passive. Hence the distinction of verbs, according to the attributes which they denote, into *active*, *passive*, and *neuter*. *Lego*, which is an assertion that I am employed in the act of reading, is an active verb; *verberor*, which is an assertion that I am suffering under the rod, is a passive verb, because it denotes a passion; and *sto*, which is an assertion that I am standing still, is said to be a neuter verb, because it denotes neither action nor passion. But it is self-evident that there cannot be action without an agent, nor passion without a passive being; neither can we make a predication of any kind, though it denote neither action nor passion, without predicating of something. All verbs, therefore, whether active, passive, or neuter, have a necessary reference to some noun expressive of the substance of which the attribute denoted by the verb is predicated. This noun, which in all languages must be in the nominative case, is said to be the nominative of the verb; and in those languages in which the verb has person and number, it must in these respects agree with its nominative.

Of action, and consequently of verbs denoting action, there are obviously two kinds. There is an action which passes from the agent to some subject upon which he is employed, and there is an action which respects no object beyond the agent himself. Thus *lego* and *ambulo* are verbs which equally denote action; but the action of *lego* refers to some external object as well as to the agent; for when a man is reading, he must be reading something, a book, a newspaper, or a letter, whereas the action of *ambulo* is confined wholly to the agent; for when a man is walking he is employed upon nothing beyond himself, his action produces no effect upon any thing external. These two species of verbs have been denominated transitive and intransitive; a designation extremely proper, as the distinction which gave rise to it is philosophically just. Verbs of both species are active; but the action of those only which are called transitive respects an external object; and therefore in those languages of which the nouns have cases, it is only after verbs which are transitive as well as active, that the noun denoting the subject of the action is put in the accusative or objective case. Verbs which are intransitive, though they be really active, are in the structure of sentences considered as neuter, and govern no case.

So much, then, for that most important of all words, the verb. We proceed now to the consideration of participles, adjectives, and adverbs, which, as they have a near relation to one another, we shall treat of under one head or division.

V.—*Of Participles, Adjectives, and Adverbs.*

1. *Of Participles.*

The nature of verbs being understood, that of *participles* is not of difficult comprehension. Every verb, except that which is called the substantive verb, is expressive of an attribute, of time, and of an assertion. Now if we take away the assertion, and thus destroy the verb, there will remain the attribute and the time; and these combined make the essence of that species of words called *participles*. Thus, take away the assertion from the verb *γϱαφει*, *writeth*, and there remains the participle *γϱαφων*, *writing*, which, without the assertion, denotes the same attribute and the same time. In the same manner, by withdrawing the assertion, we discover *γϱαψας*, *written*, in *εγϱαψε*, *wrote*; *γϱαψων*, *about to write*, in *γϱαψει*, *shall be writing*. This is the doctrine of Mr Harris respecting participles; and, in our opinion, it is equally elegant, perspicuous, and just. But as it has been controverted by an author of some note in the republic of letters, we should perhaps be wanting in duty to our readers were we to pass his objections wholly unnoticed.

It is acknowledged by Dr Beattie, the writer to whom we allude, that the view which we have taken is the most convenient in which the participle can be considered in universal grammar; but he affirms that present participles do not always express present time, nor preterite participles past time; nay, that participles have often no connection with time at all. He thus exemplifies his assertion in Greek, in Latin, and in English:

"When Cebes says, *Ετυγχανομεν πεϱιπατουντες ἐν τῳ του Κϱονου ἱεϱῳ*, 'We *were walking* in the temple of Saturn,' the participle of the present *walking* is, by means of the verb

---

our turn to ask, Why are not *tentasse* and *percurrisse* reckoned abstract nouns as well as *tentatio* and *cursus*? To this question it is not easy to conceive what answer can be returned upon the doctor's principles. In his theory there is nothing satisfactory; and what has not been done by himself, we need scarcely expect from any of his followers. On the other hand, our principles furnish a very obvious reason for excluding *tentatio* and *cursus* from the class of verbs; it is, because these words express no predication. *Tentasse* and *percurrisse* indeed denote predication no more than *tentatio* and *cursus*; and therefore upon the same principle we exclude them likewise from a class to which, if words are to be arranged according to their import, they certainly do not belong.

were, applied to time past, and therefore of itself cannot be understood to signify any sort of time." Again, after observing, that in English we have but two simple participles, such as *writing* and *written*, of which the former is generally considered as the present and the latter as the past, the doctor adds, but "the participle *writing*, joined to a verb of different tenses, may denote either past or future action; for we may say not only, *I* AM *writing*, but also, *I* WAS *writing* yesterday, and *I* SHALL BE *writing* to-morrow;" and hence he infers that *no time whatever* is denoted by the present participle. But this is obviously a hasty inference, drawn from the doctrine of absolute time and a definite present, which we have already shown to be groundless and contradictory. When we speak simply of an action as present, we must mean that it is present with respect to something besides itself, or we speak a jargon which is unintelligible; but we do not ascertain the time of its presence. From the very nature of time, an action may be present now, it may have been present formerly, or it may be present at some future period; but the precise time of its presence cannot be ascertained even by the present of the indicative of the verb itself; yet who ever supposed that the present of the indicative denotes no time? The participle of the present represents the action of the verb as going on; but an action cannot be going on without being present in time with something. When, therefore, Cebes says, "We were walking in the temple of Saturn," he represents the action of the verb walking as present with something; but by using the verb expressive of his assertion in a past tense, he gives us to understand that the action was not present with any thing at the period of his speaking, but at some portion of time prior to that period; and what that portion of time was, must be collected from the subsequent parts of his discourse. The same thing may also be said of the phrases *I was writing yesterday*, and *I shall be writing to-morrow*. They indicate that the action of the verb *write* was present with me yesterday, and will again be present with me to-morrow. The action and the time of action are denoted by the participle; that action is affirmed to belong to me by means of the verb; and the time at which it belonged to me is pointed out by the tenses of that verb, *am*, *was*, and *shall be*. All this is so plain, that it could not have escaped Dr Beattie's penetration, if he had not hastily adopted the absurd and contradictory notion of a definite present.

Of the truth of his assertion respecting past participles he gives a Greek and a Latin example. The former is taken from St Mark, viz. *ὁ πιστευσας σωθησεται*; and the latter is that which is commonly called the perfect future of the passive verb *amor*, *amatus fuero*. In the first instance, he says that the participle, though belonging to the aorist of the past time, must be rendered either by the indefinite present, "he who *believeth*;" or by the *future*, "he who *will* believe;" and the reason which he gives for this rendering of the word is, that "the believing here spoken of is considered as posterior in time to the enunciation of the promise." This is indeed true, but it is not to the purpose; for with the enunciation of the promise the time of the participle has no manner of concern. The time of *πιστευσας* depends entirely upon the time of *σωθησεται*, with respect to which it must undeniably be past. Our Lord is not here asserting, that he who shall believe at the day of final retribution shall be saved, but that he who shall on that day be found to *have believed* in time past shall be saved; and if the participle had not been expressive of a finished action and a past time, the whole sentence would have conveyed a meaning not friendly to the interests of the gospel. In like manner, the time of *amatus* is referred, not to the time of speaking, but to the time of *fuero*, with respect to which, who sees not that it is past? The two words, taken together, contain a declaration, that he who utters them shall, at some time posterior to that of speaking, *have* BEEN *loved;* the expression *shall have been loved* denotes two times, both future with respect to the time of speaking; but when the time denoted by *shall have* comes to be present, that of the participle *loved* must be *past*, for it is declared that the action of it shall *then* be complete and finished.

We conclude, then, that it is essential to a participle to express both an attribute and time; and that such words as denote no time, though they may be in the *form* of participles, as *doctus*, "learned," *eloquens*, "eloquent," &c. belong to another part of speech, which we now proceed to consider.

2. *Of Adjectives.*

The nature of verbs and participles being understood, that of *adjectives* becomes easy. A verb implies, as we have said, an attribute, time, and an assertion; a participle implies only an attribute and time; and an *adjective* implies only an attribute as belonging to some substance. In other words, an *adjective* has no assertion, and it denotes only such an attribute as has not its essence either in motion or its privation. Thus, in general, the attributes of quantity, quality, and relation, such as *many*, *few*, *great*, *little*, *black*, *white*, *good*, *bad*, *double*, *treble*, and the like, are all denoted by *adjectives*.

To understand the import and the use of this species of words, it must be observed that every adjective is resolvable into a substantive and an expression of connection equivalent to *of*. Thus, a *good man* is a *man of goodness;* where we see the attribute denoted by the adjective fully expressed by an abstract noun. But it is evident that the noun *goodness* does not express the *whole meaning* of the adjective *good;* for every adjective expresses not only an attribute, but also the connection between the attribute and its substance; whereas in the abstract noun, the attribute is considered as a substance unconnected with any other substance.

In the next place, it is to be observed, that the connection expressed by adjectives, like that expressed by *of*, is of a nature so general and indefinite, that the particular kind of connection must, in some languages, be inferred from our previous knowledge of the objects between which it subsists, or it will for ever remain unknown. This might be proved by a variety of examples, but will perhaps be sufficiently evident from the following: *Color salubris* signifies colour that *indicates* health; *exercitatio salubris*, exercise that *preserves* health; *victus salubris*, food that *improves* health; *medicina salubris*, medicine that *restores* health. In all these examples the connection expressed by the adjective form of *salubris* is different; and though it may be known from previous experience, there is nothing in any of the expressions themselves by which it can be ascertained. Thus, adjectives are each significant of an attribute and connection; but the particular kind of connection is ascertained by experience. The usual effect of adjectives in language, is to modify or particularize a general term, by adding some quality or circumstance which may distinguish the object meant by that term, from the other objects of the same species. I have occasion, for example, to speak of a particular man, of whose name I am ignorant. The word *man* is too general for my purpose, it being applicable to every individual of the human species. In what way then do I proceed, in order to particularize it, so as to make it denote that very man whom I mean to specify? I annex or conjoin to it such words as are significant of objects and qualities with which he is connected, and which are not equally applicable to others from whom I mean to distinguish him. Thus I can say, *a man of prudence* or a *prudent man*, a *wise man*, a *good man*, a *brave man*, and so on. By means of these additions the general term *man* is limited or modified, and can be applied only to certain men to whom belong the attributes expressed by the adjectives *prudent*, *wise*, *good*, and *brave*. If it be still too general for my purpose, I can add to it other qualities and circumstances, till I make it so particular as to be applicable to but one individual man in the universe.

This is the way in which adjectives are commonly used, but this is not the only way. Instead of being employed to modify a substantive, they sometimes appear as the principal words in the sentence, when the sole use of the substantive seems to be to modify the abstract noun, contained under the adjective to which that substantive is joined. In order to understand this, it will be necessary to attend to the following observations.

It may be laid down as a general proposition, that when any term or any phrase is employed to denote a complex conception, the mind has a power of considering, in what order it pleases, the simple ideas of which the complex conception is composed. To illustrate this observation by an example: The word *eques* in Latin denotes a complex conception, of which the constituent simple ideas are those of a man and a horse; with this connection subsisting between them, that the man is conceived as on the back of the horse. In the use of this word, it is well known that the idea first in order, as being the principal subject of the proposition, is commonly the *man* on the back of the horse; but it is not always so, for the mind may consider the *horse* as the principal object. Thus, when Virgil says,

> Fræna Pelethronii Lapithæ gyrosque dedere,
> Impositi dorso; atque *equitem* docuere sub armis
> *Insultare solo*, et *gressus glomerare superbos*—

the energies attributed to the object signified by *equitem* make it evident that the horse, and not the man, is meant; for it is not the property of a man, *insultare solo, et gressus glomerare superbos.*

The same observation holds true where the *complex object* is denoted by two or more words; an adjective, for instance, and a substantive. Thus in the phrase *summus mons se inter nubila condit*, the words *summus mons* represent a complex conception, of which the constituent ideas are those of *height* and *mountain*, connected together by the adjective form of *summus*. Either of these ideas may be the subject of the proposition; and the expression will accordingly admit of two different significations. If *mons* be made the subject of the proposition, the meaning will be, "the highest mountain hides itself amongst the clouds." If the substantive included in the radical part of *summus* be made the subject of the proposition, the expression will signify, "the summit, or highest part, of the mountain, hides itself amongst the clouds." The latter is the true import of the sentence.

From these observations and examples, we shall be enabled to understand the two uses of the adjective. It is either employed, as has been already observed, to restrict or modify a general term; or the abstract substantive contained in the adjective is modified by the noun, with which, in the concrete or adjective form, that abstract substantive is joined. The first may be called the *direct*, the second the *inverse*, acceptation of adjectives.

The inverse acceptation of adjectives and participles, for both are used in the same manner, has scarcely been noticed by any grammarian excepting Dr Hunter of St Andrews; yet the principle is of great extent in language. In order to explain it, we shall produce a few examples, which on any other principle it is impossible to understand. Livy, speaking of the abolition of the regal authority at Rome, says, *Regnatum est Romæ ab* URBE CONDITA *ad* LIBERATAM *annos ducentos quadraginta quatuor*, "Monarchy subsisted at Rome (*not* from the *city built*, which would convey no meaning, but) from the *building of the city* to its *deliverance*." Both the participles *condita* and *liberatam* are here used inversely; that is, the abstract substantives contained in *condita* and *liberatam* are modified or restricted by the substantives *urbe* and *urbem*, with which they unite. Again, Ovid, speaking of the contest between Ajax and Ulysses for the arms of Achilles, has these lines:

> Qui, licet eloquio fidum quoque Nestora vincat,
> Haud tamen efficiet, *desertum* ut *Nestora crimen*
> Nullum esse rear.———

Here also the adjective or participle *desertum* is taken inversely, and the general notion of *desertion* contained in it is modified or rendered particular by being joined with the substantive *Nestora*. The meaning of the passage is, "I will never be induced to believe that the *desertion of Nestor* was not a crime." Were *desertum* to be taken directly as an adjective modifying its substantive, the sentence must be translated, "I cannot believe that *Nestor deserted* was not a crime." But it is evident that this is nonsense; as *Nestor*, whether deserted or not deserted, could not be a crime.

It were easy to produce many more examples of adjectives taken inversely; but these may suffice to illustrate the general principle, and to show, that without attending to it, it is impossible to understand the ancient authors. We shall produce one instance of it from Shakspeare, to evince that it is not confined to the ancient languages, though in these it is certainly more frequent than in the modern:

> Freeze, freeze, thou bitter sky,
> Thou canst not bite so nigh
> As *benefits forgot;*
> Though thou the waters warp,
> Thy sting is not so sharp
> As *friends remember'd not.*

Here it is evident that the adjective *forgot* is taken inversely; for it is not a benefit, but the *forgetting* of a benefit, which bites more than the bitter sky; and therefore, in this passage, the adjective serves not to modify the noun, but the noun *benefits* is employed to modify the abstract substantive contained in the adjective *forgot*, which is the subject of the proposition, and the principal word in the sentence.

Had Mr Harris attended to this principle, and reflected upon what he could not but know, that all adjectives denote substances; not indeed subsisting by themselves, as those expressed by nouns, but concretely, as the attributes of other substances; he would not have classed adjectives with verbs, or have passed so severe a censure upon the grammarians for classing them with nouns. It matters very little how adjectives are classed, provided their nature and effect be understood; but they have at least as good a title to be ranked with nouns as with verbs, and in our opinion a better. To adopt Mr Harris's language, they are homogeneous with respect to nouns, as both denote substances; they are heterogeneous with respect to verbs, as they never do denote assertion.

Besides original adjectives, there is another class, which is formed from substantives. Thus, when we say, *the party of Pompey, the style of Cicero, the philosophy of Socrates*; in these cases the *party*, the *style*, and the *philosophy* spoken of, receive a stamp and character from the persons whom they respect; and those persons, therefore, perform the part of attributes. Hence they actually pass into attributives, and assume as such the form of adjectives. It is thus we say, the *Pompeian party*, the *Ciceronian style*, and the *Socratic philosophy*. In like manner, for a trumpet *of brass*, we say a *brazen* trumpet, and for a crown *of gold*, a *golden* crown, &c. Even pronominal substantives admit a similar mutation. Thus, instead of saying the book *of me*, and *of thee*, we say *my* book, and *thy* book;

and instead of saying the country *of us* and *of you*, we say *our* country and *your* country. These words, *my, thy, our, your*, &c. have therefore been properly called pronominal adjectives.

It has been already observed, and must be obvious to all, that substances alone are susceptible of sex; and that therefore substantive nouns alone should have distinctions respecting gender. The same is true with respect to number and person. An *attribute* admits of no change in its nature, whether it belong to *you* or to *me*, to a *man* or a *woman*, to *one man* or to *many;* and therefore the words expressive of attributes ought on all occasions, and in every situation, to be fixed and invariable. For as the qualities *good* and *bad, black* and *white*, are the same, whether they be applied to a man or a woman, to many or to few; so the word which expresses any one of these attributes ought in strictness to admit of no alteration, with whatever substantive it may be joined. Such is the order of nature, and that order, on this as on other occasions, the English language most strictly observes; for we say equally, *a good man* or *a good woman; good men* or *good women; a good house* or *good houses.* In some languages, indeed, such as Greek and Latin, of which the nouns admit of cases, and the sentences of an inverted structure, it has been found necessary to endow adjectives with the threefold distinction of gender, number, and person; but as this is only an accidental variation, occasioned by particular circumstances, and not in the least essential to language, it belongs not to our subject, but to the particular grammars of these tongues.

There is, however, one variation of the adjective, which has place in all languages, is founded in the nature of things, and properly belongs to universal grammar. It is occasioned by comparing the attribute of one substance with a similar attribute of another, and falls naturally to be explained under the next section.

3. *Of Adverbs, and the Comparison of Adjectives.*

As adjectives denote the attributes of substances, so there is an inferior class of words which denote the modifications of these attributes. Thus, when we say, "Cicero and Pliny were both of them *eloquent;* Statius and Virgil both of them *wrote;*" the attributes expressed by the words *eloquent* and *wrote* are immediately referred to Cicero, Virgil, &c.; and as denoting the attributes of substances, these words, the one an adjective, and the other a verb, have been both called *attributives of the first order*. But when we say, "Pliny was *moderately* eloquent, but Cicero *exceedingly* eloquent; Statius wrote *indifferently*, but Virgil wrote *admirably;*" the words *moderately, exceedingly, indifferently*, and *admirably*, are not referrible to substantives, but to other attributes; that is, to the words *eloquent* and *wrote*, the signification of which they modify. Such words, therefore, having the same effect upon adjectives that adjectives have upon substantives, have been called *attributives of the second order.* By grammarians they have been called *adverbs;* and if we take the word *verb* in its most comprehensive signification,[1] as including not only verbs properly so called, but also every species of words which, whether essentially or accidentally, are significant of the attributes of substances, we shall find the name *adverb* to be a very just appellation, as denoting *a part of speech, the natural appendage of such verbs.* So great is this dependence in grammatical syntax, that an adverb can no more subsist without its verb, that is, without some word significant of an attribute, than a verb or adjective can subsist without its substantive. It is the same here as in certain natural subjects. Every colour, for its existence, as much requires a superficies, as the superficies for its existence requires a solid body.

Amongst the attributes of substance are reckoned quantity and quality; thus we say a *white garment*, a *high mountain*, and the like. Now some of these quantities and qualities are capable of intension or remission; or, in other words, one substance may have them in a greater or less degree than another. Thus we say, *a garment* EXCEEDINGLY *white, a mountain* TOLERABLY OF MODERATELY *high.* Hence, then, one copious source of secondary attributes or *adverbs* to denote these two, that is, intension and remission; such as *greatly, tolerably, vastly, extremely, indifferently.*

But where there are different intensions of the same attribute, they may be compared together. Thus, if the garment A be EXCEEDINGLY *white*, and the garment B be MODERATELY *white*, we may say, the garment A is MORE *white* than the garment B. This paper is *white*, and snow is *white;* but snow is MORE *white* than this paper. In these instances the adverb *more* not only denotes intension, but relative intension; nay, we stop not here, as we not only denote intension merely relative, but relative intension than which there is none greater. Thus we say, Sophocles was *wise*, Socrates was MORE *wise* than he, but *Solomon* was the MOST *wise* of men. Even verbs, properly so called, which denote an attribute as well as an assertion, must admit both of simple and of comparative intensions; but the simple verb *to be* admits of neither the one nor the other. Thus, in the following example, *Fame he* LOVETH MORE *than riches, but virtue of all things he* LOVETH MOST; the words *more* and *most* denote the different comparative intensions of the attribute included under the verb *loveth;* but the assertion itself, which is the essential part of the verb, admits neither of intension nor remission, and is the same in all possible propositions.

From this circumstance of quantities and qualities being capable of intension and remission, arise the *comparison* of adjectives, and its different *degrees*, which cannot well be more than the two species above mentioned; one to denote simple excess, and one to denote superlative. Were we indeed to introduce more degrees than these, we ought perhaps to introduce an infinite number, which is absurd. For why stop at a limited number, when in all subjects susceptible of intension, the intermediate excesses are in a manner infinite? Between the first simple *white* and the superlative *whitest* there are infinite degrees of *more white;* and the same may be said of *more* great, *more* strong, *more* minute, and so on. The doctrine of grammarians about *three* such degrees of comparison, which they call the *positive*, the *comparative*, and the *superlative*, must be absurd; both because in their positive there is no comparison at all, and because their superlative is a comparative as much as their comparative itself. Examples to evince this may be met with everywhere. *Socrates was the* MOST WISE *of all the Athenians; Homer was the* MOST SUBLIME *of all poets.* In this sentence Socrates is evidently compared with the Athenians, and Homer with all other poets. Again, if it be said that *Socrates was* MORE WISE *than any other Athenian, but that Solomon was the* MOST WISE *of men*, is not a comparison of Solomon with mankind in general, as plainly implied in the last clause of the sentence, as a comparison of Socrates with the other Athenians in the first?

---

[1] Aristotle and his followers called every word a verb which denotes the predicate of a proposition. This classification was certainly absurd; for it confounds not only adjectives and participles, but even substantives, with *verbs;* but the authority of Aristotle was great; and hence the name of adverb, though that word attaches itself only to an adjective or participle, or a verb significant of an attribute, and does not attach itself to the pure verb.

But if both imply comparison, it may be asked, in what consists the difference between the comparative and superlative? Does the superlative always express a greater excess than the comparative? It does not; for though Socrates was the *most* wise of the Athenians, yet is Solomon affirmed to have been *more* wise than he; so that here a higher superiority is denoted by the comparative *more* than by the superlative *most.* Is this then the difference between these two degrees, that the superlative implies a comparison of *one with many,* whilst the *comparative* implies only a comparison of *one with one?* No, this is not always the case neither. The Psalmist says, that "he is *wiser* (or *more wise*) than all his teachers;" where, though the comparative is used, there is a comparison of one with many.

The real difference between these two degrees of comparison may be explained thus:—When we use the superlative, it is in consequence of having compared individuals with the species to which they belong, or one or more species with the genus under which they are comprehended. Thus *Socrates was the* MOST WISE *of the Athenians, and the Athenians were the* MOST ENLIGHTENED *of ancient nations.* In the first clause of this sentence, Socrates, although compared with the Athenians, is at the same time considered as one of them; and in the last the Athenians, although compared with ancient nations, are yet considered as one of those nations. Hence it is that in English the superlative is followed by the preposition *of,* and in Greek and Latin by the genitive case of the plural number; to show that the object which has the pre-eminence is considered as belonging to that class of things with which it is compared. But when we use the comparative degree, the objects compared are set in direct opposition; and the one is considered not as a part of the other, or as comprehended under it, but as something altogether distinct and belonging to a different class. Thus, were any one to say, "Cicero was *more eloquent* than the Romans," he would speak absurdly; because every body knows, that of the class of men expressed by the word *Romans,* Cicero was one, and such a sentence would affirm that orator to have been more eloquent than himself. But when it is said that "Cicero was *more eloquent* than all the *other* Romans, or than *any other* Roman," the language is proper, and the affirmation true; for though the persons spoken of were all of the same class or city, yet Cicero is here set in contradistinction to the rest of his countrymen, and is not considered as one of the persons with whom he is compared. It is for this reason that in English the comparative degree is followed by a noun governed by the word of contradistinction *than,* and in Latin by a noun in the ablative case governed by the preposition *præ*[1] either expressed or understood. We have already observed, that the ablative case denotes concomitancy; and therefore when an adjective in the comparative degree is prefixed to a noun, that noun is put in the ablative case, to denote that two things are compared together in company; but by means of the preposition, expressed or understood, that which is denoted by the comparative adjective is seen to be preferred before that which is denoted by the noun.

We have hitherto considered the comparative as expressed by the words *more* and *most;* but the authors or improvers of language have contrived a method of retrenching the use of these adverbs, by expressing their force by an inflexion of the adjective. Thus, instead of *more fair,* they say *fairer;* instead of *most fair, fairest;* and the same method of comparison takes place both in the Greek and Latin languages; with this difference, however, between the genius of these languages and ours, that we are at liberty to form the comparison either in the one method or in the other; whereas in those languages the comparison is seldom or never formed by the assistance of the adverb, but always by the inflexion of the adjective. Hence this inflexion is by the Greek and Latin grammarians considered as a necessary accident of the adjective; but it has reached no further than to adjectives, and participles sharing the nature of adjectives. The attributes expressed by verbs are as susceptible of comparison as those expressed by adjectives; but they are always compared by means of adverbs, the verb being too much diversified already to admit of more variations without perplexity.

It must be confessed, that comparatives, as well the simple as the superlative, seem sometimes to part with their relative nature, and to retain only their intensive. Thus in the degree denoting simple excess,

> *Tristior,* et lacrymis oculos suffusa nitentes.—*Virg.*

Tristior means nothing more than that Venus was very sad. In the degree called the superlative this is more usual. Phrases extremely common are, *Vir doctissimus, vir fortissimus,* "a most learned man, a most brave man;" that is, not the bravest and most learned man that ever existed, but a man possessing those qualities in an eminent degree. In English, when we intimate that a certain quality is possessed in an eminent degree, without making any direct comparison between it and a similar quality, we do it by the intensive word *very,* more commonly than by *most;* as, Cicero was *very* eloquent, the mind of Johnson was *very* vigorous. This mode of expression has been called the superlative of eminence, to distinguish it from the other superlative, which is superlative upon comparison. Yet it may be said, that even in the superlative of eminence something of comparison must be remotely or indirectly intimated, as we cannot reasonably call a man *very* eloquent, without comparing his eloquence with the eloquence of other men. This is indeed true; but we cannot therefore affirm that comparison is more clearly intimated in this superlative than in the simple adjective *eloquent;* for when we say that a man is eloquent, we mark between his eloquence and that of other men a distinction of the same kind, though not in the same degree, as when we say that he is very eloquent.

In English we distinguish the two superlatives, by prefixing to the one the definite article *the,* to show that something is predicated of the object expressed by it, which cannot be predicated of any other object; and by subjoining the preposition *of,* to show that the objects with which it is compared are of the same class with itself; as, "Solomon was *the* wisest *of* men; Hector was *the* most valiant *of* the Trojans." To the other superlative[2] we only prefix the indefinite article *a;* as, "he was *a very* good man; he was *a most* valiant soldier."

---

[1] See Ruddiman, *Grammaticæ Institutiones,* pars secunda, lib. i. cap. 2. Although it is certainly true, that when we use the superlative, we ought in propriety to consider the things compared as of the same class; and when we use the comparative, as of different classes; yet this distinction is not always attended to by the best writers in any language. In Latin and Greek the comparative is sometimes used, where in English we should use the superlative; as *dextra est fortior manuum;* and in the Gospel it is said, that "a grain of mustard-seed is the *smaller* (μικροτερος) of all seeds, but when grown up it is the *greater* (μειζων) of herbs." Even in English, the custom of the language permits us not to say, "he is the *tallest* of the two," it must be the *taller* of the two; but we cannot say "he is the *taller* of the *three,*" it must be the *tallest.* For these and other deviations from the general rule no reason is to be found in the nature of things; they are errors made proper by use.

[2] In English, the termination *est* is peculiar to the superlative of comparison, to which the definite article is prefixed. Thus we may say, "Homer was the *sublimest* of poets;" but we cannot say, "Homer was a sublimest poet." Again, we may say, "Homer was *a very* sublime poet;" but not, "Homer was *the very* sublime poet."

As there are some qualities which admit of comparison, so there are others which admit of none; such, for example, are those which denote that quality of bodies arising from their figure, as when we say, a *circular* table, a *quadrangular* court, a *conical* piece of metal, and the like. The reason is, that a million of things participating the same figure, participate it equally, if they do it at all. To say, therefore, that whilst A and B are both quadrangular, A is *more* or *less* quadrangular than B, is absurd. The same holds true in all attributives denoting definite quantities of whatsoever nature; for as there can be no comparison without intension or remission, and as there can be no intension or remission in things always definite, therefore these attributives can admit of no comparison. By the same method of reasoning, we discover the cause why no substantive is susceptible of these degrees of comparison. A mountain cannot be said *more to be* or *to exist* than a mole-hill; but the *more* or *less* must be sought for in their quantities. In like manner, when we refer many individuals to one species, the lion A cannot be called *more* a lion than the lion B;[1] but if more any thing, he is *more* fierce, *more* swift, or exceeding in some such attribute. So, again, in referring many species to one genus, a crocodile is not *more* an animal than a lizard; nor a tiger more than a cat; but, if any thing, the crocodile and tiger are *more* bulky, *more* strong, &c. than the animals with which they are compared; the excess, as before, being derived from their attributes.

Of the adverbs or secondary attributives already mentioned, those denoting intension and remission may be called *adverbs of quantity continuous,* as *greatly, vastly, tolerably,* &c.; *once, twice, thrice,* &c.[2] are *adverbs of quantity discrete;* as *more* and *most, less* and *least,* to which may be added *equally, proportionally,* &c. are *adverbs of relation.* There are others of *quality;* as when we say, *honestly* industrious, *prudently* brave; they fought *bravely,* he painted *finely.*

And here it may be worth while to observe, how the same thing, participating the same essence, assumes different grammatical forms from its different relations. For example, suppose it should be asked, How differ *honest, honestly,* and *honesty?* The answer is, they are in essence the same; but they differ in as much as *honest* is the attributive of a noun; *honestly,* of a verb or adjective; and *honesty* being divested of these its attributive relations, assumes the power of a noun or substantive, so as to stand by itself.

The adverbs hitherto mentioned are common to verbs of every species; but there are some which are confined to verbs properly so called, that is, to such verbs as denote motions or energies with their privations. All motion and rest imply time and place as a kind of necessary coincidence. Hence, when we would express the place or time of either, we have recourse to adverbs formed for this purpose; of *place,* as when we say, he stood *there,* he went *hence,* he came *hither;* of time, as when we say, he stood *then,* he went *afterwards,* he travelled *formerly.* To these may be added the adverbs which denote the intensions and remissions peculiar to *motion,* such as *speedily, hastily, swiftly, slowly,* &c.; as also adverbs of place made out of prepositions, such as *upwards* and *downwards,* from *up* and *down.* It may, however, be doubted whether some of these words, as well as many others, which do not so properly modify attributes, as mark some remote circumstance attending an attribute or our way of conceiving it, are truly adverbs, though so called by the grammarians. The simple affirmative and negative *yes* and *no* are called adverbs, though they surely do not signify that which we hold to be the very essence of the adverb, a modification of attributes. "Is he learned? No." "Is he brave? Yes." Here the two adverbs, as they are called, signify not any modification of the attributes *brave* and *learned,* but a total negation of the attribute in the one case, and in the other a declaration that the attribute belongs to the person spoken of.

Adverbs are indeed applied to many purposes; and their general nature may be better understood by reading a list of them, and attending to their etymology, than by any general description or definition. Many of them seem to have been introduced into language in order to express by one word the meaning of two or three, and are mere abbreviations of nouns, verbs, and adjectives. Thus, the import of the phrase, *in what place,* is expressed by the single word *where;* to what place, by *whither;* from this place, by *hence;* in a direction ascending, by *upwards;* at the present time, by *now;* at what time, by *when;* at that time, by *then;* many times, by *often;* not many times, by *seldom;* and so of others.

Mr Horne Tooke has, with great industry and accuracy, traced many of the English adverbs from their origin in the ancient Saxon and other northern tongues, and shown them to be either corruptions of other words or abbreviations of phrases and sentences. He observes, "that all adverbs ending in *ly,* the most prolific branch of the family, are sufficiently understood; the termination being only the word *like* corrupted, and the corruption so much the more easily and certainly discovered, as the termination remains more pure and distinguishable in the other sister languages, in which it is written *lick, lyh, lig, ligen.*" He might have added, that in Scotland the word *like* is, at this day, frequently used instead of the English termination *ly;* as for a *goodly figure,* the common people say a *good-like* figure. Upon this principle the greater part of adverbs are resolved into those parts of speech which we have already considered, as *honestly* into *honest-like, vastly,* into *vast-like,* &c.; so that when we say of a man he is *honestly industrious,* we affirm that he is *honest-like industrious,* or that his industry has the appearance of being honest. Adverbs of a different termination the same acute writer resolves thus; *aghast* into the past participle *agazed;*

> The French exclaimed, the Devil was in arms.
> All the whole army stood *agazed* on him.—*Shaksp.*

Ago, into the past participle *agone* or *gone.* *Asunder* he derives from *asundered,* separated; the past participle of the Anglo-Saxon verb *asundrien,* a word which, in all its varieties, is to be found in all the northern tongues, and comes originally from *sond,* that is, sand. *To wit,* from *wittan,* to know; as *videlicet* and *scilicet,* in Latin, are abbreviations of *videre-licet* and *scire-licet.* *Needs,* he resolves into *need is,* used parenthetically; as, "I must *needs* do such a thing." "I must (need is) do such a thing;" that is, "I *must* do it, there *is need* of it." *Anon,* which our old authors use for *immediately, instantly,* means, he says, *in one,* that is, *in one instant, moment, minute.* As,

> And right *anon* withouten more abode.
> *Anon* in all the haste I can.

Alone and *only* are resolved into *all one,* and *one-like.* In the Dutch, *een* is one; and *all een* alone; and *all-een-like,* only, anciently *alonely.* *Alive* is on live, or in life. Thus, in Chaucer,

---

[1] When Pope says of a certain person, that he is "a tradesman, meek, and *much a liar,*" the last phrase is the same with *much given* to lying, the word *liar* having the effect of an attributive.

[2] These words were anciently written *one's, twie's, thrie's,* and are merely the genitives of *one, two, three,* the substantive *time* or *turn* being omitted. Thus, *How often did you write?* Answer, *Once,* that is, *one's time.* (See Horne Tooke's *Diversions of Purley*).

Christ eterne *on live.*

Aught or *ought; a whit* or *o whit; o* being formerly written for the article *a*, or for the numeral *one;* and *whit* or *hwit*, in Saxon, signifying a small thing, as a *point* or *jot*. *Awhile*, which is usually classed with adverbs, is evidently a noun with the indefinite article prefixed; *a while*, that is, *a time*. *Whilst*, anciently and more properly *whiles*, is plainly the Saxon *hwilees, time that*. *Aloft* was formerly written *on-loft*. As, in Chaucer,

> And ye, my mother, my sovereigne pleasance
> Over al thing, *out take* Christ *on lofte.*

Now, says Mr Horne Tooke, *lyft*, in the Anglo-Saxon, is the air or the clouds, as, *in lyfte cummende*, coming in the clouds (St Luke). In the Danish, *luft* is air; and "at spronge i *luften*," to blow up into the air, or *aloft*. So in the Dutch, *de loef hebben*, to sail before the wind; *loeven*, to ply to windward; *loef*, the weather gage, &c. From the same root are our other words, *Loft, lofty*, to *luff, lee, leeward, lift*, &c. It would be needless, as the ingenious author observes, to notice such adverbs as, *afoot, adays, ashore, astray, aslope, aright, abed, aback, abreast, afloat, aloud, aside, afield, aground, aland*, &c. These are at first view seen for what they are. Nor shall we follow him through the analysis which he has given of many other adverbs, of which the origin is not so obvious as of these. Of the truth of his principles we are satisfied; and have not a doubt, but that upon those principles a man conversant with our earliest writers, and thoroughly skilled in the present languages, may trace every English adverb[1] to its source, and show that it is no part of speech separate from those which we have already considered. The adverbs, however, of affirmation and negation, are of too much importance to be thus passed over; and as we have never seen an account of them at all satisfactory, except that which has been given by Mr Horne Tooke, we shall transcribe the substance of what he says concerning *aye, yea, yes*, and *no*. To us these words have always appeared improperly classed with adverbs, upon every definition which has been given of that part of speech. Accordingly, our author says, that *aye* or *yea* is the imperative of a verb of northern extraction; and means *have, possess, enjoy*. And *yes* is a contraction of *ay-es*, have, possess, enjoy, *that*. Thus, when it is asked whether a man be learned, if the answer be by the word *yes*, it is equivalent to *have that, enjoy that* belief or that proposition.

The northern verb of which *yea* is the imperative, is in Danish *ejer*, to possess, have, enjoy. *Eja*, aye or yea; *eje*, possession; *ejer*, possessor. In Swedish it is *ega*, to possess, of which the imperative is *ja*, aye, yea; *egare*, possessor. In German, *ja* signifies aye or yea; *eigener*, possessor, owner; *eigen*, own. In Dutch, *eigenen* is to possess; *ja*, yea. Greenwood derives *not* and its abbreviate *no* from the Latin; Minshow, from the Hebrew; and Junius, from the Greek. Our author very properly observes, that the inhabitants of the north could not wait for a word expressive of dissent till the establishment of those nations and languages; and adds, that we need not be inquisitive nor doubtful concerning the origin and signification of *not* and *no;* since we find that, in the Danish *nodig*, in the Swedish *nodig*, and in the Dutch, *noode, node*, and *no*, mean averse, unwilling. So that when it is asked whether a man be brave, if the answer be *no*, it is a declaration that he who makes it is averse from or unwilling to admit that proposition.

Most writers on grammar have mentioned a species of adverbs, which they call adverbs of interrogation, such as *where, whence, whither, how*, &c. But the truth is, that there is no part of speech which, of itself, denotes interrogation. A question is never asked otherwise than by abbreviation, by a single word, whether that word be a noun, a pronoun, a verb, or an adverb. The word *where* is equivalent to in what place; *whence*, to from what place; and *how*, to in what manner, &c. In these phrases, *in* what place, *from* what place, and *in* what manner, the only word that can be supposed to have the force of an interrogative, is *what*, which is resolvable into *that which*. But we have already explained, under the head of Pronouns, the principles upon which the relative is made to denote interrogation; and the same reasoning will account for the adverbs *where, whence, whither, how*, &c. being employed as interrogatives. When we say, "Where were you yesterday? whence have you come? whither are you going? how do you perform your journey?" we merely use so many abbreviations for the following sentences: "Tell us, or describe to us, *the place where* (or in which) you were yesterday; *the place whence* (or from which) you have come; *the place to which* you are going; *the manner in which* you perform your journey? And so much for adverbs. We now proceed to those parts of speech which are usually called prepositions and conjunctions, and of which the use is to connect the other words of a sentence, and to combine two or more simple sentences into one compound sentence.

VI.—*Of Prepositions, Conjunctions, and Interjections.*

It has been observed, that a man whilst awake is conscious of a continued train of perceptions and ideas passing in his mind, which depends little upon his own will; that he cannot to the train add a new idea; and that he can but very seldom break its connection. To the slightest reflection these truths must be apparent. Our first ideas are those which we derive from external objects making impressions on the senses; but all the external objects which fall under our observation are linked together in such a manner as indicates them to be parts of one great and regular system. When we take a view of the things by which we are surrounded, and which are the archetypes of our ideas, their inherent qualities are not more remarkable than the various relations by which they are connected. Cause and effect, contiguity in time or place, high and low, prior and posterior, resemblance and contrariety, with a thousand other relations, connect things together without end. There is not a single thing which appears solitary and altogether devoid of connection. The only difference is, that some are intimately and some slightly connected, some nearly and some at a distance. That the relations by which external objects are thus linked together must have great influence in directing the train of human thought, so that not one perception or idea can appear to the mind wholly unconnected with all other perceptions or ideas, will be admitted by every man who believes that his senses and intellect represent things as they are.

---

[1] The same resolution might probably be made of the Greek and Latin adverbs, were we as intimately acquainted with the sources of those tongues as Mr Horne Tooke is with the sources of the English language. "Many of the Latin adverbs," says Ruddiman, "are nothing else but adjective nouns or pronouns, having the preposition and substantive understood; as *quo, eo, eodem*, for *ad quæ, ea, eadem* (*loca*) or *cui, ei, eidem* (*loco*); for of old these datives ended in *o*. Thus, *qua, hac, illac*, &c. are plainly adjectives in the ablative singular feminine, the word *via*, "a way," and the preposition *in*, being understood. Many of them are compounds; as, *quomodo*, i. e. *quo modo; quemadmodum*, i. e. *ad quem modum; quamobrem*, i. e. *ob quam rem; quare*, i. e. (*pro*) *qua re; quorsum*, i. e. *versus quem* (*locum*); *scilicet*, i. e. *scire licet; videlicet*, i. e. *videre licet; ilicet*, i. e. *ire licet; illico*, i. e. *in loco; magnopere*, i. e. *magno opere; nimirum*, i. e. *ni* (*est*) *mirum; hodie*, i. e. *hoc die; postridie*, i. e. *postero die; pridie*, i. e. *præ die*. *Perfecto, certe, sane, male, bene, plane*, are obviously adjectives. *Forte* is the ablative of *fors;* and if we had leisure to pursue the subject, and were masters of all the languages from which the Latin is derived, we doubt not but we should be able to resolve every adverb into a substantive or adjective.

This being the case, it is necessary, if the purpose of language be to communicate thought, that the speaker be furnished with words, not only to express the ideas of substances and attributes which he may have in his mind, but also to indicate the order in which he views them, and to point out the various relations by which they are connected. In many instances all this may be done by the parts of speech which we have already considered. The closest connection which we can conceive, is that which subsists between a substance and its qualities; and in every language with which we are acquainted, that connection is indicated by the immediate coalescence of the adjective with the substantive; as we say, *a good man*, *a learned man; vir bonus, vir doctus.* Again, there is a connection equally intimate, though not so permanent, between an agent and his action; for the action is really an attribute of the agent; and therefore we say, the *boy reads*, the *man writes;* the noun coalescing with the verb so naturally, that no other word is requisite to unite them. Moreover, an action and that which is acted upon being contiguous in nature, and mutually affecting each other, the words which denote them should in language be mutually attractive, and capable of coalescing without external aid; as, he *reads a book*, he *builds a house*, he *breaks a stone.* Further, because an attribute and its modifications are inseparably united, an adjective or a verb is naturally connected with the adverb which illustrates or modifies its signification; and therefore, when we say, he *walks slowly*, he is *prudently brave*, it is plain that no other word is necessary to promote the coalescence of the attributes "walking" and "bravery" with their modifications of "slowness" and "prudence." The agreement between the terms of any proposition which constitutes truth is absolutely perfect; but as either of the terms may agree with many other things besides its correlate, some word is requisite in every proposition to connect the particular predicate with the particular subject; and that is the office of the simple verb *to be;* as, the three angles of every triangle *are* equal to two right angles.

Thus we see that many of the relations subsisting between our ideas may be clearly expressed by means of nouns, adjectives, verbs, and adverbs; and in those languages of which the nouns have cases, there is perhaps no relation of much importance which might not be thus pointed out, without being under the necessity of employing the aid of any additional part of speech. In English, however, the case is otherwise; for were we to say, "He rode Edinburgh, went the parliament-house, walked his counsel the court met," we should speak unintelligibly; as in these expressions there is either a total want of connection, or such a connection as produces falsehood and nonsense. In order to give meaning to the passage, the several gaps must be filled up by words significant of the various relations by which the different ideas are connected in the mind; as, "He rode *to* Edinburgh, went *to* the parliament-house, *and* walked *with* his counsel *till* the court met." Of these *connecting* words, *to* and *with* are called *prepositions, and* and *till* are usually called *conjunctions.* Although these prepositions and conjunctions are not so absolutely necessary in Greek and Latin as they are in English, yet as there is no language wholly without them, nor any language in which it is not of importance to understand their force, they well deserve a place in universal grammar.

The sole use of conjunctions and prepositions in language is to connect either sentences or other words; but the theory of these connectives themselves has certainly never been understood, unless Mr Horne Tooke has at last hit upon the truth. Mr Harris writes about them and about them, quoting passages from Greek and Latin authors, and produces at last no information. His definitions of both, as parts of speech void of signification, are highly absurd; and even the principal distinction which he makes between them seems not to be well founded. Prepositions and conjunctions denote the relations subsisting between the ideas expressed by those words or sentences which they serve to connect; and as relations are contemplated by the mind as well as positive ideas themselves, the words which denote these relations cannot be insignificant. The essential difference between the conjunction and preposition, according to the same author, consists in this, that the former connects sentences, and the latter words; but the fact is often otherwise. An obvious example occurs where the conjunction *and* connects not sentences but words. "A man of wisdom *and* virtue is a perfect character." Here it is not meant to be asserted, "that the man of *wisdom* is a perfect character, *and* that the man of *virtue* is a perfect character;" for both these assertions would be false. This sentence therefore (and many such will occur) is not resolvable into two; whence it follows, that the conjunction *and* does not always connect sentences; and the same is frequently the case with other conjunctions.

Mr Horne Tooke's idea of prepositions and conjunctions is, that they do not form distinct classes of words, but are merely abbreviations of nouns and verbs; and, with respect to the English language, he has been remarkably successful in proving his position. But though such be undeniably the case in English, it would be rash to conclude *a priori* that it is so in all other tongues. To establish this general conclusion would require a long and tedious deduction in each particular language; and how much language, leisure, industry, and acuteness, such an undertaking would require, even in one tongue, it is not easy to determine. In the languages with which we are best acquainted, many conjunctions, and most prepositions, have the appearance at least of original words; and though this most acute grammarian, from his knowledge of the northern tongues, has been able to trace the most important of those in English to very plausible sources, the same thing would be difficult in other languages of which the sources are obscure, and absolutely impossible in those of which they are wholly unknown. It is, however, a strong presumption in favour of his opinion, that grammarians have never been able to assign any general characteristic of those species of words, which, did they constitute distinct parts of speech, one would think could not have so long remained undiscovered. It is a further presumption in his favour, that many words in Greek and Latin, as well as in English, which have been called conjunctions, are obviously resolvable upon his principles, and indeed discover their meaning and origin upon mere inspection. We shall therefore content ourselves with retailing the common doctrine respecting these parts of speech so far as it is intelligible, subjoining at the bottom of the page the analysis given by Mr Horne Tooke, of the most important English conjunctions and prepositions; and requesting our readers, who would understand the subject, to attend more to the relations between their various ideas, than to the frivolous distinctions which, in compliance with custom, we are compelled to lay before them. We shall treat first of the *conjunction.*

1. *Of Conjunctions.*

A conjunction is a part of speech of which, as its name indicates, the use is to connect either two or more words in a sentence, or to make of two simple sentences one compound sentence. It is usually said that conjunctions never connect words, but sentences only, and that this is the circumstance which distinguishes them from *prepositions.* We have already given one example which proves this distinction to be ill founded; we shall now give from Mr Horne Tooke one or two more, which will place its absurdity in a still clearer light: Two *and* two are four; John *and* Jane are a handsome couple; AB *and* BC *and* CA form a triangle. Are *two four?* Is *John* a *couple* and *Jane* a *couple?* Does *one straight line* form a *triangle?* It appears indeed that *and* may connect any two things which can be connected, as it signifies addition.[1]

Conjunctions connecting sentences sometimes connect their meaning, and sometimes not. For example, let us take these two sentences, "Rome was enslaved, Cæsar was ambitious," and connect them together by the conjunction *because;* "Rome was enslaved *because* Cæsar was ambitious." Here the meanings, as well as the sentences, appear to be connected by that natural relation which subsists between an effect and its cause; for the enslaving of Rome was the effect of Cæsar's ambition. That particular relation therefore is that which is denoted by the conjunction *because*,[2] which would be improperly used to connect two sentences between which the relation of an effect to its cause exists not. But if it be said, "manners must be reformed, *or* liberty will be lost;" here the conjunction *or*, though it joins the sentences, yet as to their meaning is a perfect disjunctive. Between the reformation of manners and the loss of liberty there is certainly a natural relation; but it is not the relation of contiguity or similitude, or of cause and effect, but of contrariety. The relation of contrariety therefore is the signification of the word *or*.[3] And thus it appears, that though all conjunctions may combine sentences, yet, with respect to the sense, some are *conjunctive* and others *disjunctive.*

Those conjunctions which conjoin both sentences and their meanings are either *copulatives* or *continuatives.* The principal copulative in English is *and*, which we have already considered. The continuatives are much more numerous; *if, an, because, therefore, wherefore, hence,* &c. The difference between them is this: The copulative does no more than barely couple words or sentences, and is therefore applicable to all subjects of which the natures are not incompatible.[4] The relation which it denotes is that of juxtaposition, or of one thing added to another. Continuatives, on the contrary, by a more intimate connection, consolidate sentences into one continuous whole; and are therefore applicable only to subjects which have an essential relation to each other, such as that of an effect to its cause, or of a cause to its effect. For example, it is no way improper to say, "Lysippus was a statuary, *and* Priscian a grammarian; the sun shineth, *and* the sky is clear;" because these are things that can co-exist, and yet imply no absurdity. But it would be absurd to say, "Lysippus was a statuary *because* Priscian was a grammarian;" though not to say, "the sun shineth *because* the sky is clear." With respect to the first, the reason is, that the word *because* denotes the relation which an effect bears to its cause; but the skill of Priscian in grammar could not possibly be the cause of Lysippus's skill in statuary; the coincidence between the skill of the one and that of the other, in arts so very different, was merely accidental. With respect to the shining of the sun and the clearness of the sky, the case is widely different; for the clearness of the sky is the *cause* of the sun's shining, at least so as to be seen by us.

As to the continuatives, they are either *suppositive*, such as *if, an;* or *positive*, such as *because, therefore, as,* &c. Take examples of each: "You will live happily *if* you live honestly; you live happily *because* you live honestly; you live honestly, *therefore* you live happily." The difference between these continuatives is this: The suppositives denote connection, but do not assert actual existence; the positives imply both the one and the other.[5]

---

[1] *And* is a Saxon word, being, according to Mr Horne Tooke, an abbreviation of ANAD, the imperative of the verb ANANAD, *to add to* or *heap up.* So that when we say *two* AND *two are four*, we only declare that *two* ADDED TO *two are four.*

[2] *Because* is compounded of the Saxon BE, *by*, and *cause;* and by some of our most ancient authors it was written BY CAUSE. "*Rome was enslaved* BECAUSE *Cæsar was ambitious*," is therefore equivalent to, "*Rome was enslaved by the cause* CÆSAR WAS AMBITIOUS;" taking the phrase, "Cæsar was ambitious," as an abstract noun in concord with the other noun cause.

[3] *Or* seems to be a mere contraction of the Saxon ODER, which signifies *other*, that is, something different and often contrary. So that the conjunction *or* must always denote diversity, and very often contrariety.

[4] As *day* and *night*, *heat* and *cold;* for we cannot say of the same portion of time, *it is day* AND *it is night;* or of the same body, it is both *hot* AND *cold.*

[5] The reason of all this will be apparent from the analysis given by Mr Horne Tooke of those words which we have called suppositive conjunctions. *If* and *an* may be used mutually and indifferently to supply each other's place; for they are both verbs, and of the same import. *If* is merely the imperative of the Gothic and Anglo-Saxon verb GIFAN, *to give;* and in those languages, as well as in the English formerly, this supposed conjunction was pronounced and written as the common imperative GIF. Thus,

My largesse
Hath lotted her to be your brother's mistresse,
Gif shee can be reclaimed; *gif* not, his prey. *Sad Shepherd.*

Gawin Douglass almost always uses *gif* for *if*, as the common people in some counties of Scotland do even at this day; and it is obvious, that our *if* has always the signification of the English imperative *give*, and no other. So that the resolution of the construction in the sentence, "IF *you live honestly you will live happily*," is simply this, "GIVE *you live honestly* (taking *you live honestly* as an abstract noun) *you will live happily.*" Your living *happily* is declared to depend upon your living *honestly* as the *condition;* but *give that*, and your happiness is positively asserted. In like manner may such sentences be resolved as,

I wonder he can move! that he's not fixed!
IF THAT his feelings be the same with mine.

Thus, "His feelings be the same with mine, *give that*, I wonder he can move," &c. And here we cannot forbear giving our assent to the truth of Mr Horne Tooke's observation, that when the datum upon which any conclusion depends is a sentence, the article *that*, if not expressed, may always be inserted. We do not, however, think the insertion at all times absolutely necessary to complete the syntax; for active verbs govern whole sentences and clauses of sentences as well as substantive nouns. Instances of this occur so frequently in the Latin classics, that they can have escaped no man's notice who has ever read Horace or Virgil with attention. We agree likewise with this most ingenious author, that where the datum is not a sentence, but some noun governed by the verb *if* or *give*, the article *that* can never be inserted. For example, if we be asked how the weather will dispose of us to-morrow, we cannot say: "*If that* fair, it will send us abroad; *if that* foul, it will keep us at home;" but "*if* fair, it will send us abroad," &c. The reason is obvious. The verb in this case directly governs the noun; and the resolved construction is, "*give* fair weather, it will send us abroad; *give* foul weather, it will keep us at home."

An, the other suppositive conjunction mentioned, is nothing else than the imperative of the Anglo-Saxon verb ANAN, which likewise means *to give* or *to grant.* As, "*An* you had an eye behind you, you might see more detraction at your heels than fortune before you;" that is, "*Grant* you had an eye behind you, you might see," &c. This account of the two conditional conjunctions in English is so rational and satisfactory, that we are strongly inclined to believe that all those words which are so called, are in all languages to be accounted for in the same manner. Not indeed that they must all mean precisely *to give* or *grant*, but some word equivalent; such as, *be it, suppose, allow, permit;* which meaning is to be sought for in the particular etymology of each respective language.

The positives above mentioned are either *causal*, such as *because, since, as*, &c.;[1] or *collective*, such as *therefore, wherefore*, &c. The difference between them is this: The causals subjoin causes to effects; as, "the sun is in eclipse, *because* the moon intervenes:" the collectives subjoin effects to causes; as, "the moon intervenes, *therefore*[2] the sun is in eclipse." We therefore use causals in those instances where, the effect being conspicuous, we seek for its cause; and collectives, in demonstration and science, properly so called, where the cause being first known, by its help we discern effects.

As to causal conjunctions, we may further observe, that there is not one of the four species of causes which they are not capable of denoting. For example, the *material* cause; "The trumpet sounds *because* it is made of metal." The *formal;* "The trumpet sounds *because* it is long and hollow." The *efficient;* "The trumpet sounds *because* an artist blows it." The *final;* "The trumpet sounds *that* it may raise our courage." It is worth observing, that the first three causes are expressed by the strongest affirmation; because if the effect actually be, these must be also. But this is not the case with respect to the last, which is only affirmed as a thing that may happen. The reason is obvious; for whatever may be the end which set the artist first to work, that end it may still be beyond his power to obtain; as, like all other contingents, it may either happen or not. Hence also it is connected by a particular conjunction, *that*,[3] absolutely confined to this cause.

We come now to the *disjunctive conjunctions*, a species of words which bear this contradictory name, because whilst they *conjoin* the sentences, they *disjoin* the sense; or, to speak a language more intelligible, they denote relations of *diversity* or *opposition*.

That there should be such words, whether called conjunctions or not, is extremely natural. For as there is a principle of *union* diffused throughout all things, by which *this whole* is kept together and preserved from dissipation; so is there in like manner a principle of *diversity* diffused throughout all, the source of distinction, of number, and of order. Now it is to express in some degree the modifications of this diversity, that those words called *disjunctive conjunctions* are employed.

Of these disjunctives some are *simple* and some *adversative:* Simple, as when we say, "*either* it is day or it is night;" adversative, as when we say, "it is not day, *but* it is night." The difference between these is, that the simple express nothing more than a relation of *diversity;* the adversative express a relation not barely of diversity, but also of *opposition*. Add to this, that the adversatives are *definite*, the simple *indefinite*. Thus, when we say, "the number three is not an even number, *but*[4] an odd," we not only disjoin two opposite attributes, but we definitely af-

---

[1] Of the causal conjunctions mentioned in the text, *because* has been already considered; and some account must be given of the two words *since* and *as*. The former of these, according to Mr Horne Tooke, is a very corrupt abbreviation, confounding together different words and different combinations of words. To us it appears to be compounded of SEAND, *seeing*, and ES, *that* or *it;* or of SIN, *seen*, and ES. *Seand* and *sin* are the present and past participles of the Anglo-Saxon verb SEON, *to see.* In modern English *since* is used four ways; two as a preposition affecting words, and two as a conjunction affecting sentences. When used as a preposition, it has always the signification of the past participle SEEN joined to THENCE (that is, *seen and thenceforward*), or else the signification of the past participle *seen* only. When used as a conjunction, it has sometimes the signification of the present participle *seeing*, or *seeing that;* and sometimes the signification of the past participle *seen*, or *seen that*. We shall give examples of all these significations. 1*st*, As a preposition signifying SEEN *and thenceforward:* "A more amiable sovereign than George III. has not swayed the English sceptre SINCE *the conquest*." That is, "*The conquest seen* (or at the completion of the sight of the conquest), and thenceforward, a more amiable sovereign than George III. has not swayed the English sceptre." *Since*, taken in this sense, seems rather to be a corruption of *siththan* or *sithence*, than a compound of *seand* and *es*. 2*dly*, As a preposition signifying SEEN simply: "Did George III. reign *before* or SINCE that example?" 3*dly*, As a conjunction, *since* means *seeing that:* as, "If I should labour for any other satisfaction but that of my own mind, it would be an effect of frenzy in me, not of hope; SINCE (or *seeing that*) it is not truth, but opinion, that can travel through the world without a passport." 4*thly*, It means *seen that* or *that seen;* as, "*Since* death in the end takes from all whatsoever fortune or force takes from any one, it were a foolish madness in the shipwreck of worldly things, when all sinks but the sorrow, to save that;" that is, "Death in the end takes from all whatsoever fortune or force takes from any one; *that seen*, it were a foolish madness," &c.

As, the other *causal* conjunction mentioned in the text, is an article meaning always *it*, or *that*, or *which*. Take the following example:

She glides away under the foamy seas
As swift AS darts or feather'd arrows fly.

That is, "She glides away (with) *that* swiftness (with) *which* darts or feathered arrows fly." In German, where *as* still retains its original signification and use, it is written *es*. *So* is another conjunction of the same import with *as*, being evidently the Gothic article *sa* or *so*, which signifies *it* or *that*.

[2] As Mr Harris has called *therefore, wherefore*, &c. collective conjunctions, we have retained the denomination, though perhaps a more proper one might be found. It is indeed of little consequence what name any class of words be called, provided the import of the words themselves be understood. *Wherefore* and *therefore* evidently denote the relation of a cause to its effects. They are compounds of the Saxon words HWÆR and THÆR with FOR or VOOR; and signify *for which, for those*, or *for that*. It is worthy of remark, that in some parts of Scotland the common people even at this day use *this* for *these*.

[3] We have already considered the word *that*, and seen that it is never a conjunction, but uniformly a definite article. "The trumpet sounds (for) *that* it may raise our courage;" taking the clause "it may raise our courage" as an abstract noun in concord with *that* and governed by *for*. Or the sentence may be resolved thus: "The trumpet may raise our courage (for) that (purpose) it sounds."

[4] Mr Horne Tooke has favoured us with some ingenious remarks on the two different derivations of the word BUT, when used in the two acceptations which are usually annexed to it, viz. that which it bears in the beginning of a sentence, and that which it has in the middle. He has given it as his opinion, that this word, when employed in the former way, is corruptly put for BOT, the imperative of the Saxon verb BOTAN, *to boot, to superadd, to supply*, &c. and that when used in the latter it is a contraction of BE-UTAN, the imperative of BEON-UTAN, *to be out.* Our ancient writers made the proper distinction between the orthography of the one word and that of the other. Gawin Douglass, in particular, although he frequently confounds the two words, and uses them improperly, does yet abound with many instances of their proper use; and so contrasted, as to awaken, says our author, the most inattentive reader. Of the many examples quoted by him, we shall content ourselves with the two following:

BOT thy worke shall endure in laude and glorie,
BUT spot or fault condigne eterne memorie.

BOT gif the fates, BUT pleid,
At my pleasure sufferit me life to leid.

If this derivation of the word BUT from BOTAN, *to superadd*, be just, the sentence in the text, "the number three is not an even number, BUT an odd," will be equivalent to "the number three is not an even number, superadd (it is) an odd number;" and if so, the opposition is not marked (at least directly) by the word *but*, but by the adjectives *even* and *odd*, which denote attributes in their own nature opposite. It is only when BUT has this sense that it answers to *sed* in Latin, or to *mais* in French. In the second line of the quotation from Gawin Douglass's Preface the word BUT is evidently a contraction of BE-UTAN, and has a sense very different from firm the one to belong to the subject, and deny the other. But when we say, "the number of the stars is *either*[1] even *or* odd," though we assert one attribute to be, and the other not to be, yet the alternative is notwithstanding left indefinite.

As to adversative disjunctives, it has been already said, after Mr Harris, that they imply *opposition;* but the truth seems to be, that they only unite in the same sentence words or phrases of opposite meanings. Now it is obvious, that opposite attributes cannot belong to the same subject; as when we say, "Nereus was beautiful," we cannot *superadd* to this sentence that he was ugly; we cannot say, "he was beautiful *but* ugly." When there is opposition, it must be either of the same attribute in different subjects; as when we say, "Brutus was a patriot, *but* Cæsar was not;" or of different attributes in the same subject, as when we say, "Gorgias was a sophist, *but* not a philosopher;" or of different attributes in different subjects, as when we say, "Plato was a philosopher, *but* Hippias was a sophist." The conjunctions used for all these purposes have been called absolute adversatives, we think improperly, as the opposition is not marked by the conjunctions, but by the words or sentences which they serve to connect. Mr Locke, speaking of the word *but*, says, that "it sometimes intimates a stop of the mind, in the course it was going, before it came to the end of it;" to which Mr Horne Tooke replies with truth, that *but* itself is the farthest of any word in the language from intimating a stop. On the contrary, it always intimates something to follow; insomuch that when any man in discourse finishes his words with *but*, instead of supposing him to have stopped, we always ask, *but* what?

Besides the adversatives already mentioned, there are two other species, of which the most important are *unless* and *although*. For example, "Troy will be taken, *unless* the palladium be preserved; Troy will be taken, *although* Hector defend it." The nature of these adversatives may thus be explained. As every event is naturally allied to its cause, so by parity of reason it is opposed to its preventive; and as every cause is either adequate or inadequate (inadequate when it endeavours without being effectual), so in like manner is every preventive. Now adequate preventives are expressed by such adversatives as *unless:* "Troy will be taken, *unless* the palladium be preserved;" that is, this alone is sufficient to prevent it. The inadequate are expressed by such adversatives as *although:* "Troy will be taken, *although* Hector defend it;" that is, Hector's defence will prove ineffectual. These may be called adversatives *adequate* and *inadequate*.

Such is the doctrine of Mr Harris, which, although we can discover in it no determinate meaning, we have ventured with others to retail, from respect to our readers, who may be more perspicacious than ourselves. The author was a man of great learning, and the subject, as he has treated it, appears to be intricate. But whatever sense or nonsense there may be in what he says of causes and preventives, adequate and inadequate, we have no hesitation in affirming that he has totally mistaken the import of the words *unless* and *although*. From these being called both preventives, the one adequate and the other inadequate, an unwary reader might be led to infer that they denote the same idea or the same relation; and that the whole difference between them is, that the expression of the one is more forcible than that of the other. Nothing, however, can be further than this from the truth. The meaning of *unless* is directly opposite to that of *although*. *Unless*[2] and *though* are both verbs in the imperative mode; the former signifying *take away* or *dismiss*, the latter *allow*, *permit*, *grant*, *yield*, *assent*. This being the case, "Troy will be taken *unless* the palladium be preserved," is a sentence equivalent to "*Remove* the palladium be preserved (taking *the palladium be preserved* as an abstract noun, *the preservation of the palladium*) Troy will be taken." Again, "Troy will be taken, *although* Hector defend it," is the same as "Troy will be taken *allow* Hector (to) defend it." The idea, therefore, expressed by *unless* is that of the *removal* of one thing to make way for another; the idea expressed by *although*[3] is that of *allow-*

---

that of BOT in the preceding line. The meaning of the couplet is, "SUPERADD (to something said or supposed to be said before) thy worke shall endure in laude and glorie, BE OUT (id est, *without*) spot or fault." In the following passage from Donne, the word BUT, although written in the same manner, is used in both its meanings: "You must answer that she was brought very near the fire, and as good as thrown in; or else, that she was provoked to it by a divine inspiration. BUT that another divine inspiration moved the beholders to believe that she did therein a noble act, this act of her's might have been calumniated." That is, "You must answer that she was brought very near the fire," &c. "Superadd (to that answer) BE OUT (or *unless* or *without*, for, as will be seen by and by, all those words are of the same import) that another divine inspiration moved," &c. To these remarks and examples it may be worth while to add, that even now BUT is often used by the illiterate Scotch for WITHOUT; as nothing is more common than to hear a clown say, "He came from home *but* his breakfast."

Having mentioned *without* as a word of the same import with *but* when distinguished from *bot*, it may not be improper to consider that word here; for though in modern English it is entirely confined to the office of a preposition, it was formerly used indifferently either as a preposition or a conjunction. *Without*, then, is nothing but the imperative WYRTHAN-UTAN, from the Anglo-Saxon and Gothic verb WEORTHAN, WITHAN, which in the Anglo-Saxon language is incorporated with the verb BEON, *esse*. According to this derivation, which is Mr Horne Tooke's, the word *without*, whether called conjunction or preposition, is the same as *be out;* and such will be its import, should it after all be nothing more than a compound of *with*, which signifies to join, and sometimes to be, and *ute*, out.

[1] *Either* is nothing more than a distributive pronoun which every body understands, and *or* we have already explained.

[2] So low down as in the reign of Queen Elizabeth, says Mr Horne Tooke, this conjunction was sometimes written *oneles* or *onelesse;* but more anciently it was written *onles* and sometimes *onlesse*. Thus, in the trial of Sir John Oldcastle in 1413, "It was not impossible for them to make whole Christes cote without seme, *onlesse* certeyn great men were brought out of the way." So, in "The image of governance," by Sir T. Elliot, 1451, "Men do fere to approache unto their sovereigne Lord *oneles* they be called." So again, in "A necessary doctrine and erudition for any Christian man, set furthe by the king's majestie of England," 1543, "*Onles* ye believe, ye shall not understande." "No man shall be crowned, *onles* he lawfully fight." "The soul waxeth feeble, *onlesse* the same be cherished." "It cannot begynne, *onelesse* by the grace of God." Now ONLES is the imperative of the Anglo-Saxon verb ONLESAN, *to dismiss* or *remove*.

LES, the imperative of LESAN, which has the same meaning as ONLESAN, is likewise used sometimes by old writers instead of *unless*. Instances might be given in abundance from Gawin Douglass and Ben Jonson; but perhaps it may be of more importance to remark, that it is this same imperative LES which, placed at the end of nouns, and coalescing with them, has given to our language such adjectives as *hopeless*, *restless*, *deathless*, *motionless*, &c. that is, *dismiss* hope, rest, death, motion, &c.

Mr Horne Tooke observes, that all the languages which have a conjunction corresponding to *less* or *unless*, as well as the manner in which the place of these words is supplied in the languages which have not a conjunction correspondent to them, strongly justify his derivation which we have adopted. The Greek *ειμη*, the Latin *nisi*, the Italian *se non*, the Spanish *sino*, the French *si non*, all mean *be it not*. And in the same manner do we sometimes supply its place in English by *but*, *without*, *be it not*, *but if*, &c. It may be proper just to add, that, according to the same author, the conjunction *lest* is a contraction of *lesed*, the past participle of LESEN; and that *lest* with the article *that*, either expressed or understood, means no more than *hoc dimisso* or *quo dimisso*.

[3] *Although* is compounded of *al* or *all*, and *tho'*, *though*, *that*, or, as the vulgar more purely pronounce it, *thaf*, *thauf*, and *thof*. Now

Conjunctions.

ing one thing to *co-exist* with another, with which it is *apparently* incompatible.

Before we take leave of this subject, we might treat, as others have treated, of adverbial conjunctions, and conjunctions of various other denominations.[1] But of multiplying subdivisions there is no end; and systems in which they abound convey for the most part no information. The nature of conjunctions can be thoroughly understood only by tracing each to its original in some parent or cognate tongue; and when that shall be done in other languages with as much success as it has been done by Mr Horne Tooke in English, then, and not till then, may we hope to see a rational, comprehensive, and consistent theory of this part of speech. Then too shall we get rid of all that farrago of useless distinctions into conjunctive, adjunctive, disjunctive, subjunctive, copulative, continuative, subcontinuative, positive, suppositive, causal, collective, preventive, adequate and inadequate, adversative, conditional, illative, and the like, which explain nothing, and which serve only to veil ignorance and perplex sagacity.

That Mr Horne Tooke's principles will apply exactly to the conjunctions of every language both dead and living, is what our limited knowledge of these languages does not authorize us positively to affirm. It is, however, a strong presumption in favour of his opinion, that illiterate savages, the first cultivators of language, are little likely to have sent out their faculties in quest of words to denote the abstract relations subsisting among their ideas, when we have such evidence as his book affords, that the names of the most common substances and qualities could answer that and every other purpose, which in the ordinary intercourse of life can be answered by the faculty of speech. It is a further presumption in his favour, that in the rudest languages there are few if any conjunctions; and that even in others which are the most highly polished, such as Greek and Latin, as well as English, many of those words which have been called conjunctions are obviously resolvable into other parts of speech. Thus αλλα, translated *but*, is evidently the neuter gender of either the nominative or accusative plural of αλλος, *another;* and when used as a conjunction, it intimates that you are going to add something to what you have already said. *Cæterum* has the same meaning, and is nothing but και ἑτερον. Mais, *but*, in French, is the Latin *majus*; *ut*, *uti*, ὁτι, *quod*, is the relative pronoun. Of *quocirca*, *quia*, *præterea*, *antequam*, *quenquam*, *quemvis*, *quantumvis*, *quamlibet*, &c. the resolution is too obvious to require being mentioned. Where such resolutions as these can be made, or when the conjunctions of any particular tongue can be traced to their origin in any other, there needs be no dispute about their true import; but when the case is otherwise, and the conjunction either appears to be an original word, or is derived from a source to which it cannot be traced, we would advise such of our readers as wish to speak or write correctly, to dismiss from their minds all consideration of copulatives, continuatives, causals, and disjunctives, with the rest of that jargon which we have already mentioned; and to inquire diligently in what manner and for what purpose the conjunction in question is used by the best writers, both ancient and modern, of the particular language which they are studying. This will indeed be found a work of labour; but it appears to us to be the only means left of discovering the precise relations which such conjunctions were intended to express; and, by consequence, of knowing what words or sentences they are fitted to connect, so as to produce a style at once accurate and perspicuous.

Prepositions.

2. *Of Prepositions.*

By Mr Harris and his followers, a *preposition* is defined to be a part of speech devoid itself of signification, but so formed as to unite two words that are significant, and that refuse to coalesce or unite of themselves. We have already expressed our opinion of that theory which holds certain words to be devoid of signification; but its absurdity, in the present instance, is more than ever glaring. Concerning the number of *prepositions*, it is well known that hitherto authors have never been agreed. The ancient Greek grammarians admitted only eighteen, the ancient Latin grammarians above fifty; though the moderns, Sanctius, Scioppius, Perizonius, Vossius, and Ruddiman, have endeavoured to lessen the number without fixing it. Bishop

---

thaf or *thauf* is evidently the imperative THAF or THAFIG of the verb THAFIAN or THAFIGAN, *to allow*, *permit*, *grant*, *yield*, *assent*; and THAFIG becomes *thah*, *though*, *thoug*, and *thoch*, as Gawin Douglass and other Scottish authors write it, by a transition of the same sort, and at least as easy as that by which HAFUC becomes *hawk*. It is no small confirmation of this etymology, that anciently they often used *all be*, *albeit*, *all had*, *all were*, *all give*, instead of ALTHOUGH; and that as the Latin SI (*if*) means *be it*, and NISI and SINE, *unless* and *without*, mean *be not*, so ETSI, *although*, means *and be it*.

[1] In a work of this kind, which professes to treat of universal grammar, it would be impertinent to waste our own and our reader's time on a minute analysis of each conjunction which may occur in any one particular language. We shall therefore pursue the subject no further; but shall subjoin Mr Horne Tooke's table of the English conjunctions, referring those who are desirous of fuller satisfaction to his ingenious work entitled *The Diversions of Purley.*

If	Are the Imperatives	Gif	Of their respective verbs	Gif	To give.
An		An		Anan	To grant.
Unless		Onles		Onlesan	To dismiss.
Eke		Eac		Eakan	To add.
Yet		Get		Getan	To get.
Still		Stell		Stellan	To put.
Else		Ales		Alesan	To diminish.
Though or Tho'		Thafig or Thaf		Thafigan or Thafian	To allow.
But		Bot		Botan	To boot, or superadd.
But		Be-utan		Beon-utan	To be out.
Without		Wyrth-utan		Wyrthan-utan	To be out.
And		An ad		Anan ad	Dare congeriem.

Lest is the participle LESED, of LESAN, to dismiss.

Since	Siththan Syne Seand-es Siththe or Sin-es	is the participle of Seon, to see.

That is the article or pronoun THAT.

As is ES, a German article, meaning *it*, *that*, or *which*. And

So is SA or SO, a Gothic article of the same import with AS.

Wilkins thinks that thirty-six are sufficient; and Girard says that the French language has done the business effectually with thirty-two. But if prepositions be words devoid of signification, why should there be disputes respecting their numbers? or why in any language should there be more than *one* preposition, since a single unmeaning mark of connection would certainly answer the purpose as well as a thousand? The cipher, which has no value of itself, and only serves, if we may use the language of grammarians, to connote and consignify, and to change the value of figures, is not several and various, but uniformly one and the same. That "the preposition is so formed as to unite two words which refuse to coalesce or unite of themselves," is indeed true; and this union it effects, not by having no signification of its own, but by signifying the relation by which the things expressed by the *united* words are connected in nature. Prepositions are to be accounted for in much the same manner as the cases of nouns. The necessity of this species of words, or of some equivalent invention, follows from the impossibility of having in language a distinct complex term for each distinct collection of ideas which we may have occasion to put together in discourse. The addition or subtraction of any one idea to or from a collection of ideas, makes it a different collection; and if, after either of these operations, it were to be expressed by the same word as before, nothing could ensue but misrepresentation and falsehood. Now, to use in language a different and distinct complex term for each different and distinct collection of ideas, is equally impossible as to use a distinct particular term for each particular and individual idea. To supply, therefore, the place of the complex terms which are wanting in a language, are the cases of nouns and prepositions employed; by the aid of which, complex and general terms are prevented from being infinite or too numerous, and are used only for those collections of ideas which we have most frequent occasion to mention in discourse. By means of prepositions this end is obtained in the most simple manner. For, having occasion to mention a collection of ideas, for which there is no single complex term in the language, we either take that complex term which includes the greatest number, though not all, of the ideas we would communicate; or else we take that complex term which includes all and the fewest ideas more than those we would communicate; and then, by the help of the preposition, we either make up the deficiency in the one case, or retrench the superfluity in the other. For instance, having occasion to mention a house of a particular description, and knowing that the term *house* is too general for our purpose, and that the building we have in view has no appropriate name, we say, perhaps, "a house *with* a party-wall," or a "house *without* a roof." In the first instance, the complex term *house* is deficient, and the preposition directs to add what is wanting; in the second instance, the complex term is redundant, as it denotes a complete house. The preposition, therefore, directs to take away what is superfluous.

Now, considering prepositions in this the most simple light, as serving only to limit or modify general terms, it is absolutely necessary that they should have meanings of their own; for otherwise, how could we, in the instance before us, make known by them our intention, whether of adding to, or retrenching from, the same general term *house*. If, to a disciple of Mr Harris, we should say, *a house* JOIN; he would reply *join what?* But he would not contend that *join* is an indeclinable word which has no meaning of its own, because he knows that it is the imperative of a verb, of which the other parts are still in use; and its own meaning is clear, though the sentence is not completed. If, instead of *join*, we should say to him, *a house* WITH, he would still ask the same question, *with what?* But if we were to discourse with him concerning the word *with*, he would probably tell us that *with* is a preposition, an indeclinable word, which is itself devoid of signification, but so formed as to unite two words that are significant. And yet it would be evident by his question, that he felt it had a meaning of its own; which is in reality the same as *join*.[1] Indeed, so far has always been plainly perceived, that *with* and *without* are directly opposite and contradictory; and it would puzzle the most acute philosopher to discover opposition and contradiction in two words where neither of them had any signification. Wilkins, therefore, has well expressed their meaning, where he says, that *with* is a preposition "relating to the notion of social, or circumstance of society *affirmed;* and that *without* is a preposition relating to the same notion of social, or circumstance of society *denied*."

But to denote the relations of adding and taking away, is not the only purpose for which prepositions are employed. They all indeed serve to modify some general term or general affirmation, but not precisely in the same way as *with* and *without*. It has already been observed, that words significant of those things which coincide in nature, coalesce with one another in syntax, without being beholden to any auxiliary tie. For instance, an adjective coalesces with its substantive, a verb with its nominative; a noun expressing an object acted upon, with a verb denoting action; and an adverb with its verb. Take the following example: "*The splendid sun genially warmeth the fertile earth.*" But suppose we were desirous to modify this affirmation by the addition of other substantives, *air*, for instance, and *beams;* how would these coincide with the other words of the sentence, or under what character could they be introduced? Not as nominatives or accusatives to the verb, for both these places are already filled; the nominative by the substance *sun*, which is certainly the agent in this operation; the accusative by the substance *earth*, which is as certainly the object acted upon. Not as qualities of the *sun* and *earth;* for qualities inhering in their substances can only be expressed by adjectives, and the words air and beams are both substantives. Here then we must have recourse to prepositions; but we can employ only such prepositions as point out the relations which the *air* and the *beams* have to the sun warming the earth. In English we should say, "the splendid sun *with* his beams genially warmeth *through* the air the fertile earth." The sentence, as before, remains entire and one; the substantives required are both introduced; and not a word which was there before is detruded from its proper place. The import of *with* we have already discovered; it directs to *unite* the beams to the sun, as *jointly* with him performing the operation. But the *air* has no other connection with this operation, than as the *medium* or *passage* between the *sun* and the *earth;* and therefore the preposition *through*[1] must denote that relation which subsists between an object in motion and the medium in which it moves; nor could a preposition of a different import have been employed, without altering the meaning of the whole sentence.[2]

---

[1] This account of prepositions is taken from Mr Horne Tooke, who adds, that the only difference between the two words *with* and *join*, is, that the other parts of the Gothic and Anglo-Saxon verb WITHAN, *to join* (of which *with* is the imperative), have ceased to be employed in the language. As WITH means *join*, so the corresponding French preposition *avec* means, *and have that*, or *have that also.* But though *with*, as the imperative of WITHAN, means *join*, it has sometimes a very different signification. Mr Tyrwhit in his Glossary has truly observed, that *with* and *by* are often synonymous. They certainly are so; but then *with* seems to be an abbreviation of the imperative of WYRTHAN, *to be;* as *without* is of WYRTHAN-UTAN, *to be out.* This being the case, our two instances in the text will stand thus: *a house* JOIN *a party-wall; a house* BE-OUT *a roof.* Nor let any one be surprised that we make no difference between the conjunction *without* and the preposition *without.* The word is the same, whether it be employed to unite words or sentences. Prepositions were originally, and for a long time, classed with conjunctions; and when first separated from them, they were only distinguished by the name of prepositive conjunctions. They are generally used to unite words, but not always; for we may say indifferently, "I came after *his departure*," or "I came after *he departed*." By the greater part of grammarians indeed, *after*, when employed as in the first sentence, is classed with the prepositions; when employed as in the second, it is classed with the conjunctions. The word, however, is the same in both sentences; its meaning is the same, and its effect precisely the same. The only circumstance of discrimination is, that in the first example it is prefixed to a noun, "his departure;" in the second, it is prefixed to a nominative and a verb, "he departed." But even the nominative and the verb, thus applied, express no more than a specifying circumstance annexed to the other proposition, "I came;" and whenever they are rightly apprehended by the mind, they are stripped of their prepositionary form, and considered abstractedly under a new phasis, "his departure." Thus then the two sentences are synonymous in every respect, excepting the apparent grammatical nature of the words "his departure," and "he departed;" and even these are reduced to one grammatical form in the mind, whenever the import of the propositions is rightly apprehended. *Without*, and many other prepositions, especially in the learned languages, are used exactly as *after* is used in the two instances which we have given. Mr Horne Tooke quotes Lord Mansfield for saying, "It cannot be read *without* the attorney-general consents to it." This, in modern English, is not the common phraseology; but it offends not against any principle of grammar. The nominative and the verb are here, as in the former instance, considered as an abstract noun. "It cannot be read WITHOUT the consent of the attorney-general."

Mr Harris is of opinion that most, if not all, prepositions were originally formed to denote the relations of *place*. For this opinion we see not sufficient evidence. If indeed we could suppose the inventors or earliest improvers of language to have at all concerned themselves with relations as abstracted from the objects related, we must believe that those which first attracted their attention were the relations subsisting among themselves, and the various bodies with which they were surrounded. We must likewise agree with our author, that place is the grand relation which bodies or natural substances maintain at all times to one another; but we do not therefore think that it would attract the earliest notice of untaught barbarians. On the contrary, we are of opinion that mankind must have made very considerable progress in science before they attempted to abstract place from body; an attempt which, according to some of the most profound philosophers,[3] is not only difficult, but absolutely impracticable. But whatever be in this, the relations of cause and effect, of duration and motion, are in themselves as obvious, and as likely to arrest the attention and obtain names, as those of place. Amongst men totally illiterate they are evidently more so; for pain and pleasure would suggest some idea of cause and effect as matters of importance. There is, however, no probability that the inventors of any language had the least idea of abstract relations. They doubtless expressed complex conceptions by nouns and verbs, significant at once of the particular ideas and of the various relations by which they viewed those ideas as combined together in a complex conception. Afterwards, when men's minds became enlarged, and when, from the fluctuation inseparable from a living language, objects or ideas received new names, the old words, whether nouns or verbs, which were originally employed to express a particular complex conception, of which certain particular *relations* made a part, might be retained for the purpose of denoting those and all similar *relations;* and thus verbs and nouns would degenerate into particles bearing the names of prepositions and conjunctions. For instance, one Anglo-Saxon being desirous to communicate to another his own conception of a house with a party-wall, and having, we shall suppose, no such word in his tongue as a preposition, would naturally utter the word *house*, desiring his friend, at the same time, to add to that well-known sound another sound (uttering it) significant of the particular circumstance wanting to complete his complex conception, viz. a house *with* (that is *join*) a party-wall. The word *with*, as the imperative of a verb, denotes of course three ideas combined together, namely, a command or wish, an affirmation, and the idea of junction. But when the verb *withan* was dismissed from the English language, the imperative *with* was still retained; but losing its verbal and modal nature, it was thenceforth employed to denote only one of the three ideas for which it originally stood, viz. the idea of junction. And thus it is that verbs, and also nouns and adjectives, in passing from one language to another, may become prepositions[4] and conjunctions. Thus too it is that some of those prepositions come to denote the contiguous, and some the detached, relation of body. The contiguous, as when we say, "Caius walked *with* a staff;" that is, "Caius *join* a staff, walked;" "the statue stood *upon*[5] a pedestal;" that is, "the statue stood (the place of its standing) the *higher part* of a pedestal;" "the river ran

---

[1] *Thorough*, *thourough*, *thorow*, *through*, or *thro'*, is no other, says Mr Horne Tooke, than the Gothic substantive DAURO, or the Teutonic substantive THURUH, and, like them, means *door*, *gate*, *passage*. So that the sentence in the text, resolved upon his principles, stands thus: "The splendid sun—*join* his beams—genially warmeth—PASSAGE *the air* (or, the air being the *passage* or *medium*)—the fertile earth." And in the same manner may we translate the preposition *through* in every instance where *through* is used in English, or its equivalent preposition in any language; as from the Latin and Italian word *porta*, in Spanish *puerta*, and in French *porte*, have come the Latin and Italian preposition *per*, the French *par*, and the Spanish *por*.

[2] If, for instance, we were to substitute *with* or *of* instead of *through*, we should in the one case alter the meaning, and in the other speak nonsense. "The sun warmeth *with* the air the fertile earth," is an affirmation that "the sun warmeth *both the air and the earth;*" whereas the original sentence affirmed nothing more than that "he warmeth the *earth*." "The sun warmeth *of* the air the fertile earth," is nonsense, as it makes the earth a *part*, or a *consequence*, of the air. So necessary is it that prepositions have a meaning, and that the meaning of each be attended to.

[3] Bishops Berkeley and Law, with Principal Campbell of Aberdeen. See *The Principles of Human Knowledge*, Law's *Notes* on King's *Origin of Evil*, and *The Philosophy of Rhetoric*.

[4] As the Italian substantive *casa*, a house, race, family, nation, &c. in passing to the French, becomes the preposition *chez*, to which there is not, so far as we know, a preposition of precisely the same import in any language. *Senza* or *senze*, in Italian, becomes *sans* in French, and means *absence*. Nor is it necessary that verbs and nouns should always pass from one language to another, in order to be converted into prepositions. The Greek preposition *χωρις* is evidently the corrupted imperative of *χωριζειν*, *to sever*, *to disjoin*, *to separate*. The Latin *sine* is *sit ne*, *be not*. The German *sonder* is the imperative of *sondern*, which has the same meaning as *χωριζειν*.

[5] *Up*, *upon*, *over*, *'bove*, *above*, have all, says Mr Horne Tooke, one common origin and signification. In the Anglo-Saxon, UFA, UFERA, UFEMÆST, are the adjectives *altus*, *altior*, *altissimus*. UFA or UFAN, *up;* comparative UFERA, OFERE, or OFER, *over* or *upper;* superlative UFEMÆST, *utmost* or *uppermost*. BEUFAN, BUFAN, ON BUFAN, *'bove*, *above*. If this be a just account of the origin of these words, the sentences in the text, where *upon*, *over*, and *above*, occur, will run thus: "The statue stood *on high* a pedestal;" "the river ran *higher* a sand;" "the sun is risen *on high* the hills." And here we may observe, that the mere relation between standing, running, &c. and place, is rather inferred from the verb itself, than expressed by a separate word. The reason is obvious. For if a statue stand, every one knows that it must stand on some thing as well as at some time. There is therefore no necessity, whatever elegance there may be in it, for employing any word to denote that relation, which is commonly believed to be signified by *on;* but it is

over a sand," that is, "the river ran (the place of its running) the *higher part* of a sand." The detached relation, as when we say, "He is going *to*[1] Italy," that is, "He is going, *the end* (of his journey) Italy;" "the sun is risen *above* the hills," that is, "the sun is risen (the place) *the top* of the hills;" "these figs came *from* Turkey," that is "these figs came *beginning* (their journey at) Turkey."

Besides the detached relation of body, Mr Harris is of opinion that the preposition *from* denotes two other relations not less different than those of motion and rest. Thus, if we say, "That lamp hangs *from* the ceiling," the preposition *from* assumes a character of quiescence. But if we say, "That lamp is falling *from* the ceiling," the preposition in such case assumes a character of motion. But this is evidently a mistake. The detached relation in the former instance of the *figs*, as well as the motion and rest in the present instances, are expressed not by the preposition, but by the verbs, *came*, *falls*, *hangs*. The word *from* has as clear, as precise, and at all times as uniform and unequivocal a meaning, as any word in the language. *From* means merely *beginning*, and nothing else. It is simply the Anglo-Saxon and Gothic noun FRUM, *beginning*, *origin*, *source*, *fountain*, *author*.[2] Now if this meaning be applied to Mr Harris's instances, *from* will speak clearly for itself, without the assistance of the interpreting verbs, which are supposed by him to *vary its character*.

---

necessary to insert, between the verb and pedestal, a word significant of place, that pedestal may not be mistaken, by an ignorant person, for a portion of time, or any thing else connected with the standing of the statue.

[1] That *to* is significant of detached relation, is the language of Mr Harris, which, though it may be allowed in a loose and vulgar sense, is certainly not philosophically just. The preposition *to*, in Dutch written *toe* and *tot*, is the Gothic substantive TAUI or TAUHTS, signifying *act*, *effect*, *result*, or *consummation;* which Gothic substantive is itself no other than the past participle TAUID or TAUIDS of the verb TAUJAN, *agere*. And it is obvious that what is done is terminated, ended, finished. In the Teutonic this verb is written TUAN or TUON; whence the modern German THUN, and its preposition *tu*. In the Anglo-Saxon, the verb is TEOGAN, and the preposition *to*. *Do*, the auxiliary verb, as it has been called, is derived from the same root, and is indeed the same word as *to*. The difference between a T and a D is so very small, that an etymologist knows by the practice of languages, and an anatomist by the reason of that practice, that in the derivation of words it is scarcely worth regarding. To support this etymon of *to*, Mr Horne Tooke gives a similar instance in the Latin tongue. The preposition *ad*, he says, is merely the past participle of *agere*, which past participle is likewise employed as a Latin substantive. He exhibits the derivation of *ad* thus:

$$\textit{Agitum—agtum}\begin{cases}\text{AGDUM——AGD——AD}\\ \text{or} \qquad\quad \text{or} \qquad\quad \text{or}\\ \text{ACTUM——ACT——AT.}\end{cases}$$

The most superficial reader of Latin verse, he observes, knows how readily the Romans dropped their final *um*. And a little consideration of the organs and practice of speech will convince him how easily *agd* or *act* would become *ad* or *at;* as indeed this preposition was indifferently written either way by the ancients. By the later writers of Rome, the preposition was written *ad* with *d* only, in order to distinguish it from the other corrupt word called the conjunction *at;* which for the same reason was written with the *t* only, though that likewise had anciently been written, as the preposition, either *ad* or *at*. The preposition *to* and the conjunction *too* in English, are both in syntax and in meaning used exactly as the preposition *ad* and the conjunction *at* in Latin. From the specimens prefixed to Johnson's Dictionary, as a history of our language, it appears that, as late as the reign of Elizabeth, the preposition and conjunction were both written with one *o*. And it has been shown in the first volume of the Transactions of the Royal Society of Edinburgh, that *to* and *too*, as well as *ad* and *at*, are precisely of the same import. The only difference, in either language, between the preposition and the conjunction, is, that the former directs, as a modification of some previous proposition, the addition of some substantive or noun; the latter, sometimes a sentence or clause of a sentence considered abstractedly as a noun; and that, when the former is used, the preposition to which the modifying circumstance is to be added, is formally expressed, but omitted when the latter is employed. Thus Denham says,

Wisdom he has, and *to* his wisdom courage;
Temper *to* that, and *unto* all success.

In this example, every succeeding circumstance is by the preposition *to* marked as an addition to the preceding. "Wisdom he has, and courage *additional* to his wisdom." But Denham might with equal propriety have omitted the object which *to* governs, or to which it directs something to be *added*, though he must then, from the custom of the language, have employed the conjunction instead of the preposition. As,

Wisdom he has, and courage *too*.

That this mode of expression would have been more concise than, and as intelligible as, the other, "Wisdom he has, and courage *to* his wisdom," must be evident to every one.

Not only is the object governed by *to* omitted, when it is represented by a substantive in the context, but also when it is involved in a preposition; and then the conjunction, as it is called, is always used. Thus,

Let those eyes that view
The daring crime, behold the vengeance *too*.

So, "He made him prisoner, and killed him *too*." In the one example, the circumstance of beholding the vengeance is stated as an *addition* to the viewing of the crime; and in the other, the *killing him* is stated as an *addition* to the making him a prisoner. In both examples, the object governed by *too* is the amount of the preceding proposition taken abstractedly as a noun or substantive. Thus then it appears, that *to* and *too*, though classed the one with the prepositions, and the other with the conjunctions, are really one and the same word. The same is true of *ad* and *at*. Thus, "AD *hoc*, promissa barba et capilli efferaverant speciem oris," signifies "*Additional to this*, his long beard and hair had given a wildness to his aspect." But when the object governed by *ad* is not formally stated, *ad* itself is classed with the conjunctions, and written differently, *at*. Thus Terence, "*Ph.* Fac ita ut jussi, deducantur isti. *Pa.* Faciam. *Ph. At* diligenter. *Pa.* Fiet. *Ph. At* mature." By the means of *at*, the circumstances of *diligence* and *haste* are *superadded* to the action commanded. "*Ph.* It is not enough that you do it; you must do it carefully *too*. *Pa.* Well, it shall be carefully done. *Ph.* In good time *too*." *At*, taken in this sense, is most commonly employed, like the English *but*, to mark the unexpected union of incongruous objects; as, "Aulam tyranni frequentabat, *at* patriam amabat;" literally, "He frequented the court of the tyrant; joined *even to* that he loved his country." "He was a courtier and a patriot *too*." But if *ad* and *at* in Latin, and *to* and *too* in English, be derived from verbs which signify *to do* or *act*, it may be asked how they come themselves to denote *addition*. The answer is obvious. If a man should utter a sentence, and to the end of it subjoin the very general word *do*, the person to whom he spoke would naturally ask, *do* what? and this question would, of course, produce an additional sentence or clause of a sentence. Besides, it is to be observed, that *agere*, from which the Latin preposition is derived, as well as the Gothic verb, which is the source of the English particles, means not only *to do*, but also to adduce or bring; so that when we say, "he is going *to* Italy," we do nothing more than affirm that "he is going," and desire the person to whom we speak, "to *add* Italy to the journey."

From this derivation of the preposition *to*, it will be seen at once upon what principle it is employed to mark the infinitive mode. In the learned languages that mode is generally known by its termination; but in English it would be impossible, without the aid of *to*, or of some other word significant of action, to distinguish the verb *love* from the noun or substantive.

[2] This derivation is Mr Horne Tooke's; and he supports it by the following sentence: *Ne rædd ge se the on frumman worhte, he worhte wæpman and wifmen;* which is the Anglo-Saxon of St Matthew, xix. 4, "Annon legistis, quod qui eos *in principio* creavit, creavit eos marem et feminam?"

These figs *came* FROM Turkey.
That lamp *falls* FROM the ceiling.
That lamp *hangs* FROM the ceiling.

Came is a complex term for one species of motion; *falls* is a complex term for another species of motion; and *hangs* is a complex[1] term for a species of attachment. Have we occasion to communicate or mention the *commencement* or *beginning* of these motions, and of this attachment, and also the place where they commence or begin? To have complex terms for each occasion of this sort is absolutely impossible; and therefore nothing can be more natural or more simple than to add the signs of those ideas, viz. the word *beginning*, which will remain always the same, and the NAME of the *place*, which will perpetually vary. Thus,

These figs came—*BEGINNING Turkey.*
That lamp falls—*BEGINNING ceiling.*
That lamp hangs—*BEGINNING ceiling.*
That is,
Turkey the *place* of BEGINNING to come.
Ceiling the *place* of BEGINNING to fall.
Ceiling the *place* of BEGINNING to hang.

It has been said by no less a man than Bishop Wilkins, that *from* refers primarily to place, and secondarily to time. But the truth is, that *from* relates to every thing to which *beginning* relates, and to nothing else.

> *From* morn till night the eternal larum rang.

That is, the "larum rang *beginning* morning," or morning being the *time* of its *beginning*, till night.

As *from* always denotes beginning, so *to* and *till* always denote the end. There is, however, this difference between them, that *to* denotes the end of any thing; *till* the end only of time. We may say indifferently, "From morn *to* night," or "from morn *till* night, the eternal larum rang;" but we cannot say, "These figs came from Turkey *till* England." That *till* can, with propriety, be opposed to *from* only when we are talking of time, is evident; for it is a word compounded of *to* and *while*, that is, time. And as the coalescence of these two words *to-while* took place in the language long before the present superfluous use of the article *the*, the phrase, "From morn *till* night" is neither more nor less than "From morn *to time* night." When we say, "from morn *to* night," the word *time* is omitted as unnecessary.

Besides *from*, Mr Harris mentions *over* as significant sometimes of motion and sometimes of rest; and quotes as instances the two following passages from Milton:

> ....To support uneasy steps
> *Over* the burning marl.

Here, says he, *over* denotes *motion*. Again,

> ....He with looks of cordial love
> Hung *over* her enamoured.

Here *over* denotes rest. But the truth is, that *over* denotes neither motion nor rest in either of these passages. In the first quotation, indeed, *motion* is implied; but it is implied in the word *steps*, and not in *over*, which denotes only that the place of the steps was the top of the burning marl. In the second quotation, rest is implied, and that too a particular *species* of rest; but it is implied, or rather expressed, by the verb *hung*, and *over* denotes the place of that species of rest.

But though the original use of prepositions was to denote the relations of body, they could not be confined to this office only. They by degrees extended themselves to subjects incorporeal, and came to denote relations, as well intellectual as local. Thus, because in point of place he who is above has commonly the advantage of him who is below; hence we transfer *over* and *under*[2] to dominion and obedience. Of a king we say, "he ruled *over* his people;" and of a soldier, "he served *under* his general." So too we say, *with* thought; *without* attention; thinking *over* a subject; *under* anxiety; *from* fear; *through* jealousy, and the like. All which instances, with many others of a similar kind, show that the first words of men, like their first ideas, had an immediate reference to sensible objects; and that in after days, when they began to discern with their intellect, they took those words which they found already made, and transferred them by metaphor to intellectual conceptions.

Amongst the relations which may be considered rather as intellectual than corporeal, are those of cause and consequence; and for the denoting of these we have two prepositions, which sometimes *appear* in direct opposition to one another, and at other times may exchange places without injury to the sense.

"Well! 'tis e'en so! I have the London disease they call love. I am sick *of* my husband, and *for* my gallant." (Wycherley's *Country Wife.*)

Here *of* and *for* seem almost placed in opposition; at least their effects in the sentence appear to be very different; for, by the help of these two prepositions alone, and without the assistance of any other words, she expresses the two contrary affections of loathing and desire. The truth, however, is, that the author, if it had pleased him, might have used *of* where he has employed FOR, and FOR where he has put *of*. This is evident from the following quotation from the *Sad Shepherd:*

> *Marian.* Come, Amie, you'll go with us.
> *Amie.* I am not well.
> *Lionel.* She's sick *of* the young shepherd that bekist her.

In the same manner we may, with equal propriety, say, "We are sick *of* hunger;" or, "We are sick *for* hunger." And in both cases we shall have expressed precisely the same thing, with only this difference, that, in the former sentence, we declare sickness to be a *consequence;* in the latter we declare hunger to be a *cause*. But to return to the Country Wife, that poor lady seems to have had a complication of distempers; she had at least two disorders; a sickness *of loathing*, and a sickness *of love*. She was sick *for* disgust, and sick *for* love. She was

Sick *of* disgust *for* her husband.
Sick *of* love *for* her gallant.
Sick *for* disgust *of* her husband.
Sick *for* love *of* her gallant.

In the first sentence, as thus stated, sickness is declared to be the *consequence* of disgust, of which her husband is declared to be the *cause*. In the second, sickness is declared to be the *consequence* of love, of which her gallant is declared to be the *cause*. In the third sentence, disgust is declared to be the *cause* of her sickness, and the *consequence* or *offspring* of her husband. In the fourth, love is declared to be the *cause* of her sickness, and the *consequence* or *offspring* of her gallant.

---

[1] These are complex terms because they are verbs. Each denotes an affirmation and time; and, combined with these, *came* and *falls* denote *motion*, and *hangs* denotes *rest*.

[2] *Under* and *beneath*, though by the sound they seem to have little connection, are yet in fact almost the same word, and may very well supply each other's place. *Under* is nothing but *on-neder*, and *beneath* is compounded of the imperative *be* and the noun *neath*. *Neath* uncompounded having slipped away from our language, would perhaps be unintelligible, had not the nouns *nether* and *nethermost* still continued in common use. *Neath*, Anglo-Saxon, *neothan*, *neothe;* Dutch, *neden;* Danish, *ned;* German, *niedre;* and Swedish, *nedre* and *neder;* is undoubtedly as much a substantive, and has the same meaning, as the word *nadir*. In common language it denotes the bottom.

Prepositions.

Thus, then, it appears, that though the first two of these sentences, taken entire, convey the very same meaning with the last two, yet the import of the preposition *for* is as different from that of *of*, as *cause* is from *consequence*.[1] When two words or sentences are linked together by the former of these prepositions, the object expressed by the last word or sentence is declared to be the *cause* of that which is expressed by the preceding; when two words or sentences are linked together by the latter preposition, the object expressed by the first word or sentence is declared to be the *consequence of*, or to *proceed from*, the object expressed by the second. It is therefore a matter of perfect indifference to the sense whether we say "sickness *of* hunger," or "sickness *for* hunger;" "the man, *of* he speaks little, is wise," or "the man is wise, *for* he speaks little." By means of the preposition *of*, we declare sickness to be the *consequence* proceeding from hunger, and wisdom to be the *consequence* we infer from the man's speaking little; by means of *for*, we declare hunger to be the *cause* of sickness, and the circumstance of speaking little to be the *cause* from which we infer the man's wisdom. In the one sentence, *of* is to be considered as a noun in apposition to *sickness;* in the other, as a noun in apposition to *the man is wise* taken abstractedly as a noun. In the one sentence *for* (id est, *cause*) is to be considered as a noun in apposition to *hunger;* in the other, as the same noun in apposition to *he speaks little* taken abstractedly as a noun.

In the foregoing use of prepositions, we have seen how they are applied by way of juxtaposition; that is to say, where they are prefixed to a word without becoming a part of it. But they are used also by way of composition; that is, they are prefixed to other words so as to become real parts of them. Thus in Greek we have ἐπιστασθαι; in Latin, *intelligere;* and in English, *UNDERstand*. So also, to *FOREtell*, or *OVERact*, to *UNDERvalue*, to *OUTgo;* and in Greek and Latin other instances innumerable. In this case the prepositions commonly transfuse something of their own peculiar meaning into the word with which they are compounded. For example, if we suppose some given space, E and EX signify *out of* that space; PER, *through it;* IN, *within it;* SUB, *under it.* Hence, E and PER, in composition, augment: *Enormis* is something not simply big, but big in excess; something got out of the rule, and beyond the measure. *Dico*, "to speak;" *Edico*, "to speak out;" whence *Edictum*, "an edict," something so effectually spoken that all are supposed to hear and to obey. On the contrary, IN and SUB diminish and lessen. *INjustus*, *INiquus*, "UNjust, INequitable;" something that lies within justice and equity, that reaches not so far, that falls short of them. *SUBniger*, "blackish;" *SUBrubicundus*, "reddish; *tending* to black, and *tending* to red; but yet *under* the standard, and *below* perfection.

Before we dismiss this part of our subject, we shall make the same general remark upon prepositions which we formerly made on conjunctions, viz. that the precise import of each can with certainty be known only by tracing it to its source in some word of known and determinate meaning, either in the language where the preposition itself has place, or in some parent or cognate tongue. And it may be laid down as an infallible rule, that where different languages use the same or a similar particle, that language ought to be considered as its legitimate parent, in which the true meaning of the word can be found, and where its use is as common and familiar as that of any other verbs and substantives. When prepositions can be traced to such sources as these, no room can be left for disputes concerning their meaning. In carrying on this etymological pursuit, we find advantages in the nature of prepositions which conjunctions do not afford us. *With* and *without*, *from* and *to*, with many other words belonging to this class, have meanings directly opposite and contradictory to each other. If, then, by the total or partial extinction of an original language, the root of any one preposition be lost, whilst that of its opposite remains, the philosopher ought to be satisfied with reasoning from contrariety, as nothing is more evident than that the meaning of a word is known when we know with precision the meaning of its opposite. When we meet, however, with a luckless preposition of which no root is left to be dug up, and which has itself no direct opposite in the language, nothing remains but that we inquire for what purpose it is used by the best writers both ancient and modern; and if we can fix upon one meaning which will apply, however awkwardly, to all the places where it occurs, or to the greater part of them, the probability is, that we have discovered the true and original meaning of the preposition;[2] and by keeping that meaning constantly in view, we shall ourselves be enabled to use the word with perspicuity and precision.

Interjections.

3. *Of Interjections.*

Besides the above parts of speech, there is another acknowledged in all the languages of Europe, called the *interjection;* a word which cannot be comprehended under any of the foregoing classes. The genuine interjections are very few in number, and of very little importance, as they are thrown into a sentence without altering its form either in syntax or in signification. In the words of Mr Horne Tooke, the brutish inarticulate interjection has nothing to do with speech, and is only the miserable refuge of the speechless. The dominion of speech, according to the same author, is erected on the downfall of interjections. Without the artful contrivances of language, mankind would have nothing but interjections with which to communicate orally any of their feelings. "The neighing of a horse, the lowing of a cow, the barking of a dog, the purring of a cat, sneezing, coughing, groaning, shrieking, and every other involuntary convulsion with oral sound, have almost as good a title to be called parts of speech as interjections. In the intercourse of language, interjections are employed only when the suddenness or vehemence of some affection or passion returns men to their natural state, and makes them for a moment forget the use of speech; or when, from some circumstance, the shortness of speech will not permit them to exercise it." The genuine interjection, which is always expressive of some very strong sensation, such as AH! when we feel pain, does not owe its characteristical expression to the arbitrary form of articulation, but derives its whole force from the tone of voice and modification of countenance and gesture. Of consequence, these tones and gestures express the same meaning, without any relation whatever to the articulation they may assume; and are therefore universally understood by all mankind. Voluntary interjections are used in books only for embellishment, and to mark forcibly a strong emotion. But where speech can be employed, they are totally useless, and are always insufficient for the purpose of communicating thought. Dr Beattie ranks *strange, prodigious, amazing, wonderful, O dear, dear me*, &c. when used alone, and without apparent grammatical syntax, amongst the interjections; but he might with as much propriety have considered *hardly, truly, really*, and even many Latin verbs, as interjections; for these too are often used alone to supply the place of whole sentences. The truth is, that all men, when suddenly and violently agitated, have a strong tendency to shorten their discourse by employing a single word to express a sentiment. In such cases, the word employed, whether noun, adjective, or verb, would be the principal word of the sentence, if that sentence were completed; and the agitation of the speaker is such, and the cause of it so obvious, that the hearer is in no danger of mistaking the *sense*, and can himself supply the words which are wanting. Thus, if a person, after listening to a romantic narrative, were to exclaim, *strange!* would any man of common sense suppose, that the word *strange*, because uttered alone, had lost the power of an adjective and become an interjection? No, surely; every one sees that the exclamation is equivalent to, "that is *strange*," or "that is a *strange* story." Real interjections are never employed to convey truth of any kind. They are not to be found amongst laws, in books of civil institutions, in history, or in any treatise of useful arts or sciences; but in rhetoric and poetry, in novels, plays, and romances, where in English, so far from giving pathos to the style, they have generally an effect that is disgusting or ridiculous.

---

[1] Junius derives *for* from the Greek προ; Skinner from the Latin *pro;* but I believe, says Mr Horne Tooke, that it is no other than the Gothic substantive FAIRINA, *cause.* He imagines also that *of*, in the Gothic and Anglo-Saxon *af*, is a fragment of the Gothic and Saxon words AFARA and AFORA, *posteritas*, *proles.* In a word, he considers *for* and *of* as nouns or substantives; the former always meaning *cause*, the latter always meaning *consequence*, *offspring*, *successor*, *follower*, &c. If this account of these words be just, and we have no doubt of it, the prepositions *for* and *of* are in syntax to be considered as nouns in apposition with other nouns, or with sentences taken abstractedly as nouns.

[2] For instance, let us suppose that Mr Horne Tooke's derivation of *for*, from the Gothic substantive FAIRINA, is fanciful and ill founded: yet there can be little doubt but *cause* is its true and original meaning, when it is found, that of sixteen examples brought by Greenwood and forty-six by Johnson, of different significations of the word *for*, there is not one where the noun *cause* may not be substituted instead of the preposition *for;* sometimes indeed awkwardly enough, but always without injury to the sense. Even where *for* seems to be *loco alterius*, which Lowth asserts to be its primary sense, it will be found to be *cause*, and nothing else. Thus, "He made considerable progress in the study of the law before be quitted that profession *for* this of poetry;" that is, "before he quitted that profession, this of poetry" being the *cause* of his quitting it.

Having now analysed every part of speech which can be necessary for the communication of thought, or which is acknowledged in any language with which we are acquainted, we shall dismiss the subject, after annexing an abstract, which may present at one view the several classes and subdivisions of words. Of the different modes of dividing the parts of speech, as well as of the little importance of systematic classifications, we have already declared our decided opinion; but for the sake of those who may think differently from us, we shall in the abstract subjoined adopt Mr Harris's classification as far as it is intelligible; after informing our readers that Mr Horne Tooke admits only three parts of speech, the article, the noun, and the verb, and considers all other words as corruptions or abbreviations of the two last of these.

GRAMMATICAL ABSTRACT,

Exhibiting a Systematic View of Words, as they are commonly arranged into distinct Classes, with the Subdivisions under each Class.

All language is composed of words, each of which may be defined, a sound significant of some idea or relation. These words may be arranged into four general divisions, namely,

I. SUBSTANTIVES; which are all those words that are expressive of things which exist, or are conceived to exist, of themselves, and not as the energies or qualities of any thing else. These may be divided into two orders, viz.

1. NOUNS, properly so called, being the names of all those things which exist, or are conceived to exist. These may be divided into three kinds, each of which admits of the subdivisions after mentioned, viz.

Natural, or those which are used as the names of natural substances; such are (genus) *animal;* (species) *man, dog;* (individual) *Alexander, Cyrus, Cerberus, Argus.*

Artificial, or the several names of artificial objects; such as, (genus) *edifice;* (species) *house, church;* (individual) *Vatican, St Peter's, St Paul's.*

Abstract, or those which are the names of qualities considered as abstracted from their substances; such as, (genus) *motion;* (species) *flight, course;* (individual) the *falcon's flight*, the *greghound's course.*

Nouns of all kinds admit of the following accidents, viz.

Gender, which is a certain affection of nouns denoting the sex of those substances of which they are the names. For as in nature every object is either male or female, or neither the one nor the other, grammarians, following this idea, have divided the names of beings into three classes. Those which denote males are said to be of the *masculine* gender; those which denote females, of the *feminine* gender; and those which denote neither the one nor the other, of the *neuter* gender. The English is the only language of which the nouns are, with respect to sex, an exact copy of nature.

Number. As there is no object in nature single and alone, and as by far the greater part of nouns are the names of whole classes of objects, it is evident that every such noun ought to have some variation, to denote whether it is one individual of the class which is meant, or more than one. Accordingly we find, that in every language nouns have some method of expressing this. If one be mentioned, the noun is used in that form which is called the *singular* number; if more than one, it is used in a different form, which is called the *plural* number.

Cases. All nouns, excepting proper names, are general terms; but it is often necessary to use those general terms for the purpose of expressing particular ideas. This can be done only by connecting the general term with some word significant of a quality or circumstance peculiar to the individual intended. When that quality or circumstance is not expressed by an adjective, it is in English and most modern languages commonly connected with the noun by the intervention of a preposition; but in the Greek and Latin languages the noun has cases to answer the same, and even in English the noun has, besides the nominative, one case to denote possession.

2. PRONOUNS, which are a species of word invented to supply the place of nouns in certain circumstances. They are of two kinds, viz.

First, the prepositive; so called because they are capable of leading a sentence. These are divided into three orders, called the pronouns of the

First person. The pronoun of this person, in English *I*, denotes the speaker as characterized by the present act of speaking, in contradistinction to every other character which he may bear. It is said to be of the first person, because there must necessarily be a speaker before there can be a hearer; and the speaker and hearer are the only persons employed in discourse.

Second person. The pronoun of this person, in English *thou*, denotes the person addressed as characterized by the present circumstance of being addressed. It is said to be of the second person, because in discourse there cannot be a hearer till there be a speaker. The pronouns of the first and second persons have number and cases, for the same reason that nouns have these accidents; but in no language have they any variation denoting gender. The reason is, that sex, and all other properties and attributes whatever, excepting those just mentioned as descriptive of the nature of these pronouns, are foreign from the mind of the speaker when he utters *I* or *thou* in discourse.

Third person. The pronouns of this person, *he, she, it,* are employed to denote any object which may be the subject of discourse different from the speaker and the hearer. They are improperly said to be of any person; for there can be but two persons employed in discourse, the speaker and the party addressed. They are, however, pronouns; since they stand by themselves, and are the substitutes of nouns. *He* is the substitute of a noun denoting a male animal; *she,* of a noun denoting a female animal; and *it,* of a noun denoting an object which has no sex. All these, like the pronouns personal, admit of number and cases; but there is this peculiarity attending them, that though in every case of the singular number the distinction of gender is carefully preserved, in the plural it is totally lost in some languages; *they, theirs,* and *them* being the nominative, possessive, and accusative cases of *he,* of *she,* and of *it.*

Secondly, the subjunctive; so called, because they cannot lead a sentence, but only serve to subjoin a clause to another previously enunciated. Of this kind are

Which and *who.* This subjunctive pronoun may be substituted in the place of any noun whatever, whether it be expressive of a genus, a species, or an individual; as, the animal *which,* the man *who,* Alexander *who,* &c. Nay, it may even become the substitute of the personal pronouns themselves; as when we say, I *who* now write, you *who* now read, thou *who* readest, he *who* wrote, she *who* spoke; where it is observable, that the subjunctive *who* adopts the person of that prepositive pronoun which it represents, and affects the verb accordingly. *Who* and *which,* therefore, are real pronouns, from substitution; and they have this peculiarity besides, that they have not only the power of a pronoun, but also of a connective of the same import with that which in English is expressed by the preposition *of.* The word *that* is now used indifferently for *who* or *which,* as a subjunctive pronoun; but it was originally used only as a definitive, and as such it ought still to be considered in philosophical grammar.

II. ATTRIBUTIVES; which are those words that are expressive of all such things as are conceived to exist, not of themselves, but as the attributes of other things. These are divided into,

1. Verbs, or those words which are expressive of an attribute and an assertion; as, *I wrote.*

The attributes expressed by verbs have their essence in motion or its privation; and as motion is always accompanied by time, therefore verbs are liable to certain variations called TENSES, viz.

The *present,* which represents the action of the verb as going on, and as contemporary with something else; as, *I write,* or *I am writing,* either just now, or when you are reading. The *præter-imperfect,* which represents the action of the verb as having been going on but not finished in some portion of past time; as, *I was writing,* no matter when, yesterday, last week, or last year. The *aorist of the past,* which represents the action of the verb as finished in some indefinite portion of past time; as, *I wrote,* or *did write,* yesterday, or last week. The *præter-perfect,* which represents the action of the verb as just *now* finished, or as finished in some portion of time within which the present instant is comprehended; as, *I have written* this day or this week. The *plusquam-perfect,* which represents the action of the verb as having been finished in some portion of time within which a determinate past instant was comprehended; as, *I had written* last week before I saw you. The *first future,* which represents the action of the verb as to be going on at some indefinite future time; as, *I shall write* or *be writing* to-morrow, or next week. The *second future,* which represents the action of the verb as to be completed at some definite future time; as, *I shall have written* when you come to-morrow, next week, next month, or next year.

Affirmation is the essence of every verb, insomuch that all verbs may be resolved into the substantive verb *is,* and another attributive. But a man may affirm something of the action of the verb directly, something of his liberty or capacity to perform that action, or something of his wish that another should perform it. To denote these several kinds of affirmation, all verbs have what grammarians call MODES, viz. the *indicative,* to denote the first kind of affirmation; as, *I write:* the *subjunctive,* to denote the second; as, *I may* or *can write:* the *imperative,* to denote the third; as, *write thou,* or *do thou write.* Besides these, grammarians have given to every verb a mode, called the *infinitive;* as, *to write.* But this seems on every account to be improperly styled a mode. Nay, if affirmation be the essence of verb, the infinitive cannot be considered as any part of the verb at all, for it expresses no affirmation. It is indeed nothing more than an abstract noun denoting the simple energy of the verb in conjunction with time.

Verbs have likewise been distinguished into the following kinds, according to the nature of the attribute of which they are expressive, namely, 1*st, Active-transitive,* or those which denote an action that passes from the agent to some external object; as Cæsar *conquered* Pompey: 2*d, Active-intransitive,* or those which express that kind of action which has no effect upon any thing beyond the agent himself; as, Cæsar *walked:* 3*d, Passive,* or those which express not action but passion, whether pleasing or painful; as, Portia *was loved,* Pompey *was conquered:* 4*th, Neuter,* or those which express an attribute that consists neither in action nor in passion; as, Cæsar *stood.*

2. Participles, or those words which are expressive of an attribute combined with time. In English there are only two participles; the present, as *writing,* which expresses the action of the verb *to write,* as going on; and the past, as *written,* which expresses the action of the same verb as finished, and therefore past in time. In Greek and Latin there is a future participle, by which the attribute is represented as being in a state of exertion at some future time; as, *γϱαψων, scripturus,* about to write.

3. Adjectives, or those words which express as inhering in their substances the several qualities of things, of which the essence consists not in motion or its privation; as, *good, bad, black, white, large, small,* and the like. As attributes are the same whether they belong to males or females, to one object or to many, adjectives ought in strictness to admit of no variation respecting sex or number; and in English they actually admit of none. Some qualities, however, are of such a nature, that one substance may have them in a greater degree than another; and therefore the adjectives denoting these qualities admit in most languages of a variation which grammarians call the degrees of comparison. Thus Plato was *wise,* Socrates was *wiser* than he, but Solomon was *the wisest* of men. There is a species of adjectives derived from nouns, and even from pronouns; for we say, *the Pompeian* party, *a brazen* trumpet, and *my* book, which are phrases equivalent to "the party of Pompey, a trumpet of brass, and the book of me."

4. Adverbs, or those words which, as they denote the attributes of attributes, have been called *attributives of the second order,* to distinguish them from verbs, participles, and adjectives, which denote the attributes of substances, and are therefore called *attributives of the first order.* Adverbs are divided into two kinds, viz.

First, Those which are common to all attributives of the first order, that is, which coalesce equally with verbs, with participles, and with adjectives. These may be divided into adverbs of *intension* and *remission,* or of *quantity continuous;* as *moderately, vastly, exceedingly,* &c. These, like adjectives of a similar nature, admit of the different degrees of comparison. Of *quantity discrete;* as, *once, twice, thrice,* &c. These are not, in strictness of speech, adverbs, being in reality the possessive cases of one, two, three, &c. Of *relation;* as *more, most, less, least, equally, proportionally,* &c.

Second, Those which are confined to verbs properly so called, and which are of the following kinds: Of *time;* as, *then, when, afterward, now,* &c.: of *place;* as, *here, there, where, hence, whence,* &c.; and also adverbs derived from prepositions; as, *upward, downward,* &c.: of *intensions* and *remissions peculiar to motion;* as, *speedily, hastily, slowly,* &c. We have given adverbs a place amongst the parts of speech necessary for the communication of thought; but it may be doubted whether they be entitled to this distinction. English adverbs at least seem to be nothing more than corruptions of nouns, adjectives, and verbs.

III. DEFINITIVES; which are all those words that serve to define and ascertain any particular object or objects as separated from others of the same class. These are commonly called ARTICLES, which are divided into two kinds, viz.

1. INDEFINITE, as *a* or *an,* which is prefixed to a noun or general term, to denote that but one individual is meant of that genus or species of which the noun is the common name. This article, however, leaves the individual itself quite indeterminate. Thus, *man* is the general name of the whole human race; *a* man is one individual, but that individual is unknown. *Any* is prefixed to a noun either in the singular or plural number, when it is indifferent as to the truth of the proposition what individual or individuals be supposed; thus, "*any* man will be virtuous when temptation is away." *Some* is prefixed to nouns in the plural number, to denote that only part of the species or genus is meant, leaving that part undetermined; thus, "*some* men are great cowards."

2. DEFINITE, as *the,* which is prefixed to a noun, to denote one individual of the species of which something is predicated that distinguishes it from every other individual. Thus, "*the* man that hath not music in himself is fit for treasons." It is used before nouns in both numbers, and for the same purpose; for we may say, "*the men* who have not music in themselves are fit for treasons." *This,* prefixed to a noun in the singular number, denotes an individual as present and near at hand; as, "*this* man beside me." *That,* prefixed to a noun in the singular number, denotes an individual as present but at a little distance; as, "*that* man in the corner."[1]

Besides these, there are many other articles both definite and indefinite.

IV. CONNECTIVES, or those words which are employed to connect other words, and of several distinct parts to make one complete whole. These may be divided into two kinds, viz.

1. CONJUNCTIONS, by which name are distinguished all those connectives which are commonly employed to conjoin sentences. These have been divided into two kinds, called *conjunctives,* or those words which conjoin sentences and their meanings also; and *disjunctives,* or those words which, at the same time that they conjoin sentences, disjoin their meanings. Each of these general divisions has been again subdivided; the former into copulatives and continuatives, the latter into simple disjunctives and adversative disjunctives. But the general division is absurd, and the subdivisions are useless. Conjunctions never disjoin the meaning of sentences, nor have any other effect than to combine two or more simple sentences into one compound sentence. If those simple sentences be of opposite meanings before their combination, they will continue so after it, whatever conjunction be employed to unite them. In nature, different truths are connected, if they be connected at all, by different relations; and therefore, when the sentences expressive of those truths are connected in language, it must be by words significant of those natural relations. Thus, accidental addition is expressed by the conjunction *and;* as when we say, "Lysippus was a statuary, *and* Priscian was a grammarian." The unexpected junction of contrary truths is expressed by *but;* as, "Brutus was a patriot, *but* Cæsar was not." The relation of an effect to its cause is expressed by *because;* as, "Rome was enslaved *because* Cæsar was ambitious." The relation of an effect to a cause of which the existence is doubtful, is expressed by *if;* as, "you will live happily *if* you live honestly:" the relation of a cause to its effect, by *therefore;* as, "Cæsar was ambitious, *therefore* Rome was enslaved." The idea of simple diversity is expressed by *either* and *or;* "*either* it is day *or* it is night." Contrariety between two affirmations, which, though each may be true by itself, cannot both be true at once, is expressed by *unless;* as, "Troy will be taken *unless* the Palladium be preserved." Coincidence of two affirmations apparently contrary to each other is expressed by *although;* as, "Troy will be taken *although* Hector defend it."

2. PREPOSITIONS, or those connectives of which the common office is to conjoin words which refuse to coalesce; and this they can do only by signifying those relations by which the things expressed by the united words are connected in nature. The first words of men, like their first ideas, had an immediate reference to sensible objects; and therefore there can be no doubt but that the original use of prepositions was to denote the various relations of body. Afterwards, when men began to discern with their intellect, they took those words which they found already made, prepositions as well as others, and transferred them by metaphor to intellectual conceptions.

Prepositions viewed in this light are

Either *proper,* or those which literally denote the relations subsisting amongst the objects of sense, such as the accidental junction of two things between which there is no necessary connection; as, "a house *with* a party wall." The separation of two things which we should expect to find united; as, "a house *without* a roof, a man *without* hands." The relation subsisting between any thing and that which supports it; as, "the statue stands *upon* a pedestal." The relation of higher and lower; as, "the sun is *above* the hills," "to support uneasy steps *over* the burning marl," "the sun is set *below* the horizon," "the shepherd reclines *under* the shade of a beech tree." The relation between any thing in motion and that in which it moves; as, "the rays of light pass *through* the air." The relation between any thing continued, whether motion or rest, and the point of its beginning; as, "the rays of light proceed *from* the sun," "these figs came *from* Turkey," "that lamp hangs *from* the ceiling." The relation between any thing continued and the point to which it tends; as, "he is going *to* Italy," "he slept *till* morning." The relation between an effect and its cause; as, "I am sick *of* my husband and *for* my gallant."[2]

Or *metaphorical.* For as those who are above others in place have generally the advantage over them, the prepositions which denote the one kind of superiority or inferiority, are likewise employed to denote the other. Thus we say of a king, "he ruled *over* his people;" and of a soldier, "he served *under* such a general."

---

[1] These two articles have plurals; *these* is the plural of *this,* and *those* the plural of *that.*

[2] Conjunctions and prepositions are indeed employed only to connect sentences and words; but it may be doubted whether they be parts of speech distinct from nouns, verbs, and adjectives.

INTERJECTIONS are a species of words which are found perhaps in all languages on earth, but which cannot be included in any of the classes above mentioned; for they are not subject to the rules or principles of grammar, as they contribute nothing to the communication of thought. They may be called a part of that natural language with which man is endowed, in common with other animals, to express or allay some very strong sensation; such as, *ah!* when he feels pain. In this view the interjection does not owe its characteristical expression to the arbitrary form of articulation, but to the tone of voice, and the modifications of countenance and of gesture with which it is uttered; it is therefore universally understood by all mankind. In discourse interjections are employed only when the suddenness or vehemence of some affection returns men to their natural state, and makes them for a moment forget the use of speech. In books they are thrown into sentences without altering their form either in syntax or in signification; and in English this is generally done with a very bad effect, though the writer no doubt employs them with a view to pathos or embellishment.

To the masterly and instructive treatise on the Theory of Language, which is here reprinted, it does not seem to be either necessary or desirable that any large supplement should now be added. Historical or Comparative Grammar—that special department of philology which traces the history of particular languages, and disentangles their mutual relations—has in the present age made vast advances, if it might not rather be said to be a science almost altogether new. But there has not, and could not have been, a similar progress in that first and fundamental department of philology on which Historical Grammar rests—the recent developments of Universal Grammar may safely be asserted not to have yet stretched, in any leading section, beyond points reached in the foregoing dissertation. It is true, indeed, that a science like Universal Grammar, directly dependent on mental laws, and on not a few mental laws which are far from having been satisfactorily evolved by the psychologers or metaphysicians themselves, cannot in all quarters be free from discrepancies of opinion. But, if there were here room or fit occasion for a systematic exposition of the relations between our article *Grammar* and the most modern phases of philological inquiry, both special and general, the commentary, fairly conducted, would make two things appear very clearly. On the one hand, the results of late investigations into the history of particular tongues, while they would give rise to very few corrections, and to none that are at all important, would exhibit many additional proofs and illustrations of doctrines taught in the article. On the other hand, a comparison with later attempts to develop the universal theory of language, would show that several doctrines, now so currently recognised as to be even trite, were propounded or proved for the first time, either in this treatise, or in the oral teaching of the distinguished thinker and philologer, from whose prelections its materials are announced as having been mainly derived.

One part only of Dr Hunter's philological system has the advantage of being published authoritatively in his own words: and, perhaps, in the preceding dissertation, this part is less clearly set forth than the rest; because his own enunciation of it was not made in print till late in his life, and because it involves several fine and peculiar steps of analysis. The part in question is his Theory of the Verb, which probably contains no doctrine not to be found in the foregoing pages, but which, nevertheless, should also be studied as a whole in his own statement of it. That statement, in the shape of an "Introductory Essay on the Moods and Tenses of the Greek and Latin Verb," is affixed to the several impressions of Dr Hunter's edition of Ruddiman's *Latin Rudiments;* and some specific illustrations from the tenses of the Greek verb appeared in the ninth volume of *Transactions of the Royal Society of Edinburgh.*

A complete generalization of this Theory of the Verb, such as to fit it exactly to its place in a system of Universal Grammar, would be a very ambitious undertaking; while it would be liable to the risk of incorporating, with the opinions of the venerable scholar himself, others which might not really be his. A few sentences, however, attempting to explain the outline of the theory, may be useful as a clue to some of the views stated in the body of the article.

1. The separate consideration of the element of Time is the key to all the intricacies presented by the Verb.

2. Two only of the three possible Modes of Time are expressed *directly* by the verb. These are, the Present and the Past. Those forms of the verb which deal with the Future do not express it directly: they merely enable us to *infer* it. This is seen most easily through the auxiliary forms prevalent in such languages as our own. Our "will" expresses directly nothing more than resolution, and our "shall" nothing more than obligation; but futurity is naturally and necessarily inferred, in regard to the action or suffering to which the resolution or the obligation relates.[1]

3. In all tenses of the verb Time is expressed, not Absolutely, but *Relatively;* that is, relatively to those two points, the present and the past. "If," says Dr Hunter, "we separate the Time from the other circumstances involved in those forms of the Greek and Latin verb called the Moods and Tenses, the Time thus separated, or separately attended to, will in every one of them be found to be either the Present or the Past. One primary object of those forms seems to have been, to give the present and the past as two *fixed points* of time, with a reference to which all the other ideas involved in them are to be estimated and determined. They are all past, present, future, contingent, &c., with reference to one or other of these two fixed points."

4. It is implied in the preceding propositions, that the Moods of the verb cannot be rightly analysed, until the relations of the Tenses have been clearly brought to light.

5. For the dissection of the Moods, however, a second principle is required, which may be stated broadly thus. That which forms the radical part of a verb into a Mood (a flexional termination in some languages, an auxiliary or group of auxiliaries in others) is commonly said to modify the radical part of the verb. But the opposite view is the correct one. The radical part of the verb modifies that by which it is formed into a mood; the radical part modifies the flexion or auxiliary. The Modal part of the expression really contains the leading assertion, whose varieties are thus comparatively few; the Radical part of the verb modifies and varies the meaning of the assertion, according to an indefinite multiplicity of occasions. Whatever opinion may be adopted as to the origin and history of the [Greek and Latin] Flexions, no doubt can be entertained that they are similar in their nature to our Auxiliaries; that the terminations contain the *generic* part of the expression, and are *modified* by the radical part of the verbs combined with them." Thus, in the expression "*Amem*, I may love," the generic assertion is made by "*—em*, I may;" and this assertion is specificated by "*Am*—, love."

---

[1] Besides classical and other illustrations of the inferential character of the future tense, the fact is curiously exemplified by our own mother-tongue. In the Anglo-Saxon verb, one and the same form does duty both as present and as future, the context determining which of the two is intended.

6. This analysis, when followed out to its consequences, is maintained to carry with it the doctrine, that there is only one true Mood, namely, the Indicative. Our English auxiliaries are again convenient as examples. "I am, or I am not; I do, or I do not;" expressions affirming or denying existence and action,—are readily admitted to be indicatives. But so, likewise, are expressions like these: "I may, or I may not; I can, or I cannot;" which affirm or deny liberty and power; and which affirm or deny liberty and power quite as positively as the other expressions affirm or deny action and existence. "To consider certain of those forms as exclusively Indicative or Assertive, and others as not so, seems to be founded completely in misapprehension, and tends to perplex and mislead. "I may write," "I might write," are equally Assertions as "I do write" and "I did write." The thing indicated or asserted is different; but, in so far as assertion is concerned, they are completely similar; they stand on precisely the same footing."

7. The result of the examination of the moods, in its application to the classical languages and our own, is, in skeleton, briefly this. Our common Auxiliary Verbs, "am, do, have, shall, will, may, can," assert, respectively, existence, action, possession, duty or obligation, volition, liberty or possibility, ability or power; "and they are all verbs of the *present* time or tense, each of them having a correspondent form appropriated to *past* time." The Flexional Forms of the Greek and Latin verbs imply or involve those auxiliaries, and contain the same assertions; and each of them "will be found, like the auxiliaries which they involve, to have two corresponding forms, the one predicating those attributes of the *present* time, the other of the *past*."

8. The manner in which this analysis of the moods is applied in detail to the modifications expressed by the tenses, will be best learned from Dr Hunter's own treatise. But, in the preceding article, in the section on the verb, the particulars are worked out with so much of general adherence to the principles just explained, that, with no further aid than these few general propositions, the application of the two laws jointly cannot be difficult.

GRAMMONT, a town of Belgium, province of East Flanders, on both sides of the Dender, 21 miles S.S.E. of Ghent. It is a walled town, and contains two churches, several chapels, a town-hall, hospital, college, and several schools. It has manufactures of lace, cotton yarn, linen and woollen goods, leather, soap, paper, and tobacco; as well as bleaching and dyeing works, breweries, and distilleries. Pop. (1851) 7816.

GRAMMONT, COUNT. See HAMILTON.

GRAMPIANS, a mountain chain in Scotland. See SCOTLAND.

GRAMPUS, an animal of the cetaceous order. See index to MAMMALIA.

GRAN (Hung. *Esztergom*, anc. *Strigonium*), a royal free city of Hungary, capital of a cognominal county, on the right bank of the Danube, nearly opposite the mouth of the river Gran, 26 miles N. by W. of Buda. This was long the residence of the Hungarian monarchs, and the finest city in Hungary, till almost annihilated by the attacks of the Turks. These held it for seventy years previous to 1683, when they were finally expelled by John Sobieski of Poland. It is now the seat of the archbishop and prince-primate of Hungary. The cathedral, the palace of the archbishop, and the houses of the chapter, occupy the summit of a high and precipitous rock, the site of an ancient fortress, of which only portions of the walls now remain. The cathedral, commenced in 1821, and only recently finished, is said to be the most splendid building in Hungary. Gran, with its several suburbs, contains about 12,000 inhabitants, who are chiefly employed in the weaving and dyeing of woollen cloths.

GRAN CANARIA. See CANARY ISLANDS.

GRANADA, sometimes called Upper Andalucia, is bounded on the E. and S. by the Mediterranean and Murcia, and on the N. and W. by Andalucia. It is situated between N. Lat. 36. 16. and 38. 4., and between W. Long. 1. 38. and 5. 30. Its greatest extent from E. to W. is about 200 miles, and from N. to S. about 140. The area is 9630 square miles English; and the population (in 1849) amounted to 1,157,584. The form of this province is an irregular triangle, with the base to the E. on Murcia, and the apex to the S.W. towards the Straits of Gibraltar. Granada is beautifully diversified with majestic mountains, extensive plains, and rich valleys, all fringed with a tropical maritime border. The Sierra Nevada chain extends throughout the province, from N.E. to S.W., under the names of Ronda, Antequerra, Orca, Huescar, and Sierra Nevada, "with its diadem of snow," which, in its highest point, the Cerro de Mulhacen, a little S.E. from Granada, is 12,762 feet above sea-level. All this chain has an elevation of more than 9900 feet, and above this height is covered with perpetual snow. Thus, under a latitude of 37°, eternal snow and the temperature of Africa are combined; hence every variety of vegetable production from the lichen to the cotton plant and sugar-cane is found here. Towards the south the mountains gradually decline to the Sierra de Gador, near Almeria, where the elevation is 7800 feet. At this extremity, near Macael, stands the famous rock Filabers, 2000 feet high, and 4 miles in circuit, consisting of one solid mass of white marble. The secondary mountains are of several kinds; but many of them are formed of marble of various colours, red, black, white. About 8 miles from Granada, on the banks of the Xenil, there is a quarry of beautifully veined green serpentine, capable of receiving a fine polish. In the mountains immediately surrounding the city of Granada occur many kinds of alabaster, some of which are as transparent and brilliant as Oriental cornelians; there are also quarries of jasper, and a considerable variety of precious stones. Some lead, copper, and silver mines still exist, and several of them were worked by the Moors. In the sands of the Darro gold is found; and mineral waters, chiefly chalybeate and sulphureous, are abundant in the province, yet few of them have been analyzed. The most famous of them are those of Alhama (with a temperature of 118° Fahr.), Almeria, and Javal-cohol. As might be expected, the climate of Granada is cold in the mountainous districts, temperate in the plains, and extremely hot and sultry in the valleys. The hot wind called Soláno, which blows from the S.E., is here attended with pernicious effects. It shrivels up the vegetation, and affects the human body with the sensations of strong fever; assassinations, murders, and suicides, are most frequent during the prevalence of this wind. The snowy range is a perpetual alembic of fertilizing water, which is beautifully commensurate with the heats; for the hotter the weather the more copious do the waters become from the melting of the snow. This water is wealth; for the soil of the plains, though light, becomes very productive under the combined effect of moisture and warmth. Here the succession of crops is continuous, and the hemp is the finest in the world. Agriculture, though much degenerated since the expulsion of the Moors, still forms the wealth of the province, which teems with corn and wine, oil, silk, and delicious fruits, in great abundance. The line of irrigation divides the desert from the paradise; all lying within its influence is green and fruitful;

all beyond it is brown and barren. Agriculture is more flourishing in this province, however, than in any other part of Spain. The *Vega* of Granada is considered the richest plain in the kingdom. The estate of the Duke of Wellington is formed of part of this rich plain, and is occupied by nearly 300 tenants. This estate is so managed as to form an excellent model for Spanish agriculturists. The principal assistance rendered to the crops is the irrigation of the soil, which is accomplished by conveying streams along the more elevated side of every field by means of embankments, in which sluices are cut, which convey the water into small rills, which occur at short intervals, so as to flood the whole field with ease in the hot season. The preservation of manure is carefully attended to. It is collected in large pits, well rammed to prevent leaking; and as soon as well rotted it is distributed in an almost liquid state over the land. This is according to the old Moorish mode, which has always proved the best. This manure is not applied to the production of corn, but is used for gardens, melon-grounds, and mulberry plantations. The most abundant grain crops are raised by the mere assistance of irrigation, without any manure; and the average annual produce of land well watered is fifty bushels of wheat per acre English. Near the rivers in the lower grounds considerable quantities of rice are cultivated, but often before sowing the rice a crop of hemp or flax is taken from the land. The breeding and fattening of cattle, however, is much more attended to by the Spanish than the cultivation of cereals. In winter the cattle are pastured in the uplands, where grass is best; but no hay is made by the farmers; and after harvest, which occurs in June, the flocks and herds are fed in the stubble fields. The horses of Granada are inferior to those of Córdova, but the asses are very fine animals, and are highly esteemed in all the eastern countries of Europe. The wool produced in this province is coarse, and of comparatively little value. The best sailcloth is made from the hemp of Granada, which has a very strong fibre. The mulberry tree is cultivated solely for the sake of its leaves as food for the silk-worm. In the Vega as much silk is produced as furnishes employment to 1500 persons; and the manufactures in Granada alone require a supply of 120,000 lbs. annually.[1] The mountains surrounding Granada itself are well adapted for the nurture of the vine; but so badly managed are all things connected with its cultivation, that the wine is of very inferior quality, and mostly has the flavour of the sheep-skins with tarred seams in which it is carried from the vineyards. The Tierno, Moscatel, and Malaga, however, which are made in other parts of this province, are excellent wines, and in high repute. Though olive-trees are extensively cultivated, yet sufficient oil is not produced for home consumption. The sugar-cane is especially cultivated around Velez-Malaga, and is of excellent quality, quite equal to that of the West Indies for size and juiciness. The foreign trade is chiefly carried on from the ports of Malaga and Almeria, and consists in exports of sumach, lead, kali, dried fruits, almonds, lemons, anchovies, oil, and wine; while the chief imports are cloths, mercery, hardwares, &c. The internal commerce consists chiefly in exchanging dried fruits, corn, and wine, for silk and oil.

The people of Granada, like the rest of the Andalucians, are generally considered by the Castilians as the Gascons of Spain. The women are rather handsome and very attractive. The features and complexion of the people generally indicate traces of their mixed Moorish descent. The posterity of those Moors who professed Christianity in order to escape persecution are chiefly to be found here; and they are at present equally as bigoted as the Spaniards themselves. In the Alpujarras, however, there still remain a few scattered families of that unfortunate race who still secretly cling to the doctrines of the Korán, and reluctantly concede an external conformity to the Roman Catholic creed. Since the fall of the last Moorish kingdom in 1492, when Granada was united to the crown of Castile, this province has been governed by the Castilian laws. At Almeria resides a captain-general, as well as the civil and military provincial authorities; but the law-courts were transferred to Albacete in 1835. In order to protect the province from the corsairs of the African coast, watch-towers are erected along the shores at short distances from the mouth of the Rio-Frio to the Straits of Gibraltar.

This province contains 18 cities or towns; 300 villages; and about 200 convents of both sexes. Thirty-five of these religious houses are in the city of Granada.

Granada, a city of Spain, and the capital of a province of the same name, is situated on the Xenil, at the influx of the Darro. The Moorish name of this famous city is Karñattah, "the city of strangers," composed of the Arabic *Kar*, the same as the Celtic *caer*, or *cahir*, "an eminence," or what is built on it, and *nattah*, "a pilgrim," or "stranger."[2] Others consider it the name of a local goddess. At the Moorish invasion one of Tarik's generals gave Karñattah, or Granada, to the Jews, whence it was called Karñattah-el-Yahood. It occupied the site of the modern Torres Bermejas, and ranged above the Campo del Principe, being quite distinct from Illiberis (which in Basque means "new city"), with which it has been often confounded. Illiberis was built on the Sierra Elvira.[3] Granada stands partly on level ground near the river, at an elevation of 2445 feet above the sea, and partly on the slopes of two adjacent hills. It is divided into four quarters—the Alhambra with the fauxbourg Churna; the City properly so called; the Albaycin fauxbourg; and the Antequeruela fauxbourg. Of these the city proper is surrounded by high walls, flanked by towers now in ruins; the Alhambra and the Albaycin have separate walls and ramparts; but the Antequeruela is quite open. On the summit of the Alhambra Hill stand the magnificent remains of the regal palace, which attest the perfection of art among the Moors, as well as the splendour of their princes during their palmy days in the Peninsula. (See Alhambra.) The Albaycin occupies the other hill; the Antequeruela is the chief residence of the working classes; the town proper occupies the space between the two hills, and extends into the plains. The streets are generally narrow and tortuous; but the houses are tolerably well built, while their oriental structure and antiquity render them objects of great interest. There are several handsome squares, and a number of public fountains in the town. Though the great object of attraction is the Alhambra, Granada contains several other edifices worthy of notice. The cathedral, though an irregular and heavy building, is profusely ornamented with jasper and coloured marble. It is surmounted with a dome resting on twelve arches upheld by as many pilasters, beneath which stands its richly decorated high altar. In the adjoining royal chapel are numerous fine monuments, among which are those of their "Catholic majesties," Ferdinand and Isabella. The church of Nuestra Señora de las Angustias has a splendid high altar and two magnificent towers. The church of San José is an elegant modern edifice built on the site of a very ancient one, of which the tower still stands. Among the other public buildings of Granada may be mentioned the unfinished palace of the Emperor Charles; the monastery of San Gerónimo, founded by the famous Gonzalo de Córdova, whose remains were deposited in a splendid mausoleum in its church; the old Carthusian convent, situated

---

[1] It is estimated that 1 lb. of silk is produced by 1500 worms, and that a mulberry tree ten years old will barely supply food for as many worms as yield 7 lbs.

New Granada.

on an eminence in the suburbs, and adorned with paintings by Murillo, Morales, and Cano; the Generalife, a Moorish palace, surrounded with gardens and fountains; the episcopal palace; the university; and the general hospital. Its manufactures are unimportant; the chief being silk and coarse woollen stuffs, hats, and paper. It has, also, a royal manufactory for saltpetre and gunpowder. The trade of the city is insignificant, and carried on entirely in the weekly markets, which are lively and well attended. The roads to Granada are kept in wretched repair, so that during the rainy season it is nearly isolated from the rest of the world.

Granada was founded by the Moors in the tenth century, near the site of the ancient Illiberis, and at first belonged to the kingdom of Córdova. In A.D. 1235 it became the capital of the new kingdom of Granada, and rose to almost unparalleled splendour. Its population at this time is said to have amounted to 500,000. In 1491, when it had become the last stronghold of the Moors in Spain, it mustered the extraordinary number of 60,000 men to defend it against the Christian forces of Ferdinand and Isabella. The besiegers, after innumerable deeds of valour on both sides, gained possession of the city, January 2, 1492, when the banner of Castile first floated on the towers of the Alhambra. The Moors still continued to constitute the great body of the inhabitants till 1610, when they were expelled from all parts of Spain; and in no part of the kingdom was this severe and impolitic proceeding more keenly felt than in Granada, which has never recovered from its effects. Pop. (in 1845) 70,025.

GRANADA, *New*, is the most important of the three republics into which the South American republic of Colombia resolved itself at the dissolution of that confederation in 1831. Till 1810 it was a vice-royalty under the Spanish crown, but subsequently a part of the republic of Colombia, the middle and western portions of which it now embraces. New Granada is bounded on the N. by the Caribbean Sea, on the E. by the republic of Venezuela, on the S.E. by Brazilian Guiana, on the S. by the republic of Ecuador, and on the W. by the Pacific Ocean. It lies mostly between the equator and 12. N. Lat., and between 70. and 83. W. Long. Area about 480,000 square miles.

Several offshoots of the Andes traverse the western and larger portion of the republic; but the eastern portion belongs to the immense *llanos* or planes of the Orinoco. On the borders of Ecuador, not far north of the town of Pasto, the great chain of the Andes separates into two branches—the western branch, called the Cordillera de la Costa, running parallel to the coast of the Pacific; and the other to the east, containing several *paramos* or elevated plains, as well as the sources of the Japura and Putumayo, affluents of the Marañon. Further north rise the Rio Grande or Magdalena, and its largest tributary the Cauca, which flow nearly due S. to N., and fall into the Caribbean Sea by deltoid mouths nearly seven miles broad. Again, in N. Lat. 1. 50., the Eastern Cordillera parts, forming two branches nearly parallel, inclosing the broad, rich valley of the Rio Grande. Of these chains, the most easterly, stretching to the Sierra Nevada de Merida, along the right bank of the Rio Grande, is called the Eastern Cordillera de Cundinamarca; the valleys of the Rio Grande, and its tributary the Cauca, are separated by the Central Cordillera; and the valley of the Cauca is separated from the Choco districts by the Western Cordillera. These three Cordilleras are by some designated respectively—Cordillera de la Suma Paz, from the colossal groupe of this name near Santa Fe de Bogotá; Cordillera de Quindiu; and Cordillera de Choco. The eastern chain does not exceed 13,000 feet in elevation so long as the central one rises to the perpetual snow-line; but at the point where the Western Nevadas cease, the eastern chain rises to the snow limit (N. Lat. 5. 5.), and is collectively the most elevated of the three Cordilleras. The Peak of Tolima (N. Lat. 4. 46.), which rises to the height of 18,270 feet, and is the culminating peak of the Andes in the northern hemisphere, belongs to the Quindiu chain. The Sierra Nevada de Santa Marta, which extends along the coast between the Cundinamarca and the Quindiu chains, does not properly belong to the Andes. About 30 miles from the shore this Sierra rises abruptly from the plains between the Sea of Maracaybo and the Gulf of Darien to the height of nearly 19,500 feet. The vast tract of country between the Western Andes and the Pacific contains the basins of the rivers San Juan and Atrato, as well as a narrow tract along the sea-shore. This narrow strip has a soft, alluvial, and very fertile soil, but is almost always in a swampy state from the incessant rains which drench it, and render it most insalubrious, especially for Europeans. Hence it is abandoned almost exclusively to native tribes and a few negroes, who are employed in washing the gold sand found along the western declivity of the Andes in considerable quantity, and is here and there intermixed with platinum. The most southern of the table-lands which extend along the western declivities of the Eastern Andes, as well as those of Tunja and Bogotá, are at an average elevation of 9000 feet above sea-level; and on them are cultivated the cereals and fruits of Europe, as well as the root called aracacha. Those further north are much less elevated, and adapted to the cultivation of tropical grains, fruits, roots, coffee, sugar, tobacco, and cotton. The low country, extending between the plateaux of Cucuta and Girona and the mountain group of Santa Marta, is mostly covered with extensive forests, and almost destitute of population from the insalubrity of the climate, caused by the almost incessant rains, numerous swamps, and frequent inundations. It contains the extensive lake of Zapatosa.

The *llanos* or plains of the Orinoco extend over the entire tract, stretching away to the western banks of the Orinoco and to the Cassiquiare, between the Rio Negro on the S. and the Rio Apure on the N. As far south as the Vichada, the northern part is a complete level, averaging only 300 feet above sea-level near the mountains, whence it gradually but almost imperceptibly declines towards the Orinoco. With the exception of a few palms that occur at great intervals all over the plain, and some low bushy trees along the rivers, this district is quite destitute of trees. During the rainy season, which is from April till November, rain falls in torrents, accompanied with fearful thunderstorms, which usually occur between two and four o'clock in the afternoon; but the contrast is very striking in December, January, and February, when a cloud never crosses the sky. This immense plain is not at all fit for cultivation; but innumerable herds of cattle and horses find abundant pasture on it during the rainy season, though they suffer much during the dry months from November till April. The wet season is, on an average, 8° Fahr. hotter than the dry, and the mean annual temperature is 80° Fahr. The part of this great plain south of the River Vichada is covered with immense forests, infested with numerous wild beasts; and it is somewhat hilly in several districts, especially between the rivers Negro and Guaviare, where steep rocks start out of the plain abruptly to an elevation of from 300 to 600 feet. No breeze ever passes over this part of the plain, and its temperature averages three or four degrees above that of the northern portion. In it also rain falls every day in the year, except during December and January, sometimes in the form of dense mist, and oftener in great torrents. Such is the state of the climate, that the most S.E. part of it, inclosed by the Atabapo, Negro, Orinoco, and Cassiquiare, is uninhabited, though covered with enormous forest-trees. At all seasons since A.D. 1788 the navigation between the Atlantic and the Pacific has been practicable for boats by means of a canal dug in the Raspadura Ravine between the two rivers, under the superintendence of a monk.

The principal rivers of New Granada are the Magdalena and Cauca, which run their whole course within the territory of the republic, taking their rise in the Andes near the southern frontier, and, after flowing nearly the entire length of the country from S. to N., unite in one channel, and discharge their combined waters through a delta by three channels into the Caribbean Sea, about W. Long. 75. Besides these two principal streams, a large number of the tributaries of the Orinoco, having their sources in the different ranges of the Andes, drain the *llanos* of the east. Of these the principal are the Apure, Meta, Vichada, Guaviare, Rio Negro, and Japura on the mutual boundary with Ecuador. The lakes of New Granada are inconsiderable; the most celebrated is the Guatavita, not far from the city of Bogotá, into which, it is affirmed, large treasures were thrown by the natives during the Spanish invasion and conquests.

The mineral riches of New Granada are considerable, and mostly occur in the western declivity of the three chains of the Andes. They consist of salt-rock, lead, iron, copper, mercury, platinum, silver, and gold. Along all the central and western declivity of the Andes gold is found, and is obtained by washing the sand of the rivers as well as that on the sides and foot of some hills. It is found on the plateaux of Cucuta and Girona in the Eastern Andes, where silver also is obtained in considerable quantity. There are also some very rich mines in the mountain region between the Rios Cauca and Magdalena N. of N. Lat. 5½. Platinum is found in the western declivity of the Western Andes, and mercury in the valley of Santa Rosa, near Antioquia, and near the Pass of Quindiu in the Central Andes. Copper is found in the Eastern Andes, near Pamplona, and N. of Tunja. Iron and coal occur in the mountains bordering on the table-lands of Bogotá, and lead in various parts of the Eastern Andes. In some mountains N.E. of Bogotá large masses of rock-salt are found, and it is worked by the government. Large quantities of salt are furnished also by salt-springs in the same mountains.

From the great diversity of surface, soil, and climate of New Granada, the natural productions are extremely varied, embracing almost every variety found in the temperate as well as in the tropical zone. The chief objects of culture over the table-lands of Bogotá, and the district north of it along the western slopes of the eastern range, are the cereals as in Europe, the aracacha-root, and potatoes; but in the river-valleys, and on the coast-plains, maize is the chief grain cultivated with rice, sweet potatoes, and plantains. As articles of commerce are cultivated coffee, cotton, cocoa, tobacco, some sugar, and indigo. The forests abound with numerous kinds of useful timber trees; but those converted into articles of export are the logwood, Brazil, Nicaragua, and fustic trees, which grow most abundantly in the forests of the Santa Marta chain. The balsam of Tolu, so named from a village near Cartagena, is collected largely on the banks of the Rio Sinu, and ipecacuanha on those of the Rio Magdalena; cinchona, or Peruvian bark, is obtained in large quantities in the region of the Sierra de Santa Marta, as well as in several other places; cochineal of the finest quality is procured from the banks of the Sogamozo. Previous to the discovery of this country by Europeans, horses and cattle were unknown in these regions; but now tasajo, or jerked beef, and hides, as articles of commerce, are furnished by the immense herds of cattle which the *llanos* support; and mules, horses, and cattle are exported to the West Indies.

The population of New Granada are descendants of the Spaniards who have settled there during the three last centuries, and some of the native tribes intermixed with a few negroes. Very different degrees of civilization are found among the native tribes. Before the invasion of the Spaniards, those of the table-lands along the Eastern Andes had organized a political system and made some progress in the simpler arts of civilization. These, with the Indians in the valley of the Upper Magdalena, are still the best husbandmen in the republic. Between the Pacific and the Western Andes, nearly all the population are descendants of the aboriginal native tribes, whose progress in the arts of civilized life is very small, and almost exclusively owing to the few Spanish priests scattered among them as missionaries. None but the descendants of Europeans dwell in the treeless *llanos;* and their occupation is the care of the herds of mules, horses, and cattle. Wandering Indians, still in a very barbarous state, occupy the southern wooded portion of the *llanos*. The numbers of the respective races occupying New Granada have been estimated by Hubner as follows:—

White Caucasians	450,000
Native civilized Americans	301,000
Negroes	80,000
Metis (descendants of Spaniards and natives)	999,000
Mulattoes	283,000
Samoyes	120,000
Zambos (in Magdalena)	100,000
Quadrones	30,000
Total estimated population in 1853	2,363,000

Agriculture holds the first place in the industry of New Granada. Rice, cotton, tobacco, cocoa, sugar, and tropical fruits, are among the productions of the coast region; while the elevated plains yield maize, wheat, and all the products of a temperate zone. The cultivation of the soil, however, is carried on very carelessly; and reclaimed land bears but a small proportion to the whole. On the *llanos* towards the Orinoco, almost the sole occupation of the people is the rearing of cattle and horses. Agriculture is chiefly in the hands of the converted Indians, who manifest a very decided predilection for these labours of peace. Manufacturing industry is of so little importance that it can hardly be said to exist in the republic. It is limited to home-made coarse woollens and cottons, adapted for the use of the lower classes only. At Bogotá the capital, and the other principal towns, indeed, straw-hats, carpets, and some other articles are made, but in no case does the native industry become commensurate with the demands of the country, so that nearly all manufactured goods in use are imported. Mining is carried on, but only to a very inconsiderable degree. There is a silver mine at Santa Ana, in Bogotá, the only one now worked; and gold is collected in a few localities. Emeralds, diamonds, and pearls, are also obtained. The salt mines of Zipaquira are, however, extensively worked. With the exception of this last, the mining business of the country is left entirely to the poor and ignorant.

The principal ports of New Granada are,—on the Caribbean Sea, Santa Marta, Cartagena, Chagres, Rio de la Hacha, and Portobello; on the Pacific, Panamá and Buenaventura. Steamers now navigate the Magdalena; and the only railway in the country is that from Aspinwall to Panamá.

The commerce of this republic was much more extensive before its independence than at present. This arises from almost incessant internal war, the unsettled state of the government, and the inadequate means of communication with the interior, which, for want of roads, cannot export its superabundant produce. Another great hindrance is the swampy insalubrious nature of the climate over the tracts bordering on the sea, endangering the lives of those who traverse them. So thoroughly inaccessible is the valley of the Upper Cauca, which is the most fertile tract in the republic, that none of its produce can be exported except what is carried over its inclosing mountains on the backs of men. It is everywhere surrounded by lofty mountains, and the Cauca becomes unfit for navigation on issuing from the valley. The exports of New Granada average annually about L.900,000; while the imports somewhat exceed L.1,000,000. The total value of the exports from New Granada to the United Kingdom in 1854 was L.376,065; of imports therefrom L.284,695; of which L.270,722 were goods of British manufacture. The trade of the interior is carried on chiefly by mule-carriage, the roads being exceedingly bad; but of late years considerable improvement has been made in this respect.

New Granada enjoys a republican form of government, based on the written constitution of 1832, which was a close copy of the constitution of the United States of North America. On this, however, some amendments have since been made. Every man born in the country, able to read and write, and that without distinction of class or colour, is a citizen; and foreigners are naturalised at the age of twenty. The supreme government is centralized, and not as in the United States federal. The legislature consists of a chamber of deputies, with 65 members, elected by the people, and a senate of 39 members, elected by provincial colleges. The president, in whom the chief executive power is vested, is chosen for four years. Justice is administered by an independent judiciary, consisting of a supreme court, and provincial and other inferior courts; and all judges are appointed by the president, with the consent of the senate. Representation is based on population, but each province must be represented by at least one deputy. All religious sects are tolerated in the state, but the Roman Catholic is the only religion that receives support from the public treasury. They do not, however, recognise the supremacy of the Pope—the Archbishop of Bogotá being considered the head of the church. The bishops of Cartagena, Mompox, Neyva, Pamplona, Santa Marta, and Popayan, are his suffragans, and exercise authority in their particular dioceses. Education, formerly greatly neglected, has of late years received the attention of government, and the public generally have become alive to its great importance. Public schools, on the Lancasterian system, are established in all the large towns. In Bogotá there is a university; and in the provincial capitals colleges, or high schools, have been established. Bogotá has also an observatory, a public library, and several special schools; and in several places associations have been formed for the promotion of science, art, and literature. Much, however, is still wanting to a complete educational system.

The armed force of the republic is still small. The army proper consists of less than 2000 men; while the active militia does not amount to 6000. In time of war, however, every male adult is liable to military service. The navy is only fit for coast service.

The war of the revolution bequeathed to the state a bankrupt treasury and a heavy debt. In 1852 the national liabilities amounted to $37,060,888; and this sum is being constantly increased by unsatisfied interest, and a deficiency in the annual receipts. The expenditure in 1851–2 amounted to $2,145,779, while the receipts were $1,553,513.

The republic of New Granada is now divided into five departments, which are again subdivided into 18 provinces:—

Cundinamarca, containing the four provinces of Bogotá Antioquia, Neyva, and Mariquita.

Boyaca, containing also four, Pamplona, Socorro, Tunja, and Casanare.

Magdalena, also four, Cartagena, Santa Marta, Rio Hacha, and Mompox.

Cauca, also four, Pastos, Popayan, Choco, and Buenaventura.

Istmo, two, Panamá and Veragua.

The principal towns:—In Cundinamarca—Bogotá, the capital not only of the department but of the republic, having a population of about 40,000; Honda, which has about 5000 inhabitants; Rio Negro, 6000; Mariquita, a small town near rich mines of gold, west of Honda; Neyva, pop. 4000; Timana, 2000—both these are noted for their plantations of cacao, and gold is washed near Timana—Ibague has a college, and is situated nearly 4900 feet above sea-level, at the foot of the Central Andes; in the valley of the Cauca are Antioquia, pop. 4500, and Madellin, 9000.

In Boyaca—Tunja, the capital, has a population of about 7000; Socorro, 12,000; Rosario de Cucuta, a pretty large town carrying on an active commerce in cacao, sugar-cane, coffee, and cotton; Pamplona, with 4000 inhabitants, and several gold mines in its vicinity.

In Magdalena—Cartagena, the capital; Mompox, pop. 10,000; Ocaña, 8000; Santa Marta, 3000; Ciudad de la Hacha, 3000; west of this town, along the coast, pearls were formerly fished.

In Cauca—Popayan, the capital, has about 20,000 inhabitants. It is situated 5824 feet above sea-level, near the sources of the Cauca river; and the volcanoes Porace and Sotara are in the vicinity; Cali, in the vale of Cauca, from which the chief road over the Western Andes leads to Buenaventura on the Pacific; Buenaventura, a collection of a few miserable huts built on posts, and yet it is the only port that supplies the valley of the Cauca and Popayan with wares, and it has mostly several vessels anchored there, both coasters and foreign. Atacames and Barbacoas are small harbours also on the Pacific. Pasto, with a population of 5100, stands at an elevation above the sea of 8580 feet in the Andes, near the boundary of Ecuador, on a fine plain near the foot of a very restless volcano.

In Istmo—Los Santos has a population of about 1600; David, 2800 inhabitants; Panamá, 6000; and Santiago, 2200.

History.

New Granada was discovered by Columbus 1498–1502. Different governments having been established throughout the country, a vice-royalty was at length, in 1732, formed of what is now the republics of Ecuador and New Granada. In 1810 the Spanish authority was thrown off, and an incessant war against that power maintained until 1824, when the Spaniards were finally vanquished. Bolivar, the most distinguished leader of the Spanish-American revolution in 1818, proposed the union of Venezuela with New Granada; and when the Congress of Angostura met early in 1819, the fundamental law was enacted, which established the republic of Colombia, and which was inaugurated on the 17th December of the same year. This union was never cordial, and lasted only ten years. In November 1829, Venezuela seceded from it; and in May 1830, Ecuador also withdrew. The central part of Colombia constituted itself the Republic of New Granada, 21st November 1831. In 1832 the constitution was promulgated, and the republic divided into provinces. Under the constitution, New Granada became an integral state, and the powers of government were divided into legislative, judicial, and executive, each independent of the other. The provinces secured to themselves municipal bodies, having powers over all local legislation. In 1843 the constitution was reformed, but without any variation in the organization of the government. On January 1, 1852, slavery was entirely abolished, and no slave has been born in the republic since 1821. In 1855 the Isthmus of Panamá was constituted a state under the name of Istmo, subject to the national government, however, in certain specified affairs.

GRANADA, a town of Central America, state of Nicaragua, on the N.W. bank of the lake of Nicaragua. By means of the lake and the river S. Juan, it communicates with the Caribbean Sea, and thus carries on a considerable trade. Pop. about 12,000.

GRANADA, FRAY LUIS DE, a celebrated Dominican friar, one of the greatest of the ascetic writers of Spain, was born in 1505, and died in 1588. His father was one of those whom Ferdinand the Catholic induced by valuable privileges and immunities to settle in Granada after the conquest of the Moors. At five years of age Luis was left a destitute orphan by the death of both his parents; but the Conde de Tendilla, alcalde of Alhambra, struck with the singular intelligence of the child, took him under his protection and had him educated with his own sons. Having completed his nineteenth year, Luis determined to devote himself to the Church, assumed the habit of the preaching friars in the convent of Santa Cruz, and became the first evangelical orator of his day. In vain did the queen offer him the bishopric of Viseu, and afterwards nominate him to the metropolitan church of Braga: he declined all ecclesiastical honours and emoluments in order that he might spend his life in what appeared to him a sphere of humble but extensive usefulness.

Luis de Granada wrote several things in Latin; but his *Guide to Sinners*, his *Meditations for the Seven Mornings and Evenings of the Week*, and his *Symbol of Faith*, which are all in the vernacular, are his most celebrated works. His friend, and predecessor of the same school, Juan de Avila, had created, so to speak, a powerful, deeply-coloured language for embodying religious sentiment, and Granada beautified it by retouching it with light and shade, giving it additional harmony, fluency, and dignity. These authors long seem to have been considered the great models for Spanish prose; and though we cannot enter into the rapture of the Spanish critics in extolling the power and pathos of their effusions, yet we may mention those on the sufferings and death of the Saviour as exquisite specimens. The *Descent into Hell*, to emancipate the spirits there imprisoned, we consider the finest specimen of the style and eloquence of Luis de Granada. This is justly considered one of the most sublime passages in the Spanish language. Fray Luis de Granada lived to the age of 83, honoured by all ranks, and died in a convent at Lisbon, where he had spent his declining years in strict seclusion.

GRANARD, a market-town of Ireland, county of Longford, 65 miles W.N.W. of Dublin. It has a parish church, a Roman Catholic chapel, dispensary, market-house, barracks, and union workhouse. Near the town is the Mote of Granard, an artificial mound, with vestiges of an encampment. Pop. (1851) 1805, besides 1855 in workhouse.

GRANARY, a building to store corn in. Granaries are generally built of brick, with quarters of timber wrought in the inside, to which the boards, with which the inside of the granary must be lined, are nailed so close to the bricks that there may be no space left for vermin to harbour in. There is an advantage in having many storeys, because the shallower the corn lies the better, and the more easily it is turned.

The two great requisites in the erecting of granaries are—to make them sufficiently strong, and to give them an exposure to the most drying winds. In many parts of England, particularly in Kent, corn is treated in the following manner. To separate it from dust and other impurities after it is threshed, it is tossed with shovels from one end to the other of a long and large room; the lighter substances fall down in the middle of the room, and the corn only is carried from side to side or from end to end of it. After this the corn is screened; and being then brought into the granary, it is spread about half a foot thick, and turned from time to time, about twice in a week; the screening of it is also repeated once a week. This sort of management is continued about two months, after which it is laid a foot thick for two months more; and during this time it is turned once a week, or twice if the season be damp, and now and then screened. After about five or six months, it is raised to two feet thickness in the heaps, and then turned once or twice in a month, and screened from time to time. After a year, it is laid two and a half or three feet deep, and turned once in three weeks or a month, and screened proportionally. When it has lain two years or more, it is turned once in two months, and screened once a quarter; and however long it be kept, the oftener the turning and screening are repeated the better will the grain be preserved. It is proper to leave an area of a yard wide on every side of the heap of corn, and other empty spaces into which the corn may be turned and tossed as often as required. In Kent two square holes are made at each end of the floor, and a round one in the middle, by means of which the corn is thrown out of the upper into the lower rooms, and so up again, that it may be the better turned and aired. The screens are made with two partitions, to separate the dust from the corn, which falls into a bag; and when sufficiently full this is thrown away, while the pure and good corn remains behind. Corn has by these means been kept thirty years; and it is observed, that the longer it is kept the more flour it yields in proportion to the corn, and the purer and whiter the bread is, the superfluous humidity alone evaporating in the keeping. At Zurich in Switzerland corn has been kept eighty years, or longer, by methods of a similar description.

The public granaries at Danzig are seven, eight, or nine storeys in height, and have a funnel in the midst of each floor, to let down the corn from one to another. They are built so securely, that though every way surrounded with water, the corn contracts no damp, and the vessels have the convenience of coming up to the walls to be loaded. The Russians and others preserve their corn in subterranean granaries of the figure of a sugar-loaf, wide below and narrow at top, the sides being well plastered, and the top covered with stones. They are careful to have the corn well dried before it be laid into these storehouses, and often dry it by means of ovens, especially where the summer dry weather is too short to effect this sufficiently. This method of storing grain has been practised in many countries from remote antiquity; and in Sicily, in particular, at the present day, many of the granaries are simply excavations in the calcareous rock.

Some recommend that the roofs of granaries should be composed of tiles, because in the worst seasons, when the regular apertures cannot be opened with safety, there will always be a considerable inlet for fresh air at their joinings, and also an issue for the exhalations given out by the grain; while others prefer a very close roof, as of lead or zinc, for the perfect exclusion of insects and vermin. If there happen to be any windows to the south, care must be taken to shut them in moist weather, and in the time of the hot southern winds. There must be no cellar or other damp place under a granary, nor should it ever be built over stables; for in either of these cases the corn will certainly suffer by the exhalations—be rendered damp in the one, and ill-tasted in the other.

M. Duhamel and Dr Hailes have recommended various contrivances for ventilating or blowing fresh air through corn laid up in granaries or ships, in order to preserve it sweet and dry, and to prevent its being attacked by weevils or other insects. This may be done by nailing wooden bars or laths on the floor of the granary, about an inch distant from each other when they are covered with hair-cloth only; or at the distance of two or three inches when coarse wire-work, or basket-work of osiers, is laid under the hair-cloth, or when an iron plate full of holes is laid upon them. These laths may be laid across other laths, nailed at the distance of fifteen inches, and two or more inches deep, that there may be a free passage for the air under them. The under laths must come about six inches short of the wall of the granary at one end, on which a board is to be set edgewise, sloping against the wall; for by this disposition a large air-pipe is formed, which having an open communication with all the interstices between and under the bars, will admit the passage of air below forcibly through a hole at the extremity, and consequently carry off the moist exhalations of the corn. The ventilators for supplying fresh air may be fixed against the wall, on the inside or outside of the granary, or under the floor, or in the ceiling; but wherever they are fixed, the handle of the lever that works them must be out of the granary, otherwise the person who works them would be in danger of suffocation when the corn is fumigated with burning brimstone, as is sometimes done for destroying weevils. Small moveable ventilators will answer the purpose for ventilating corn in large bins in granaries, and may easily be moved from one bin to another. If the granary or corn-ship be very long, the main air-pipe may pass lengthwise along the middle of it, and convey air on both sides under the corn. In large granaries, double ventilators laid upon each other may be fixed at the middle and near the top of the granary, that they may be worked by a windmill fixed on the roof of the building, or by a water-mill. The air is conveyed from the ventilators through a large trunk or trunks, reaching down through the several doors to the bottom of the granary, with branching trunks to each floor, by means of which it may be made to pass into a large trunk along the adjoining cross-walls; and from these trunks several lesser trunks, about four inches wide, branch off at the distance of three or four feet from one another, and reach through the whole length of the granary, their farther ends being closed. Seams of one-tenth or one-twelfth of an inch should also be left open at the four joinings of the boards, where they are nailed together, that the air may pass through them into the corn. In some of these lesser trunks there may be sliding shutters, to stop the passage of the air through those trunks which are not covered with iron, or to ventilate one part of the granary more briskly than others, as there may be occasion. There should also be wooden shutters, hung on hinges at their upper part, so as to shut close of themselves; and these should be fixed to openings in the walls of the granary on their outside; by which means they will readily open to give a free passage for the ventilating air, which ascends through the corn, but will instantly shut when the ventilation ceases, and thereby prevent the admission of damp from the external air. The ventilation should be made only in the middle of dry days, unless the corn, when first put in, be cold and damp.

GRAND CANAL. See Ireland.

GRAND ISLAND, an island in the Niagara River, United States of North America. Its lower extremity is about four miles above the Niagara Falls. It is about nine miles in length by six in breadth, having an area of about 17,400 acres. The soil is fertile; the surface is level, and mostly covered with a heavy growth of timber.

GRAND RAPIDS, a town in the United States of North America, capital of Kent county, Michigan. It is finely situated on the left bank of the rapids of the Grand River, forty miles from its mouth and sixty miles W.N.W. from Lansing. This is one of the most important and flourishing inland towns of the state, and a place of much activity in trade and manufactures. Steamboats run daily from this place to Grand Haven at the mouth of the river, where they meet the lake steamers. Grand Rapids was founded in 1833, and incorporated in 1850. Pop. (1853) about 5000.

GRAND RIVER, in the state of Michigan, the largest river lying wholly within the state. It rises in the Washtenaw and Hillsdale counties by two branches, which unite in Jackson county. Thence it pursues a very winding course, generally in a westward direction, to Lake Michigan. It is about 270 miles in length, and is about 320 yards wide at its mouth. There are several smaller streams of this name in the United States.

GRAND SERJEANTRY, an ancient species of tenure, whereby the tenant was bound, instead of serving the king in the wars, to do some special honorary service to the king in person; as to carry his banner, sword, or the like; or to be his butler, champion, or other officer, at his coronation.

GRANDEE (Span. *grande*), a nobleman of the highest rank. This term was originally applied in Spain to those great lords of the court on whom was conferred the privilege of remaining covered in the presence of the king. In some Spanish families this honour is hereditary.

GRANDOLLA, a town of Portugal, prov. of Alentejo, 30 miles S.S.E. of Setubal. It is situated in a plain west of the Serra de Grandolla, and is celebrated for its annual fair and the ruins of an old castle in its vicinity. The surrounding country abounds in fruits of the finest quality, and an active trade is carried on in these, and wines and oil of excellent quality manufactured here. Pop. nearly 3000.

GRANGE, an ancient term for a granary, and originally applied to the storehouse in which religious tithes paid in grain were deposited. It was also used in a more extended sense for a whole farm, with all its appendages of barns, stables, &c.

GRANGEMOUTH, a seaport-town of Scotland, county of Stirling, on the Carron and the Forth and Clyde Canal, a quarter of a mile from the Firth of Forth, and 11 miles S.S.E. of Stirling. It has a custom-house, extensive quays and warehouses, and a dry dock. The chief exports are iron goods, coal, grain, wool, linen yarn, and cotton and woollen goods; imports, timber, hemp, flax, tallow, &c. The harbour is commodious, but is not accessible to vessels drawing above twelve feet of water. Pop. (1841) 1488. The population of 1851 is included in Falkirk.

GRANGER, James, a well-known biographer, who has himself been left without any memorial. The time and place of his birth, and the condition of his parents, are equally unknown. He studied, however, at Christ Church, Oxford, which he probably left without taking a degree; and having entered into holy orders, was presented to the vicarage of Shiplake in Oxfordshire, which appears to have been his only preferment. In the dedication of his *Biographical Dictionary*, which was published in 1769, he informs us that his name and person were at that time known to few persons, as he had the good fortune to retire early to independence, obscurity, and contentment. In 1772 he published a sermon entitled *An Apology for the Brute Creation*, in which he strongly censured cruelty to animals; but which, owing to the mention made in it of horses and dogs, seems to have excited disgust amongst the purists of that time. In 1773 he presented to the public another sermon on the "Nature and Extent of Industry," which, notwithstanding a strange dedication, was more favourably received. But his principal work, indeed that by which alone he is now known, is his *Biographical History of England*, from the time of Egbert the Great to the Revolution, a production of very considerable merit, which occupied him many years, and of which he lived to see two editions sold. In this work he has only given biographies of those persons of whom some engraved portrait had been executed; and this circumstance, joined to the success which it met with, seems to have had the effect contemplated by the author, namely, to create a taste for collections of portraits. The *Biographical History* was first published in 1769, in four thin vols. quarto; but the second and subsequent editions have been published in octavo. On the 14th April 1776, whilst at the communion table in the act of administering the sacrament, Granger was seized with an apoplectic fit, and died next morning.

GRANICUS, in *Ancient Geography*, a small river of Asia Minor, rising in Mount Ida in the Troad, and flowing northwards into the Propontis, which it enters opposite the island of Proconnesus. Its historical is greater than its geographical interest; for it was the scene of two very famous battles, the first gained by Alexander over the Persians in 334 B.C., and the second by Lucullus over Mithridates in 74 B.C. The Granicus is probably represented by the modern Kodsha-su, though some writers identify it with the *Dimotico.*

GRANITE, a compound rock, constituting the lowest of the geological formations, according to older geologists; but it has lately been found resting even on secondary formations in the Alps. It (essentially) consists of quartz, felspar, and mica. Its great durability as a material for building is attested by many of the ancient Egyptian monuments, in which the stone exhibits no appearance of decay even after a lapse of 3000 years. There are some granites, however, which shake and crumble down in a very few years, particularly those in which felspar predominates. This rock becomes refractory to work after it has been some time quarried; and it is usual to keep it for some time under water before it is wrought into ornamental objects. See MINERALOGY and GEOLOGY.

GRANJA (LA) DE TORREHERMOSA, a royal town of Spain in the province of Estremadura. It is situated in a very beautiful plain, and its streets and houses are regularly and commodiously built. The vicinity abounds with excellent water, fruits, honey, and yields abundance of cereals. The town contains one large and two small squares, a parish church, a town-house, a prison, and a primary school. It has manufactures of woollen and linen cloth, and a considerable trade in cattle, wool, and corn. Pop. about 2000.

GRANOLLERS, a royal town of Spain, in the province of Cataluña, 20 miles N. by E. of Barcelona, on the left bank of the rivers Besos and Congost. It is not well built, has narrow, badly-paved streets, four squares, a large parish church, a chapel, two schools, a town-house, hospital, prison, and storehouse. Its manufactures are hempen shoes, linen, woollen, earthenware, and cotton fabrics; and its principal trade is in corn, fruits, wool, and cattle. Pop. about 2500. Two annual cattle fairs are held here.

GRANTHAM, a municipal and parliamentary borough and market-town of England, county of Lincoln, on the right bank of the Witham, 22 miles S.S.W. of Lincoln. The parish church is a spacious Gothic edifice of the thirteenth century, surmounted by an elegant spire 273 feet high, and has an elaborately carved font, and some splendid monuments. At the free grammar-school, founded by Bishop Fox, Sir Isaac Newton received part of his education. Grantham has also a guildhall, with a spacious assembly room, a gaol, house of correction, savings-bank, dispensary, several dissenting places of worship, and national and other schools. The principal trade is that of malting, which is carried on to a great extent. Market-day, Saturday. It is governed by a mayor, four aldermen, and twelve councillors, and returns two members to parliament. Pop. (1851) of municipal borough, 5,375; of parliamentary borough, 10,873.

GRANULATION of metals, an operation simply performed by slowly pouring the melted mass through an iron cullender into water, which is kept in agitation by means of a bundle of twigs. By this method metals may be reduced to minute grains.
